TO  
**THE QVEENES**  
**MOST EXCELLENT**  
**MAIESTIE.**

*Madame,*

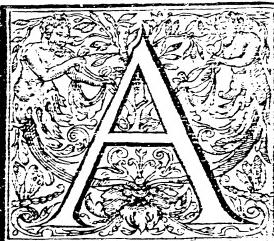

Nowing your Maiestie so much delighted with all the faire Flowers of a Garden, and furnished with them as farre beyond others, as you are eminent before them; this my VVorke of a Garden, long before this intended to be published, and but now only finished, seemed as it were destined, to bee first offered into your Highnesse hands, as of right challenging the proprietie of Patronage from all others. Accept, I beseech your Maiestie, this speaking Garden, that may informe you in all the particulars of your store, as well as wants, when you cannot see any of them fresh vpon the ground : and it shall further encourage him to accomplish the remainder; who, in praying that your Highnesse may enjoy the heauenly Paradise, after the many yeares fruition of this earthly, submitteth to be

*Your Maiesties  
in all  
humble devotion,*

JOHN PARKINSON.

TO THE COVREOUS  
READER.

Although the ancient Heathens did appropriate the first invention of the knowledge of Herbes, and so consequently of Physicke, some vnto Chiron the Centaure, and others vnto Apollo or Aculapius his sonne; yet wee that are Christians haue out of a better Schoole learned, that God, the Creator of Heauen and Earth, at the beginning when he created Adam, inspired him with the knowledge of all natural things (which successively descended to Noah afterwardes, and to his posterity): for, as he was able to giue names to all the living Creatures, according to their severall natures; so no doubt but hee had also the knowledge, both what Herbes and Fruits were fit, either for Meate or Medicine, for Use or for Delight. And that Adam might exercise this knowledge, God planted a Garden for him to liue in, (wherein euен in his innocency he was to labour, and spend his time) which hee stored with the best and choyest Herbes and Fruits the earth could produce, that he might haue not onely for necessarie whereon to feede, but for pleasure also; the place or garden called Paradise importing as much, and more plainly the words set downe in Genesis the second, which are these: Out of the ground the Lord God made to growe euerie tree pleasant to the sight and good for meate; and in the 24. of Numbers, the Parable of Balaam, mentioning the Aloe trees that God planted; and in other places if there were neede to recite them. But my purpose is onely to shew you, that Paradise was a place (whether you will call it a Garden, or Orchard, or both, no doubt of some large extent) wherein Adam was first placed to abide; that God was the Planter thereof, hauing furnished it with trees and herbes, as well pleasant to the sight, as good for meate, and that hee being to dresse and keepe this place, must of necessity know all the things that grew therein, and to what vses they serued, or else his labour about them, and knowledge in them, had been in vaine. And although Adam lost the place for his transgression, yet he lost not the naturall knowledge, nor use of them: but that, as God made the whole world, and all the Creatures therein for Man, so hee may use all things as well of pleasure as of necessarie, to bee helpe vnto him to serue his God. Let men therefore, according to their first institution, so use their seruice, that they also in them may remember their seruice to God, and not (like our Grand-mother Eve) set their affections so strongly on the pleasure in them, as to deserue the losse of them in this Paradise, yea and of Heauen also. For truly from all sorts of Herbes and Flowers we may draw matter at all times not only to magnifie the Creator that hath giuen them such diuersties of formes, scents and colours, that the most cunning Work-

## The Epistle to the Reader.

Worke-man cannot imitate, and such vertues and properties, that although wee know many, yet many more lye hidden and vnowne, but many good instructions also to our selues : That as many herbes and flowers with their fragrant sweete smels doe comfort, and as it were reuise the spirits, and perfume a whole houſe; even so ſuch men as liue vertuously, labouring to doe good, and profit the Church of God and the Common wealth by their paines or penne, doe as it were ſend forth a pleaſing ſauour of ſweete iſtructions, not only to that time wherein they liue, and are fresh, but being drye, withered and dead, ceaſe not in all after ages to doe as much or more. Many herbes and flowers that haue ſmall beautie or ſauour to commend them, haue much more good uſe and vertue : ſo many men of excellent rare parts and good qualities doe lyē bidden and not reſpected, vntill time and uſe of them doe ſet forth their properties. Againe, many flowers haue a glorious ſhew of beauty and brauery, yet ſtink in ſmell, or elſe of no other uſe : ſo many doe make a glorious oſtentation, and flouriſh in the world, when as if they ſtinke not horribly before God, and all good men, yet ſurely they haue no other vertue then their outside to commend them, or leaue behind them. Some alſo riſe vp and appear like a Lilly among Thornes, or as a goodly Flower among many Weedes or Graffe, eithere by their honourable authoritie, or eminence of learning or riches, whereby they excell others, and thereby may doe good to many. The frailty alſo of Mans life is learned by the ſoone fading of them before their flowing, or in their pride, or ſoone after, being either cropt by the hand of the ſpectator, or by a ſudden blaſt withered and parched, or by the revolution of time decaying of it owne nature : as alſo that the faireſt flowers or fruits first ripe, are ſoonest and first gathered. The mutabilitie alſo of ſtates and persons, by this, that as where many goodly flowers & fruits did grow this yeaſt and age, in another they are quite pulled or digged vp, and eithere weedes and graffe grow in their place, or ſome building erected thereon, and their place is no more known. The Ciuill respects to be learned from them are many alſo: for the delight of the varieties both of formes, colours and properties of Herbes and Flowers, bath euer beeene powerfull ouer dull, vnnurtured, rusticke and ſavage people, led only by Natures iſtinct; how muſt powerfull is it, or ſhould be in the mindes of generous persons? for it may well bee ſaid, he is not humane, that is not allured with this obiect. The ſtudy, knowledge, and trauel in them, as they haue been entertained of great Kings, Princes and Potentates, without diſparagement to their Greatneſſe, or hinderance to their more ſerious and weighty Affaires: ſo no doubt vnto all that are capable thereof, it is not onely pleasant, but profitable, by comforting the minde, ſpirits and ſenses with an harmelesſe delight, and by enabling the judgement to conſerue and apply helpe to many dangerous diſeases. It is alſo an Inſtructor in the verity of the genuine Plants of the Ancients, and a Correcter of the many errors whereunto the world by continuance hath bin diuerted, and almost therein fixed, by eradicating in time, and by degrees, the pertinacious wilfulneſſe of many, who because they were brought vp in their errors, are moſt unwilling to leaue them without conſideration of the good or euill, the right or wrong, they draw on therewith. And for my ſelfe I may well ſay, that had not mine owne paines and ſtudies by a naturall inclination beeene moſe powerfull in mee then any others helpe (althoſe through an euill diſpoſition and ignorance haue ſo far traduced me as to ſay this was rather another mans worke then mine owne, but I leaue them to their folly) I had neuer done ſo much as I here publith; nor been fit or prepared for a larger, as time may ſuddenly (by Gods permission) bring to light, if the malevolent diſpoſitions of degenerate ſpirits doe not hinder the accomplishment.

But

## The Epifle to the Reader.

But perwading my ſelfe there is no ſhowre that produceth not ſome fruit, or no word but worketh ſome effect, eyther of good to perwade, or of reprooſe to cōuince; I could not but declare my minde herein, let others iudge or ſay what they please. For I haue alwaies held it a thing conſit, to conceale or bury that knowledge God bath giuen, and not to impart it, and further others therewith as much as is conuenient, yet without oſtentation, which I haue euer hated. Now further to informe the courteous Reader, both of the occaſion that led me on to this worke, and the other occurrences to it. First, hauing peruſed many Herbals in Latine, I obſerved that moſt of them haue eyther neglected or not knowne the many diuerſities of the flower Plants, and rare fruits are knowne to vs at this time, and (except Cluſius) haue made mention but of a very few. In English likewiſe we haue ſome extant, as Turner and Dodonaeus tranſlated, who haue haue ſaid little of Flowers, Gerard who is laſt, bath no doubt giuen vs the knowledge of as many as he attained vnto in his time, but ſince his dates we haue had many more varieties, then he or they ever heard of, as may be perceiued by the ſtores I haue here produced. And none of them haue particularly ſeuereled thoſe that are beautiſull flower plants, fit to ſtore a gaſten of delight and pleasure, from the wilde and conſit: but haue enterlaced many, one among another, whereby many that haue deſired to haue faire flowers, haue not knowne either what to chooſe, or what to deſire. Diuers Bookes of Flowers also haue been ſet forth, ſome in our owne Countrey, and more in others, all which are as it were but handfuls ſnatched from the plentiſull Treaſury of Nature, none of them being willing or able to open all ſorts, and declare them fully; but the greateſt hinderance of all mens delight was, that none of them had giuen any deſcription of them, but the bare name only. To ſatisfie therefore their deſires that are louers of ſuch Delights, I took vpon me this labour and charge, and haue here ſelected and ſet forth a Garden of all the chiefeſt for choyce, and faireſt for ſhew, from among all the ſeuall Tribes and Kindreds of Natures beauty, and haue ranked them as neere as I could, or as the worke would permit, in affinity one vnto another. Secondly, and for their ſakes that are ſtudious in Authors, I haue ſet down the names haue bin formerly giuen vnto them, with ſome of their errores, not intending to cumber this worke with all that might bee ſaid of them, because the deciding of the many controverſies, doubts, and queſtions that concerne them, pertaine more fitly to a geuerall Hiſtory: yet I haue beeene in ſome places more copious and ample then at the firſt I had intended, the occaſion drawing on my deſire to informe others with what I thought was fit to be known, reſerving what else might be ſaid to another time & worke, wherein (God willing) I will enlarge my ſelfe, the ſubiect matter requiring it at my hands, in what my ſmall ability can effect. Thirdly, I haue alſo to embelliſh this Worke ſet forth the figures of all ſuch plants and flowers as are materiall and diſſerent one from another: but not as ſome others haue done, that is, a number of the figures of one ſort of plant that haue nothing to diſtinguiſh them but the colour, for that I hold to be ſuperfluouſ and waste. Fourthly, I haue alſo ſet down the Vertues and Properties of them in a briefe manner, rather deſiring to giue you the knowledge of a few certaine and true, then to relate, as others haue done, a needleſt and false multiplicite, that ſo there might as well profit as pleasure be taſten from them, and that nothing might be wanting to accomplish it fully. And ſo much for this firſt part, my Garden of pleaſant and delightfull Flowers. My next Garden conſiſteth of Herbes and Rootes, fit to be eaten of the rich and poor as nouriſhment and food, as ſauice or condiment, as ſallet or reſtreſhing, for pleaſure or profit; where I doe as well play the Gardiner, to ſhew you (in briefe, but not at large) the times and

## The Epistle to the Reader.

and manner of sowing, setting, planting, replanting, and the like (although all these things, and many more then are true, are set down very largely in the severall bookees that others haue written of this subiect) as also to shew some of the Kitchen-woes (because they are Kitchen herbes &c.) although I confess but very sparingly, not intending a treatise of cookery, but briefly to giue a touch thereof; and also the Physicall properties, to shew somewhat that others haue not set forth; yet not to play the Empericke, and giue you receipts of medicines for all diseases, but only to shew in some sort the qualities of Herbes, to quicken the minds of the studious. And lastly an Orchard of all sorts of domesticke or forraine, rare and good fruits, fit for this our Land and Countrey, whiche is at this time better stored and furnished then euer in any age before. I haue herein endeauoured, as in the other Gardens, to set forth the varieties of every sort in as briefe a manner as possibly could be, without superfluous repetitions of descriptions, and onely with especiall notes of difference in leaues, flowers and fruits. Some few properties also are set downe, rather the chiefeſt then the moſt, as the worke did require. And moreouer before every of these parts I haue giuen Treatises of the ordering, preparing and keeping the severall Gardens and Orchard, with whatſoever I thought was conuenient to be known for every of them.

Thus haue I ſhewed you both the occaſion and ſcope of this Worke, and herein haue ſpent my time, paines and charge, whiche if well accepted, I ſhall thinke well employed, and may the ſooner haſten the fourth Part, A Garden of Simples; whiche will be quiet no longer at home, then that it can bring his Maſter newes of faire weather for the iourney.

Thine in what he may,

JOHN PARKINSON.

Societatis confors.

# THE ORDERING OF THE GARDEN OF PLEASVRE.

## CHAP. I.

*The situation of a Garden of pleasure, with the nature of soyles, and how to amend the defects that are in many sorts of situations and grounds.*

HE feuerall situations of mens dwellings, are for the most part vnauoideable and vremoueable; for most men cannot appoint forth such a manner of situation for their dwelling, as is most fit to auoide all the inconueniences of winde and weaker, but must bee content with such as the place will afford them; yet all men doe well know, that some situations are more excellent than others: according therfore to the feuerall situation of mens dwellings, so are the situations of their gardens also for the most part chosen, or wherein they dwel. As some those places that are ~~near~~ vnto a riuer or brooke to be best for the pleauantesse of the water, the easie of transportation of themselves, their friends and goods, as also for the fertility of the soyle, which is seldom bid neare vnto a riuers side; And others extoll the side or top of an hill, bee it small or great, for the prospects sake; And againe, some the plaine or champian ground, for the euene leuell thereof: every one of which, as they haue their commodities accompanying them, so haue they also their discommodities belonging vnto them, according to the Latine Proverbe, *Omne comodum fert suum incommodeum.* Yet to shew you for euerie of these situations which is the fittest place to plant your garden in, and how to defend it from the iniuries of the cold windes and frosts that may annoy it, will, I hope, be well accepted. And first, for the waterside, I suppose the North side of the water to be the best side for your garden, that it may haue the comfort of the South Sunne to lye vpon it and face it, and the dwelling house to bee aboue it, to defend the cold windes and frosts both from your herbes, and flowers, and early fruits. And so likewise I iudge for the hill side, that it may lye full open to the South Sunne, and the house aboue it, both for the comfort the ground shall receave of the water and raine descending into it, and of defence from winter and colds. Now for the plaine leuell ground, the buildings of the house should be on the North side of the garden, that so they might bee a defence of much sufficiencie to safeguard it from many iniurious cold nights and dayes, which else might spoyle the pride thereof in the bud. But because every one cannot so appoint his dwelling, as I here appoint the fittest place for it to be, every ones pleasure thereof shall be according to the site, cost, and endeauours they bestow, to cause it come nearest to this proportion, by such helpe of bricke or stone walys to defend it, or by the helpe of highe growne and well spread trees, planted on the North side thereof, to keepe it the warmer. And euery of these three situations, having the fairest buildings of the house facing the garden in this manner before specified, besides the benefit of that it shall haue from them, the buildings and roomes abutting thereon, shall haue reciprocally the beautifull prospect into it, and haue both sight and sent of whatsoeuer is excellent, and worthy to giue content out from it, which is one of the greatest pleasures a garden can yeeld his Master. Now having shewed you the best place where this your

A

garden

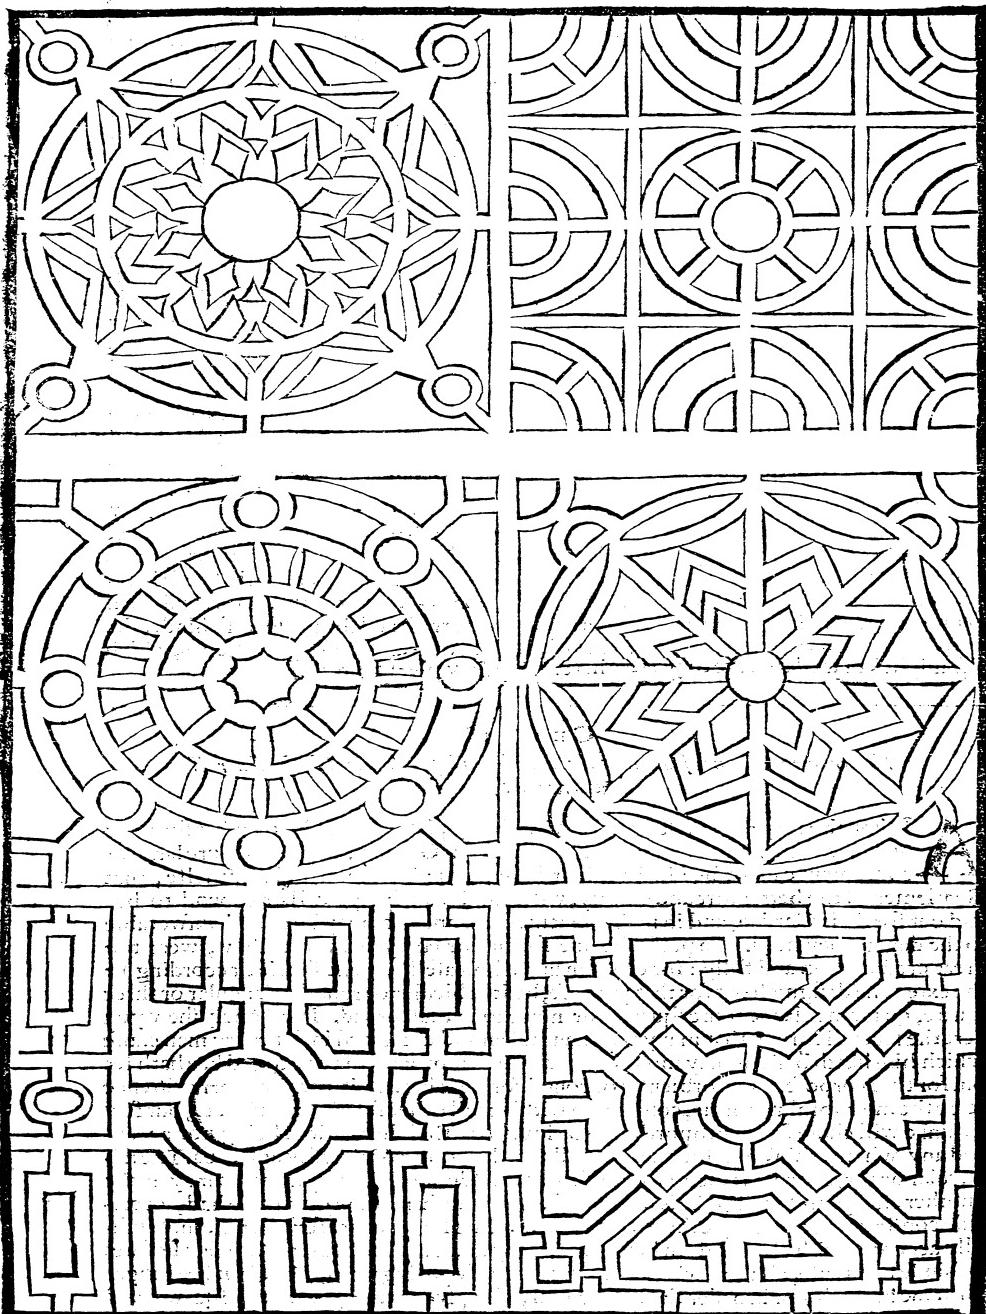

garden should be, let me likewise aduise you where it should not be, at least that it is the worst place wherein it may be, if it be either on the West or East side of your house, or that it stand in a moorisly ground, or other vnwholsome ayre (for many, both fruits, herbes, and flowers that are tender, participate with the ayre, taking in a manner their chiefeſt thriuing from thence) or neare any common Lay-stalles, or common Sewers, or else neare any great Brew-house, Dye-house, or any other place where there is much smoake, whether it be of straw, wood, or especially of ſea-coales, which of all other is the worſt, as our Citie of London can giue proofe ſufficient, wherein neither herbe nor tree will long proſper, nor hath done euer ſince the uſe of ſea-coales beganne to bee frequent therein. And likewiſe that it is much the worſe, if it bee neare vnto any Barnes or ſtackes of corne or hey; because that from thence will continually with the wind bee brought into the garden the strawe and chaffe of the corne, the duff and ſeede of the hey to choake or peſter it. Next vnto the place or ſituation, let mee ſhew you the grounds or ſoyles for it, eyther naturall or artificiall. No man will deny, but the naturall blacke mould is not only the fatteſt and richest, but farre exceedeth any other either naturall or artificiall, as well in goodneſſe as durability. And next therunto, I hold the sandy loame (which is light and yet firme, but not loſe as ſaad, nor ſtiffe like vnto clay) to be little inferiori for this our Garden of pleaſure; for that it doth cauſe all bulbous and tuberous rooted plants to thriue ſufficiently therein, as likewiſe all other flower-plants, Roſes, Trees, &c. which if it ſhall decay by much turning and working out the heart of it, may ſooone be helped with old ſtable manure of horſes, being well turned in, when it is old and almoſt conuerted to mould. Other grounds, as chalke, ſand, grauell, or clay, are euery of them one more or leſſe fertill or barren than other; and therefore doe require ſuch helpe as is moſt fit for them. And thoſe grounds that are ouer dry, loſe, and duffie, the manure of ſtall fedde beaſts and cattell being buried or trenched into the earth, and when it is thorough rotten (which will require twice the time that the ſtable ſoyle of horſes will) well turned and mixed with the earth, is the beſt ſoyle to temper both the heate and driness of them. So contrariwise the ſtable dung of horſes is the beſt for cold grounds, to giue them heate and life. But of all other ſorts of grounds, the ſtiffe clay is the very worſt for this purpoſe, for that although you ſhould digge out the whole compaſſe of your Garden, carry it away, and bring other good mould in the stead thereof, and fill vp the place, yet the nature of that clay is ſo predominant, that in a ſmall time it will eate out the heart of the good mould, and conuerte it to its owne nature, or very neare vnto it: ſo that to bring it to any good, there muſt bee continuall labour beſtowed thereon, by bringing into it good ſtore of chalke, lime, or ſand, or elſe ashes eyther of wood or of ſea-coales (which is the beſt for this ground) well mixed and turned in with it. And as this ſtiffe clay is the worſt, ſo what ground ſouer commeth neareſt vnto the nature thereof, is neareſt vnto it in badneſſe, the ſigues whereof are the ouermuch moyſture thereof in Winter, and the much cleauing and chapping thereof in Summer, when the heate of the yeare hath conuerted the moyſture, which tyed and bound it fast together, as also the ſtiffe and hard working therein: but if the nature of the clay bee not too ſtiffe, but as it were tempered and mixed with ſand or other earths, your old ſtable ſoyle of horſes will helpe well the ſmall rifting or chapping thereof, to be plentifullly beſtowed therin in a fit ſeafon. Some alſo do commend the casting of ponds and ditches, to helpe to manure theſe ſtiffe chapping grounds. Other grounds, that are ouermoſt by ſprings, that lyē too neare the vpper face of the earth, beſides that the beds thereof had need to be laid vp higher, and the allies, as trenches and furrowes, to lyē lower, the ground it ſelfe had neede to haue ſome good ſtore of chalke ſtones beſtowed thereon, ſome certaine yeares, if it may be, before it be laid into a Garden, that the Witter froſts may breake the chalke ſmall, and the Raine diſſolute it into mould, that ſo they may be well mixed together; than which, there is not any better manure to ſoyle ſuch a moſt ground, to helpe to dry vp the moyſture, and to giue heate and life to the coldneſſe thereof, which doth alwayes accompany theſe moſt grounds, and alſo to cauſe it abide longer in heart than any other. For the sandy and granely grounds, althoſe I know the well mollified manure of beaſts and cattell to be excellent good, yet I know alſo, that ſome commend a white Marle, and ſome a clay to be well ſpread thereon, and after turned thereinto: and for the chalkie ground, & conuerto, I commend fatte clay to helpe it. You muſt vnderſtand, that the leſſe rich or more barren that your ground is, there nee-  
deth

deth the more care, labour, and cost to bee beſtowed thereon, both to order it rightly, & ſo to preſerue it from time to time: for no artiſciall or forc't ground can endure good any long time, but that within a few yeares it muſt be reſtreched more or leſſe, according as it doth require. Yet you ſhall likewiſe vnderſtand, that this Garden of pleasure ſtored with theſe Out-landiſh flowers; that is, bulbous and tuberous rooted plants, and other fine flowers, that I haue hereaſter deſcribed, and aſſigned vnto it, neeđeth not ſo much or ſo often manuring with ſoyle, &c. as another Garden planted with the other ſorts of English flowers, or a Garden of ordinary Kitchin herbs doth. Your ground likewiſe for this Garden had neede to bee well cleaſed from all annoyances (that may hinder the well doing or proſpering of the flowers thereiñ) as ſtones, weedes, rooteſ of trees, buſhes, &c. and all other things cumbersome or hurtfull; and therefore the earth being not naturally fine enough of it ſelfe, is vſed to bee liſted to make it the finer, and that either through a hurdle made of ſticks, or lathes, or through ſquare or round ſieues plaſted with fine and ſtrong thin ſticks, or with wyers in the bottome. Or elſe the whole earth of the Garden being course, may be caſt in the ſame manner that men vſe to try or fine ſand from grauell, that is, againſt a wall; whereby the courſer and more ſtony, falling downe from the fine, is to be taken away from the foothe of the heape, the finer ſand and ground remaining ſtill aboue, and on the heape. Or elſe in the want of a wall to caſt it againſt, I haue ſene earth ſined by it ſelfe in this manner: Hauiing made the floore or vpper part of a large plat of ground cleane from ſtones, &c. let there a reasonable round heape of fine earth be ſet in the midſt thereof, or in stead thereof a large Garden flower-pot, or other great pot, the bottome turned vpwards, and then poure your course earth on the top or head thereof, one ſhouell full after another ſomewhat gently, and thereby all the course ſtuffe and ſtones will fall downe to the bottome round about the heape, which muſt continually be carefully taken away, and thus you may make your earth as fine as if it were caſt againſt a wall, the heape being growne great, ſeruing in stead thereof. Thoſe that will not prepare their grounds in ſome of the manners aforesaid, ſhall ſooone finde to their loſe the negleſt thereof: for the trash and ſtones ſhall ſo hinder the encrease of their roots, that they will be halfe loſt in the earth among the ſtones, which elſe might be ſaued to ſerue to plant wheresoeuer they please.

## C H A P. II.

*The frame or forme of a Garden of delight and pleaſure, with the ſeverall varieties thereof.*

**A**LTHOUGH many men muſt be content with any plat of ground, of what forme or quantity ſouer it bee, more or leſſe, for their Garden, because a more large or conuenient cannot bee had to their habitation: Yet I perſwade my ſelfe, that Gentlemen of the better ſort and quality, will prouide ſuich a parcell of ground to bee laid out for their Garden, and in ſuich conuenient manner, as may be fit and anſwerable to the degree they hold. To preſcribe one forme for euery man to follow, were too great presumption and folly: for every man will pleafe his owne fancie, according to the extent he deſigneth out for that purpose, be it orbicular or round, triangular or three ſquare, quadrangular or four ſquare, or more long than broad. I will onely ſhew you herethe ſeverall formes that many men haue taken and delighted in, let euery man chufe which him liketh beſt, or may moſt fitly agree to that proportion of ground hee hath ſet out for that purpose. The orbicular or round forme is held ia it owne proper exiſtence to be the moſt absolute forme, containing within it all other formes whatſouer; but few I thinke will chufe ſuich a proportion to be ioyned to their habitation, being not accep-  
ted any where I think, but for the generall Garden to the Vniuersity at Padoa. The tri-  
angular or three ſquare is ſuich a forme alſo, as is ſeldome choſen by any that may make another choiſe, and as I thinke is onely had where another forme cannot be had, accep-  
tice conſtraining them to be therewith content. The four ſquare forme is the moſt vi-  
ually accepted with all, and doth beſt agree to any mans dwelling, being (as I ſaid before)  
behinde the house, all the backe windowes thereof opening into it. Yet if it bee longer  
than the breadth, or broader than the length, the proportion of walkeſ, ſquares, and  
knots may be ſoon brought to the ſquare forme, and be ſo caſt, as the beauty thereof may  
be

bee no lesse than the foure square proportion, or any other better forme, if any be. To forme it therfore with walks, crosse the middle both waies, and round about it also with hedges, with squares, knots and trayles, or any other worke within the foure square parts, is according as every mans conceit alloweth of it; and they will be at the charge: For there may be therein walkes eyther open or close, eyther publike or priuate, a maze or wildernesse, a rocke or mount, with a fountaine in the midst thereof to conuey water to every part of the Garden, eyther in pipes vnder the ground, or brought by hand, and emptied into large Cisternes or great Turke Iarres, placed in conuenient places, to serue as an easie to water the nearest parts thereunto. Arbours also being both gracefull and necessary, may be appointed in such conuenient places, as the corners, or else where, as may be most fit, to serue both for shadow and rest after walking. And because many are desirous to see the formes of trayles, knots, and other compartments, and because the open knots are more proper for the Out-landish flowers; I haue here caised some to be drawne, to satisfie their desires, not intending to cumber this worke with ouer manie, in that it would be almost endlesse, to expresse so many as might bee conceiued and set downe, for that every man may inuent others farre differing from these, or any other can be set forth. Let every man therefore; if hee like of these, take what may please his mind, or cut of these or his own conceit, frame any other to his fancy, or cause others to be done as he liketh best, obseruing this *decorum*, that according to his ground he do cast out his knots, with conuenient roome for allies and walkes; for the fairer and larger your allies and walkes be, the more grace your Garden shall haue, the lesse harme the herbes and flowers shall receiue, by passing by them that grow next vnto the allies sides; and the better shall your Weeders cleanse both the beds and the allies.

### CHAP. III.

*The many sorts of herbes and other things, wherewith the beds and parts of knots are bordered to set out the forme of them, with their commodities and discommodities.*

IT is necessary also, that I shew you the seuerall materials, wherewith these knots and trayles are set forth and bordered; which are of two sorts: The one are living herbes, and the other are dead materials; as leade, boords, bones, tyles, &c. Of herbes, there are many sorts wherewith the knots and beds in a Garden are vsed to bee set, to shew forth the forme of them, and to preserue them the longer in their forme, as also to be as greene, and sweete herbes, while they grow, to be cut to perfume the house, keeping them in such order and proportion, as may be most conuenient for their severall natures, and euery mans pleasure and fancy: Of all which, I intend to giue you the knowledge here in this place; and first, to begin with that which hath beene most anciently received, which is Thrift. This is an eueriuering greene herbe, which many take to border their beds, and set their knots and trayles, and therein much delight, because it will grow thicke and bushie, and may be kept, being cut with a paire of Garden sheeres, in some good handsome manner and proportion for a time, and besides, in the Summer time send forth many short stalkes of pleasant flowers, to decke vp an house among other sweete herbes: Yet these inconueniences doe accompany it; it will not onely in a small time ouergrow the knot or trayle in many places, by growing so thicke and bushie, that it will put out the forme of a knot in many places: but also much thereof will dye with the frosts and snowes in Winter, and with the drought in Summer, whereby many voide places will be seene in the knot, which doth much deform it, and must therefore bee yearly refreshed: the thicknesse also and bushing thereof doth hide and shelter snayles and other small noysome wormes so plentifullly, that Gilloflowers, and other fine herbes and flowers being planted therein, are much spoyled by them, and cannot be helped without much industry, and very great and daily attendance to destroy them. Germanander is another herbe, in former times also much vsed, and yet also in many places; and because it will grow thicke, and may be kept also in some forme and proportion with cutting, and that the cuttings are much vsed as a strawing herbe for houses, being pretty and sweete, is also much affected by driers: but this also will often dye and grow out of forme, and besides that, the stalkes will grow too great, hard and stubby, the rootes doe so farre shoothe vnder ground, that vpon a little continuall thereof, will

spread into many places within the knot, which if continually they be not plucked vp, they will spoile the whole knot it selfe ; and therefore once in three or four yeares at the most, it must be taken vp and new set, or else it will grow too roynish and cumbersome. Hyssope hath also been vsed to be set about a knot, and being sweet, will serue for strewings, as Germanander : But this, although the rootes doe not runne or creep like it, yet the stalkes doe quickly grow great aboue ground, and dye often after the first yeares letting, whereby the grace of the knot will be much lost. Marierome, Sauorie, and Thyme, in the like manner being sweete herbes, are vsed to border vp beds and knors, and will be kept for a little while, with cutting, into some conformity ; but all and every of them serue most commonly but for one yearevsfe, and will soone decay and perish : and therefore none of these, no more than any of the former, doe I commend for a good bordering herbe for this purpose. Lauander Cotton also being finely slipped and iet, is of many, and those of the highest respect of late daies, accepted, both for the beauty and forme of the herbe, being of a whitish greene mealy colour, for his sent smelling somewhat strong, and being euerialiuing and abiding greene all the Winter, will, by cutting, be kept in as euen proportion as any other herbe may be. This will likewife soone grow great and stubbed, notwithstanding the cutting, and besides will now and then perish in some places, especially if you doe not strike or put off the snow, before the Sunne lying vpon it dissolute it : The rarity & nouelty of this herbe, being for the most part but in the Gardens of great persons, doth cause it to be of the greater regard, it must therefore be renewed wholly every second or third yeare at the most, because of the great growing therof. Slips of Juniper or Yew are also receiuied of some & planted, because they are alwayes green, and that the Juniper especially hath not that ill sent that Boxe hath, which I will presently commend vnto you, yet both Juniper and Yew will soone grow too great and stubbed, and force you to take vp your knot sooner, than if it were planted with Boxe. Which lastly, I chiefly and aboue all other herbes command vnto you, and being a small, lowe, or dwarfe kinde, is called French or Dutch Boxe, and serueth very well to set out any knot, or border out any beds : for besides that it is euer greene, it being reaonable thicke set, will easilly be cut and formed into any fashion one will, according to the nature thereof, which is to grow very slowly, and will not in a long time rise to be of any height, but shooting forth many small branches from the roote, will grow very thicke, and yet not require so great tending, nor so much perish as any of the former, and is only receiuied into the Gardens of those that are curious. This (as I before said) I commend and hold to bee the best and surest herbe to abide faire and greene in all the bitter stormes of the sharpest Winter, and all the great heates and droughts of Summer, and doth recompence the want of a good sweet sent with his fresh verdure, euen proportion, and long lasting continuance. Yet these inconueniences it hath, that besides the vnpleasing sent which many mislike, and yet is but small, the rootes of this Boxe do so much spread themselves into the ground of the knot, and doe draw from thence so much nourishment, that it robbeth all the herbes that grow neare it of their sap and substance, thereby making all the earth about it barren, or at least lesse fertile. Wherefore to shew you the remedy of this inconuenience of spreading, without either taking vp the Boxe of the border, or the herbes and flowers in the knot, is I thinke a secret knowne but vnto a few, which is this : You shall take a broad pointed Iron like vnto a Slipe or Cheffill, which thrust downe right into the ground a good depth all along the inside of the border of Boxe somewhat close thereunto, you may thereby cut away the spreading rootes thereof, which draw so much moisture from the other herbes on the inside, and by this meanes both preserue your herbes and flowers in the knot, and your Boxe also, for that the Boxe will be nourished sufficiently from the rest of the rootes it shooteth on all the other sides. And thus much for the liuing herbes, that serue to set or border vp any knot. Now for the dead materials, they are also, as I said before diuers : as first, Leade, which some that are curious doe border their knots withall, causig it to be cut of the breadth of foure fingers, bowing the lower edge a little outward, that it may lye vnder the vpper crust of the ground, and that it may stand the faster, and making the vpper edge either plain, or cut out like vnto the battlements of a Church : this fashions hath delighted some, who haue accounted it stately (at the least costly) and fit for their degree, and the rather, because it will be bowed and bended into any round square, angular, or other proportion as one listeth, and is not much to be misliked, in that the Leade doth

doth not easily breake or spoile without much iniury, and keepeth vp a knot for a very long time in his due proportion : but in my opinion, the Leade is ouer-hot for Sommer, and ouer-cold for Winter. Others doe take Oaken inch boordes, and sawing them foure or five inches broad, do hold vp their knot therewith : but in that these boordes cannot bee drawne compasse into any small scantling, they must serue rather for long outright beds, or such knots as haue no rounds, halfe rounds, or compassings in them. And besides, these boordes are not long lasting, because they stand continually in the weather, especially the ends where they are fastned together will soonest rot and perish, and so the whole forme will be spoyled. To prevent that fault, some others haue chosen the shanke bones of Sheep, which after they haue beeene well cleansed and boyled, to take out the fat from them, are stucke into the ground the smal end downewards, and the knockle head vpwards, and thus being set side to side, or end to end close together, they set out the whole knot therewith, which heads of bones although they looke not white the first yeare, yet after they haue abiden some frostes and heates will become white, and prettily grace out the ground : but this inconuenience is incident to them, that the Winter frostes will raise them out of the ground oftentimes, and if by chance the knockle head of any doe breake, or be strucke off with any ones foot, &c. going by, from your store, that lyeth by you of the same sort, set another in the place, hauing first taken away the broken peece: although these will last long in forme and order, yet because they are but bones many mislike them, and indeed I know but few that vse them. Tyles are also vsed by some, which by reason they may bee brought compasse into any fashon many are placed with them, who doe not take the whole Tyle at length, but halfe Tyles, and other broken peeces set somewhat deepe into the ground, that they may stand fast, and these take vp but little roome, and keepe vp the edge of the beds and knors in a pretty comely manner, but they are often out of frame, in that many of them are broken and spoiled, both with mens feete passing by, the weather and weight of the earth beating them downe and breaking them, but especially the frostes in Winter doe so cracke off their edges, both at the topes and sides that stand close one vnto another, that they must bee continually tended and repaired, with fresh and sound ones put in the place of them that are broken or decayed. And lastly (for it is the latest inuention) round whitish or blewisch pebble stones, of some reasonable proportion and bignesse, neither too great nor too little, haue beeene vsed by some to be set, or rather in a manner but laide vpon the ground to fashion out the traile or knot, or all along by the large grauelly walke fides to set out the walke, and maketh a pretty handsome fiew, and because the stones will not decay with the iniuries of any time or weather, and will be placed in their places againe, if any should be thrust out by any accident, as also that their sight is so conspicuous vpon the ground, especially if they be not hid with the store of herbes growing in the knot, is accounted both for durability, beauty of the sight, handsonnesse in the worke, and ease in the working and charge, to be of all other dead materials the chiefest. And thus, Gentlemen, I haue shewed you all the varieties that I know are vsed by any in our Countrey, that are worth the reciting (but as for the fashions of lawe-bones, vsed by some in the Low-Countries, and other places beyoud the Seas, being too grosse and base, I make no mention of them) among which every one may take what pleasest him best, or may most fitly be had, or may best agree with the ground or knot. Moreover, all these herbes that serue for borderings, doe serue as well to be set vpon the ground of a leuelled knot, that is, where the allies and foot-pathes are of the same leuell with the knot, as they may serue also for the raised knot, that is, where the beds of the knot are raised higher than the allies : but both Leade, Boordes, Bones, and Tyles, are onely for the raised ground, be it knot or beds. The pebble stones againe are onely for the leuelled ground, because they are so shallow, that as I said before, they rather lye vpon the earth than are thrust any way into it. All this that I haue here set downe, you must understand is proper for the knots alone of a Garden. But for to border the whole square or knot about, to serue as a hedge therento, enery one taketh what liketh him best; as either Priuet alone, or sweete Bryer, and white Thorne enterlaced together, and Roses of one, or two, or more sorts placed here and there amongst them. Some also take Lauander, Rosemary, Sage, Southernwood, Lauander Cotton, or some such other thing. Some againe plant Cornell Trees, and plash them, or keep them lowe, to forme

forme them into an hedge. And some againe take a lowe prickly shrubbe, that abideth alwayes greene, described in the end of this Booke, called in Latine *Pyracantha*, which in time will make an euer greene hedge or border, and when it beareth fruit, which are red berries like vnto Hawthorne berries, make a glorious shew among the greene leaues in the Winter time, when no other shrubbes haue fruit or leaues.

## C H A P. IV.

*The nature and names of divers Out-landish flowers, that for their pride, beauty, and earlinesse, are to be planted in Gardens of pleasure for delight.*

H Aving thus formed out a Garden, and diuided it into his fit and due proportion, with all the gracefull knots, arbours, walkes, &c. likewise what is fit to keepe it in the same comely order, is appointed vnto it, both for the borders of the squares, and for the knots and beds themselues; let vs now come and furnish the inward parts, and beds with those fine flowers that (being strangers vnto vs, and giuing the beauty and brauery of their colours so early before many of our owne bred flowers, the more to entice vs to their delight) are most beſeeming it: and namely, with Daffodils, Fritillarias, Iacinthes, Saffron-flowers, Lillies, Flowerdeluces, Tulipas, Anemones, French Cowslips, or Beares eares, and a number of ſuch other flowers, very beaufiull, delightfull, and pleasant, hereafter deſcribed at full, whereof although many haue little ſweete ſent to commend them, yet their earlinesſe and exceeding great beaufie and varietie doth ſo farre counteruiale that defēſt (and yet I muſt tell you with all, that there is among the many ſorts of them ſome, and that not a few, that doe excell in ſweetneſſe, being ſo ſtrong and heady, that they rather offend by too much than by too little ſent, and ſome againe are of ſo milde and moderate temper, that they ſcarce come ſhort of your moſt delicate and daintieſt flowers) that they are almoſt in all places with all persons, especially with the better ſort of the Gentry of the Land, as greatly deſired and accepted as any other the moſt choiſeft, and the rather, for that the moſt part of theſe Out-landiſh flowers, do ſhew forth their beauty and colours ſo early in the year, that they ſeeme to make a Garden of delight even in the Winter time, and doe ſo giue their flowers one after another, that all their brauery is not fully ſpent, vntil that Gilliflower, the pride of our English Gardens, do ſhew themſelues: So that whōſoever would haue of euery ſort of theſe flowers, may haue for every moneth ſeuerall colours and varieties, euen from Chriſtmas vntill Midfommer, or after; and then, after ſome little reſpite, vntill Chriſtmas againe, and that in ſome plenty, with great content and without forcing, ſo that every man may haue them in every place, if they will take any care of them. And becauſe there bee many Gentlewomen and others, that would gladly haue ſome fine flowers to furnish their Gardens, but know not whathe names of thoſe things are that they deſire, nor what are the times of their flowring, nor the ſkill and knowledge of their right ordering, planting, diſplanting, transplanting, and replanting; I haue here for their ſakes ſet downe the nature, names, times, and manner of ordering in a briue manner, referring the more ample declaration of them to the worke following. And firſt of their names and natures: Of Daffodils there are almoſt an hundred ſorts, as they are ſeuerally deſcribed hereafter, every one to be diſtinguished from other, both in their times, formes, and colours, ſome being eyther white, or yellow, or mixt, or elſe being ſmall or great, ſingle or double, and ſome hauing but one flower vpon a ſtalke, others many, whereof many are ſo exceeding ſweete, that a very few are ſufficient to perfume a whole chamber, and beſides, many of them be ſo faire and double, eyther one vpon a ſtalke, or many vpon a ſtalke, that one or two ſtalkes of flowers are in ſtead of a whole noſe-gay, or bundell of flowers tyed together. This I doe affirme vpon good knowledge and certaine expeſience, and not as a great many others doe, tell of the wonders of another world, which themſelues neuer ſaw nor euer heard of, except ſome ſuperficiall relation, which themſelues haue augmented according to their owne fanſie and conſeit. Againe, let me here alſo by the way tell you, that many idle and ignorant Gardiners and others, who get names by ſtealthe, as they doe many other things, doe call ſome

ſome of theſe Daffodils Narciſſes, when as all know that know any Latine, that Narciſſus is the Latine name, and Daffodill the English of one and the ſame thing; and therefore alone without any other Epithite cannot properly diſtinguifh ſeuerall things. I would willingly therefore that all would grow iudicious, and call euery thing by his proper English name in ſpeaking English, or elſe by ſuch Latine name as euery thing hath that hath not a proper English name, that thereby they may diſtinguifh the ſeuerall varieties of things and not confound them, as also to take away all excuses of miſtaſking; as for example: The ſingle English baſtard Daffodill (which groweth wilde in many Woods, Groues, and Orchards in England.) The double English baſtard Daffodill. The French ſingle white Daffodill many vpon a ſtalke. The French double yellow Daffodill. The great, or the little, or the leaſt Spaniſh yellow baſtard Daffodill, or the great or little Spaniſh white Daffodill. The Turkie ſingle white Daffodill, or, The Turkie ſingle or double white Daffodill many vpon a ſtalke, &c. Of Fritillaria, or the checker'd Daffodill, there are halfe a ſcore ſeuerall ſorts, both white and red, both yellow and blacke, which are a wonderfull grace and ornament to a Garden in regard of the Checker like ſpots are in the flowers. Of Iacinthes there are aboue halfe an hundred ſorts, as they are ſpecified hereafter, ſome like vnto little bells or starres, others like vnto little bottles or pearles, both white and blew, ſky-coloured and bluſh, and ſome starlike of many pretty various formes, and all to giue delight to them that will be curioſe to obſerve them. Of Crocus or Saffron flowers, there are alſo twenty ſorts, ſome of the Spring time, others flowring onely in the Autume or Fall, earlier or later than another, ſome whereof abide but a while, others indure aboue a moneth in their glorious beauty. The Colchicum or Medowe Saffron, which ſome call the ſonne before the father, but not properly, is of many ſorts alſo; ſome flowring in the Spring of the yeare, but the moſt in Autume, whereof ſome haue faire double flowers very delightfull to behold, and ſome party coloured both ſingle and double ſo variable, that it would make any one admire the worke of the Creatour in the various ſpots and ſtripes of theſe flowers. Then haue wee of Lillies twenty ſeuerall ſorts and colours, among whom I muſt reckon the Crowne Imperiaſl, that for his ſtately forme deſerueth ſome ſpeciall place in this Garden, as alſo the Martagon, both white and red, both bluſh and yellow, that require to be ſet by themſelues apart, as it were in a small round, or ſquare of a knot, without many other, or tall flowers growing neare them. But to tell you of all the ſorts of Tulipas (which are the pride of delight) they are ſo many, and as I may ſay, almoſt infinite, doth both paſſe my ability, and as I heleeue the ſkill of any other. They are of two eſpeciall ſorts, ſome flowring earlier, and others later than their fellowes, and that naturally in all grounds, wherein there is ſuch a wonderfull variety and mixture of colours, that it is almoſt imposſible for the wit of man to deſcipher them thoroughly, and to giue names that may be true & ſeuerall diſtinctions to euery flower, threſcore ſeuerall ſorts of colours ſimple and mixt of each kind I can reckon vpt that I haue, and of eſpeciall note, and yet I doubt not, but for euery one of them there are ten others diſtinguished from them, which may be ſeen at ſeuerall times, and in ſeuerall places: & beſides this glory of variety in colors that theſe flowers haue, they carry ſo ſtately & delightfull a forme, & do abide ſo long in their brauery (enduring aboue three whole moneths from the firſt vnto the laſt) that there is no Lady or Gentlewoman of any worth that is not caught with this delight, or not delighted with theſe flowers. The Anemones like wife or Windeflowers are ſo full of variety and ſo dainty, ſo pleasant and ſo delightsome flowers, that the ſight of them doth enforce an earnest longing deſire in the minde of any one to be a poffessor of ſome of them at the leaſt: For without all doubt, this one kinde of flower, ſo variable in colours, ſo diſtinguished in forme (being almoſt as many ſorts of them double as ſingle) ſo plentifull in bearing flowers, and ſo durable in lasting, and alſo ſo eaſie both to preſerve and to encrease, is of it ſelfe alone almoſt ſufficient to furniſh a garden with their flowers for almoſt halfe the yeare, as I ſhall ſhew you in a fit and conuenient place. The Beares eares or French Cowſlips muſt not want their deſerved commendations, ſeeing that their flowers, being many ſet together vpon a ſtalke, doe ſeeme every one of them to bee a Noſe-gay alone of it ſelfe: and beſides the many diſtinguished colours that are to be ſeen in them, as white, yellow, bluſh, purple, red, tawney, murrey, haire colour, &c. which encreaſe much delight in all ſorts of the Gentry of the Land, they are not unfurniſhed with a pretty ſweete ſent, which

which doth adde an encrease of pleasure in those that make them an ornament for their wearing. Flowerdeluces also are of many sorts, but diuided into two especiall kindes; the one bearing a leafe like a flagge, whose rootes are tuberous, thicke and short (one kinde of them being the Orris rootes that are sold at the Apothecaries, whereof sweete powders are made to lye among garments) the other having round rootes like vnto Onions, and narrow long leaues somewhat like grasse: Of both these kindes there is much variety, especially in their colours. The greater Flagge kinde is frequent enough and dispersed in this Land, and well doth serue to decke vp both a Garden and House with natures beauties: But the chiefe of all is your Sable flower, so fit for a mourning habit, that I thinke in the whole compasse of natures store, there is not a more pathetricall, or of greater correspondency, nor yet among all the flowers I know any one comming neare vnto the colour of it. The other kinde which bath bulbous or Onion like rootes, diversifieth it selfe also into so many fine colours, being of a more neat shape and succinct forme than the former, that it must not bee wanting to furnish this Garden. The Hepatica or Noble Luerwoort is another flower of account, whereof some are white, others red, or blew, or purple, somewhat resembling Violets, but that there are white threads in the middest of their flowers, which addeth the more grace vnto them; and one kinde of them is so double, that it resembleth a double thicke Dasie or Marigold, but being small and of an excellent blew colour, is like vnto a Button: but that which commendeth the flower as much as the beauty, is the earlinesse in flowring, for that it is one of the very first flowers that open themselves after Christmas, even in the midst of Winter. The Cyclamen or Sowebread is a flower of rare receipt, because it is naturally hard to encrease, and that the flowers are like vnto red or blush coloured Violets, flowring in the end of Summer or beginning of Autumne: the leaues likewise hereof haue no small delight in their pleasant colour, being spotted and circled white vpon greene, and that which most preferreth it, is the Physicall properties thereof for women, which I will declare when I shall shew you the severall descriptions of the varieties in his proper place. Many other sorts of flowers there are fit to furnish this Garden, as Leucoum or Bulbous Violet, both early and late flowring. Muscari or Muske Grape flower. Starre flowers of divers sorts. Phalangium or Spiderwort, the chiefe of many is that sort whose flowers are like vnto a white Lilly. Winter Crowfoote or Wolfes bane. The Christmas flower like vnto a single white Rose. Bell flowers of many kindes. Yellow Larkes spurre, the prettiest flower of a score in a Garden. Flower-gentle or Floramour. Flower of the Sunne. The Maruaile of Peru or of the world. Double Marsh Marigold or double yellow Buttons, much differing and farre exceeding your double yellow Crowfoote, which some call Batchelours Buttons. Double French Marigolds that smell well, and is a greater kinde than the ordinary, and farre surpasseth it. The double red Ranunculus or Crowfoote (farre excelling the most glorious double Anemone) and is like vnto our great yellow double Crowfoote. Thus hauing giuen you the knowledge of some of the choicest flowers for the beds of this Garden, let me also shew you what are fittest for your borders, and for your arbours. The Iasmine white and yellow. The double Honysuckle. The Ladies Bower, both white, and red, and purple single and double, are the fittest of Outlandish plants to set by arbours and banqueting houses, that are open, both before and aboue to helpe to couer them, and to giue both sight, smell, and delight. The sorts of Roses are fittest for standards in the hedges or borders. The Cherry Bay or Laurocerasus. The Rose Bay or Oleander. The white and the blew Syringa or Pipe tree, are all gracefull and delightfull to set at severall distances in the borders of knots; for some of them giue beautifull and sweete flowers. The Pyracantha or Prickly Corall tree doth remaine with greene leaues all the yearre, and may be plashed, or laid downe, or tyed to make a fine hedge to border the whole knot, as is said before. The Wilde Bay or Laurus Tinus, doth chiefly desire to be sheltered vnder a wall, where it will best thrive, and giue you his beautifull flowers in Winter for your delight, in recompence of his fenced dwelling. The Dwarf Bay or Meseleon, is most commonly either placed in the midst of a knot, or at the corners thereof, and sometimes all along a walke for the more grace. And thus to fit every ones fancy, I haue shewed you the variety of natures store in some part for you to dispose of them to your best content.

## C H A P. V.

*The nature and names of those that are called vsually English flowers.*

**T**Hose flowers that haue beene vsually planted in former times in Gardens of this Kingdome (when as our forefathers knew few or none of those that are recited before) haue by time and custome attained the name of English flowers, although the most of them were never naturall of this our Land, but brought in from other Countries at one time or other, by those that tooke pleasure in them where they first saw them: and I doubt not, but many other sorts than here are set downe, or now knowne to vs, haue beene brought, which either haue perished by their negligence or want of skill that brought them, or else because they could not abide our cold Winters; those onely remaining with vs that haue endured of themselves, and by their encreasing haue beene distributed ouer the whole Land. If I should make any large discourse of them, being so well knowne to all, I doubt I should make a long tale to small purpose: I will therefore but briefly recite them, that you may haue them together in one place, with some little declaration of the nature and quality of them, and so passe to other matters. And first of Primroses and Cowslips, whereof there are many prettie varieties, some better knowne in the West parts of this Kingdome, others in the North, than in any other, vntill of late being obserued by some curious louers of varieties, they haue been transplanted diuersly, and so made more common: for although we haue had formerly in these parts about London greene Primroses vsually, yet we never saw or heard of greene Cowslips both single and double but of late dayes, and so likewise for Primroses to be both single and double from one roote, and diuers vpon one stalke of diuers fashions, I am sure is not vsuall: all which desire rather to bee planted vnder some hedge, or fence, or in the shade, than in the Sunne. Single Rose Campions, both white, red, and blussh, and the double red Rose Champion also is knowne sufficiently, and will abide moderate Sunne as well as the shade. The flower of Bristow or None-such is likewise another kinde of Champion, whereof there is both white flowring plants and blussh as well as Orange colour, all of them being single flowers require a moderate Sunne and not the shadow: But the Orange colour None-such with double flowers, as it is rare and not common, so for his brauery doth well deserue a Master of account that will take care to keepe and preferue it. Batchelours Buttons both white and red, are kindes of wilde Campions of a very double forme, and will reasonably well like the Sunne but not the shade. Wall-flowers are common in euery Garden, as well the ordinary double as the single, and the double kinde desirer no more shade than the single, but the greater kindes both double and single must haue the Sunne. Stock-Gilloflowers likewise are almost as common as Wall-flowers, especially the single kindes in every womans Garden, but the double kindes are much more rare, and possessed but of a few, and those onely that will bee carefull to preferue them in Winter, for besides that the most of them are more tender, they yeeld no seede as the single kindes doe to preferue them, although one kinde from the sowing of the seed yeeld double flowers: They will all require the comfort of the Sunne, especially the double kindes, and to be defended from cold, yet so as in the Summer they doe not want water wherein they much ioy, and which is as it were their life. Queens Gilloflowers (which some call Dames Violets, and some Winter Gilloflow-  
ers, are a kinde of Stock-Gilloflower) planted in Gardens to serue to fill vp the parts thereof for want of better things, hauing in mine opinion neither sight nor sent much to commend them. Violets are the Springs chiefe flowers for beauty, smell, and vse, both single and double, the more shadic and moist they stand the better. Snapdragon are flowers of much more delight, and in that they are more tender to keep, and will hardly endure the sharpe Winters, vniess they stand well defended, are scarce seene in many Gardens. Columbines single and double, of many sorts, fashions, and colours, very variable both speckled and party coloured, are flowers of that respect, as that no Garden would willingly bee without them, that could tell how to haue them, yet the rarer the flowers are, the more trouble to keepe; the ordinary sorts on the contrary

try part will not be lost, doe what one will. Larkes heeles, or spurres, or toes, as in seuerall Countries they are called, exceed in the varietie of colours, both single and double, any of the former times; for vntill of late dayes none of the most pleasant colours were seene or heard of: but now the single kindes are reasonable well dispersit ouer the Land, yet the double kindes of all those pleasant colours (and some other also as beautifull) which stand like little double Roses, are enjoyed but of a few: all of them rise from seed, and must be sowne every yeaer, the double as well as the single. Pansyes or Hertes easies of diuers colours, and although without sent, yet not without some respect and delight. Double Poppies are flowers of a great and goodly proportion, adorning a Garden with their variable colours to the delight of the beholders, wherein there is some speciall care to be taken, lest they turne single; and that is, if you see them grow vp too thicke, that you must pull them vp, and not suffer them to grow within lesse than halfe a yard distance, or more one from another. Double Daifies are flowers not to be forgotten, although they be common enough in every Garden, being both white and red, both blushe and speckled, or party coloured, besides that which is called Iacke an Apes on horsebacke, they require a moist and shadowie place; for they are scorched away, if they stand in the Sunne in any dry place. Double Marigolds also are the most common in all Gardens. And so are the French Marigolds that haue a strong heady sent, both single and double, whose glorious shew for colour would cause any to beleue there were some rare goodnessse or vertue in them. These all are sometimes preferued in the Winter, if they bee well defended from the cold. But what shall I say to the Queene of delight and of flowers, Carnations and Gillo-flowers, whose brauery, variety, and sweete smell ioyned together, tyeth every ones affection with great earnestnesse, both to like and to hate them? Those that were knowne, and enjoyed in former tyme with much acceptation, are now for the most part lesse accounted of, except a very few: for now there are so many other varieties of later inuention, that troubleth the other both in number, beauty, and worth: The names of them doe differ very variably, in that names are imposed and altered as euerie ones fancy will haue them, that carryed or set them into the seuerall Countries from London, where their truest name is to be had, in mine opinion. I will here but giue you the names of some, and referre you to the worke ensuing for your further knowledge. The red and the gray Hulo. The old Carnation, differing from them both. The Gran Perc. The Camberisue. The Sauadge. The Chriftall. The Prince. The white Carnation, or Delicate. The ground Carnation. The French Carnation. The Douer. The Bristow. The Westminster. The Daintie. The Grano, and many other Gilloflowers too tedious to recite in this place, because I haue amply declared them in the booke following. But there is another sort of great delight and varietie, called the Orange tawny Gilloflower, which for the most part hath risen from seed, and doth giue seed in a more plentifull manner than any of the former sorts, and likewise by the sowing of the seed there hath been gained so many varieties of that excellent worth and respect, that it can hardly be expressed or beleued, and called by diuers names according to the marking of the flowers; as The Infanta. The Stript Tawny. The Speckled Tawny. The Flackt Tawny. The Grifeld Tawny, and many others, every one to bee distinguished from others: Some also haue their flowers more double and large than others, and some from the same seed haue single flowers like broad single Pinkes: the further relation of them, *viz.* their order to sowe, encrease, and preferue them, you shall haue in the subsequent discourse in a place by it selfe. Pinkes likewise both single and double are of much variety, all of them very sweete, comming neare the Gilloflowers. Sweete Williams and Sweete Iohns, both single and double, both white, red, and spotted, as they are kindes of wilde Pinkes, so for their grace and beauty helpe to furnish a Garden, yet desyre not to stand so open to the Sunne as the former. Double and single Peonies are fit flowers to furnish a Garden, and by reason of their durability, giue out fresh pleasure every yeaer without any further trouble of sowing. And lastly, Hollihocks both single and double, of many and sundry colours, yeeld out their flowers like Roses on their tall branches, like Trees, to sute you with flowers, when almost you haue no other to grace out your Garden: the single and double doe both yeeld seed, and yet doe after their seeding abide many yeaers. Thus haue I shewed you most of the English, as well as (I did before) the Out-landish

landish flowers, that are fit to fuenish the knots, trailes, beds, and borders of this Garden. Roses onely, as I said before, I refreue to circle or encompass all the rest, because that for the most part they are planted in the outer borders of the quarters, and sometimes by themselves in the middle of long beds, the sorts or kindes whereof are many, as they are declared in their proper place: but the White Rose, the Red, and the Damaske, are the most ancient Standards in England, and therefore accounted natural.

## C H A P. VI.

*The order and manner to plant and replant all the sorts of Out-landish flowers spoken of before, as well those with bulbous rootes, as others with stringie rootes.*

**V**Hereas it is the vsuall custome of most in this Land, to turne vp their Gardens, and to plant them againe in the Spring of the yeare, which is the best time that may bee chosen for all English flowers, yet it is not so for your Out-landish flowers. And herein indeede hath beeone not onely the error of a great many to hinder their rootes from bearing out their flowers as they shold, but also to hinder many to take delight in them, because as they say, they will not thrive and prosper with them, when as the whole fault is in the want of knowledge of the fit and conuenient time wherein they shold bee planted. And because our English Gardiners are all or the most of them vtterly ignorant in the ordering of these Out-landish flowers, as not being trained vp to know them, I haue heretaken vpon me the forme of a new Gardiner, to giue instructions to those that will take pleasure in them, that they may be the better enabled with these helpe to shew them, both to know how they shold be ordered, and to direct their Gardiners that are ignorant thereof, rightly to dispose them according to their naturall qualities. And I doe wish all Gentlemen and Gentlewomen, whom it may concerne for their owne good, to bee as carefull whom they trust with the planting and replanting of these fine flowers, as they would be with so many Jewels; for the rootes of many of them being small, and of great value, may be soone conveyed away, and a cleanly tale faire told, that such a roote is rotten, or perished in the ground if none be seene where it shold be, or else that the flower hath changed his colour, when it hath been taken away, or a counterfeit one hath beeene put in the place thereof; and thus many haue been deceived of their daintiest flowers, without remedy or true knowledge of the defect. You shall therefore, if you will take the right course that is proper for these kindes of flowers, not set or plant them among your English flowers; for that when the one may be remoued, the other may not be stirred: but plant those rootes that are bulbous, or round like Onions, either in knots or beds by themselves which is the best, or with but very few English or Out-landish flower plantes that haue stringie rootes: For you must take this for a generall rule, that all those rootes that are like Lillies or Onions, are to bee planted in the moneths of Iuly or August, or vnto the middle or end of September at the furthest, if you will haue them to prosper as they shold; and not in the Spring of the yeare, when other gardening is vsed. Yet I must likewise giue you to understand, that if Tulips, and Daffodils, and some other that are firme and hard rootes, and not limber or spongie, being taken vp out of the ground in their fit season, that is, in Iune, Iuly, and August, and likewise kept well and dry, may bee reserved out of the ground vntill Christmas or after, and then (if they could not be set sooner) being set, will thrive reasonable well, but not altogether so well as the former, being set long before: but if you shall remoue these bulbous rootes againe, either prelently after their planting haing shot their small fibres vnder the round rootes, and sprung likewise vpwards, or before they be in flower at the soonest (yet Tulips, Daffodils, and many other bulbous, may be safelie remoued being in flower, and transplanted into other places, so as they be not kept too long out of the ground) you shall much endanger them either vtterly to perish, or to be hindered from bearing out their flowers they then would haue borne,

borne, and for two or three years after from bearing flowers againe. For the order of their planting there are diuers wayes, some whereof I will shew you in this place: Your knot or beds being prepared fitly, as before is declared, you may place and order your rootes therein thus, Eyther many rootes of one kind set together in a round or cluster, or longwise crosse a bed one by another, whereby the beauty of many flowers of one kinde being together, may make a faire shew well pleasing to many; Or else you may plant one or two in a place dispersedly ouer the whole knot, or in a proportion or diameter one place answering another of the knot, as your store will suffer you, or your knot permit: Or you may also mingle these rootes in their planting many of diuers sorts together, that they may give the more glorious shew when they are in flower; and that you may so doe, you must first obserue the severall kindes of them, which doe flower at one and the same time, and then to place them in such order and so neare one vnto another, that their flowers appearing together of severall colours, will cause the more admiration in the beholders: as thus, The Vernal Crocus or Saffron flowers of the Spring, white, purple, yellow, and stript, with some Vernal Colchicum or Medow Saffron among them, some Deus Canius or Dogges teeth, and some of the small early Leucoium or Bulbous Violet, all planted in some proportion as neare one vnto another as is fit for them, will give such a grace to the Garden, that the place will seeme like a peece of tapstry of many glorious colours, to encrease every ones delight: Or else many of one sort together, as the blew, white and blush Grape flowers in the same manner intermingled, doe make a maruellous delectable shew, especially because all of them rise almost to an equall height, which causeth the greater grace, as well neare hand as farre off. The like order may be kept with many other things, as the Hepatica, white, blew, purple, and red set or sowne together, will make many to beleue that one roote doth bear all those colours: But aboue and beyond all others, the Tulips may be so matched, one colour answering and setting of another, that the place where they stand may resemble a peece of curious needle-worke, or peece of painting: and I haue knowne in a Garden, the Master as much commended for this artificiall forme in placing the colours of Tulips, as for the goodnesse of his flowers, or any other thing. The diuers sorts and colours of Anemones or Winde-flowers may be so ordered likewise, which are very beautifull, to haue the severall varieties planted one neare vnto another, that their severall colours appearing in one place will be a very great grace in a Garden, or if they be dispersed among the other sorts of flowers, they will make a glorious shew. Another order in planting you may obserue, which is this, That those plants that grow low, as the Aconitum Hyemale or Winter-wolues bane, the Vernal Crocus or Saffron-flowers of diuers sorts, the little early Leucoium or Bulbous Violet, and some such other as rise not vp high, as also some Anemones may be very well placed somewhat neare or about your Martagons, Lillies, or Crownes Imperiall, both because these little plants will flower earlier than they, and so will bee gone and past, before the other greater plants will rise vp to any height to hinder them; which is a way may well be admitted in those Gardens that are small, to saue roome, and to place things to the most aduantage. Thus hauing shewed you diuers wayes and orders how to plant your rootes, that your flowers may give the greater grace in the Garden, let mee shew you likewise how to set these kindes of rootes into the ground; for many know not well eyther which end to set vpwards or downewards, nor yet to what depth they should be placed in the ground. Daffodils if they be great rootes, will require (as must bee obserued in all other great plants) to bee planted somewhat deeper then the smaller of the same kinde, as also that the tops or heads of the rootes be about two or three fingers breadth hid vnder ground. The Tulips likewise if you set them deepe, they will be the safer from frosts if your ground be cold, which will also cause them to be a little later before they be in flower, yet vsually if the mould be good, they are to be set a good hand breadth deep within the ground, so that there may be three or four inches of earth at the least aboue the head, which is the smaller end of the roote: for if they shall lye too neare the vpperface or crust of the earth, the colds & frosts will pierce and pinch them sooner. After the same order and manner must Hyacinthes, whether great or small, and other such great rootes be planted. Your greater rootes, as Martagons, Lillies, and Crownes Imperiall, must be set much deeper then any other bulbous roote, because they are greater rootes then others, and by themclues also, as

is most vsuall either in some square, round, triangle, or other small part in the Garden, because they spread and take vp a very great deale of ground. All of them likewise are to be set with the broad end of the roote downewards, and the small end vpwards, that is, both Lillies, Daffodils, Hyacinthes, and Tulipas, and all other sorts of round rootes, which shew one end to bee smaller than another. But the Colchicum or Medow-Saffron onely requireth an exception to this generall rule, in regard the roote thereof hath a small eminence or part on the one side thereof, which must bee set or planted downward, and not vpward; for you shall obserue, if the roote lye a little moist out of the ground, that it will shooe fibres out at the small long end thereof, although you may perceiue when you take it vp, that the fibres were at the other broad end or side of the roote. As for the Crowne Imperiall, which is a broad round roote and flat withall, haing a hole in the middle, for the most part quite thorow, when it is taken vp in his due time out of the ground, you shall perceiue the scales or cloues of the rootes to bee a little open on the vpperside, and close and flat on the vnderside, which will direct you which part to set vpward, as also that the hole is bigger aboue then it is below. The Persian Lilly is almost like vnto the Crowne Imperiall, but that the roote thereof is not so flat, and that it hath a smaller head at the one part, whereby it may be discerned the plainer how to be set. The Fritillaria is a small white root diuided as it were into two parts, so that many haue doubted, as formerly in the Crowne Imperiall, what part to set vppermost; you shall therefore marke, that the two parts of the roote are ioyned together at the bottome, where it shooeth out fibres or small stringie rootes, as all other sorts of bulbous rootes doe, and withall you shall see, that betweene the two parts of the roote a small head will appeare, which is the burgeon that will spring vp to beare leaues and flowers. In the rootes of Anemones there are small round swelling heads, easie enough to be obserued if you marke it, which must be set vpwards. All other sorts of stringie rooted plants (and not bulbous or tuberous rooted) that lose their greene leaues in Winter, will shew a head from whence the leaues and flowers will spring, and all others that keepe their greene leaues, are to bee planted in the same manner that other herbes and flower-plants are accustomed to be. But yet for the better thriving of the stringie rooted plants, when you will plant them, let me informe you of the best way of planting, and the most sure to cause any plant to comprehend in the ground without failing, and is no common way with any Gardiner in this Kingdome, that euer I heard or knew, which is thus: Presuming that the stringie rooted plant is fresh and not old gathered, and a plant that being remoued will grow againe, make a hole in the ground large enough where you meane to set this roote, and raise the earth within the hole a little higher in the middle then on the sides, and set the roote thereon, spreading the strings all abroad about the middle, that they may as it were couer the middle, and then put the earth gently round about it, pressing it a little close, and afterwards water it well, if it be in Summer, or in a dry time, or otherwise moderately: thus shall every severall stringe of the roote haue earthenough to cause it to shooe forth, and thereby to encrease farre better than by the vsuall way, which is without any great care and respect to thrust the rootes together into the ground. Diuers other flower plants are but annuall, to bee new sowne euery yeare; as the Maruaile of the world, the Indian Cresses, or yellow Larkes heele, the Flower of the Sunne, and diuers other: they therefore that will take pleasure in them, that they may enjoy their flowers the earlier in the yeare, and thereby haue ripe seede of them while warme weather lasteth, must nurse vp their seedes in a bed of hot dung, as Melons and Cowcumbers are, but your bed must be provided earlier for these seedes, than for Melons, &c. that they may haue the more comfort of the Summer, which are to be carefully tended after they are transplanted from the hot bed, and couered with straw from colds, whereby you shall not faile to gaine ripe seede every yeare, which otherwise if you should mise of a very kindly & hot Summer, you should never haue: Some of these seedes neede likewise to be transplanted from the bed of dung vnder a warme wall, as the Flower of the Sunne, and the Maruaile of the world, and some others, and that for a while after their transplanting, as also in the heate of Summer, you water them at the roote with water that hath stood a day or two in the Sunne, haing first laid a round wispe of hay or such other thing round about the roote, that so all helpe may further their giving of ripe seede: One or two rules more I will giue you concerning these

these dainty flowers, the first whereof is this, That you shall not bee carefull to water any of your bulbous or tuberous rooted plants at any time; for they all of them do better prosper in a dry ground than in a wet, onely all sorts of tuberous rooted Flowe-deluces vpon their remouall had neede of a little water, and some will doe so also to such Tulipas and other bulbous rootes as they transplant, when they are in flower, and this is I grant in some sort tolerable, if it bee not too much, and done onely to cause the stalke and flower to abide sometime the longer before they wither, but else in no other case to be permitted. The second rule is, That I would aduise you to water none of your dainty flowers or herbes, with any water that hath presently before been drawne out of a well or pumpe, but onely with such water that hath stood open in the Sunne in some cisterne, tubbe, or pot for a day at the least, if more the better: for that water which is presently drawne out of a well, &c. is so cold, that it presently chilleth & killeth any dainty plant be it younger or elder grown, wherof I haue had sufficient proofoe: and therfore I give you this caution by mine owne experience. Thus haue I directed you from point to point, in all the particulars of preparing & planting that belong to this Garden, sauing only that yet I would further enforme you, of the time of the flowing of these Out-landish plants, according to the seuerall moneths in the yeare, that every one may know what flowers every moneth yeeldeth, and may chuse what them liketh best, in that they may see hat there is no moneth, but glorieth in some peculiar sorts of rare flowers. I would likewise rather in this place shew you, the true and best manner & order to encrease and preserue all sorts of Gilloflowers & Carnations, then ioyne it with the Chapter of Gilloflowers in the worke following, because it would in that place take vp too much roome. And lastly, I must of necessity oppose three sundry errors, that haue possessed the mindes of many both in former and later times, which are, that any flower may be made to grow double by art, that wasbut single before by nature: And that one may by art cause any flower to grow of what colour they will: And that any plants may be forced to flower out of their due seasons, either earlier or later, by an art which some can vse. All which being declared, I then suppose enough is spoken for an introduction to this worke, referring many other things to the seuerall directions in the Chapters of the booke.

### CHAP. VII.

*The severall times of the flowing of these Out-landish flowers, according to the severall moneths of the yeare.*

I intend in this place onely to giue you briefly, the names of some of the chiefest of these Out-landish flowers, according to the seuerall moneths of the yeare wherein they flower, that every one seeing what sorts of flowers every moneth yeeldeth, may take of them which they like best. I begin with January, as the first moneth of the yeare, wherein if the frosts be not extreme, you shall haue these flowers of plants; the Christmas flower or Helleborus niger verus, Winter wolues bane or Aconitum hycmal, Hepatica or Noble Liver wort blew and red, and of shrubbes, the Laurus Tinus or Wilde Bay tree, and Melereon or the dwarfe Bay: but because Januarie is often-times too deepe in frosts and snow, I therefore referre the Hepaticas vnto the moneth following, which is February, wherein the weather beginneth to be a little milder, and then they will flower much better, as also diuers sorts of Crocus or Saffron flower will appeare, the little early Summer foole or Leucoium bulbofum, and towards the latter end thereof the Vernal Colchicum, the Dogges tooth Violet or Deus Caminus, and some Anemones, both single and double, which in some places will flower all the Winter long. March will yeeld more varieties; for besideth that it holdeth some of the flowers of the former moneth, it will yeeld you both the double blew Hepatica, and the white and the blush single: then also you shall haue diuers other sorts of Crocus or Saffron flowers, Double yellow Daffodils, Orientall Iacinths and others, the Crowne Imperiall, diuers sorts of early Tulipas, some sorts of French Cowslips, both tawney, murry, yellow, and blush, the early Fritillaria or checkerd Daffodill,

dill, and some other sorts of early Daffodils, and many sorts of Anemones. In Aprill commeth on the pride of these strangers, for herein you may behold all the sorts of Auricula Varsi or Beares Eares, many sorts of Anemones, both single and double, both the sorts of Tulipas, the earlier vntill the middle of the moneth, and the later then beginning, which are of so many different colours, that it is almost impossible to expresse them, the white, red, blacke, and yellow Fritillarias, the Muscaria or Muske Grape flower, both ash colour and yellow. Diuers other sorts of Iacinths and Daffodils, both single and double, the smaller sorts of Flowerdeluces, the Velvet Flowerdeluce and double Honysuckles, with diuers others. May likewise at the beginning seemeth as glorious as Aprill, although toward the end it doth decline, in regard the heate of the Sunne hath by this time drawne forth all the store of natures tenderest dainties, which are vsually spent by the end of this moneth, and then those of stronger constitution come forward. Herein are to bee seene at the beginning the middle flowing Tulipas, and at the end the later sort: some kindes of Daffodils, the Day Lillies, the great white Starre flower, the Flowerdeluce of Constantinople or the mourning Sable flower, the other sorts of Flowerdeluces. Single and double white Crowfoote, and single and double red Crowfoot, the glory of a Garden: the early red Martagon, the Persian Lilly, the yellow Martagon, the Gladiolus or Corne flagge, both white, red, and blush: the double yellow Rose, and some other sorts of Roses. In June doe flower the white and the blush Martagon, the Martagon Imperiall, the mountaine Lillies, and the other sorts of white and red Lillies, the bulbous Flowerdeluces of diuers sorts, the red flowred Ladies bower, the single and double purple flowred Ladies bower, the white Syringa or Pipetree, for the blew Pipe tree flowreth earlier, the white and the yellow Jasmin. July holdeth in flower some of the Ladies bowers and Jasmines doth glory in the Female Balſame apple, the Indian Cresses or yellow Larkspur, the purple Flower-gentle and the Rose Bay. In August begin some of the Autumne bulbous flowers to appeare, as the white and the purple Colchicum or Medow Saffron, the purple mountaine Crocus or Saffron flower, the little Autumne Leucoium and Autumne Iacynth, the Italian Starrewort, called of some the purple Marigold, the Meruaile of Peru or of the world, the Flower of the Sunne, the great blew Bell-flower, the great double French Marigold. September flourishest with the Flower of the Sunne, the Meruaile of the world, the purple Marigold, and blew Bell-flower spoken of before, and likewise the other sorts of Medow Saffron, and the double kinde likewise, the siluer Crocus, the Autumnie yellow Daffodill, Cyclamen also or Sowbread shew their flowers in the end of this moneth. October also will shew the flowers of Cyclamen, and some of the Medow Saffrons. In November, as also sometimes in the moneth before, the party coloured Medow Saffron may bee seene, that will longest hold his flower, because it is the latest that sheweth it selfe, and the ash coloured mountaine Crocus. And even December it selfe will not want the true blacke Hellebor or Christmas flower, and the glorious shew of the Laurus Tinus or wilde Bay tree. Thus haue I shewed you some of the flowers for every moneth, but I referre you to the more ample declaration of them and all the others, vnto the work following.

### CHAP. VIII.

*The true manner and order to encrease and preserue all sorts of Gilloflowers, as well by sippes as seedes.*

Because that Carnations and Gilloflowers bee the chiefest flowers of account in all our English Gardens, I haue thought good to entreate somewhat amply of them, and that a part by it selfe, as I said a little before, in regard there is so much to be said concerning them, and that if all the matters to be entreated of should haue beeene inserted in the Chapter of Gilloflowers, it would haue made it too tedious and large, and taken vp too much roome. The particular matters whereof I mean in this place to entreate are these: How to encrease Gilloflowers by planting and by sowing,

sowing, and how to preserue them being encreased, both in Summer from noysome and hurtfull vermine that destroy them, and in Winter from frosts, snowes, and windes, that spoile them. There are two wayes of planting, whereby to encrease these faire flowers, the one is by slipping, which is the old and ready vsuall way, best knowne in this Kingdome; the other is more sure, perfect, ready, and of later inuenction, *videjice*, by laying downe the branches. The way to encrease Gilloflowers by slipping, is so comon with all that euer kept any of them, that I thinke most persons may thinke me idle, to spend time to set downe in writing that which is so well known vnto all: Yet giue me leaue to tell them that so might imagine, that (when they haue heard or read what I haue written thereof, if they did know fully as much before) what I here write, was not to informe them, but such as did not know the best, or so good a way as I teach them: For I am assured, the greatest number doe vse, and follow the most vsuall way, and that is not alwaies the best, especially when by good experiance a better way is found, and may be learned; and therefore if some can doe a thing better than others, I thinke it is no shame to learne it of them. You shall not then (to take the surest course) take any long spindled branches, nor those branches that haue any young shooetes from the ioynts on them, nor yet slie or teare any slippe or branch from the roote; for all these waies are vsuall and comon with most, which caufeth so many good rootes to rot and perish, and also so many slippes to be lost, when as for the most part, not the one halfe, or with some, not a third part doth grow and thriue of thole slippes they set. And although many that haue store of plants, doe not so much care what haueocke they make to gaine some, yet to saue both labour and plants, I doe wish them to obserue these orders: Take from those rootes from whence you intend to make your encrease, those shooetes onely that are reasonable strong, but yet young, and not either too small and slender, or hauing any shooetes from them upon them; cut these slippes or shooetes off from the stemme or roote with a knife, as conueniently as the shooete or branch will permit, that is, either close vnto the maine branch, if it be short, or leaving a ioynt or two behinde you, if it be long enough, at which it may shooote anew: When you haue cut off your slippes, you may either set them by and by, or otherwise, Gardiners vse to doe, cast them into a tubbe or pot with water for a day or two, and then hauing prepared a place conuenient to set them in, which had neede to bee of the fynest, richest, and best mould you can prouide, that they may thriue therein the better, cut off your slippe close at the ioynt, and hauing cut away the lowest leaues closer to the stalk, and the uppermost even at the top, with a little sticke make a little hole in the earth, and put your slippe therein so deep, as that the ypper leaues may be wholly aboue the ground, (some vse to cleane the stalke in the middle, and put a little earth or clay within the cleft, but many good and skilfull Gardiners doe not vse it;) put the earth a little cloese to the slippe with your finger and thumbe, and there let it rest, and in this maner doe with as many slippes as you haue, setting them somewhat close together, and not too farre in funder, both to saue ground and cost thereon, in that a small compasse will serue for the first planting, and also the better to give them shadow: For you must remember in any case, that these slippes new set, haue no sight of the Sunne, vntill they be well taken in the ground, and shot aboue ground, and also that they want not water, both vpon the new planting and after. When these slippes are well growne vp, they must be transplanted into such other places as you thinke meete; that is, either into the ground in beds, or otherwise, or into pots, which that you may the more safelie doe, after you haue well watered the ground, for halfe a day before you intend to tranplant them, you shall separate them severally, by putting downe a broad pointed knife on each side of the slippe, so cutting it out, take every one by it selfe, with the earth cleauing close vnto the roote, which by reason of the moisture it had formerly, and that which you gaue presently before, will be sufficient with any care had, to keepe it to hold fast vnto the roote for the tranplanting of it; for if the earth were dry, and that it should fall away from the roote in the tranplanting, it would haueard, and endanger the roote very much, if it did thriue at all. You must remember also, that vpon the remouing of these slips, you shadow them from the heate of the Sunne for while with some straw or other thing, vntill they haue taken hold in their new place: Thus although it bee a little more labour and care than the ordinary way is, yet it is surer, and will give you plants that

will

will be so strongly growne before Winter, that with the care hereafter specified, you shall haue them beare flowers the next yeare after, and yeld you encrease of slippes also. To giue you any set time, wherein these slippes will take roote, and begin to shooote aboue ground, is very hard to doe; for that euery slip, or yet every kinde of Gilloflower is not alike apt to grow; nor is every earth in like manner fit to produce and bring forward the slippes that are set therein: but if both the slippe be apt to grow, and the earth of the best, fit to produce, I thinke within a fortnight or three weekes, you shall see them begin to put forth young leaues in the middle, or else it may be a moneth and more before you shall see any springing. The best time likewise when to plant, is a speciaill thing to be knowne, and of as great consequence as any thing else: For if you slippe and set in September, as many vse to doe, or yet in August, as some may thinke will doe well, yet (vnlesse they be the most ordinary sorts, which are likely to grow at any time, and in any place) the most of them, if not all, will either assuredly perish, or neuer prosper well: for the more excellent and dainty the Gilloflower is, the more tender for the most part, and hard to nurse vp will the slippes be. The best timetherefore is, that you cut off such slippes as are likely, and such as your rootes may spare, from the beginning of May vntill the middle of Iune at the furthest, and order them as I haue shewed you before, that so you may haue faire plants, plenty of flowers, and encrease sufficient for new supply, without offence or losse of your store. For the enriching likewise of your earth, wherein you shall plant your slippes, that they may the better thriue and prosper, diuers haue vsed diuers sorts of manure, as stable soyle of horse, beasts or kine, of sheepe, and pigeons, all which are very good when they are thoroughly turned to mould, to mixe with your other earth, or being steeped in water, may serue to water the earth at times, and turned in with it. And some haue likewise proued Tanners earth, that is, their barkes, which after they haue vsed, doth lye on heapes and rot in their yards, or the like mould from wood stackes or yards; but especially, and beyond all other is commended the Willow earth, that is, that mould which is found in the hollow of old Willow trees, to be the most principall to mixe with other good earth for this purpose. And as I haue now giuen you directions for the first way to encrease them by slipping, so before I come to the other way, let mee giue you a caute or two for the preseruing of them, when they are beginning to runne vterly to decay and perishe. The one is, that whereas many are ouer greedy to haue their plants to giue them flowers, and therefore let them runne all to flower, so farre spending themselues thereby, that after they haue done flowering, they grow so weake, hauing out spent themselves, that they cannot possibly be preferued from the injuries of the succeding Winter; you shall therefore keepe the kinde of any sort you are delighted withall, if you carefully looke that too many branches doe not runne vp and spindle for flowers, but rather either cut some of them downe, before they are run vp too high, within two or three ioynts of the rootes; or else plucke away the innermost leaues where it springeth forwards, which you see in the middle of every branch, before it be runne vp too high, which will caufe them to breake out the faster into slips and suckers at the ioynts, to hinder their forward luxurie, and to preserue them the longer: The other is, If you shall perceiue any of your Gilloflower leaves to change their naturall fresh verdure, and turne yellowish, or begin to wither in aie part or branch thereof, it is a sure signe that the roote is infected with some canker or rotteneesse, and will soone shew it selfe in all the rest of the branches, whereby the plant will quickly be lost: to preserue it therefore, you shall betime, before it be runne too farre, (for otherwise it is impossible to saue it) either couer all or most of the branches with freſtrearth, or else take the faireſt slippes from it, as many as you can possibly, and cast them into a pot or tubbe with water, and let them there abide for two or three daies at the leaſt: the first way hath recovered many, being taken in time. Thus you shall see them recover their former stiffenesse and colour, and then you may plant them as you haue beeene heretofore directed; and although many of them may perish, yet shall you haue some of them that will grow to continue the kinde againe. The other or second way to encrease Gilloflowers by planting, is, as I said before, by in-laying or laying downe the branches of them, and is a way of later inuenction, and as frequently vsed, not only for the tawney or yellow Gilloflower, and all the varietieſ therof, but with the other kinds of Gilloflowers, whereof experiance hath shewed that

that they will likewise take if they be so vsed ; the manner whereof is thus : You must choose out the youngest, likeliest, and lowest branches that are nearest the ground (for the vpper branches will sooner breake at the ioynt, than bend downe so low into the earth, without some pot with earth raised vp vnto them) and cut it on the vnderside thereof vpwards at the second ioynt next vnto the roote, to the middle of the branch, and no more, and not quite thorough in any case, and then from that second ioynt vnto the third, slit or cut the branch in the middle longwise, that so it may be the more easily bended into the ground, the cut ioynt seeming like the end of a flippe, when you haue bended downe the branch where it is cut into the ground (which must bee done very gently for feare of breaking) with a little sticke or two thrust slopewise, crosse ouer it, keepe it downe within the earth, and raise vp sufficient earth ouer it, that there it may lye and take roote, which commonly will be effected within sixe weekes or two moneths in the Summer time, and then (or longer if you doubt the time too short for it to take sufficient roote) you may take or cut it away, and transplant it where you thinke good, yet so as in any case you shadow it from the heate of the Sunne, vntill it haue taken good hold in the ground. The other way to encrease Gilloflowers, is by sowing the seede : It is not vsuall with all sorts of Gilloflowers to giue seede, but such of them as doe yeeld seede may be encreased thereby, in the same manner as is here set downe. The Orange tawney Gilloflower and the varieties thereof is the most vsual kinde, (and it is a kinde by it selfe, how various soever the plants be that rise from the seede) that doth giue seede, and is sowne, and from thence ariseth so many varieties of colours, both plaine and mixt, both single and double, that one can hardly set them downe in writing : yet such as I haue obserued and marked, you shall finde expressed in the Chapter of Gilloflowers in the worke following. First therefore make choise of your seede that you intend to sowe (if you doe not desire to haue as many more single flowers as double) that it bee taken from double flowers, and not from single, and from the best colours, howsoever some may boast to haue had double and stript flowers from the seede of a single one ; which if it were so, yet one Swallow (as we say) maketh no Summer, nor a thing comming by chance cannot bee reckoned for a certayne and constant rule ; you may be assured they will not vsually doe so : but the best, fairest, and most double flowers come alwaies, or for the most part, from the seede of those flowers that were best, fairest, and most double, and I doe aduise you to take the best and most double : for euen from them you shall haue single spes e-nown, you neede not to sowe any wiser sort. And againe, seethat your seede bee new, of the last yeres gathering, and also that it was full ripe before it was gathered, lest you lose your labour, or misse of your purpose, which is, to haue faire and double flowers. Having now made choise of your seede, and prepared you a bedde to sowe them on, the earth whereof must be rich and good, and likewise sifted to make it the finer, for the better it is, the better shall your profit and pleasure bee : hereon being first made leuell, plaine, and smooth, sowe your seede somewhat thinne, and not too thicke in any case, and as evenly as you can, that they be not too many in one place, and too few in another, which afterwards couer with fine sifted earth ouer them about one fingers thicknesse ; let this be done in the middle of April, if the time of the yere be temperate, and not too cold, or else stay vntill the end of the moneth after they are sprung vp and growne to be somewhat bigge, let them bee drawne forth that are too close and neare one vnto another, and plant them in such place wherethay shall continue, so that they stand halfe a yard of ground distance asunder, which after the planting, let be shadowed for a time, as is before specified, and this may bee done in the end of July, or sooner if there be cause. I haue not set downe in all this discourse of planting, transplanting, sowing, setting, &c. any mention of watering those slips or plants, not doubting but that every ones reason will induce them to thinke, that they cannot prosper without watering. But let this Cauter be a sufficient remembrance vnto you, that you never water any of these Gilloflowers, nor yet indeede any other sime herbe or plant with cold water, such as you haue presently before drawne out from a pumpe or Well, &c. but with such water as hath stood open in the aire in a cistern, tubbe, or pot, for one whole day at the least, if it be two or three daies it will be neuer the worse, but rather the better, as I haue related before : yet take especiall heed that you doe not giue them too much to ouer-glut them at any time, but temperately to ir-

rorate

rorate, bedew or sprinkle them often. From the seedes of these Gilloflowers hath risen both white, red, blush, stamell, tawny lighter and sadder, marbled, speckled, striped, flaked, and that in diuers maners, both single and double flowers, as you shall see them set downe in a more ample manner in the Chapter of Gilloflowers. And thus much for their encrease by the two wayes of planting and sowing : For as for a third way, by grafting one into or vpon another, I know none such to be true, nor to be of any more worth than an old Wiues tale, bothe nature, reason, and experience, all contesting against such an idle fancy, let men make what ostentation they please. It now resteth, that we also shew you the manner how to preserue them, as well in Summer from all noysome and hurtfull things, as in the Winter and Spring from the sharp and chilling colds, and the sharpe and bitter killing windes in March. The hurtfull things in the Summer are especially these, too much heate of the Sunne which scorcheth them, which you must be carefull to preuent, by placing boughes, boords, clothes or mats, &c. before them, if they bee in the ground ; or else if they bee in pots, to remoue into them into the shadow, to giue them refreshing from the heate, and giue them water also for their life : too much water, or too little is another annoyance, which you must order as you see there is iust cause, by withholding or giuing them water gently out of a watering pot, and not cast on by dishfuls : Some also to water their Gilloflowers, vse to set their pots into tubbes or pots halfe full of water, that so the water may soake in at the lower holes in each flower pot, to giue moisture to the roots of the Gilloflowers onely, without casting any water vpon the leaues, and assuredly it is an excellent way to moisten the roots so sufficiently at one time, that it doth sauе a great deale of paines many other times. Earwicks are a most infestuous vermine, to spoyle the whole beauty of your flowers, and that in one night or day, for these creatures delighting to creepe into any hollow or shadowie place, doe creepe into the long greene pods of the Gilloflowers, and doe eat away the white bottomes of their leaues, which are sweete, whereby the leaues of the flowers being loose, doe either fall away of themselves before, or when they are gathered, or handled, or presently wither within the pods before they are gathered, and blowne away with the wind. To auoide which incounuenience, many haue devised many waies and iuentions to destroy them, as pots with double verges or brimmes, containing a hollow gutter betweene them, which being filled with water, will not suffer these small vermine to passe ouerit to the Gilloflowers to spoile them. Others haue vsed old shooes, and such like hollow things to bee set by them to take them in : but the best and most vsual things now vsed, are eyther long hollow canes, or else beasts hoofes, which being turned downe vpon sticks ends set into the ground, or into the pots of earth, will soone draw into them many Earwicks, lying hid therein from sunne, winde, and raine, and by care and diligence may soone bee destroyed, if every morning and euening one take the hoofes gently off from the sticks, and knocking them against the ground in a plain allie, shake out all the Earwicks that are crept into them, which quickly with ones foot may be trode to peeces. For sodain blasting with thunder and lightening, or fierce sharpe windes, &c. I know no other remedy, vnlesse you can couer them therewith when you first foresee the danger, but patiently to abide the losse, whatsover some haue aduised, to lay litter about them to auoide blasting ; for if any shall make tryall thereof, I am in doubt, he shall more endanger his rootes thereby, being the Summer time, when any such feare of blasting is, than any wise sauē them from it, or doe them any good. For the Winter preseration of them, some haue aduised to couer them with Bee-hives, or else with small Willow stickes, prickt crossewise into the ground ouer your flowers, and bowed archwise, and with litter laid therpon, to couer the Gilloflowers quite ouer, after they haue beeene sprinkled with sope ashes and lyme mixt together : and this way is commended by somat that haue written thereof, to be such an admirable defence vnto them in Winter, that neither Ants, nor Snails, nor Earwicks shall touch them, because of the sope ashes and lyme, and neyther frosts nor stormes shall hurt them, because of the litter which so well will defend them ; and hereby also your Gilloflowers will bee ready to flower, not onely in the Spring very early, but euen all the Winter. But whosoever shall follow these directions, may peraduenture finde them in soime part true, as they are there set downe for the Wintertime, and while they are kept close and couered ; but let them bee assured, that

that all such plants, or the most part of them, will certainly perish and dye before the Summer be at an end : for the sope afhest and lyne will burne vp and spoile any herbes, and againe, it is impossible for any plant that is kept so warme in Winter, to abide eyther the cold or the windes in the Spring following, or any heate of the Sun, but that both of them will scorch them, and carry them quite awy. One great hurt vnto them, and to all other herbes that wee preserue in Winter, is to suffer the snow to lye vpon them any time after it is fallen, for that it doth so chill them, that the Sunne afterward, although in Winter, doth scorch them and burne them vp : looke therefore vnto your Gilloflowers in those times, and shake or strike off the snow gently off from them, not suffering it to abide on them any day or night if you can ; for assure your selfe, if it doth not abide on them, the better they will be. The frosts likewise is another great annoyance vnto them, to corrupt the rootes, and to cause them to swell, rot, and breake : to prevent which inconuenience, I would aduise you to take the straw or litter of your horse stable, and lay some thereof about every roote of your Gilloflowers (especially those of the best account) close vnto them vpon the ground, but be as carefull as you can, that none thereof lye vpon the greene leaues, or as little as may be, and by this onely way haue they been better defended from the frosts that spoile them in Winter, then by any other that I haue seen or knowne. The windes in March, and Sunnesheine dayes then, are one of the greatest inconueniences that happeneth vnto them : for they that haue had hundreds of plants, that haue kept faire and greene all the Winter vntill the beginning or middle of March, before the end thereof, haue had scarce one of many, that either hath not vtterly perisched, or been so tainted, that quickly after haue not been lost ; which hath happened chiefly by the neglect of these cautions before specified, in not defending them from the bitter sharpe windes and sunne in this moneth of March. You shall therefore for their better preseruation, besides the litter laid about the rootes, which I aduise you not to remoue as yet, shelter them somewhat from the windes, with eyther bottomlesse pots, pales, or such like things, to keep away the violent force both of windes and sun for that moneth, and for some time before & after it also : yet so, that they be not couered close aboue, but open to receiu ayre & raine. Some also vs to wind wites of hey or straw about the rootes of their Gilloflowers, and fasten them with sticke thrust into the ground, which serue very well in the stead of the other. Thus haue I shewed you the whole preseruation of these worthy and dainty flowers, with the whole manner of ordering them for their encrease : if any one haue any other better way, I shall be as willing to learne it of them, as I haue beeene to give them or any others the knowledge of that I haue here set downe.

## C H A P. IX.

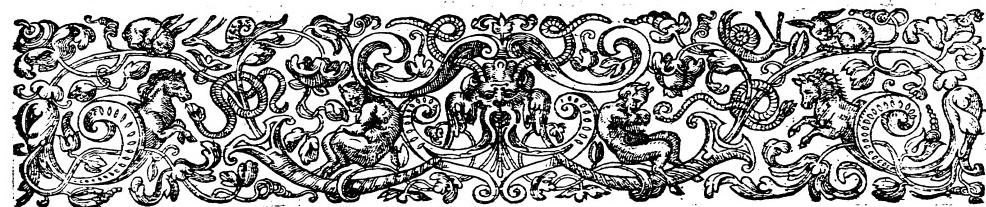

*That there is not any art whereby any flower may be made to grow double, that was naturally single, nor of any other sent or colour than it first had by nature ; nor that the sowing or planting of herbes one deeper than other, will cause them to be in flower one after another, every moneth in the yeare.*

**T**He wonderfull desire that many haue to see faire, double, and sweete flowers, hath transported them beyond both reason and nature, feigning and boasting often of what they would haue, as if they had it. And I thinke, from this desire and boasting hath risen all the false tales and reports, of making flowers double as they list, and of giuing them colour and sent as they please, and to flower likewise at what time they will, I doubt not, but that some of these errors are ancient, and continued long by tradition, and others are of later inuention : and therefore the more to be condemned, that men of wit and judgement in these dayes should expouse themselves in their writings, to be rather laughed at, then beleueed for such idle tales. And although in the contradiction of them, I know I shall vndergoe many calumnies, yet notwithstanding, I will endeauour to set downe and declare so much, as I hope may by reason perswade

perswade many in the truth, although I cannot hope of all, some being so strongly wedded to their owne will, and the errors they haue beeene bred in, that no reason may alter them. First therefore I say, that if there were any art to make some flowers to grow double, that naturally were singe, by the same art, all sorts of flowers that are singe by nature, may be made to grow double : but the sorts of flowers that are singe by nature, whereof some are double, were never made double by art ; for many sorts abide still singe, whereof there was never seene double : and therefore there is no such art in any mans knowledge to bring it to passe. If any man shall say, that because there are many flowers double, whereof there are singe also of the same kinde, as for example, Violets, Marigolds, Daifyes, Daffodils, Anemones, and many other, that therefore those double flowers were so made by the art of man : viz. by the obseruation of the change of the Moone, the constellations or coniunctions of Planets, or some other Starres or celestiall bodies. Although I doe confess and acknowledge, that I thinke some constellations, and peraduenture changes of the Moone, &c. were appointed by the God of nature, as conducing and helping to the making of thoe flowers double, that nature hath so produced, yet I doe deny, that any man hath or shall ever be able to proue, that it was done by any art of man, or that any man can tell the true causes and seasons, what changes of the Moone, or constellations of the Planets, wrought together for the producing of those double flowers, or can imitate nature, or rather the God of nature, to doe the like. If it shall bee demanded, From whence then came these double flowers that we haue, if they were not so made by arte I answer, that assuredly all such flowers did first grow wilde, and were so found double, as they doe now grow in Gardens, but for how long before they were found they became double, no man can tell ; we onely haue them as nature hath produced them, and so they remaine. Againe, if any shall say, that it is likely that these double flowers were forced so to be, by the often planting and transplanting of them, because it is obserued in most of them, that if they stand long in any one place, and not be often remoued, they will grow still lese double, and in the end turne singe. I doe confess, that *Facilius est descendens quam ascensus*, and that the vnfruitfulness of the ground they are planted in, or the neglect or little care had of them, or the growing of them too thicke or too long, are oftentimes a cause of the diminishing of the flowers doublenesse ; but withall you shall obserue, that the same rootes that did beare double flowers (and not any other that never were double before) haue returned to their former doublenesse againe, by good ordering and looking vnto : singe flowers haue only beeene made somewhat fairer or larger, by being planted in the richer and more fruitfull ground of the Garden, than they were found wilde by nature ; but never made to grow double, as that which is naturally so found of it selfe : For I will shew you mine owne experience in the matter. I haue beene as inquisitiue as any man might be, with euery one I knew, that made any such report, or that I thought could say any thing therein, but I never could finde any one, that could assuredly resolute me, that he knew certainly any such thing to be done : all that they could say was but report, for the obseruation of the Moone, to remoue plants before the change, that is, as some say, the full of the Moone, others the new Moone, whereupon I haue made triall at many times, and in many sorts of plants, accordingly, and as I thought fit, by planting & transplanting them, but I could never see the effect desired, but rather in many of them the losse of my plants. And were there indeed such a certayne art, to make singe flowers to grow double, it would haue beeene knowne certainly to some that would practise it, and there are so many singe flowers, whereof there were never any of the kinde seene double, that to produce such of them to be double, would procure both credit and coyne enough to him that should vse it ; but *Vltra posse non est esse* : and therefore let no man beleue any such reports, bee they never so ancient, for they are but meere tales and fables. Concerning colours and sent, the many rules and directions extant in manie mens writings, to cause flowers to grow yellow, red, greene, or white, that never were so naturally, as also to be of the sent of Cinamon, Muske, &c. would almost perswade any, that the matters thus set downe by such persons, and with some shew of probability, were constant and assured proofes thereof : but when they come to the triall, they all vanish away like smoake. I will in a few words shew you the matters and manners of their proceedings to effect this purpose : First (they say) if you shall steepe

your seedes in the lees of red Wine, you shall haue the flowers of those plants to be of a purple colour. If you will haue Lillies or Gilloflowers to be of a Scarlet red colour, you shall put Vermillion or Cynaber betwene the rinde and the small heads growing about the roote : if you will haue them blew, you shall disolute Azur or Byse betweene the rinde and the heads : if yellow, Orpiment : if greene, Vardigrease, and thus of any other colour. Others doe aduise to open the head of the roote, and poure into it any colour dissolved, so that there be no fretting or corroding thing therein for feare of hurting the roote, and looke what colour you put in, iust such or neare vnto it shall the colour of the flower bee. Some againe doe aduise to water the plants you would haue changed, with such coloured liquor as you desire the flower to be of, and they shall grow to be so. Also to make Roses to bee yellow, that you should graft a white Rose (some say a Damaske) vpon a Broome stalke, and the flower will be yellow, supposing because the Broome flower is yellow, therefore the Rose will be yellow. Some affirme the like, if a Rose be grafted on a Barbery bush, because both the blossome and the barke of the Barbery is yellow, &c. In the like manner for sents, they haue set downe in their writings, that by putting Cloues, Muske, Cinamon, Benzoin, or any other such sweete thing, bruised with Rose water, betweene the barke and the body of trees, the fruit of them will smell and taste of the same that is put vnto them ; and if they bee put vnto the toppe of the rootes, or else bound vnto the head of the roote, they will cause the flowers to smell of that sent the matter put vnto them is of : as also to steep the seeds of Roses, and other plants in the water of such like sweet things, and then to sowe them, and water them morning and euening with such like liquor, vntill they be growne vp ; besides a number of such like rules and directions set downe in booke, so confidently, as if the matters were without all doubt or question : when as without all doubt and question I will assure you, that they are all but meere idle tales & fancies, without all reason or truth, or shadow of reaon or truthe : For sents and colours are both such qualties as follow the essence of plants, even as forme are also ; and one may as well make any plant to grow of what forme you will, as to make it of what sent or colour you will ; and if any man can forme plants at his will and pleasure, he can doe as much as God himselfe that created them. For the things they would adde vnto the plants to giue them colour, are all corporeall, or of a bodily substance, and whatsoeuer should giue any colour vnto a living and growing plant, must be spirituall : for no soleil corporeall substance can ioyne it selfe with the life and essence of an herbe or tree, and the spirituall part of the colour thereof is not the same with the bodily substance, but is a meere vapour that riseth from the substance, and feedeth the plant, whereby it groweth, so that there is no ground or colour of reason, that a substantiall colour should giue colour to a growing herbe or tree : but for sent (which is a meere vapour) you will say there is more probability. Yet consider also, that what sweete sent soever you binde or put vnto the rootes of herbes or trees, must be either buried, or as good as buried in the earth, or barke of the tree, whereby the substance will in a small time corrupt and rot, and before it can ioyne it selfe with the life, spirit, and essence of the plant, the sent also will perith with the substance : For no heterogeneall things can bee mixed naturally together, as Iron and Clay, and no other thing but homogeneall, can be nourishment or conuertible into the substance of man or beast : And as the stomach of man or beast altereth both formes, fens, and colours of all digestible things ; so whatsoeuer sent or colour is wholsome, and not poysyonfull to nature, being receiued into the body of man or beast, doth neither change the bloud or skinne into that colour or sent was receiued : no more doth any colour or sent to any plant, for the plants are onely nourished by the moisture they draw naturally vnto them, be it of wine or any other liquor is put vnto them, and not by any corporeall substance, or heterogeneall vapour or sent, because the earth like vnto the stomach doth soone alter them, before they are conuerted into the nature and substance of the plant. Now for the last part I vnderooke to confute, that no man can by art make all flowersto spring at what time of the yeare hee will ; although, as I haue here before shewed, there are flowers for euery moneth of the yeare, yet I hope there is not any one, that hath any knowledge in flowers and gardening, but knoweth that the flowers that appear and shew themselves in the seuerall moneths of the yeare, are not one and the same, and so made to flower by art ; but that they are seuerall sorts of plants, which will

will flower naturally and constantly in the same moneths one yeare, that they vse to doe in another, or with but little alteration, if the yeares proue not alike kindly : As for example, those plants that doe flower in January and February, will by no art or industry of man be caused to flower in Summer or in Autumn ; and those that flower in Aprill and May, will not flower in Januari or February ; or those in July, August, &c. either in the Winter or Spring: but every one knoweth their owne appointed naturall times, which they constantly obserue and keepe, according to the temperatire of the yeare, or the temper of the climate, being further North or South, to bring them on earlier or later, as it doth with all other fruits, flowers, and growing green herbes, &c. except that by chance, some one or other extraordinarily may be hindered in their due season of flowring, and so giue their flowers out of time, or else to giue their flowers twice in the yeare, by the superabundance of nourishment, or the mildnesse of the season, by moderate showers of raine, &c. as it sometimes also happeneth with fruits, which chance, as it is seldom, and not constant, so we then terme it but *Lusus naturae* : or else by forcing them in hot stoues, which then will perish, when they haue giuen their flowers or fruits. It is not then, as some haue written, the sowynge of the seedes of Lillies, or any other plants a foote deepe, or halfe a foote deepe, or two inches deepe, that will cause them to be in flower one after another, as they are sowne euery moneth of the yeare ; for it were too grosse to thinke, that any man of reaon and iudgement would so beleue. Nor is it likewise in the power of any man, to make the same plants to abide a moneth, two, or three, or longer in their beauty of flowring, then naturally they vse to doe ; for I thinke that were no humancart, but a supernaturall worke. For nature still bendeth and tendeth to perfection, that is, after flowing to give fruit or seede, nor can it bee hindered in the course thereof without manifest danger of destruction, even as it is in all other fruit-bearing creatures, which stay no longer, then their appointed time is naturall vnto them, without apparent damage. Some things I grant may be so ordered in the planting, that according to that order and time which is obserued in their planting, they shall shew forth their faire flowers, and they are Anemones, which will in that manner, that I haue shewed in the worke following, flower in seuerall moneths of the yeare, which thing as it is incident to none or very few other plants, and is found out but of late, so likewise is it knowne but vnto a very few. Thus haue I shewed you the true solution of these doubts : And although they haue not beeene amplified with such Philosophicall arguments and reasons, as one of greater learning might haue done, yet are they truly and sincerely set downe, that they may serue *tanquam galatam*, against all the calumnies and obiections of wilfull and obdurate persons, that will not be reformed. As first, that all double flowers were so found wilde, being the worke of nature alone, and not the art of any man, by planting or transplanting, at or before the new or full Moone, or any other obseruation of time, that hath caused the flower to grow double, that naturally was singel : Secondly, that the rules and directions, to cause flowers to bee of contrary or different colours or sents, from that they were or would be naturally, are meere fancies of men, without any ground of reaon or truthe. And thirdly, that there is no power or art in man, to cause flowers to shew their beauty diuers moneths before their naturall time, nor to abide in their beauty longer then the appointed naturall time for every one of them.

# THE GARDEN O F PLEASANT FLOWERS.

## C H A P . I.

*Corona Imperialis. The Crowne Imperiall.*

Because the Lilly is the more stately flower among manie : and amongst the wonderfull varietie of Lillies, knowne to vs in these daies, much more therin former times, whereof some are white, others blushe, some purple, others red or yellow, some spotted, others without spots, some standing vpright, others hanging or turning downwards. The Crowne Imperiall for his stately beautifulnes, deserueth the first place in this our Garden of delight; to be here entreated of before all other Lillies: but because it is so well knowne to most persons, being in a manner euery where common, I shall neede onely to give you a relation of the chiefe parts thereof (as I intend in such other things) which are these: The roote is yellowish on the outside, composed of fewer, but much thicker scales, then any other Lilly but the Persian, and doth grow sometimes to be as great as a pretty bigge childes head, but somewhat flat withall, from the sides whereof, and not from the bottome, it shoothe forth thicke long fibres, which perish every yeaer, haing a hole in the midst thereof, at the end of the yeaer, when the old stalke is dry and withered, and out of the which a new stalke doth spring againe (from a bud or head to be seen within the hollownesse on the one side) the yeaer following: the stalke then filling vp the hollownesse, riseth vp three or four foote high, being great, round, and of a purplish colour at the bottome, but greene aboue, beset from thence to the middle thereof with many long and broad greene leaues, very like to the leaues of our ordinary white Lilly, but somewhat shorter and narrower, confusly without order, and from the middle is bare or naked without leaues, for a certayne space vpwards, and then beareth foure, fife, or tenne flowers, more or lesse, according to the age of the plant, and the fertilitie of the soyle where it groweth: The buddes at the first appearing are whitish, standing vpright among a bush or tuft of greene leaues, smaller then those below, and standing aboue the flowers, after a while they turne themclites, and hang downwards euery one vpon his owne foote stalke, round about the great stemme or stalke, sometimes of an euent depth, and other while one lower or higher than another, which flowers are neare the forme of an ordinary Lilly, yet somewhat lesser and closer, consisting of fife leaues of an Oratige colour, striped with purplish lines and veines, which adde a great grace to the flowers: At the bottome of the flower next vnto the stalke, every leafe

Leafe thereof hath on the outside a certayne bunch or eminence, of a darke purplish colour, and on the inside there lyeth in those hollow bunched places, certayne cleare drops of water like vnto perles, of a very sweete taste almost like sugar: in the midift of each flower is a long white stile or pointell, forked or diuided at the end, and sixe white chiuies tipt with yellowish pendens, standing close about it: after the flowers are past, appeare sixe square seede vessels standing vpright, winged as it were or welted on the edges, yet seeming but three square, because each couple of those welted edges are ioyned closer together, wherein are contained broad, flat, and thinne seedes, of a pale brownish colour, like vnto other Lillies, but much greater and thicker also. The stalke of this plant doth oftentimes grow flat, two, three, or foure fingers broad, and then beareth many more flowers, but for the most part smaller: then when it beareth round stalkes. And sometimes it happeneth the stalke to be diuided at the top, carrying two or three tufts of greene leaues, without any flowers on them. And sometimes likewise, to beare two or three rowes or crownes of flowers one aboue another vpon one stalke, which is seldome and scarce seene, and besides, is but mere accidental: the whole plant and euery part thereof, as well rootes, as leaues and flowers, doe smell somewhat strong as it were the saour of a Foxe, so that if any doe but come neare it, he cannot but smel it, which yet is not vnwholome.

I haue not obserued any variety in the colour of this flower, more then that it will be fairer in a cleare open ayre, and paler, or as it were blasted in a muddy or smoakie ayre. And although some haue boasted of one with white flowers, yet I could never heare that any such hath endured in one vniiforme colour.

#### The Place.

This plant was first brought from Constantinople into these Christian Countries, and by the relation of some that sent it, growtheth naturally in Persia.

#### The Time.

It flowreth most commonly in the end of March, if the weather be milde, and springeth not out of the ground vntill the end of February, or beginning of March, so quicke it is in the springing: the heads with seede ripe in the end of May.

#### The Names.

It is of some called *Lilium Persicum*, the Persian Lilly: but because wee haue another, which is more vsually called by that name, as shall be shewed in the next Chapter, I had rather with Alphonsus Pancius the Duke of Florence his Physitian, (who first sent the figure thereof vnto M<sup>r</sup>. Iohn de Brancion) call it *Cronae Imperialis*, The Crowne Imperiall, then by any other name, as also for that this name is now more generally received. It hath been sent also by the name *Tufat*, and *Tuschat*, and *Turfan*, or *Turfanda*, being, as it is like, the Turkish names.

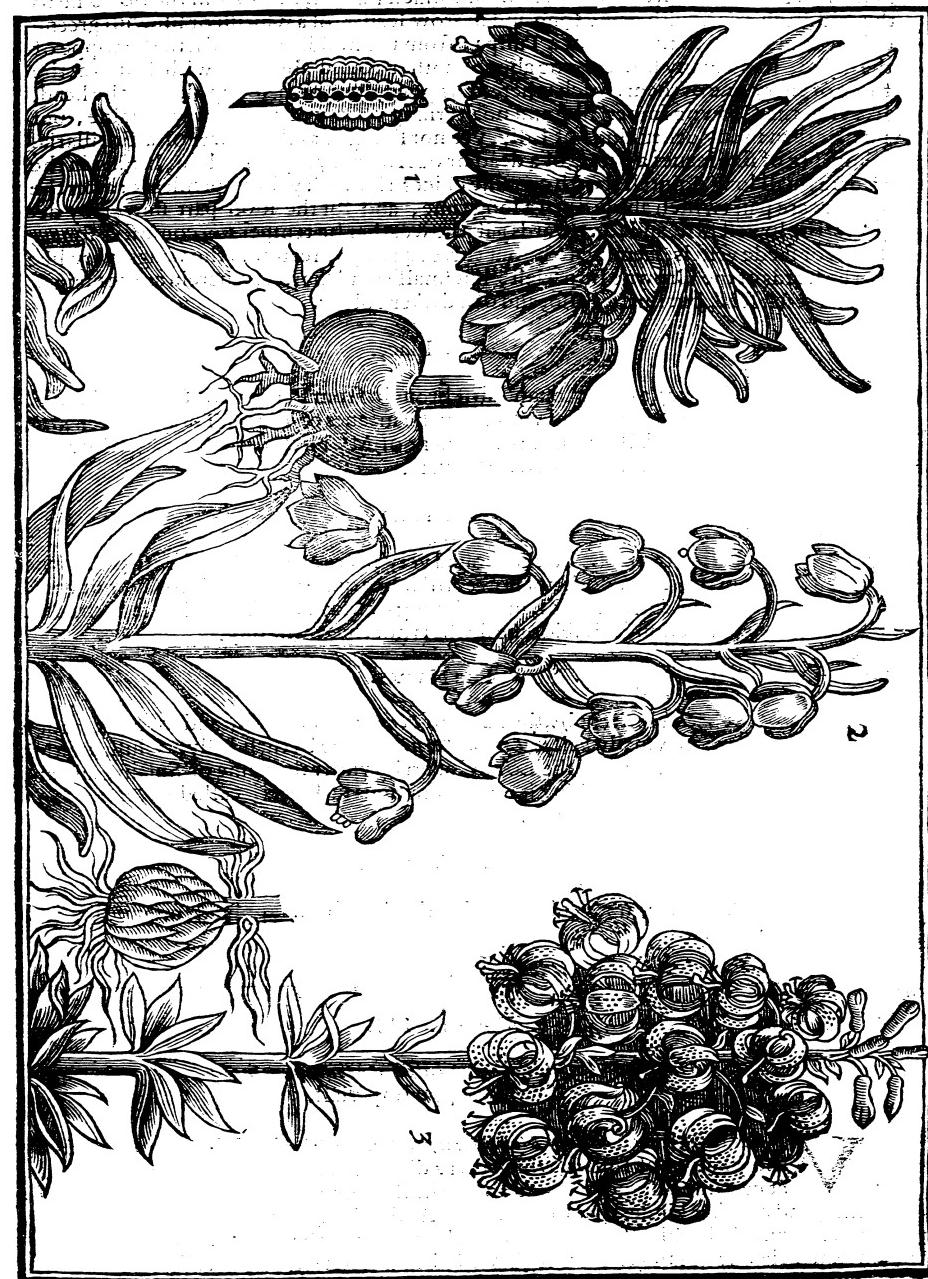

#### The Vertues.

For any Physical Vertues that are in it, I know of none, nor haue heard that any hath been found out: notwithstanding the strong sent would perswade it might be applyed to good purpose.

#### CHAP. II.

#### *Lilium Persicum*. The Persian Lilly.

The roote of the Persian Lilly is very likevnto the root of the Crowné Imperiall, and losing his fibres in like manner every year, hauing a hole therin likewise whereto the old stalke grew, but whiter, rounder, and a little longer, smaller, and not stinking at all like it, from whence springeth vp a round whitish greene stalke, not pauch

1. *Cronae Imperialis*. The Crowne Imperiall. 2. *Lilium Persicum*. The Persian Lilly.

3. *Martagon Imperiale*. The Martagon Imperiall.

much lower than the Crowne Imperiall, but much smaller, beset from the bottome to the middle thereof, with many long and narrow leaues, of a whitish or bleuish greene colour, almost like to the leafe of a *Tulipa*: from the middle vpwards, to the toppe of the stalke, stand many flowers one aboue another round about it, with leaues at the foote of euery one of them, each whereof is pendulous or hanging downe the head, like vnto the Crowne Imperiall, and not turning vp any of the flowers againe, but smaller than in any other kinde of Lilly, yea not so bigge as the flower of a *Fritillaria*, confisitng of sixe leaues a peice, of a dead or ouerworne purplish colour, hauing in the midst a small long pointell, with certayne chiuies tipt with yellow pendent: after the flowers are past (which abide open a long time, and for the most part flower by degrees, the lowest first, and so vpwards) if the weather be temperate, come sixe square heads or seede vessels, seeming to be but three square, by reason of the wings, very like to the heads of the Crowne Imperiall, but smaller and shorter, wherein are contained such like flat seed, but smaller also, and of a darker colour.

#### The Place.

This was, as it is thought, first brought from Persia vnto Constantinople, and from thence, sent vnto vs by the meanes of diuers Turkie Merchants, and in especiall, by the procurement of M<sup>r</sup>. Nicholas Lete, a worthy Merchant, and a louer of all faire flowers.

#### The Time.

It springeth out of the ground very neare a moneth before the Crowne Imperiall, but doth not flower till it bee quite past (that is to say) not vntill the latter end of Aprill, or beginning of May: the seed (when it doth come to perfection, as it seldom doth) is not ripe vntill Iuly.

#### The Names.

It hath been sent by the name of *Pennacio Persiano*, and wee thereupon doe most vsually call it *Lilium Persicum*, The Persian Lilly. Clusius saith it hath been sent into the Low-Countries vnder the name of *Susam giul*, and he thereupon thinking it came from Susis in Persia, called it *Lilium Susianum*, The Lilly of Susis.

#### The Vertues.

Wee haue not yet heard, that this hath beeene applyed for any Physicall respect.

### CHAP. III.

#### *Martagon Imperiale*, sive *Lilium Montanum maius*, The Martagon Imperiall.

**V**Nder this title of *Lilium Montanum*, or *Lilium Silviflora*, I do comprehend only those kindes of Lillies, which carry diuers circles of greene leaues set together at certaine distances, round about the stalke, and not sparfedly as the two former, and as other kindes that follow, doe. And although there bee many of this sort, yet because their chiefest difference is in the colour of the flower, wee will containe them all in one Chapter, and begin with the most stately of them all, because of the number of flowers it beareth vpon one stalke. The Imperiall Lilly hath a scaly roote, like vnto all the rest of the Lillies, but of a paler yellow colour, closely compact or set together, being short and small oftentimes, in comparison of the greatnessse of the stemme

stemme growing from it. The stalke is brownish and round at the bottome, and sometimes flat from the middle vpwards, three foote high or more, beset at certaine distances with rondles or circles of many broad leaues, larger and broader for the most part than any other of this kinde, and of a darke green colour: It hath two or three, and sometimes four of these rondles or circles of leaues, and bare without any leafe betweene; but aboue toward the tops of the stalkes, it hath here and there some leaues vpon it, but smaller than any of the other leaues: at the toppe of the stalke come forth many flowers, sometime three or four score, thicke thrift, or confusedly set together, and nothinge or sparfedly one aboue another, as in the lesser of this kinde of Mountaine Lilly. It hath been sometimes also obserued in this kinde, that it hath borne manie flowers at three severall spaces of the stalke, one aboue another, which hath made a goodly shew; each flower whereof is pendulous, hanging downe, and each leafe of the flower turning vp againe, being thicke or fleshy, of a fine delayed purple colour, spotted with many blackish or brownish spots, of a very pleasant sweet sent, which maketh it the more acceptable: in the middle of the flower hangeth downe a stile or pointell, knobbed or buttoned at the end with fixe yellow chiuies, tipt with loose pendent of an Orient red or Vermillion colour, which will easily sticke like dust vpon any thing that toucheth them: the heads or seede vessels are small and round, with small edges about them, wherein is contained flat browne seede like other Lillies, but lesser. The root is very apt to encrease or set of, as we call it, wherby the plant seldom commeth to so great a head of flowers, but riseth vp with many stalkes, and then carry fewer flowers.

Of this kinde there is sometimes one found, that beareth flowers without any spots: *Martagon Imperiale flore non punctato*.

#### *Martagon flore albo*. The White Martagon.

We haue also some other of this kind, the first wherof hath his stalke & leafe greener than the former, the stalke is a little higher, but not bearing so thicke a head of flowers, although much more plentifull than the lesser Mountaine Lilly, being altogether of a fine white colour, without any spots, or but very few, and that but sometimes also: the pendent in the middle of this flower are not red, as the former, but yellow; the roote of this, and of the other two that follow, are of a pale yellow colour, the cloues or scales of them being brittle, and not closely compact, yet so as if two, and sometimes three scales or cloues grew one vpon the head or upperpart of another; which difference is a speciall note to know these three kindes, from any other kinde of Mountaine Lilly, as in all old rootes that I haue seene, I haue obserued, as also in them that are reasonably well growne, but in the young rootes it is not yet so manifest.

#### *Martagon flore albo maculato*. The White spotted Martagon.

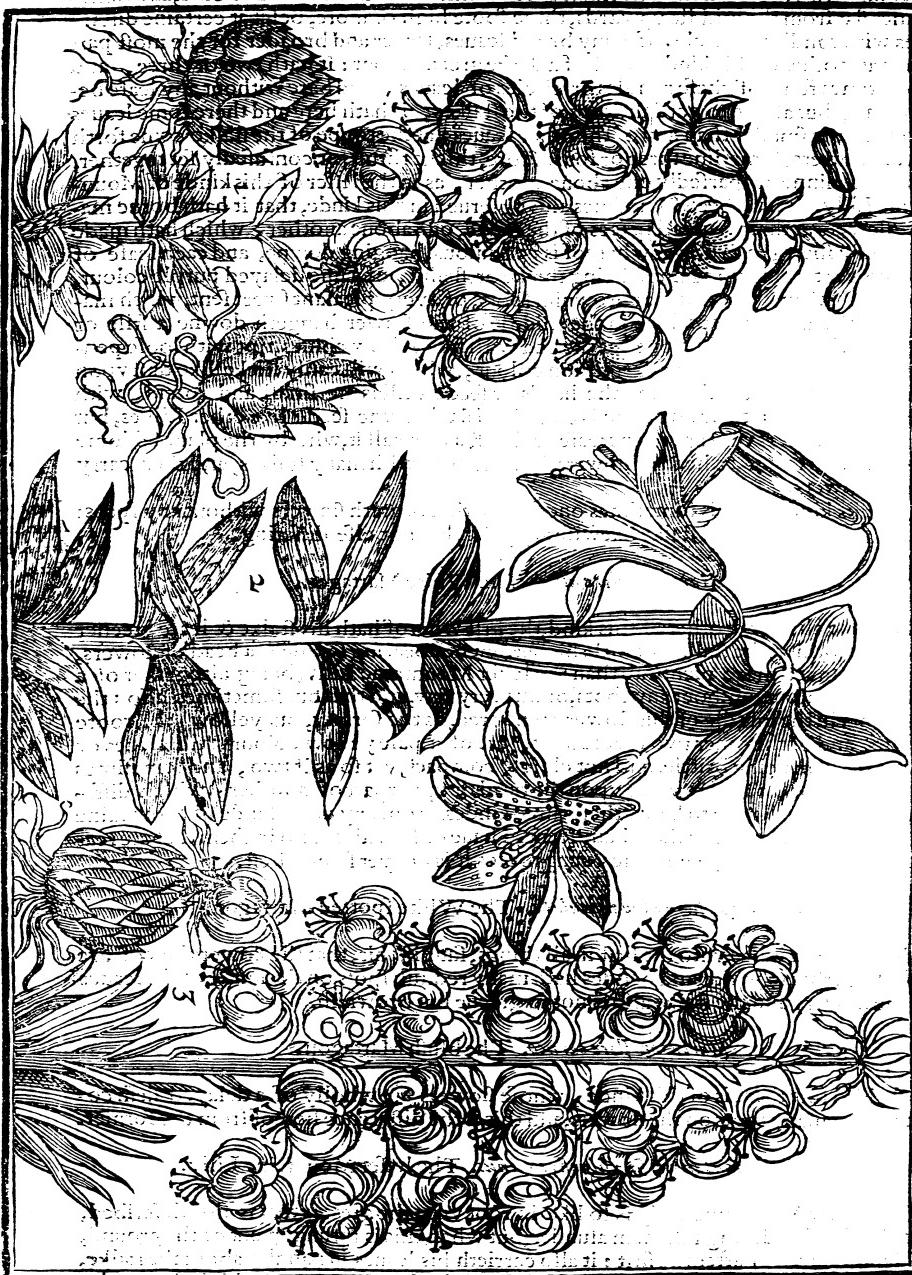

The second is like vnto the first in all things, save in this, that the flowers hereof are not altogether so white, and besides hath many reddish spots on the inside of the leaues of the flower, and the stalke also is not so greene but brownish.

#### *Martagon flore carneo*. The blush Martagon.

A third sort there is of this kinde, whose flowers are wholly of a delayed flesh colour, with many spots on the flowers, and this is the difference hereof from the former.

#### *Lilium Montanum sive silviflora minus*. The lesser Mountaine Lilly.

The lesser Mountaine Lilly is so like in root vnto the greater that is first described, that it is hard to distinguish them asunder; but when this is sprung vp out of the ground, which is a moneth after the first: it also carrieth his leaues in rondles about the stalke, although not altogether so great nor so many. The flowers are more thinly set on the stalkes one aboue another, with more distance betweene each flower than the former, and are of a little deeper flesh colour or purple, spotted in the same manner. The buds or,

1 Martagon flore albo. The white Martagon. 2 Martagon sine Lilium Canadense maculatum. The spotted Martagon, or Lilly of Canada. 3 Martagon Pomponium. The Martagon Pompony, or early red Martagon.

or heads of flowers, in some of these before they be blowne, are hoary white, or haire, whereas in others, there is no hoarinesse at all, but the buddes are smooth and purplish: in other things this differeth not from the former.

Of this sort also there is one that hath but few spots on the flowers, whose colour is *Lilium Martagon non maculatum.*

#### *Martagon Canadense maculatum.* The spotted Martagon of Canada.

Although this strange Lilly hath not his flowers hanging downe, and turning vp again, as the former kinds set forth in this Chapter; yet because the green leaues stand at severall ioynts as they do, I must needs insert it here, not knowing where more fitly to place it. It hath a small scaly roote, with many smal long fibres thereat, from whence riseth vp a reasonable great stalke, almost as high as any of the former, bearing at three or foure distanes many long and narrow greene leaues, but not so many or so broad as the former, with diuers ribbes in them: from among the uppermost rundle of leaues breaketh forth foure or five flowers together, every one standing on a long slender foote stalke, being almost as large as a red Lilly, but a little bending downwards, and of a faire yellow colour, spotted on the inside with diuers blackish purple spots or strakes, hauing a middle pointell, and sixe chies, with pendent on them.

#### The Place.

All these Lillies haue been found in the diuers Countries of Germany, as Austria, Hungaria, Pannonia, Stiria, &c. and are all made Denissons in our London Gardens, where they flourish as in their owne naturall places. The last was was brought into France from Canada by the French Colonie, and from thence vnto vs.

#### The Time.

They flower about the later end of Iune for the most part, yet the first springeth out of the ground a moneth at the least before the other, which are most vsually in flower before it, like vnto the Serotine Tulipas, all of them being early vp, and neuer the neere.

#### The Names.

The first is vsually called *Martagon Imperiale*, the Imperiall Martagon, and is *Lilium Montanum maius*, the greatest Mountaine Lilly, for so it deserueth the name, because of the number of flowers vpon a head or stalke. Some haue called it *Lilium Sarafacium*, and some *Hemerocallis*, but neither of them doth so fitly agree vnto it.

The second is *Lilium Montanum maius flore albo*, and of some *Martagon Imperiale flore albo*, but most vsually *Martagon flore albo*, the white Martagon. The second sort of this second kinde, is called *Martagon flore albo maculato*, the spotted white Martagon. And the third, *Martagon flore carneo*, the blusk Martagon.

The thira kinde is called *Lilium Monogram*, the Mountaine Lilly, and some adde the title *virginis*, the lesser, to know it more distinctly from the other. Some also *Lilium clusii*, as Clusius, and some others, and of Matthiolus Martagon. Of diuers women here in England, from the Dutch name, Lilly of Nazareth. The last hath histile *Americana & Canadense*, and in English accordingly.

## CHAP. IV.

1. *Martagon Pomponicum*, sive *Lilium rubrum precox*, vel *Lilium Macedonicum*.  
The early red Martagon, or Martagon Pompony.

**A**S in the former Chapter we described vnto you such Lillies, whose flowers being pendulous, turne their leaues backe againe, and haue their greene leaues, set by spaces about the stalke: so in this wee will set downe those sorts, which carry their greene leaues more sparsedly, and all along the stalke, their flowers hanging downe, and turning vp againe as the former, and begin with that which is of greatest beauty, or at least of most rarity.

1. This rare Martagon hath a scaly root closely compact, with broader and thinner scales than others, in time growing very great, and of a more deepe yellow colour then the former, from whence doth spring vp a round greene stalke in some plants, and flat in others, two or three foote high, bearing a number of small, long, and narrow greene leaues, very like vnto the leaues of Pinkes, but greener, set very thickc together, and without order about the stalke, vp almost vnto the toppe, and lesser by degrees vpwards, where stand many flowers, according to the age of the plant, and thrining in the place where it groweth; in those that are young, but a few, and more sparsedly, and in others that are old many more, and thicker set: for I haue reckoned threescore flowers and more, growing thickc together on one plant with mee, and an hundred flowers on another: these flowers are of a pale or yellowish red colour, and not so deep red as the red Martagon of Constantinople, hereafter set down, nor fully so large: yet of the same fashon, that is, every flower hanging downe, and turning vp his leaues againe. It is not so plentifull in bearing of seede as the other Lillies, but when it doth, it differeth not but in being lesse.

There is another, whose greene leaues are not so thickc set on the stalke, but else differeth not but in flowring a fortnight later.

There is another also of this kind, so like vnto the former in root, stalk, flower, & manner of growing, that the difference is hardly discerned; but consisteth chiefly in these two points: First, that the leaues of this are a little broader and shorter then the former; and secondly, that it beareth his flowers a fortnight earlier than the first. In the colour or forme of the flower, there can no difference bee discerned, nor (as I said) in any other thing. All these Lillies doe spring very late out of the ground, even as the yellow Martagons doe, but are sooner in flower then any others.

A fourth kinde hereof hath of late been knowne to vs, whose leaues are broader and shorter then the last, and the flowers of a paler red, tending to yellow, of some called a golden red colour: but flowreth not so early as they.

2. *Lilium rubrum Byzantium*, sive *Martagon Constantinopolitanum*.  
The red Martagon of Constantinople.

1. The red Martagon of Constantinople is become so common every where, and so well knowne to all louers of these delights, that I shall seeme vnto them to lose time, to bestow many lines vpon it, yet because it is so faire a flower, and was at the first so highly esteemed, it deserueth his place and commendations, howsoever encreasing the plenty hath not made it dainty. It riseth out of the ground early in the spring, before many other Lillies, from a great thicke yellow scaly root, bearing a round brownish stalke, beset with many faire greene leaues confusedly thereon, but not so broad as the common white Lilly, vpon the toppe whereof stand one, two, or three, or more flowers, vpon long footestalkes, which hang downe their heads, and turne vp their leaues againe, of an excellent red crimson colour, and sometimes paler, haing a long pointell in the middle, compassed with sixe whitish chives, tipt with loose yellow pendent, of a reasonable good sent, but somewhat faint. It likewise beareth seede in heads, like vnto the other, but greater.

2. *Martagon flore puerorum*.

3. *Martagon angustifolium maculatum*.

4. *Martagon latifolium precox*.

*Martagon Constantinopolitanum maculatum*.  
The red spotted Martagon of Constantinople.

We haue another of this kinde, that groweth somewhat greater and higher, with a larger flower, and of a deeper colour, spotted with diuers blacke spots, or strokcs and lines, as is to be seene in the Mountaine Lillies, and in some other hereafter to be described, but is not so in the former of this kinde, which hath no shew of spots at all. The whole plant as it is rare, so it is of much more beauty then the former.

2. *Martagon Pannonicum*, sive *Exoticum flore spadiceo*.  
The bright red Martagon of Hungarie.

Although this Martagon or Lilly bee of another Countrey, yet by reason of the neerenesse both in leafe and flower vnto the former, may more fitly be placed next vnto them, then in any other place. It hath his roote very like the other, but the leaues are somewhat larger, and more sparsedly set vpon the stalke, else not much vnlke: the flowers bend downe, and turne vp their leaues againe, but somewhat larger, and of a bright red, tending to an Orenge colour, that is, somewhat yellowish, and not crimson, like the other.

3. *Martagon Luteum punctatum*. The Yellow spotted Martagon.

1. This Yellow Martagon hath a great scaly or cloued roote, and yellow, like vnto all these sorts of turning Lillies, from whence springeth vp a round greene strong stalke, three foote high at the least, confusedly set with narrow long greene leaues, white on the edges vp to the very toppe thereof almost, haing diuers flowers on the head, turning vp againe as the former doe, of a faint yellowish, or greenish yellow colour, with many blacke spots or strokcs about the middle of the leafe of every flower, and a forked pointell, with sixe chives about it, tipt with reddish pendent, of a heauie strong smell, not very pleasant to many. It beareth seede very plentifull, in great heads, like vnto the other former Lillies, but a little paler.

2. *Martagon Luteum non maculatum*. The Yellow Martagon without spots.

The other yellow Martagon differeth in no other thing from the former, but onely that it hath no spots at all vpon any of the leaues of the flowers, agreeing with the former, in colour, forme, height, and all things else.

3. *Martagon Luteum serotinum*. The late flowring Yellow Martagon.

There is yet another yellow Martagon, that hath no other difference then the time of his flowring, which is not vntill July, vnlesse in this, that the flower is of a deeper yellow colour.

## The Place:

The knowledge of the first kindes of these early Martagons hath come from Italy, from whence they haue bin sent into the Low-Countries, and to vs, and as it seemeth by the name, whereby they haue bin sent by some into these parts, his originall shoulde be from the mountaines in Macedonia.

The second sort is sufficiently knowne by his name, being first brought from Constantinople, his naturall place being not farre from thence, as it is likely. But the next sort of this second kinde, doth plainly tell vs his place of birth to be the mountaines of Pannonia or Hungarie.

The third kindes grow on the Pyrenean mountaines, where they haue been searched out, and found by diuers louers of plants, as also in the Kingdome of Naples.

The

## The Time.

The first early Martagons flower in the end of May, or beginning of June, and that is a moneth at the least before those that come from Constantinople, which is the second kinde. The two first yellow Martagons flower somewhat more early, then the early red Martagons, and sometimes at the same time with them. But the third yellow Martagon, as is said, flowreth a moneth later or more, and is in flower when the red Martagon of Constantinople flowreth. And although the early red and yellow Martagons, spring later then the other Martagons or Lillies, yet they are in flower before them.

## The Names.

The first early red Lillies or Martagons have beene sent vnto vs by seuerall names, as *Martagon Pomponium*, and thereafter are called Martagon of Pompony, and also *Lilium* or *Martagon Macedonicum*, the Lilly or Martagon of Macedonia. They are also called by Clusius *Lilium rubrum precox*, the one *angustiore folio*, the other *latiore folio*. And the last of this kinde hath the title *flore planiceo* added or giuen vnto it, that is, the Martagon or Lilly of Macedonia with gold red flowers.

The Martagons of Constantinople haue beene sent by the Turkish name *Zufiniare*, and is called *Martagon*, or *Lilium Byzantium* by some, and *Hermoncallis Chalcedonica* by others, but by the name of the Martagon of Constantinople they are most commonly received with vs, with the distinction of *maculatum* to the one, to distinguish the sorts. The last kinde in this classis, hath his name in his title, as it hath been sent vnto vs.

The Yellow Martagons are distinguished in their severall titles, as much as is conuenient for them.

## CHAP. V.

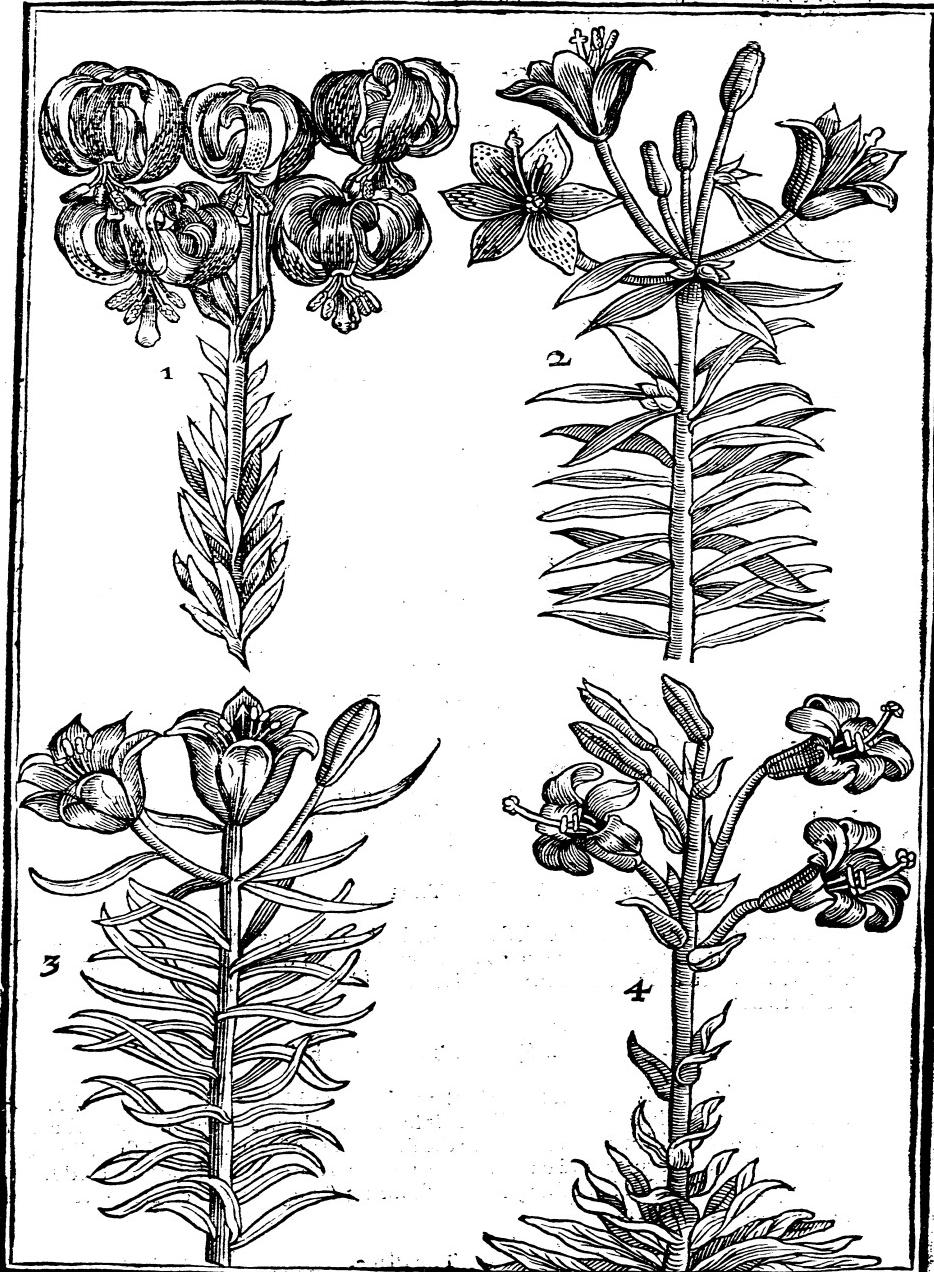

*Lilium Aureum & Lilium Rubrum. The Gold and Red Lillies.*

There are yet some other kindes of red Lillies to bee described, which differ from all the former, and remaine to be spoken of in this place. Some of them grow high, and some lowe, some haue small knots, which wee call bulbes, growing vpon the stalkes, at the ioynts of the leauers or flowers, and some haue none : all which shall be intreated of in their severall orders.

*Lilium parvulum cruentum. The dwarfe red Lilly.*

The dwarfered Lilly hath a scaly roote, somewhat like vnto other Lillies, but white, and not yellow at all, and the cloues or scales thicker, shorter, and fewer in number, then in most of the former : the stalk hereof is not aboue a foote and a halfe high, round and greene, set confusedly with many faire and short greene leauers, on the toppe of which doe stand sometimes but a few flowers, and sometimes many, of a faire purplish red colour, and a little paler in the middle, euery flower standing vpright, and not hanging downe, as in the former, on the leauers whereof here and there are some blacke spots, lynes or markes, and in the middle of the flower a long pointell, with some chiuies about it, as is in the rest of these Lillies.

*Lilium rubrum multipliciflorum.* This kinde is sometimes found to yeeld double flowers, as if all the single flowers should grow into one, and so make it consist of many leauers, which notwithstanding his

1. *Martagon rubrum sive luteum. The red or the yellow Martagon.* 2. *Lilium Bulbiferum. The red bulbed Lilly.* 3. *Lilium aureum. The gold red Lilly.* 4. *Lilium album. The white Lilly.*

his so continuing sundry yeares, vpon transplanting, will redire ad *ingenium*, that is, quickly come againe to his old byas or forme.

*Lilium Aureum.* The Gold red Lilly.

The second red Lilly without bulbes groweth much higher then the first, and almost as high as any other Lilly: the roote hereof is white and scaly, the leaues are somewhat longer, and of a darke or sad greene colour; the flowers are many and large, standing vpright as all these sorts of red Lillies doe, of a paler red colour tending to an Orange on the inside, with many blacke spots, and lines on them, as in the former, and more yellow on the outside: the seede vessels are like vnto the roundish heads of other Lillies, and so are the seedes in them likewise.

1. *Lilium minus bulbiferum.* The dwarfe bulbed Lilly.

The first of the Lillies that carrieth bulbes on the stalke, hath a white scaly roote like the former; from whence riseth vp a small round stalke, not much higher then the first dwarfe Lilly, seeming to be edged, hauing many leaues thereon of a sad green colour set about it, clofethrust together: the greene heads for flowers, will haue a kind of woollinesse on them, before the flowers begin to open, and betweene these heads of flowers, as also vnder them, and among the vppermost leaues, appeare small bulbes or heads, which being ripe if they be put into the ground, or if they fall of themselues, will shoothe forth leaues, and beare flowers within two or three yeares like the mother plant, and so will the bulbes of the other hereafter described: the flowers of this Lilly are of a faire gold yellow colour, shadowed ouer with a shew of purple, but not so red as the first, or the next to bee described. This Lilly will shoothe strings vnder ground, like as the last red Lilly will doe also, whereat will grow white bulbed roots, like the rootes of the mother plant, thereby quickly encreasing it selfe.

2. *Lilium Cruentum bulbiferum.* The Fierie red bulbed Lilly.

The second bulbed Lilly riseth vp with his stalke as high as any of these Lillies, carrying many long and narrow darke greene leaues about it, and at the toppe many faire red flowers, as large or larger then any of the former, and of a deeper red colour, with spots on them likewise, hauing greater bulbes growing about the toppe of the stalke and among the flowers, then any else.

*Lilium Cruentum flore pleno.* The Fierie red double Lilly.

The difference of this doth chiefly consist in the flower, which is composed of manie leaues, as if many flowers went to make one, spotted with black spots, and without any bulbes when it thus beareth, which is but accidentall, as the former double Lilly is said to be.

3. *Lilium maius bulbiferum.* The greater bulbed red Lilly.

The third red Lilly with bulbes, riseth vp almost as high as the last, and is the most common kinde we haue bearing bulbes. It hath many leaues about the stalke, but not of so sad a greene colour as the former: the flowers are of as pale a reddish yellow colour as any of the former, and comming neerest vnto the colour of the Gold red Lilly. This is more plentifull in bulbes, and in shooting strings, to encrease rootes vnder ground, then the others.

*The Place.*

These Lillies doe all grew in Gardens, but their naturall places of growing is the Mountaines and the Vallies neere them in Italy, as Matthiolus saith:

faith: and in many Countries of Germany, as Hungarie, Austria, Stiria, and Bohemia, as Clufius and other doe report.

*The Time.*

They flower for the most part in June, yet the first of these is the earliest of all the rest.

*The Names.*

All these Lillies are called *Lilia Rubra*, Red Lillies: Some call them *Lilium Aureum*, *Lilium Purpureum*, *Lilium Punicum*, & *Lilium Cruentum*. Some also call them *Martagon Chimistarium*. Clusius calleth these bulbed Lillies *Martagon bulbiferum*. It is thought to be *Hyacinthus Poetarum*, but I referre the discouering thereof to a fitter time. Wee haue, to distinguish them most fitly (as I take it) giuen their proper names in their severall titles.

*CHAP. VI.*

*Lilium Album.* The White Lilly.

**N**ow remaineth onely the White Lilly, of all the whole family or stocke of the Lillies, to bee spoken of, which is of two sorts. The one is our common or vulgar White Lilly; and the other, that which was brought from Constantinople.

*Lilium Album vulgare.* The ordinary White Lilly.

The ordinary White Lilly scarce needeth any description, it is so well knowne, and so frequent in every Garden; but to say somewhat thereof, as I vse to doe of every thing, be it never so common and knowne; it hath a cloused or scaly roote, yellower and bigger then any of the red Lillies: the stalke is of a blackish greene colour, and riseth as high as most of the Lillies, hauing many faire, broad, and long greene leaues thereon, larger and longer beneath, and smaller vpon the stalke vpwards; the flowers are many or few, according to the age of the plant, fertility of the soile, and time of standing where it groweth: and stand vpon long greene footstalkes, of a faire white colour, with a long pointell in the middle, and white chiuies tipt with yellow pendent about it; the sticke is somewhat heady and strong.

*Lilium Album Byzantinum.* The White Lilly of Constantinople.

The other White Lilly, differeth but little from the former White Lilly, either in roote, leafe, or flower, but only that this vsually groweth with more number of flowers, then euer we saw in our ordinary White Lilly: for I haue seen the stalke of this Lilly turne flat, of the breadth of an hand, bearing neere two hundred flowers vpon a head, yet most commonly it beareth not aboue a dozen, or twenty flowers, but smal-ler then the ordinary, as the greene leaues are likewise.

*The Place.*

The first groweth onely in Gardens, and hath not beeene declared where it is found wilde, by any that I can heare of. The other hath beeene sent from Constantinople, among other rootes, and therefore is likely to grow in some parts neere thereunto.

*The Time.*

They flower in June or thereabouts, but shoothe forth greene leaues in Autumnne,

*Autumane*, which abide greene all the Winter, the stalke springing vp betwene the lower leaues in the Spring.

#### The Names.

It is called *Lilium Album*, the White Lilly, by most Writers; but by Poets *Rosa Iunonii*, Iuno's Rose. The other hath his name in his title.

#### The Vertues.

This Lilly aboue all the rest, yea, and I thinke this only, and none of the rest is vsed in medicines now adays, although in former times Empericks vsed the red; and therefore I haue spoken nothing of them in the end of their Chapters, refering what is to be said in this. This hath a mollifying, digesting, and cleansing quality, helping to suppurate tumours, and to digest them, for which purpose the roote is much vied. The water of the flowers distilled, is of excellent vertue for women in trauell of childe bearing, to procure an easie deliuerie, as Matthiolus and Camerarius report. It is vied also of diuers women outwardly, for their faces to cleanse the skin, and make it white and fresh. Diuers other properties there are in these Lillies, which my purpose is not to declare in this place. Nor is it the scope of this worke; this that hath been said is sufficient: for were it not, that I would give you some taste of the qualities of plants (as I said in my Preface) as I goe along with them, a generall worke were fitter to declare them then this.

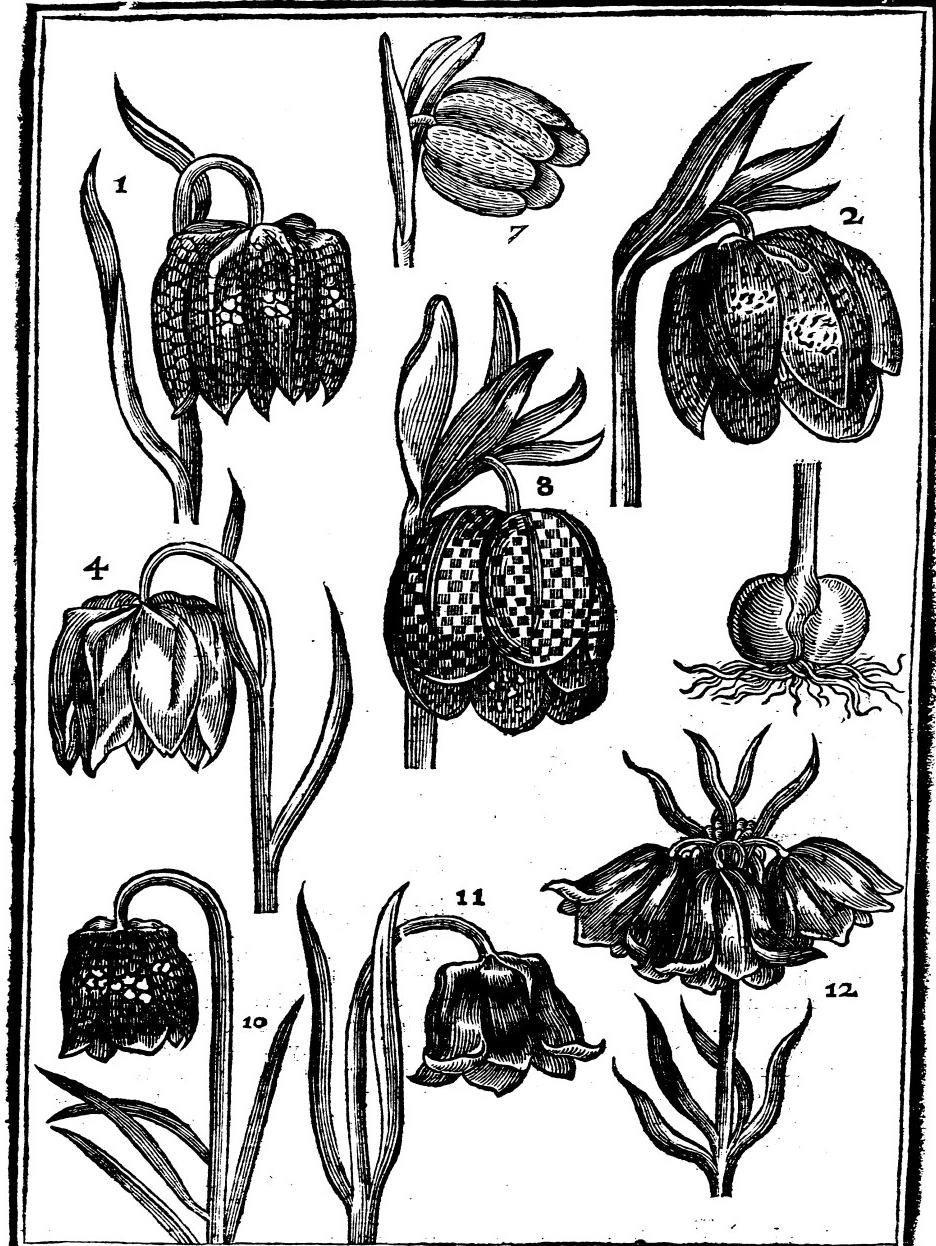

### CHAP. VII.

#### *Fritillaria*. The checkerd Daffodill.

**A**lthough diuers learned men do by the name giuen vnto this delightfull plant, thinke it doth in some things partake with a *Tulipa* or *Daffodill*, and haue therefore placed it betwene them; yet I, finding it most like vnto a little Lilly, both in roote, stalke, leafe, flower, and seede, haue (as you see here) placed it next vnto the Lillies, and before them. Hereof there are many sorts found out of late, as white, red, blacke, and yellow, besides the purple, which was first knowne; and of each of them there are also diuers sorts: and first of that which is most frequent, and then of the rest, every one in his place and order.

#### *Fritillaria vulgaris*. The common checkerd Daffodill.

The ordinary checkerd Daffodill (as it is vsually called, but might more properly be called the small checkerd Lilly) hath a small round white roote, and somewhat flat, made as it were of two clouses, and diuided in a maner into two parts, yet ioyning together at the bottome or seate of the roote, which holdeth them both together: from betwene this cleft or diuisiōn, the budde for the stalke &c. appeareth, which in time riseth vp a foote, or a foote and a halfe high, being round and of a brownish greene colour, especially neere vnto the ground, whereon there standeth dispersedly fourre or five narrow long and greene leaues, being a little hollow: at the toppe of the stalke, betwene the vpper leaues (which are smaller then the lowest) the flower sheweth it selfe, hanging or turning downe the head, but not turning vp againe any of his leaues, as some of the Lillies before described doe; (sometimes this stalke beareth two flowers, and very seldom three) consisting of sixe leaues, of a reddish purple colour, spotted diuersly with great spots, appearing like vnto square checkers, of a deeper colour; the inside of the flower is of a brighter colour then the outside, which hath some greenesse at the bottome of euery leafe: within the flower there appeare sixe

1. *Fritillaria vulgaris*. The common Fritillaria. 2. *Fritillaria flava atrorubens*. The dark red Fritillaria. 4. *Fritillaria alba*. The white Fritillaria. 7. *Fritillaria lutea punctata*. The yellow checkered Fritillaria. 8. *Fritillaria lutea Italica*. The great yellow Italian Fritillaria. 10. *Fritillaria lutea Lusitanica*. The small yellow Fritillaria of Portugal. 11. *Fritillaria Pyrenaica*. The black Fritillaria. 12. *Fritillaria umbellifera*. The Spanish blacke Fritillaria.

fixe chives tipt with yellow pendent, and a three-forked stile or pointell compassing a greene head, which when the flower is past, riseth vpright againe, and becommeth the seede vessell, being somewhat long and round, yet hauing a small shew of edges, flat at the head, like the head of a Lilly, and without any crowne as the Tulipa hath, wherein is contained pale coloured flat seede, like vnto a Lilly, but smaller.

*Fritillaria vulgaris pallidior, precox, &c. rosina.*

There is some variety to be seene in this flower, for in some the colour is paler, and in others againe of a very high or deepe colour: sometimes also they haue eight leaues, and sometimes ten or twelue, as if two flowers were made one, which some thereupon haue called a Double Fritillaria. Some of them likewise doe flower very early, even with or before the early flowring Tulipas; and some againe flower not vntill a moneth or more after the former.

2. *Fritillaria flore atrorubente.* The bloud red Fritillaria.

The roote of this Fritillaria is somewhat rounder and closer then the former, from whence the stalke riseth vp, being shorter and lower then in any other of these kindes, hauing one or two leaues thereon, and at the top thereof two or three more set closer together, which are broader, shorter, and whiter then any of them before, almost like vnto the leaues of the yellow Fritillaria, from among which toppe leaues commeth forth the flower, somewhat bending downe, or rather standing forth, being larger then any of the former, and almost equall in bignesse vnto the yellow Fritillaria, of a duskie gray colour all ouer on the outside, and of a very darke red colour on the inside, diversly spotted or straked: this very hardly increaseth by the roote, and as seldome giveth ripe seede, but flowreth with the other first sorts, and before the blacke, and abideth lesse time in flower then any.

3. *Fritillaria maxima purpurea sinuosa.* The great purple or red Fritillaria.

This great Fritillaria hath his roote equall to the bignesse of the rest of his parts, from whence riseth vp one, & oftentimes two stalks, hauing one, two or three flowers a peece on them, as nature and the seasons are fitting: every one of these flowers are larger and greater then any of the former described, and pendulous as they are, of a fad red or purplish colour, with many thwart lines on them, and small long markes, which hardly seeme checkerwise, nor are so eminent or conspicuous as in the former: the stalke is strong and high, whereon are set diuers long whitish greene leaues, larger and broader then those of the former.

4. *Fritillaria alba.* The white Fritillaria.

The white Fritillaria is so like vnto the first, that I shall not neede to make another description of this: it shall (I hope) be sufficient to shew the chiefe differences, and so proceed to the rest. The stalke and leaues of this are wholly greene, whereby it may easily be knowne from the former, which, as is laid, is brownish at the bottome. The flower is white, without almost any shew of spot or marke in it, yet in some the markes are somewhat more plainly to be seene, and in some againe there is a shew of a faint kinde of blushe colour to be seene in the flower, especially in the inside, the bottomes of the leaues of every flower sometimes are greenish, hauing also a small list of greene, comming downe towards the middle of each leafe: the head or seede vessell, as also the seede and the roote, are so like vnto the former, that the most curning cannot distinguish them.

5. *Fritillaria flore duplo albicante.* The double blush Fritillaria.

This Fritillaria hath a round flattish white roote, very like vnto the last Fritillaria, bearing a stalke with long greene leaues thereon, little differing from it, or the first ordinary Fritillaria: the flower is said to be constant, composed of many leaues, being ten at the least, and most vsually twelue, of a pale whitish purple colour, spotted like vnto the paler ordinary Fritillaria that is early, so that one would verily thinke it were

but

but an accidental kinde therof, whereas it is (as is said before) held to bee constant, continuing in this manner.

6. *Fritillaria flore luteo puro.* The pure yellow Fritillaria.

The pure yellow Fritillaria hath a more round, and not so flat a whitish roote as the former kindes, and of a meane bignesse; from the middle riseth vp a stalke a foote and a halfe high, and sometimes higher, whereon are set without order diuers long and somewhat broad leaues of a whitish greene colour, like vnto the leaues of the blacke Fritillaria, but not aboue halfe so broad: the flower is somewhat small and long, not much vnlke to the blacke for shape and fashion, but that the leaues are smaller and rounder pointed, of a faint yellowish colour, without any shew of spots or checkers at all, eyther within or without the flower, hauing some chives and yellow pendent in the middle, as is to be seene in all of them: the seede is like the first kinde.

7. *Fritillaria flore luteo vario sine punctato.* The checkerd yellow Fritillaria.

This Fritillaria groweth not much lower then the former, and brownish at the rising vp, hauing his leaues whiter, broader, and shorter then it, and almost round pointed. The flower is greater, and larger spread then any other before, of a faire pale yellow colour, spotted in very good order, with fine small checkers, which adde a wonderfull pleasing beauty thereunto: it hath also some lists of greene running downe the backe of euery leafe. It seldome giueth seede; the roote also is like the other, but not so flat.

8. *Fritillaria lutea maxima Italica.* The great yellow Italian Fritillaria.

This kinde of Fritillaria riseth vp with a round and brownie greene stalke, whereon are set diuers leaues somewhat broad and short, which compasse the stalke at the bottome of them, of a darke greene colour; at the toppe of the stalke, which bendeth a little downwards, doe most vsually stand three or four leaues, betweene which commeth forth most vsually but one flower, which is longer then the last, hanging downe the head as all the others doe, consisting of sixe leaues, of a darke yellowish purple colour, spotted with some small red checkers. This kinde flowreth late, and not vntill all the rest are past.

9. *Fritillaria Italorum polyanthos flore paruo.* The small Italian Fritillaria.

This small Italian Fritillaria carrieth more store of flowers on the stalke, but they are much smaller, and of a yellowish greene colour, spotted with long and small darke red checkers or markes: the stalke hath diuers smal short greene leaues thereon, vnto the very toppe.

10. *Fritillaria lutea Iuncifolia Lusitanica.* The small yellow Fritillaria of Portugal.

The leaues of this Fritillaria are so small, narrow and long, that it hath caused them to take the name of rushes, as if you shold call it, The rush-leaved Fritillaria, which stand on a long weake round stalke, set without order: the flower is small and yellow, but thicker checker'd with red spots then any of the other yellow Fritillaria's, the stalk of the flower, at the head thereof, being also of a yellowish colour.

11. *Fritillaria Pyrenaica sine Apenninica.* The blacke Fritillaria.

The roote of this kinde doth often grow so great, that it seemeth like vnto the roote of a small Crowne Imperiall: the stalke is strong, round, and high, set without order, with broader and whiter greene leaues then any of the former, bearing one, two, or three flowers; sometimes at the toppe, being not so large as those of the ordinary purple Fritillaria, but smaller, longer, and rounder, sometimes a little turning vp the brims or edges of the leaues againe, and are of a yellowish shining greene colour on the

the inside, sometimes spotted with red spots almost through the whole inside of the flower, vnto the very edge, which abideth of a pale yellow colour, and sometimes there are very few spots to be seene, and those from the middle onely on the inside (for on the outside there never appeareth any spots at all in this kinde) and sometimes with no shew of spots at all, sometimes also of a more pale greene, and sometime of a more yellow colour: the outside of the flowers doe likewise vary, for in some the outside of the leaues are of a darke sullen yellow, &c. else more pale yellow, and in other of a darke purplish yellow colour, which in some is so deepe, and so much, that it rather seemeth blacke then purple or yellow, and this especially about the bottome of the flower, next vnto the stalke, but the edges are still of a yellowish greene: the head of seede, and the seede likewise is like vnto the former, but bigger in all respects.

**12. *Fritillaria Hispanica umbellifera.* The Spanish blacke Fritillaria.**

This Fritillaria is no doubt of kinred to the last recited, it is so like, but greater in all parts thereof, as if growing in a more fruitfull soile, it were the stronger and lustier to beare more store of flowers: the flowers grow foure or fve from the head together, hanging downe round about the stalke, like vnto a Crowne Imperiall, and are of a yellowish greene colour on the inside, spotted with a few red spots, the outside being blackish as the former.

**The Place.**

The first of these plants was first brought to our knowledge from France, where it groweth plentifully about Orléance; the other sorts grow in divers other Countries, as some in Portugall, Spaine, Italy, &c. as their names doe import, and as in time they have been obserued by those that were curios searchers of these rarities, haue been sent to vs.

**The Time.**

The early kindes doe flower in the beginning of Aprill or thereabouts, according to the mildenesse or sharpnesse of the precedent Winter. The other doe flower after the first are past, for a moneths space one after another, and the great yellow is very late, not flowing vntill about the middle or end of May.

**The Names.**

This hath receiued diuers names: some calling it *Flos Meleagridis*, the Ginnie Hen Flower, of the variety of the colours in the flower, agreeing with the feathers of that Bird. Some call it *Narcissus Capuronius*, of the name of the first inuentor or finder thereof, called Noel Caperon, an Apothecary dwelling in Orléance, at the time he first found it, and was shortly after the finding thereof taken away in the Massacre in France. It is now generally called *Fritillaria*, of the word *Fritillus*, which diuers doe take for the Cheffe borde or table whereon they play, whereunto, by reason of the resemblance of the great squares or spots so like it, they did presently referre it. It is called by Lobel *Lilium narcissus purpureus variegatus, & tessellatus*, making it a kinde of *Tulipa*; but as I said in the beginniug of the Chapter, it doth most nearely resemble a small pendulous Lilly, and might therefore rightly hold the name of *Lilium variegatum*, or in English, the checkerd Lilly. But because the error which first referred it to a Daffodill, is growne strong by custome of continuance, I leauet to every one their owne will, to call it in English eyther *Fritillaria*, as it is called of most, or the checkerd Daffodill, or the Ginnie Hen flower, or, as I doe, the checkerd Lilly. I shall not neede in this place further to explaine the severall names of every of them, hauing given you them in their titles.

The

**The Vertues.**

I haue not found or heard by any others of any property peculiar in this plant, to be applied either inwardly or outwardly for any disease: the chiefe or onely vse thereof is, to be an ornament for the Gardens of the curios louers of these delights, and to be worne of them abroad, which for the gallant beauty of many of them, deserueth their courteous entertainment, among many other the like pleasures.

**C H A P. VIII.**

***Talipa.* The Turkes Cap.**

**N**ext vnto the Lillies, and before the Narcissi or Daffodils, the discourse of *Talipas* deserueth his place, for that it partaketh of both their natures; agreeing with the Lillies in leaues, flowers, and seede, and somewhat with the Daffodils in rootes. There are not onely diuers kindes of *Tulipas*, but sundry diuerſitieſ of colours in them, found out in these later dayes by many the searchers of natures varieties, which haue not formerly been obſerued: our age being more delighted in the ſearch, curioſity, and rareties of these pleaſant delights, then any age I thinke before. But indeede, this flower, aboue many other, deterueth his true commendations and acceptance with all louers of these beauties, both for the ſtately aspe&t, and for the admirale varietie of colours, that daily doe arise in them, farre beyond all other plants that grow, in ſo much, that I doubt, although I ſhall in this Chapter ſet downe the varieties of a great many, I ſhall leauē more vnspronken of, then I ſhall deſcribe, for I may well ſay, there is in this one plant no end of diuerſity to be expected, every yeare yielding a mixture and variety that hath not before been obſerued, and all this arising from the ſowing of the seede. The chiefe diuision of *Tulipas*, is into two ſorts: *Præcoceſ*, early flowring *Tulipas*, and *Serotine*, late flowring *Tulipas*. For that ſort which is called *Media* or *Dabie*, that is, which flower in the middle time betweene them both, and may be thought to be a kinde or ſort by it ſelfe, as well as any of the other two: yet because they doe neerer participate with the *Serotine* then with the *Præcoceſ*, not onely in the colour of the leafe, being of the ſame greynesse with the *Serotine*, and moſt vſually alſo, for that it beareth his stalke and flower, high and large like as the *Serotine* doe; but eſpecially, for that the ſeede of a *Media Tulipa* did neuer bring forth a *Præcoceſ* flower (although I know Cluſius, an induſtrious, learned, and painfull ſearcher and publisher of theſe rareties, faſhion otherwise) ſo farre as euer I could, by mine owne care or knowledge, in ſowing their ſeede apart, or the auſſurance of any oþers, the louers and fowers of *Tulipa* ſeede, obſerue, learne, or know: and because alſo that the ſeede of the *Serotine* bringeth forth *Medias*, and the ſeede of *Medias Serotine*, they may well bee comprehended vnder the generall title of *Serotine*: But becauſe they haue generally received the name of *Media*, or middle flowring *Tulipas*, to diſtinguiſh betweene them, and thoſe that vſually doe flower after them; I am content to ſet them downe, and ſpeak of them ſeuerally, as of three ſorts. Vnto the place and ranke likewiſe of the *Præcoceſ*, or early flowring *Tulipas*, there are ſome other ſeverall kinds of *Tulipas* to be added, which are notably diſſering, not onely from the former *Præcoceſ Talipa*, but every one of them, one from another, in ſome ſpeciall note or other: as the *Tulipa Boloniensis flore rubro*, the red *Bolonia Tulipa*. *Tulipa Boloniensis flore luceo*, the yellow *Bolonia Tulipa*. *Tulipa Perſica*, the *Perſian Tulipa*. *Tulipa Creſica*, the *Candie Tulipa*, and others: all which ſhall bee deſcribed and entreated of, evey one apart by it ſelfe, in the end of the ranke of the *Præcoceſ*, because all of them flower much about their time. To begin then with the *Præcoceſ*, or early flowring *Tulipas*, and after them with the *Medias* and *Serotines*. I ſhall for the better method, diuide their flowers into four primary or principall colours, that is to ſay, White, Purple, Red, and Yellow, and vnder every one of theſe colours, ſet downe the ſeverall varie‐ties

ties of mixtures we haue seene and obserued in them, that so they may be both the better described by me, and the better conceiuied by others, and euery one placed in their proper ranke. Yet I shall in this, as I intend to doe in diuers other plants that are variable, giue but one description in generall of the plant, and then let downe the varietie of forme or colour afterwards briefly by themselues.

*Tulipa praecox.* The early flowing Tulipa.

The early Tulipa (and so all other Tulipas) springeth out of the ground with his leaues folded one within another, the first or lowest leafe riseth vp first, sharpe pointed, and folded round together, vntill it be an inch or two aboue the ground, which then openeth it selfe, shewing another leafe folded also in the bosome or belly of the first, which in time likewise opening it selfe, sheweth forth a third, and sometimes a fourth and a fifth: the lower leaues are larger then the upper, and are faire, thicke, broad, long, and hollow like a gutter, and sometimes crumpled on the edges, which will hold water that falleth thereon a long time, of a pale or whitish greene colour, (and the *Media* and *Serotina* more greene) coured ouer as it were with a mealiness or hoariness, with an eye or shew of rednesse towards the botome of the leaues, and the edges in this kinde being more notable white, which are two principall notes to know a *Praecox Tulipa* from a *Media* or *Serotina*: the stalke with the flower riseth vp in the middle, as it were through these leaues, which in time stand one aboue another, compassing it at certaine vncquall distances, and is often obserued to bend it selfe crookedly downe to the ground, as if it would thrust his head thereinto, but turning vp his head (which will be the flower) againe, afterwards standeth vpright, sometimes but three or four fingers or inches high, but more often halfe a foote, and a foot high, but the *Medias*, and *Serotinas* much higher, carrying (for the most part) but one flower on the toppe thereof, like vnto a Lilly for the forme, consisting of sixe leaues, greene at the first, and afterwards changing into diuers and sundry feuerall colours and varieties, the bottomes likewise of the leaues of these sometimes, but most especially of the *Media*, being as variable as the flower, which are in some yellow, or green, or blacke, in others white, blew, purple, or tawnie; and sometimes one colour circling another: Some of them haue little or no sent at all, and some haue a better then others. After it hath beene blowne open three or four dayes or more, it will in the heate of the Sunne spread it selfe open, and lay it selfe almost flat to the stalke: in the middle of the flower standeth a greene long head (which will be the seed vessell) compassed about with sixe chiuies, which doe much vary, in being sometimes of one, and sometimes of another colour, tipt with pendent diuerly varied likewise: the head in the middle of the flower growtheth after the flower is fallen, to be long, round, and edged, as it were three square, the edges meeting at the toppe, where it is smallest, and making as it were a crowne (which is not seen in the head of any Lilly) and when it is ripe, diuideth it selfe on the inside into sixe rowes, of flat, thinne, brownish, gristly seede, very like vnto the seede of the Lillies, but brighter, stiffer, and more transparent: the roote being well growne is round, and somewhat great, small and pointed at the toppe, and broader, yet roundish at the bottome, with a certaine eminence or seat on the one side, as the roote of the Colchicum hath; but not so long, or great, it hath also an hollownesse on the one side (if it haue borne a flower) where the stalke grew, (for althoug in the time of the first springing vp, vntill it shew the budde for flower, the stalke with the leaues thereon rise vp out of the middle of the roote; yet when the stalke is risen vp, and sheweth the budde for flower, it commeth to one side, making an impression therein) couered ouer with a brownish thin coate or skin, like an Onion, hauing a little woolliness at the bottome; but white within, and firme, yet composed of many coates, one folding within another, as the roote of the Daffodils be, of a reasonable good taste, neyther very sweete, nor yet vnplesant. This description may well serue for the other Tulipas, being *Medias* or *Serotinas*, concerning their springing and bearing, which haue not any other great variety therein worth the note, which is not expressed here; the chiefe difference resting in the variety of the colours of the flower, and their feuerall mixtures and markes, as I said before: sauing onely, that the flowers of some are great and large, and of others smaller, and the leaues of some long and

1. *Tulipa praecox alba sine rubra, etc., unicolorata.* The early white or red Tulipa, &c. being of one colour.  
2. *Tulipa praecox purpurea vnde albis.* The early purple Tulipa with white edges, or the Prince. 3. *Tulipa praecox variegata.* The early striped Tulipa. 4. *Tulipa praecox rubra vnde luteis.* The early red Tulipa with yellow edges, or the Duke.

and pointed, and of others broad and round, or bluntly pointed, as shall bee shewed in the end of the Chapter: I shall therefore only expresse the colours, with the mixture or composure of them, and give you withall the names of some of them, (for it is impossible I thinke to any man, to give seuerall names to all varieties) as they are called by those that chiefly delight in them with vs.

## Tulipa præcox Alba.

- 1 Nivea tota interdum purpureis staminibus, vel sâtem luteis, fundo puro band luteo.
- 2 Alba sine nivea fundo luteo.
- 3 Albida.
- 4 Alba, venis caruleis in dorso.
- 5 Alba purpureis oris. Harum flores vel
- 6 Albacarniæ oris. Constantes, vel
- 7 Alba sanguinæ oris. Dispergentes.
- 8 Alba oris magni carniæ, & venis intro recessientibus.
- 9 Alba extra, carniæ vero coloris intus, oras habens carneus saturatores.
- 10 Albida, oris rubris, vel oris purpureis.
- 11 Albida purpurascéntibus maculis extra, intus vero carniæ viuacissimi.
- 12 Alba, purpureis maculis aspersa extra, intus vero alba purpurantibus oris.
- 13 Dux Alba, i. e. coccineis & albis variat flammis, à medio ad oras intercursantibus.
- 14 Princesse, i. e. argentei coloris maculis purpurascéntibus.
- 15 Regina pulcherrima, albis & sanguineis aspersa radis & pustulis.

## Tulipa præcox purpurea.

- 1 Purpurea saturata rubescens, vel violacea.
- 2 Purpurea pallida, Columbina dicta.
- 3 Persici coloris saturata.
- 4 Persici coloris pallidioris.
- 5 Paeonia floris copris.
- 6 Rosea.
- 7 Chermesina permanens.
- 8 Chermesina parviflora.

## The early White Tulipa.

- 1 The flower whereof is either pure snow white, with purple sometimes, or at least with yellow chivies, without any yellow bottome.
- 2 Or pure white with a yellow bottome.
- 3 Or milk white that is not so pure white.
- 4 White with blew veines on the outside.
- 5 White with purple edges. Some of these a
- 6 White with blush edges. Siding constant,
- 7 White with red edges. & others spread
- 8 White with great bluish edges, and some strakes running from the edge inward.
- 9 White without, and somewhat bluish within, with edges of a deeper bluish.
- 10 Whitish, or pale white with red or purple edges.
- 11 Whitish without, with some purplish veins & spots, & of a lively bluish within.
- 12 White without, spotted with small purple spots, and white within with purple edges.
- 13 A white Duke, that is, parted with white & crimson flames, from the middle of each leafe to the edge.
- 14 The Princesse, that is, a siluer colour spotted with fine deepe bluish spots.
- 15 The Queen, that is, a fine white sprinkled with blood red spots, and greater strakes.

## The early purple Tulipa.

- 1 A deep reddish purple, or more violet.
- 2 A pale purple, called a Doue colour.
- 3 A deep Peach colour.
- 4 A pater Peach colour.
- 5 A Peony flower colour.
- 6 A Rose colour.
- 7 A Crimson very bright.
- 8 A Crimson stript with a little white.

Princesse

- 9 Princeps, i. e. purpurea saturatior vel dilatior, oris albis magnis vel paruis, fundo luteo, vel albo orbe, que multum variatur, & colore, & oris, ita ut purpurea elegans oris magnis albis, dacta est, Princeps excellens, &
- 10 Princeps Columbina, purpurea dilutior.
- 11 Purpurea Chermesina, rubicandioris coloris, albidis vel albis oris.
- 12 Purpurea, vel obsoleta albidis oris Princeps Brancion.
- 13 Purpurea diluta, oris dilutionis purpurei coloris.
- 14 Purpurea in exterioribus, carniæ vero ad medium intus, oris albis, fundo luteo.
- 15 Purpurea albo plumata extra, oris albis, purpurascens intus, fundo luteo, vel orbe albo.
- 16 Alia, minus elegans plumata, minoribus, oris albidis.

## Tulipa præcox rubra.

- 1 Rubra vulgaris fundo luteo, & aliquando nigro.
- 2 Rubra saturata oris luteis paruis, dicta Roan.
- 3 Baro, i. e. rubra magis intensa, oris luteis paruis.
- 4 Dux maior, & minor, i. e. rubra magis aut minus elegans saturata, oris luteis maximis, vel minoribus, & fundo luteo magno. Aliæ alijs est magis amara, in alijs etiam fundo nigro vel obscuro viridi.
- 5 Duci simili, at plus lutei quam rubri, oris magnis luteis, & rubore magis aut minus intus in gyrum acto, fundo item luteo magno.
- 6 Testamentum Brancion, i. e. rubra sanguinea saturata, aut minus rubra, oris pallidis, magnis vel paruis: alia alijs magis aut minus elegans alius modo.
- 7 A Dutchesse, that is like unto the Duke, but more yellow then red, with greater yellow edges, and the red more or lesse circling the middle of the flower on the inside, with a large yellow bottome.
- 8 A Testament Brancion, or a Brancion Duke,

- 7 *Flambans, ex rubore & flavedine radiata, vel striata fundo luteo.*  
 8 *Mali Aurantij coloris, ex rubore, & flavedine integrè, non separatis mixta, oris luteis parvis, vel absq[ue] oris.*  
 9 *Minij, sive Canabaris coloris, i.e. ex purpurea, rubedine, & flavedine radiata, vnguibus lateis, & aliquando oris.*  
 10 *Rex Tuliparum, i.e. ex sanguineo & aureo radiatum mixte, aflammata diuersa, fundo luteo, orbe rubro.*  
 11 *Tunica Morionis, i.e. ex rubore & aureo separatis divisa.*

- Duke, that is, a faire deepe red, or leſſe red, with a pale yellow or butter coloured edge, ſome larger others (smaller: and ſome more pleaſing then others, in a very variable manner.)  
 7 A Flambant, differing from the Dutcheſſe, for this hath no ſuch great yellow edge, but ſtreaks of yellow through the leafe vnto the very edge.  
 8 An Orenge colour, that is, a reddish yellow, or a red and yellow equally mixed, with ſmall yellow edges, and ſometimes without.  
 9 A Vermillion, that is, a purplish red, ſreamed with yellow, the bottome yellow, and ſometimes the edges.  
 10 The Kings flower, that is, a crimson or bloud red, ſreamed with a gold yellow, differing from the Flambant, the bottome yellow, circled with red.  
 11 A Fooles coate, parted with red and yellow guardes.

*Tulipa precox lutea.*

- 1 *Lutea ſive flava.*  
 2 *Pallida lutea ſive straminea.*  
 3 *Aurea, oris rubicundis.*  
 4 *Straminea, oris rubri.*  
 5 *Aurea, rubore perſusa extra.*  
 6 *Aurea, vel magis pallida, rubore in gyram atla ſimillima Duciſſe, niſi minus rubedinis habet.*  
 7 *Aurea, extremitatibus rubris, dicti potest, Morionis Pilosa precox.*

*The early yellow Tulipa.*

- 1 A faire gold yellow without mixture.  
 2 A strawe colour.  
 3 A faire yellow with reddish edges.  
 4 A strawe colour, with red edges.  
 5 A faire yellow, reddish on the out ſide only.  
 6 A gold or paler yellow, circled on the inſide a little with red, very like the Dutcheſſe, but that it hath leſſe red therein.  
 7 A gold yellow with red topes, and may be called, The early Fooles Cap.

*Tulipa**Tulipa de Caffe. The Tulipa of Caffe.*

There is another ſort or kinde of early Tulipa, differing from the former, whose pale greene leaues being as broad and large as they, and ſometimes crumpled or waued at the edges, in ſome haue the edges onely of the ſaid leaues for a good breadth, of a whitish or whitish yellow colour, and in others, the leaues are lifted or parted with whitish yellow and greene: the ſtalke riſeth not vp ſo high as the former, and beareth a flower at the toppe like vnto the former, in ſome of a reddish yellow colour, with a ruflet coloured ground or bottome, and in others, of other ſeverall colours: the ſeede and roote is ſo like vnto others of this kinde, that they cannot be diſtinguished.

There is (as I doe heare) of this kinde, both *Preceſſe*, and *Serotine*, early flowring, and late flowring, whereof although wee haue not ſo exact knowledge, as of the reſt, yet I thought good to ſpeak ſo much, as I could hitherto vnderſtand of them, and giue others leaue (if I doe not) hereafter to amplifie it.

*Tulipa Boloniensis, ſive Bombicina fl̄e rubro major.*  
*The greater red Bolonia Tulipa.*

There are likewiſe other kindes of early Tulipas to bee ſpoken of, and firſt of the red Bolonia Tulipa; the roote whereof is plainly diſcerned, to be diſtinguished from all others: for that it is longer, and not hauing ſo plaine an eminence at the bottome thereof, as the former and later Tulipas, but more especially because the toppe is plentily ſtored with a yellowiſh ſilk-like woolliness: the outside likewiſe or ſkinne is of a brighter or palet red, not ſo eaſie to be pilled away, and runneth vnder ground both downeright and ſidewiſe (especially in the Country ground and ayre, where it will encrease abundantly, but not either in our London ayre, or forc't grounds) ſomewhat like vnto the yellow Bolonia Tulipa next following. It ſhooteth out of the ground with broad and long leaues, like the former; but neither ſo broad, nor of ſo white or mealy a greene colour as the former, but more darke then the late flowring Tulipa, ſo that this may bee eaſily diſcerned by his leafe from any other Tulipa aboue the ground, by one that is ſkilfull. It beareth likewiſe three or four leaues vpon the ſtalke, like the former, and a flower alio at the toppe of the ſame faſhion, but that the leaues hereof are alwayes long, and ſomewhat narrow, hauing a large blacke bottome, made like vnto a cheuerne, the point whereof riſeth vp vnto the middle of the leafe, higher then any other Tulipa; the flower is of a pale red colour, nothing ſo liuey as in the early or late red Tulipas, yet ſweeter for the moft part then any of them, and neerest vnto the yellow Bolonia Tulipa, which is muſt about the fame ſent.

*Tulipa pumilio rubra, ſive Bergomensis rubra media & minor.*  
*The dwarfed red Bergomo Tulipa, a bigger and a leſſer.*

There are two other ſorts hereof, and because they were found about Bergomio, do carry that name, the one bigger or leſſer then another, yet neither ſo great as the former, hauing very little other diſference to bee obſerued in them, then that they are ſmaller in all parts of them.

*Tulipa Boloniensis flore lateo. The yellow Bolonia Tulipa.*

The roote of this Tulipa may likewiſe bee knowne from the former red (or any other Tulipa) in that it ſeldome commeth to bee ſo bigge, and is not ſo woolly at the toppe, and the ſkinne or outside is ſomewhat paler, harder, and sharper pointed: but the bottome is like the former red, and not ſo eminent as the early or late Tulipas. This beareth much longer and narrower leaues then any (except the Persian & dwarfe yellow Tulipas) and of a whitish greene colour: it beareth ſometimes but one flower on a ſtalke, and ſometimes two or three wholly yellow, but ſmaller, & more open then the other kinds, and (as I ſaid) ſmelleth ſweete; the head for ſeede is muſt then in others, and hath not that crowne at the head thereof, yet the ſeede is like, but ſmaller.

## The Garden of pleasant Flowers.

*Tulipa Narbonensis, sive Monspeliensis vel pumilio.*  
The French or dwarfe yellow Tulipa.

This Tulipa is very like vnto the yellow Bolonia Tulipa, both in roote, leafe, and flower, as also in the colour thereof, being yellow: the onely difference is, that it is in all things lesser and lower, and is not so apt to beare, nor so plentifull to encrease by the roote.

*Tulipa Italica maior & minor.* The Italian Tulipa the greater and the lesser.

Both these kindes of Tulipas doe so neere resemble the last kinde, that I might almost say they were the same, but that some difference which I saw in them, maketh mee set them apart; and consisteth in these things, the stalkes of neither of both these rise so high, as of the first yellow Bolonia Tulipa: the leaues of both sorts are writhed in and out at the edges, or made like a wawe of the sea, lying neerer the ground, and the flower being yellow within, is brownish or reddish on the backe, in the middle of the three outer leaues the edges appearing yellow. Both these kindes doe differ one from the other in nothing, but in that one is bigger, and the other smaller then the other which I saw with Iohn Tradescante, my very good friend often remembred.

*Tulipa Lysitanica, sive pumilio var sceler.* Thedwarfestriped Tulipa.

This dwarfe Tulipa is also of the same kindred with the three last described; for there is no other difference in this from them, then that the flower hath some red veins running in the leaues thereof.

There are two other sorts of dwarfe Tulipas with white flowers, whereof Lobel hath made mention in the Appendix to his *Adversaria*; the one whereof is the same that Clusius setteth forth, vnder the title of *Pumilio altera*: but because I haue not seen either of them both, I speake no further of them.

*Tulipa pumilio alba.* The white dwarfe Tulipa.

But that white flower that Iohn Tradescante shewed me, and as hee saith, was deliuered him for a white Pumilio, had a stalke longer then they set out theirs to haue, and the flower also larger, but yet had narrower leaues then other sorts of white Tulipas haue.

*Tulipa Bicolor.* The small party coloured Tulipa.

Vnto these kindes, I may well addde this kinde of Tulipa also, which was sent out of Italy, whose leaues are small, long, and narrow, and of a darke greene colour, somewhat like vnto the leaues of an Hyacinth: the flower is small also, consisting of sixe leaues, as all other Tulipas doe, three whereof are wholly of a red colour, and the other three wholly of a yellow.

*Tulipa Persica.* The Persian Tulipa.

This rare Tulipa, wherewith we haue beene but lately acquainted, doth most fitly deserve to be described in this place, because it doth so nearely participate with the Bolonia and Italian Tulipas, in roote, leafe, and flower: the roote hereof is small, couered with a thicke hard blackish shell or skinne, with a yellowish woolliness both at the toppe, and vnder the shell. It rifieth out of the ground at the first, with one very long and small round leafe, which when it is three or four inches high, doth open it selfe, and shew forth another small leafe (as long almost as the former) breaking out of the one side thereat, and after it a third, and sometimes a fourth, and a fift; but each shorter then other, which afterwards be of the breadth of the dwarfe yellow Tulipa, or somewhat broader, but much longer then any other, and abiding more hollow, and of the colour of the early Tulipas on the inside: the stalke riseth vp a foot and a halfe high

1. *Tulipa Bombicina floriferab.* The red Bolonia Tulipa. 2. *Tulipa Boloniensis flore luteo.* The yellow Bolonia Tulipa. 3. *Tulipa pumilio rubra flaviore.* The red or yellow dwarfe Tulipa. 4. *Folium Tulipa de Caffa per rotum frication.* The leaf of the Tulipa of Caffa fringed throughout the whole leafe. 5. *Folium Tulipa de Caffa per oras frication.* The leaf of the Tulipa of Caffa striped at the edges only. 6. *Tulipa Persica.* The Persian Tulipa. 7. *Tulipa Cratica.* The Tulipa of Candie. 8. *Tulipa armeniaca.* The Tulipa of Armenia.

high sometimes, bearing one flower thereon, composed of sixe long and pointed leaues of the forme of other small Tulipas, and not shewing much bigger then the yellow Italian Tulipa, and is wholly white, both inside and outside of all the leaues, except the three outermost, which haue on the backe of them, from the middle toward the edges, a shew of a brownish blush, or pale red colour, yet deeper in the midift, and the edges remaining wholly white: the bottomes of all these leaues are of a darke or dun tawnie colour, and the chiuies and tippes of a darkish purple or tawnie also. This doth beare seed but seldome in our Country, that euer I could vnderstand, but when it doth, it is small like vnto the Bolonia or dwarfe yellow Tulipas, being not so plentifull also in parting, or setting of by the roote as they, and neuer groweth nor abideth so great as it is brought vnto vs, and seldome likewise flowreth after the first yeare: for the rootes for the most part with euery one grow lesse and lesse, decaying every yeare, and so perishe for the most part by reason of the frosts and cold, and yet they haue been set deepe to defend them, alough of their owne nature they will runne downe deep into the ground.

*Tulipa Bjzantina duobus floribus Clusij.* The small Tulipa of Constantinople.

The small Tulipa of Constantinople, beareth for the most part but two leaues on the stalke, which are faire and broad, almost like vnto the Candy Tulipa, next hereunto to be described: the stalke it selfe riseth not aboue a foote high, bearing sometimes but one flower, but most commonly two thereon, one below another, and are no bigger then the flowers of the yellow Bolonia Tulipa, but differing in colour; for this is on the outside of a purplish colour, mixed with white and greene, and on the inside of a faire blush colour, the bottome and chiuies being yellow, and the tippes or pendents blackish: the roote is very like the yellow Bolonia Tulipa.

*Tulipa Cretica.* The Tulipa of Candie.

This Tulipa is of later knowledge with vs then the Persian, but doth more hardly thriue, in regard of our cold climate; the description whereof, for so much as wee haue knowledge, by the sight of the roote and leafe, and relation from others of the flower, (for I haue not yet heard that it hath very often flowred in our Country) is as followeth. It beareth faire broad leaues, resembling the leaues of a Lilly, of a greenish colour, and not very whitish: the stalke beareth thereon one flower, larger and more open then many other, which is eyther wholly white, or of a deepe red colour, or else is variably mixed, white with a fine reddish purple, the bottomes being yellow, with purplish chiuies tipt with blackish pendents: the roote is small, and somewhat like the dwarfe yellow Tulipa, but somewhat bigger.

*Tulipa Armeniaca.* The Tulipa of Armenia.

This small Tulipa is much differing from all the former (except the small or dwarfe white Tulipas remembred by Lobel and Clusius, as is before set downe) in that it beareth three or four small, long, and somewhat narrow greene leaues, altogether at one ioynt or place; the stalke being not high, and naked or without leaues from them to the toppe, where it beareth one small flower like vnto an ordinary red Tulipa, but somewhat more yellow, tending to an Orenge colour with a blacke bottome: the roote is not much bigger then the ordinary yellow Bolonia Tulipa, before set downe. And these are the sorts of this first *Clusij* of early Tulipas.

*Tulipa media.* The meane or middle flowring Tulipa.

For any other, or further description of this kinde of Tulipa, it shall not neede, haing giuen it sufficiently in the former early Tulipa, the maine difference consisting first in the time of flowring, which is about a moneth after the early Tulipas, yet some more some lesse: for euen in the *Precoce*, or early ones, some flower a little earlier, and later then others, and then in the colours of the flowers; for wee haue obserued many colours,

colours, and mixtures, or varieties of colours in the *Medias*, which we could neuer see in the *Precoce*, and so also some in the *Precoce*, which are not in the *Medias*: yet there is farre greater varieties of mixture of colours in these *Medias*, then hath been obserued in all the *Precoce*, (although Clusius saith otherwise) eyther by my selfe, or by any other that I haue conuered with about this matter, and all this hath happened by the sowing of the seede, as I said before. I will therefore in this place not trouble you with any further circumstance, then to distinguishe them, as I haue done in the former early Tulipas, into their foure primary colours, and vnder them, give you their seuerall varieties and names, for so much as hath come to my knowledge; not doubting, but that many that haue trauelled in the sowing of the seed of Tulipas many yeares, may obserue each of them to haue some variety that others haue not: and therefore I thinke no one man can come to the knowledge of all particular distinctions.

*Tulipa media alba.*

- 1 *Nivosa*, fundo albo vel luteo.
- 2 *Argentea*, quasi alba cineracea fundo luteo scente, purpureis flaminibus.
- 3 *Margaritina alba*, carneo dilutissima.
- 4 *Alba*, fundo ceruleo vel nigro.
- 5 *Abida*.
- 6 *Alb*, oris rubris. Hactria generis
- 7 *Alba*, purpureis oris. Saliquibus in constanti
- 8 *Alba*, oris coccineis. Seruentem oras, in dupergunt.
- 9 *Albida primum*, deinde albida, oris purpureis, & venis intrò respiciensibus, dicta nobis Hackneyan.
- 10 *Alba*, sanguineo colore variata, fundo vel albissimo, vel alio.
- 11 *Alba*, radiatim disposita flammis, & malis coccinatis.
- 12 *Alba*, purpurea rubidine plumata, diversarum specierum, que cum superiore, vel albo, vel luteo, vel parvo ceruleo constant fundo, que constanter tenuent punctatos colores, & non dispergunt, sed post trium aut quatuor dierum spatium pulchrioris apparent.
- 13 *Panni argentei coloris*, i.e. alba, plumata, punctata, striata, vel diversimode variata, rubidine dilutiore, vel saturatiore purpurea, interius vel exterius, vel utrinque, diversarum specierum.
- 14 *Tanica morionis* alba varia, i.e. ex albo & purpureo striata diversimode, fundo albo vel alio.
- 15 *Holias alba vel albida*, absq; fundo, vel fundo purpureo caruleo, vel caruleo albo circundato, diversè signata, vel variata intus ad medietatem foliorum, sursum in orbem ut plurimum, vel ad oras pertingens amplias & albas. *Ha species tantoperè multiplicantur*, ut vix sint explicabiles.

The white meane flowring Tulipa.

- 1 A snow white, with a white or yellow bottome.
- 2 A filer colour, that is, a very pale or whitish ashe colour, with a yellowish bottome and purple chiuies.
- 3 A Pearle colour, that is, white, with a wafh or shew of blush.
- 4 A white, with a blew or black bottome.
- 5 A Creame colour.
- 6 A white, with red edges.
- 7 A white, with purple edges. These three sorts doe all three white edges confine in some, but well spread in others.
- 8 A white, with crimson edges.
- 9 A pale or whitish yellow, which after a few dayes growtheth more white, with purplish red edges, and some streakes running inward from the edge, which we call an Hackney.
- 10 A white mixed with a bloud red very variably, and with a pure white, or other coloured bottome.
- 11 A white, streamed with crimson flames, and spots through the whole flower.
- 12 A white, speckled with a reddish purple, more or lesse, of diuers sorts, with white, yellow, or blew bottomes, all which doe hold their markes constant, and doe not spread their colours, but shew fainter after they haue stood blown three or four dayes.
- 13 A cloth of siluer of diuers sorts, that is, a white spotted, striped, or otherwise marked with red or purple, in some paler, in some deeper, either on the inside, or on the outside, or on both.
- 14 A white Fooles coate of diuers sorts, that is, purple or pale crimson, and white, as it were empaled together, eyther with a white ground or other, whereof there is great variety.
- 15 A white Holias, that is, a faire white, or paler white, eyther without a bottome, or with a blewish purple bottome, or blew and white circling the bottome, and

Tanta est buies varietas, vel multitudine,  
vel striarum penitatis & distinctione, vel  
fundis variantibus, ut ad tadium effet per-  
scribere.

and from the middle vpwards, speckled  
and straked on the infide for the most  
part, with bloud red or purplish spots  
and lines vnto the very edges, which  
abide large and white. Of this kinde  
there are found very great varieties, not  
to be expressed.

Of this sort there is so much variety, some  
being larger or fairer marked then o-  
thers, their bottomes also varying, that  
it is almost impossible to expref them.

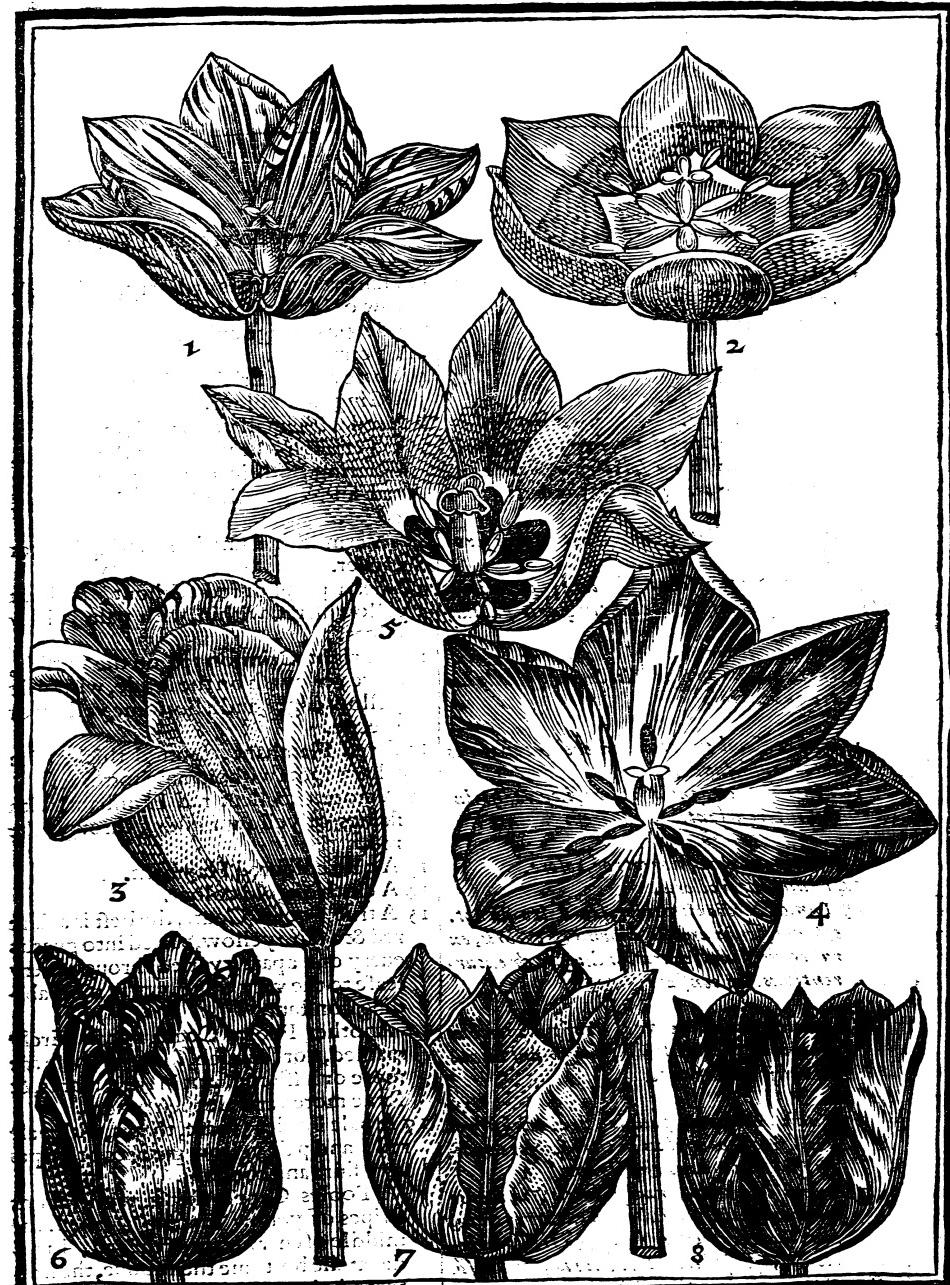

#### *Tulipa media purpurea.*

- 1 *Purpurea sativa.*
- 2 *Purpurea dilutior, diuersarum specierum,*  
*quarum Rosa una, Carnea sit altera.*
- 3 *Persicis coloris, duarum aut trium specierum.*
- 4 *Cbermefina, obscura, aut pallida.*
- 5 *Stamela, intensior aut remissior.*
- 6 *Xerampelina.*
- 7 *Purpurea, striata.*
- 8 *Persicis sativa, vel diluti coloris, undulata,*  
*vel radiata.*
- 9 *Columbina, oris & radis albū.*

#### The meane flowring purple Tulipa.

- 1 A faire deep purple.
- 2 A paler purple, of many sorts, whereof a Rose colour is one, a Blush another.
- 3 A Peach colour of two or three sorts.
- 4 A Crimson, deepe, or pale.
- 5 A Stamell, darke or light.
- 6 A Murrey.
- 7 A purple, stript and spotted.
- 8 A Peach colour, higher or paler, waued or stript.
- 9 A Doue colour, edged and straked with white.
- 10 A faire red purple, with white edges, like vnto the early Tulipa, called a Prince
- 11 A faire Crimson, or Claret wine colour, with white lines both in the middle, and towards the edges, most haue a blew bottome, yet some are white, or circled with white.
- 12 A light or deepe purple, with white edges, greater or smaller, like the early Prince, the bottomes eyther blew circled with white, or white circled with a large blew.
- 13 A purple Holias, the colour of a pale Claret wine, marked and spotted with bloud red spots, round about the middle of each leafe vpward on the infide onely, the bottome being blew.
- 14 A Crimson Fooles Coate, a darke crimson, and pale white empaled together, differing from the white Fooles Coate, the bottome blew and white.
- 15 A deeper or paler reddish purple, spotted or striped with a paler or purer white, of diuers sorts, called the Gillo-flower Tulipa.

*Tulipa*

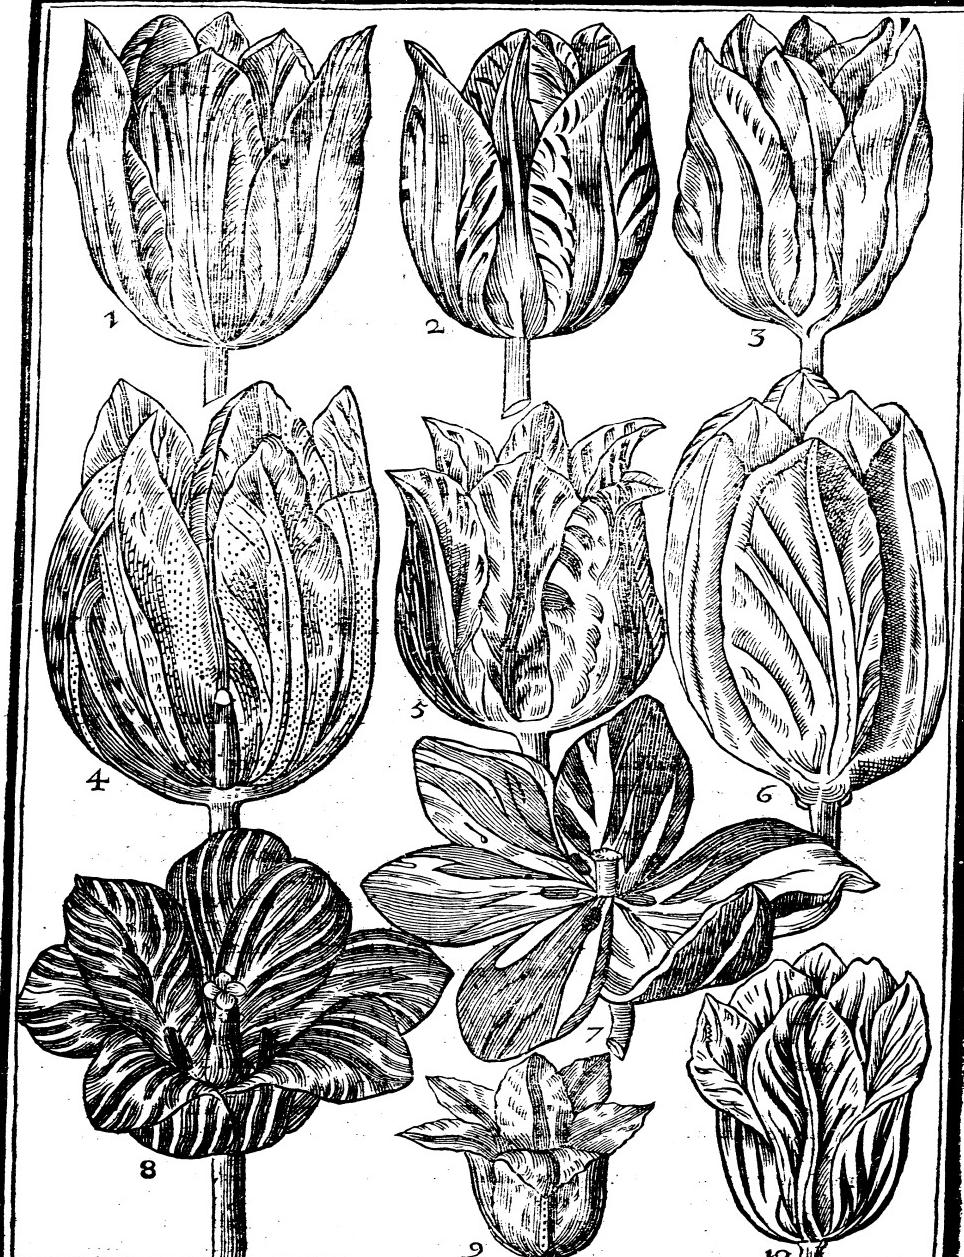

\* *Tulipa rubra & lutea varia.* The Fooles Coate red and yellow. 2 *Tulipa Helias alba absit fundo.* The white Helias without a bottome. 3 *Tulipa argentea, vel pumifera, &c.* The cloth of floures, or other spotted Tulipa. 4 *Tulipa alba flammis coccinis.* The white Fooles Coate. 5 *Tulipa Helias, &c., junda purpurea, &c.* A white Helias, &c. with a purple bottome. 6 *Tulipa rubra & lutea flammis, &c.* A red and yellow flamed Tulipa, &c. 7 *Tulipa alba striata & punctata.* A white striped and spotted Tulipa. 8 *Tulipa alba varia, &c.* Another variable Tulipa.

*Tulipa mediabra.*

- 1 *Rubra communis*, fundo latoe, vel nigro.  
 2 *Mali Anrantij coloris.*  
 3 *Cinabaris coloris.*  
 4 *Lateritij coloris.*  
 5 *Rubra, luteo aspera.*  
 6 *Rubra, oris luteis.*  
 7 *Testamentum Brancion rubra sativa, oris pallidis, diuersarum specierum, rubore variantium, & orarum amplitudine.*  
 8 *Cinabaris radiata, magis aut minus fertonis.*  
 9 *Rubra purpurascens obsoleta, exterioribus folijs, per se luteo intus, oris pallidis luteis.*  
 10 *Rubra purpurascens elegans extra, & insulatim cens, oris pallidis luteis, fundo luteo vel viridis.*  
 11 *Rubra flambans coccinea, crebris maculis luteis abs fundo.*  
 12 *Flambans elegantior rubra, i.e. radjjs intercursantibus ruborem.*  
 13 *Flambans remissior utroq; colore.*  
 14 *Penni aurei coloris.*  
 15 *Tunica Morionis verior, seu Palto da Sot. optima, tenis amplius amantis & crebris, ex rubro & flavo separatis divisis & excrucientibus, flos constans.*  
 16 *Tunica Morionis altera, tenis minoribus & minus frequentibus, magis aut minus ultro alijs inconstans.*  
 17 *Tunica Morionis pallida, i.e. tenis vel strijs frequentioribus in utroq; colore pallidius, flos est constans & elegans.*  
 18 *Pileus Morionis, radjjs luteis, in medio foliorum latis, per ruborem excurrentibus, fundo luteo, apicibus luteis, & tribus exterioribus folijs luteis oris rubris, vel alijs oris.*

## The meane flowring red Tulip.

- 1 A faire red which is ordinary, with a yellow or blacke bottome.  
 2 A deepe Orenge colour.  
 3 A Vermillion.  
 4 A pale red, or Bricke colour.  
 5 A Gingeline colour.  
 6 A red with small yellow edges.  
 7 A Testament Brancion of diuers sorts, differing both in the deepnesse of the red, and largenesse of the pale coloured edges.  
 8 A Vermillion flamed, flowring later or earlier.  
 9 A dead purplish red without, and of a yellowish red within, with pale yellow edges.  
 10 A bright Crimson red on the outside, more yellowish on the inside, with pale yellow edges, and a bottome yellow or greene.  
 11 A red Flambant, spotted thicke with yellow spots without any bottome.  
 12 A more excellent red Flambant, with flames of yellow running through the red.  
 13 A pale coloured Flambant.  
 14 A cloth of gold colour.  
 15 A true Fooles Coate, the best is a faire red & a faire yellow, parted into guards euery one apart, yaried through every leafe to the very edge, yet in most abiding constant.  
 16 Another Fooles Coate, not so fairely marked, nor so much, some of these are more or lesse constant in their marks, & some more variable then others.  
 17 A pale Fooles Coate, that is, with pale red, and pale yellow guardes or stripes very faire and constant.  
 18 A Fooles Gappe, that is, with lifts or stripes of yellow running through the middle of euery leafe of the red, broader at the bottome then above, the botome being yellow, the three Outer leaves being yellow with red edges, or without.

1 *Tulipa tricolor.* A Tulip of three colours. 2 *Tulipa Macedonica*, sive de Caffaria. The Tulipa of Caffa purple, with pale white stripes. 3 *Tulipa Helvola charmeina versicolor.* A pure Claret wine colour variable. 4 *Tulipa Cappadociana Wilmari.* Mr. Wilmers Galloflower Tulip. 5 *Tulipa Charmeina Hammis albiz.* A Crimson with white flames. 6 *Tulipa Goliah.* A kind of Zwitter called Goliah. 7 *Tulipa le Zwiff.* A Tulip called the Zwiffer. 8 *Tulipa alba fiducialis coccinea.* Another white Flambant or Foole's Coate. 9 *Tulipa Cinnabarinus albo flammatum.* The Vermillion flamed. 10 *Tulipa plumbata rubra & lutea.* The feathered Tulipated and yellow.

- 19 Le Swiffe, tenijs radiata magnis ex rubore & pallore.  
 20 Altera dicta Goliah à floris magnitudine, tenijs radiata simillima le Swiffe, nisi rubor & albedo sint elegantiores.  
 21 Holias rubra, i.e. sanguinea argenteis radjis, & guttae in orbem dispositae, presertim interius, fundo viridi saturo.  
 22 Holias coccinea, rubra coccinea, albo radiata in orbem, circa medium foliorum interius, fundo albo.  
 23 Alia huius similis, fundo albo & ceruleo.

## Tulipa media lutea.

- 1 Lutea, sive Aurea vulgaris.  
 2 Straminea.  
 3 Sulphurea.  
 4 Malis Aurantij pallidi coloris.  
 5 Lutea dilute purpurea striata, auric panni pallidi instar.  
 6 Pallide lutea fuscedine adumbrata.  
 7 Flava, oris rubri magnis, aut parvis.  
 8 Straminea oris rubris magnis intensis, vel parvis remissis.  
 9 Obscura & fuliginosa lutea, instar Poly decidi, ideoq; Foliolum mortuum appellatur.  
 10 Flana, rubore perfusa, etiamque striata per totum, dorso coccineo, oris pallida.  
 11 Pallide lutea, perfusa & magis aut minus rubore striata, fundo vel luceo, vel viridi.  
 12 Testamentum Clusii, i.e. lutea pallida fuligine obfusca, exterius & interius ad oras usq; pallidas, per totum vero floris medium, maculis interius aspera instar omnium aliarum Holias, dorso obscuriore, fundo viridi.

- 19 A Swiffe, paned with a faire red and pale white or strawe colour.  
 20 A Goliah, so called of the bignesse of the flower, most like to the Swiffe in the marks and guardes, but that the red and white is more liuely.  
 21 A red Holias. A bloudred strip with siluer white veines and spots, with a darke green bottome.  
 22 A Crimson red Holias, that is, a faire purplish red, spotted with white circelwise about the middle of the inner leaues, and a white bottome.  
 23 Another like thereunto, with a blew and white bottome.

## The meane flowring yellow Tulipa.

- 1 A faire gold yellow.  
 2 Straw colour.  
 3 A Brimstone colour pale yellowish greene.  
 4 A pale Orange colour.  
 5 A pale cloth of gold colour.  
 6 A Custard colour a pale yellow shadowed ouer with a browne.  
 7 A gold yellow with red edges, greater or smaller.  
 8 A Straw colour with red edges, deeper or paler, greater or smaller.  
 9 A fullen or smoakie yellow, like a dead leafe that is fallen, and therefore called, Fuelle mort.  
 10 A yellow shadowed with red, and striped also through all the leaues, the backside of them being of a red crimson, and the edges pale.  
 11 A pale yellow, shadowed and striped with red, in some more in some lesse, the bottomes being either yellow or green.  
 12 A Testamentum Clusii, that is, a shadowed pale yellow, both within & without, spotted round about the middle on the inside, as all other Holias are, the backe of the leaues being more obscure or shadowed with pale yellow edges, and a greene bottome.

13 Flam-

- 13 Flambans lutea, dimerisimodē intus magis aut minus striata, vel in alijs extra maculata rubore, fundo ut plurimum nigro, vel in alijs luceo.  
 14 Flambans pallidior & elegantior.  
 15 Holias lutea intensior vel remissior diversimodē, in orbem radiata interius, rubris maculis ad supremas usq; oras, aliquoties crebre, alias parct, fundo viridi, vel tanetso obscuro.  
 16 Holias straminea rubore striata & punctata, instar alba Holias.  
 17 Tunica Morionis lutea, alijs dicta Flammæ, in qua color flavus magis & conspicuus rubore, diversimodē radiata.  
 Huc reddenda esset viridium. Tuliparum classis, quæ diversarum etiam constat species. Una viridis intensior, cuius flos semper ferè semiclauius manet staminibus fimbriatis. Altera remissior, instar Pistaci pennarum viridium, luceo varitata oris albi. Tertia adhuc dilatioris, viriditate oris purpureis. Quarta, cuius folia equaliter purpura diluta, & viriditate divisa sunt. Quinta, folijs longissimis bellamente expansis, ex rubore & viriditate coacta.

## Tulipa Serratina. The late flowring Tulipa.

The late flowring Tulipa hath had his description expressed in the precedent discourse, so that I shall not neede to make a repetition of what hath already beeene set downe. The greatest matter of knowledge in this kinde is this, That it hath no such plentiful variety of colours or mixtures in his flowers, as are in the two former sorts, but is confined within these limits here expressed, as farre as hath come to our knowledge.

## Tulipa Serratina.

## The late flowring Tulipa.

- Rosea intensior, aut remissior.  
 Rubra vulgaris, aut saturatrix, & quasi nigricans, fundo luceo vel nigro, vel nigro orbe, aurio inclusa, dicta Ocellata Serratis.  
 Lutea communis.  
 Lutea oris rubris.  
 Lutea guttis sanguinis, fundo nigro, vel vario.

There

There yet remaine many obseruations, concerning these beautifull flowers, fit to be knowne, which could not, without too much prolixity, be comprehended within the body of the description of them ; but are referred to bee intreated of a part by themselves.

All sorts of Tulipas beare vsually but one stalke, and that without any branches : but sometimes nature is so plentifull in bearing, that it hath two or three stalkes, and sometimes two, or more branches out of one stalke (euery stalke or branch bearing one flower at the toppe) but this is but seldome seene ; and when it doth happen once, it is hardly seene againe in the same roote, but is a great signe, that the roote that doth thus, being an old roote, will the same yeare part into diuers rootes, whereof euery one, being of a reasonable greatnessse, will beare both his stalke and flower the next yeare, agreeing with the mother plant in colour, as all the of-ssets of Tulipas doe for the most part : for although the young of-ssets of some doe vary from the maine roote, euernwhile it groweth with them, yet being separated, it will bee of the same colour with the mother plant.

There groweth oftentimes in the *Medias*, and sometimes also in the *Præcœs*, but more seldome, a small bulbe or roote, hard aboue the ground, at the bottome of the stalke, and betweene it and the lower leafe, which when the stalke is dry, and it ripe, being put into the ground, will bring forth in time a flower like vnto the mother plant, from whence it wastaken.

The flowers also of Tulipas consist most commonly of sixe leaues, but sometimes they are seene to haue eight or tenne, or more leaues ; but vsually, those rootes beare but their ordinary number of sixe leaues the next yeare : the head for seede then, is for the most part fourre square, which at all other times is but three square, or when the flower wanteth a leafe or two, as sometimes also it doth, it then is flat, hauing but two sides.

The forme of the flower is also very variable ; for the leaues of some Tulipas are all sharpe pointed, or all blunt and round pointed, and many haue the three outer leaues sharpe pointed, and the three inner round or pointed, and some contrariwise, the three outermost round pointed, and the three inner sharpe pointed. Againe, some haue the leaues of the flowers long and narrow, and some haue them broader and shorter. Some *Præcœs* also haue their flowers very large and great, equall vnto eyther the *Media*, or *Serotina*, which most commonly are the largest, and others haue them as small as the *Bolonia* Tulipa.

The bottomes of the leaues of the flowers are also variably diuersified, and so are both the chives or thredds that stand vp about the head, and the tips or pendentts that are hanging loose on the toppes of them ; and by the difference of the bottomes or chives, many flowers are distinguished, which else are very like in colour, and alike also marked.

For the smell also there is some diuersity, for that the flowers of some are very sweete, of others nothing at all, and some betweene both, of a small sent, but not offendise : and yet some I haue obserued haue had a strong ill sent, but how to shew you to distinguish them, more then by your owne sense, I cannot : for the seedes of sweete smelling Tulipas doe not follow their mother plant, no more then they doe in the colour.

And lastly, take this, which is notthe least obseruation, worth the noting, that I haue obserued in many : When they haue beeene of one entire colour for diuers yeares, yet in some yeare they haue altered very much, as if it had not beeene the same, viz. from a purple or stamell, it hath beeene variably either parted, or mixed, or striped with white, eyther in part, or through the whole flower, and so in a red or yellow flower, that it hath had eyther red or yellow edges, or yellow or red spots, lines, veines, or flames, running through the red or yellow colour, and sometimes it hath happened, that three leaues haue beene equally parted in the middle with red and yellow, the other three abiding of one colour, and in some the red had some yellow in it, and the yellow some red spots in it also ; whereof I haue obserued, that all such flowers, not hauing their originall in that manner, (for some that haue such or the like markes from the beginning, that is, from the first and second yeares flowing, are constant, and doe not change) but as I laid, were of one colour at the first, doe shew the weaknessse

weaknesse and decay of the roote, and that this extraordinary beauty in the flower, is but as the brightnessse of a light, vpon the very extinguishing thereof, and doth plainly declare, that it can doe his Master no more seruice, and therefore with this iollity doth bid him good night. I know there is a common opinion among many (and very confidently maintained) that a *Tulipa* with a white flower, hath changed to beare a red or yellow, and so of the red or yellow, and other colours, that they are likewise inconstant, as though no flowers were certaine : but I could never either see or heare for certaine any such alteration, nor any other variation, but what is formerly expressed. Let not therefore any iudicious be carried away with any such idle conceit, but rather suspect some deceit in their Gardeners or others, by taking vp one, and putting in another in the place, or else their owne mistaking.

Now for the sowing, planting, transplanting, choise, and ordering of Tulipas, which is not the least of regard, concerning this subiect in hand, but (as I think) would be willingly entertained ; What I haue by my best endeauours learned, by mine owne paines in almost forty yeares trauell, or from others informations, I am willing here to set downe ; not doubting, but that some may adde what hath not come to my knowledge.

First, in the sowing of seedes of Tulipas, I haue not obserued (whatsoever others haue written) nor could of certainty learne of others, that there doth arise from the seedes of *Præcœs* any *Medias* or *Serotine* Tulipas, (or but very seldome) nor am certainly assured of any : but that the seedes of all *Præcœs* (so they be not doubtfull, or of the last flowring sorts) will bring *Præcœs* : And I am out of doubt, that I never saw, nor could learne, that euer the seede of the *Medias* or *Serotines* haue giuen *Præcœs* ; but *Medias* or *Serotines*, according to their naturall kinde. But if there should bee any degeneration, I rather incline to thinke, that it sooner commeth to passe (*a meliore ad peius, for facilis est decessus*), that is that *Præcœs* may giue *Medias*, then that *Medias* or *Serotines* should giue *Præcœs*.

For the choise of your seede to sowe. First, for the *Præcœs*, Clusius saith, that the *Præcox Tulipa*, that beareth a white flower, is the best to giue the greatest variety of colours. Some among vs haue reported, that they haue found great variety rise from the seede of the red *Præcox*, which I can more hardly beleue : but Clusius his experience hath the greater probability, but especially if it haue some mixture of red or purple in it. The purple I haue found to be the best, next thereunto is the purple with white edges, and so likewise the red with yellow edges, each of them will bring most of their owne colours. Then the choise of the best *Medias*, is to take those colours that are light, rather white then yellow, and purple then red ; yea white, not yellow, purple, nor red : but these againe to be spotted is the best, and the more the better, but withall, or aboue all in these, respect the ground or bottome of the flower, (which in the *Præcox Tulipa* cannot, because you shall seldome see any other ground in them but yellow) for if the flower be white, or whitish, spotted, or edged, and straked, and the bottome blew or purple (such as is found in the *Holias*, and in the *Cloth of siluer*, this is beyond all other the most excellent, and out of question the choicest of an hundred, to haue the greatest and most pleasant variety and rarity. And so in degree, the meaner in beauty you sow, the lesser shall your pleasure in rarities be. Bestowe not your time in sowing red or yellow Tulipa seede, or the diuers mixtures of them ; for they will (as I haue found by experience) seldome beworth your paines. The *Serotina*, or late flowring Tulipa, because it is seldome seene, with any especiall beautifull variety, you may easilie your selues ghesse that it can bring forth (even as I haue also learned) no rarities, and little or no diuersity at all.

The time and manner to sowe these seedes is next to be confidered. You may not sowe them in the spring of the yeare, if you hope to haue any good of them ; but in the Autumne, or presently after they be thorough ripe and dry : yet if you sowe them not vntill the end of October, they will come forward neuer the worse, but rather the better ; for it is often seene, that ouer early sowing caufeth them to spring out of the ground ouer early, so that if a sharpe spring chance to follow, it may goe neare to spoile all, or the most of your seede. Wee vsually sowe the same yeares seede, yet if you chance to keepe of your owne, or haue from others such seed, as is two years old, they will thrive and doe well enough, especially if they were ripe and well gathered :

You

You must not sowe them too thicke, for so doing hath lost many a pecke of good seede, as I can tell; for if the seede lye one vpon another, that it hath not roome vpon the sprouting, to enter and take roote in the earth, it perisheth by and by. Some vse to tread downe the ground, where they meane to sowe their seede, and hauing sowne them thereon, doe couer them ouer the thicknesse of a mans thumbbe with fine sifted earth, and they thinke they doe well, and haue good reason for it: for considering the nature of the young Tulipa rootes, is to runne downe deeper into the ground, euery yeaire more then other, they thinke to hinder their quicke descent by the fastnesse of the ground, that so they may encrease the better. This way may please some, but I doe not vse it, nor can finde the reason sufficient; for they doe not consider, that the stiffernesse of the earth, doth cause the rootes of the young Tulipas to bee long before they grow great, in that a stiffe ground doth more hinder the well thriving of the rootes, then a loose doth, and although the rootes doe runne downe deeper in a loose earth, yet they may easily by transplanting be holpen, and raised vp high enough. I haue also seene some Tulipas not once remoued from their sowing to their flowring; but if you will not lose them, you must take them vp while their leafe or stalke is fresh, and not withered: for if you doe not follow the stalke downe to the roote, be it never so deepe, you will leaue them behinde you. The ground also must be respected; for the finer, softer, and richer the mould is, wherein you sowe your seede, the greater shall be your encrease and varietie: Sift it therefore from all stones and rubbish, and let it be either fat naturall ground of it selfe, or being muckt, that it bee thoroughly rotten: but some I know, to mend their ground, doe make such a mixture of grounds, that they marre it in the making.

After the seede is thus sowne, the first yeaires springing bringeth forth leaues, little bigger then the ordinary grasse leaues; the second yeaire bigger, and so by degrees every yeaire bigger then other. The leaues of the *Præcœs* while they are young, may be discerned from the *Medias* by this note, which I haue obserued. The leaues of them doe wholly stand vp aboue the ground, shewing the small footstalkes, whereby euerie leafe doth stand, but the leaues of the *Medias* or *Serotines* doe never wholly appere out of the ground, but the lower part which is broad, abideth vnder the vpper face of the earth. Those Tulipas now growing to bee three yeaires old, (yet some at the second, if the ground and ayre be correspondent) are to bee taken vp out of the ground, wherein yee shall finde they haue runne deepe, and to be anew planted, after they haue been a little dried and cleansed, eyther in the same, or another ground againe, placing them reasonable neare one vnto another, according to their greatnessse, which being planted and couered ouer with earth againe, of about an inch or two thicknesse, may be left vntaken vp againe for two yeaire longer, if you will, or else remoued every yeaire after, as you please; and thus by transplanting them in their due season (which is still in the end of Iuly, or beginning of August, or thereabouts) you shall according to your seede and soyle, haue some come to bearing, in the fifth yeaire after the flowring, (and some haue had them in the fourth, but that hath beeene but few, and none of the best, or in a rich ground) some in the sixth and seventh, and some peraduenture, not vntill the eighth or tenth yeaire: but still remember, that as your rootes growe greater, that in re-planting you give them the more roome to be distant one from another, or else the one will hinder, if not rot the other.

The seede of the *Præcœs*, doe not thrive and come forward so fast as the *Medias* or *Serotines*, nor doe give any of-sets in their running downe as the *Medias* doe, which vsually leaue a small roote at the head of the other that is runne downe every yeaire; and besides, are more tender, and require more care and attendance then the *Medias*, and therefore they are the more respected.

This is a generall and certaine rule in all *Tulipas*, that all the while they beare but one leafe, they will not beare flower, whether they bee seedlings, or the of-sets of elder rootes, or the rootes themselues, that haue heretofore borne flowers; but when they shew a second leafe, breaking out of the first, it is a certaine signe, that it will then beare a flower, vnslese some casualty hinder it, as frost or raine, to nip or spoile the bud, or other vntimely accident befall it.

To set or plant your best and bearing *Tulipas* somewhat deeper then other rootes, I hold it the best way; for if the ground bee either cold, or lye too open to the cold

Northerne

Northerne ayre, they will be the better defended therein, and not suffer the frosts or cold to pierce them so soone: for the deepe frosts and snowes doe pinch the *Præcœs* chiefly, if they bee too neare the vppermost crust of the earth; and therefore many, with good successe, couer ouer their ground before Winter, with either fresh or old rotten dung, and that will maruellously preserue them. The like course you may hold with seedlings, to cause them to come on the forwarder, so it bee after the first yeaires sowing, and not till then.

To remoue *Tulipas* after they haue shot forth their fibres or small strings, which grow vnder the great round rootes, (that is, from September vntill they bee in flower) is very dangerous; for by remouing them when they haue taken fast hold in the ground, you doe both hinder them in the bearing out their flower, and besides, put them in hazard to perish, at least to bee put backe from bearing for a while after, as oftentimes I haue proued by experiance: But when they are now risen to flower, and so for any time after, you may safely take them vp if you will, and remoue them without danger, if you haue any good regard vnto them, vnslese it be a young bearing roote, which you shall in so doing much hinder, because it is yet tender, by reason it now beareth his first flower. But all *Tulipa* roots when their stalke and leaues are dry, may most safely then be taken vp out of the ground, and be so kept (so that they lye in a dry, and not in a moist place) for sixe moneths, without any great harme: yea I haue knowne them that haue had them nine moneths out of the ground, and haue done reasonable well, but this you must vnderstand withall, that they haue not been young but elder rootes, and they haue been orderly taken vp and preferued. The dryer you keep a *Tulipa* roote the better, so as you let it not lye in the sunne or wind, which will pierce it and spoile it.

Thus Gentlewomen for your delights, (for these pleasures are the delights of leisure, which hath bred your loue & liking to them, and although you are herein predominant, yet cannot they be barred from your beloued, who I doubt not, wil share with you in the delight, as much as is fit) haue I taken this paines, to set downe, and bring to your knowledge such rules of art, as my small skill hath enabled mee withall concerning this subiect, which of all other, seemed fittest in this manner to be enlarged, both for the varietie of matter, and excellency of beautie herein, and also that these rules set forth together in one place, might saue many repetitions in other places, so that for the planting and ordering of all other bulbous rootes, and the sowing the seeds of them, you may haue recourse vnto these rules, (*tanquam ad normam & examen*) which may serue in general for all other, little diuersitie of particulars needing exception:

#### *The Place.*

The greater *Tulipas* haue first beeene sent vs from Constantinople, and other parts of Turkie, where it is said they grow naturally wilde in the Fields, Woods, and Mountaines; as Thracia, Macedonia, Pontus about the Euxine Sea, Cappadocia, Bithynia, and about Tripolis and Aleppo in Syria also: the lesser haue come from other feuerall places, as their names doe decipher it out vnto vs; as Armenia, Persia, Candy, Portugall, Spaine, Italy, and France. They are all now made Denizens in our Gardens, where they yeeld vs more delight, and more encrease for their proportion, by reason of the culture, then they did vnto their owne naturals:

#### *The Time.*

These doe flower some earlier, some later, for three whole moneths together at the least, therein adorning out a Garden most gloriously, in that being but one kinde of flower, it is so full of variety, as no other (except the Daffodils, which yet are not comparable, in that they yeeld not that alluring pleasant variety) doe the like besides. Some of the *Præcœs* haue beeene in flower with vs, (for I speake not of their owne naturall places, where the Winters are milder, and the Spring earlier then ours) in the moneth of January, when the Winter before hath beeene milde, but many in February,

and all the *Præcœs*, from the beginning to the end of March, if the yeare be kindly: at what time the *Medias* doe begin, and abide all Aprill, and part of May, when the *Serotines* flower and fade; but this, as I said, if the yeare be kindly, or else each kinde will be a moneth later. The seede is ripe in June and July, according to their early or late flowring.

### *The Names.*

There haue bee divers opinions among our moderne Writers, by what name this plant was knowne to the ancient Authors. Some would haue it be *Cosmoandalos*, of the Ancient. Dodonæus referreth it to *νιτη* of Theophrastus, in his feuenthe Booke and thirteenth Chapter: but thereof he is so briefe, that besides the bare name, wee cannot finde him to make any further relation of forme, or quality. And Bauhinus, vpon Matthiolus Commentaries of Diſcorides, and in his Pinax also, followeth his opinion. Camerarius in his Hortus Medicus is of opinion, it may be referred to the Helychrysum of Crateua. Gesner, as I thinke, first of all, and after him Lobel, Camerarius, Clusius and many others, referre it to the Satyrium of Diſcorides: and surely this opinion is the most probable for many reasons. First, for that this plant doth grow very frequent in many places of Greece, and the lesser Asia, which were no doubt sufficiently knowne both to Theophrastus, and Diſcorides, and was accounted among bulbous rootes, although by sundry names. And secoundly, as Diſcorides setteth forth his Satyrium, so this most commonly beareth three leaues vpon a stalke (although sometimes vs it hath four or fife) like vnto a Lilly, whereof some are often seen to be both red, in the first springing, and also vpon the decaying, especially in a dry time, and in a dry ground: the flower likewise of some is white, and like a Lilly; the roote is round, and as white within as the white of an egge; couered with a browne coate, hauing a sweetish, but not vnplesant taste, as any man without danger many try. This description doth so liuely set forth this plant, that I thinke wee shall not neede to be any longer in doubt, where to finde Diſcorides his Satyrium *Triphyllum*, seeing wee haue such plenty growing with vs. And thirdly, there is no doubt, but that it hath the same qualities, as you shall hereafter heare further. And lastly, that plant likewise that beareth a red flower, may very well agree with his *Erythronium*; for the descriptions in Diſcorides are both alike, as are their qualities, the greatest doubt may be in the seede, which yet may agree vnto Lin or Flaxe as fitly, or rather more then many other plants doe, in many of his comparissons, which yet wee receiue for currant. For the seede of *Tulipa* are flat, hard, and shining as the seede of *Linum* or *Flaxe*, although of another colour, and bigger, as Diſcorides himselfe setteth it downe. But if there should be a mistaking in the writing of *νι* for *νιτη* in the Greecke Text, as the slippe is both easie and likely, it were then out of all question the same: for the seede is very like vnto the seede of Lillies, as any man may easily discerne that know them, or will compare them. It is generally called by all the late Writers, *Tulipa*, which is derived from the name *Tulpan*, whereby the Turkes of *Dalmatia* doe entitle their head Tyres, or Caps; and this flower being blowne, laide open, and inuerted, doth very well resemble them. We haue receiued the early kinde from Constantinople, by the name of *Cesalate*, and the other by the name of *Caulelate*. Lobel and others doe call it *Lilio-narcissus*, because it doth resemble a Lilly in the leafe, flower, and seede, and a Daffodill in the roote. We call it in English the Turkes Cap, bat most visually *Tulipa*, as most other Christian Countries that delight therein doe. Daleſchampius calleth it Oulada.

### *The Vertues.*

Dioscorides writeth, that his first *Satyrium* is profitable for them that haue

haue a convulsion in their necke, (which wee call a cricke in the necke) if it be drunke in harsh (which we call red) wine.

That the roots of *Tulipas* are nourishing, there is no doubt, the pleasant, or at least the no vnpleasant taste, may hereunto perswade, for diuers haue had them sent by their friends from beyond Sea, and mistaking them to bee Onions, haue vſed them as Onions in their pottage or broth, and neuer found any caufe of millike, or any ſene of euill quality produced by them, but accounted them sweete Onions.

Further, I haue made tryall of them my ſelfe in this manner. I haue preſerved the rootes of theſe *Tulipas* in Sugar, as I haue done the rootes of *Eringus*, *Orchis*, or any other ſuch like, and haue found them to be almost as pleasant as the *Eringus* rootes, being firme and ſound, fit to be preſented to the curious; but for force of Venereous quality, I cannot ſay, either from my ſelfe, nor hauing eaten many, or from any other, on whom I haue beftowed them: but ſurely, if there be any ſpeciall proprietie in the rootes of *Orchis*, or ſome other tending to that purpoſe, I think this may as well haue it as they. It ſhould ſeeme, that Diſcorides doth attribute a great Venereous faculty to the ſeede, whereof I know not any hath made any eſpeciall ex-periment with vs as yet.

### *CHAP. IX.*

#### *Narcissus. The Daffodill.*

**T**here hath beeene great conuision among many of our moderne Writers of plants, in not diſtinguishing the manifold varieties of Daffodils; for every one almost, without conſideration of kinde or forme, or other ſpeciall note, giueth names to diuerſly one from another, that if any one ſhall receiue from ſeuerall places the Catalogues of their names (as I haue had many) as they ſet them down, and compare the one Catalogue with the other, he ſhall ſcarce haue three names in a dozen to agree together, one calling that by one name, which another calleth by another, that very few can tell what they meane. And this their conuision, in not diſtinguishing the name of *Narcissus* from *Pseudonarcissus*, is of all other in this kinde the greateſt and groſteſt errour. To auoide therefore that guile, whereof I complaine that ſo manie haue bin endrenched; and to reduce the Daffodils into ſuch a methodicall order, that every one may know, to what *Classis* or forme any one doth appertaine, I will first diuide them into two principall or primary kindes: that is, into *Narcissus*, true Daffodils, and *Pseudonarcissus*, baſtard Daffodils: which diſtincſion I hold, to be moſt neceſſarie to be ſet downe first of al, that every one may be named without conuision vnder his owne primary kind, and then to let the other parts of the ſubdiuision follow, as is proper to them, and fittest to exprefſe them. Now to cauſe you to understand the diſference between a true Daffodill and a baſtard, is this: it coniſtereth onely in the flower, (when as in all other parts they cannot bee diſtinguished) and chiefly in the middle cap or chalice, for that we doe in a manner onely account those to bee *Pseudonarcissus*, baſtard Daffodils, whose middle cap is altogether as long, and ſometime a little longer then the outer leaues that doe encompasse it, ſo that it ſeemeth rather like a trunke or long nose, then a cup or chalice, ſuch as almoſt all the *Narcissi*, or true Daffodils haue; I ſay almoſt, because I know that ſome of them haue their middle cup ſo ſmall, that we rather call it a crowne then a cup; and againe, ſome of them haue them ſo long, that they may ſeem to be of the number of the *Pseudonarcissi*, or baſtard Daffodils: but yet may eaſily be knowne from them, in that, almoſt all the cup of ſome of the true Daffodils be great, yet it is wider open at the brim or edge, and not ſo long and narrow all alike as the baſtard kindes are, and this is the chiefie and onely way to know how to ſeuer theſe kindes, which rule holdeth riſing in all, except that kinde which is called *Narcissus lenticularis reflexiflorus*, whiche cup is narrow, and as long as the leaues that turne vp againe.

Secondly,

Secondly, I will subdivide each of these again apart by themselves, into four sorts; and first the *Narcissos*, or true Daffodils into,

*Latifolios*, broad leaved Daffodils.

*Angustifolios*, narrow leaved Daffodils.

*Iuncifolios*, Rush Daffodils, and

*Marinos*, Sea Daffodils.

These sorts againe doe comprehend vnder them some other diuisions, whereby they may the better be distinguished, and yet still bee referred to one of those four former sorts: as

*Monanthos*, that is, Daffodils that beare but one flower, or two at the most vpon a stalke, and

*Polyanthos*, those that beare many flowers together vpon a stalke: as also

*Simpliciflora*, those that beare single flowers, and

*Multipliciflora*, or *flore plena*, that is, haue double flowers.

*Vernales*, those that flower in the Spring, and among them some that are earliar, and therefore called

*Præcoce*, early flowing Daffodils, and

*Autumnales*, those that flower in Autumne onely.

And lastly, with the *Pseudonarcissos*, or bastard Daffodils, I will keepe the same order, to distinguish them likewise into their four severall sorts; and as with the true Daffodils, so with these false, describe vnder every sort: first, those that beare single flowers, whether one or many vpon a stalke; and then those that beare double flowers, one or many also. As for the distinctions of *major* and *minor*, greater and lesser, and of *maximus* and *minimus*, greatest and least, they doe not onely belong to these Daffodils; and therefore must be vied as occasion permitteth, but vnto all other sort of plants. To begin therefore, I thinke fittest with that stately Daffodill, which for his excellency carrieth the name of None such.

#### 1. *Narcissus latifolius omnium maximus, amplio calice flavo, sive Nomparsille.*

The great None such Daffodill, or Incomparable Daffodill.

This *Narcissus Nomparsille* hath three or four long and broad leaues, of a grayish greene colour, among which riseth vp a stalke two foote high at the least, at the toppe whereof, out of a thinnie skinnie huske, as all Daffodils haue, commeth forth one large single flower, and no more vsually, consisting of sixe very pale yellow large leaues, almost round at the point, with a large cuppe in the middle, somewhat yellower then the leaues, the bottome whereof next vnto the stalke is narrow and round, rising wider to the mouth, which is very large and open, and vneuenly cut in or indented about the edges. The cup doth very well resemble the chalice, that in former dayes vs, and beyond the Seas is still vied to hold the Sacramental Wine, that is with a narrower bottome, and a wide mouth. After the flower is past, sometimes there commeth (for it doth not often) a round greene head, and blacke round seede therein, like vnto other Daffodils, but greater. The roote is great, as other Daffodils that beare large flowers, and is couered ouer with a brownish coate or skinne. The flower hath little or no sent at all.

*Flore geminato.* This doth sometimes bring forth a flower with ten or twelue leaues, and a cup much larger, as if it wold be two, even as the flower seemeth.

#### 2. *Narcissus omnium maximus flore & calice flavo.*

The great yellow Incomparable Daffodill.

This other kinde differeth neither in forme, nor bignesse of leafe or flower from the former, but in the colour of the circling leaues of the flower, which are of the same yellow colour with the cup.

*Flore geminato.* This doth sometimes degenerate and grow luxurios also, bringing forth two flowers vpon a stalke, echi distinct from other, and sometimes two flowers thrust together, as if they were but one, although it be but seldom; for it is not a peculiar kinde that is constant, yearly abiding in the same forme.

#### 3. *Narcissus*

#### 3. *Narcissus maximus griseus calice flano.* The gray Peerlesse Daffodill.

This Peerlesse Daffodill well deserueth his place among these kindes, for that it doth much resemble them, and peraduenture is but a difference raised from the seede of the former, it is so like in leafe and flower, but that the leaues seeme to be somewhat greater, and the sixe outer leaues of the flower to be of a glistering whitish gray colour, and the cup yellow, as the former, but larger.

#### 4. *Narcissus latifolius flavo flore ample calice, sive Mattenesse.*

The lesser yellow Nomparsille, or the Lady Mattenesse Daffodill.

The leaues of this Daffodill, are somewhat like vnto the leaues of the first kind, but not altogether so long or broad: the stalke likewise riseth not vp fully so high, and beareth one flower like the former, but lesser, and both the cuppe and the leaues are of one colour, that is, of a pale yellow, yet more yellow then in the former: the cup of this also is lesser, and a little differing; for it is neither fully so small in the bottome, nor so large at the edges, nor so crumpled at the brimmes, so that all these differences doe plainly shew it to be another kinde, quite from the former.

#### The Place.

The places of none of these are certainly knowne to vs where they grow naturally, but we haue them onely in our Gardens, and haue beene sent, and procured from diuers places.

#### The Time.

They flower sometimes in the end of March, but chiefly in Aprill.

#### The Names.

The first and second haue been sent vs by the name of *Narcisse Nomparsille*, as it is called in French; and in Latine, *Narcissus omnium maximus ample calice flavo*, and *Narcissus Incomparabilis*, that is, the Incomparable Daffodill, or the greatest Daffodill of all other, with a large yellow cuppe: but assuredly, although this Daffodill doth exceed many other, both in length and bignesse, yet the great Spanish bastard Daffodill, which shall be spoken of hereafter, is in my persuasion oftentimes a farre higher and larger flower; and therefore this name was giuen but relatively, we may call it in English, The great None such Daffodill, or the Incomparable Daffodill, or the great Peerlesse Daffodill, or the Nomparsille Daffodill, which you will: for they all doe answere either the French or the Latine name; and because this name *Nomparsille* is growne currant by cōtyme, I know not well how to alter it. The third kinde may passe with the title giuen it, without controle. The last is very well knowne beyond the Seas, especially in the Low Countries, and those parts, by the Lady Mattenesse Daffodill, because Clusius received it from her. Wemay call it in English, for the correspontency with the former, The lesser yellow Nomparsille, or Peerlesse Daffodill, or the Lady Mattenesse Daffodill, which you will.

#### *Narcissus Indicus flore rubro, dictus Jacobaeus.*

The Indian Daffodill with a red flower.

This Indian Daffodill is so differing, both in forme, not hauing a cuppe, and in colour, being red, from the whole Family of the Daffodils (except the next that followeth, and the Autumne Daffodils) that some might iustly question the fitnessse of his place here. But because as all the plants, whether bulbous or other, that come from the

the Indies, either East or West (although they differ very notably, from those that grow in these parts of the world) must in a generall survey and muster be ranked every one, as neere as the surueiours wit will direct him, vnder some other growing with vs, that is of neerest likenesse; Even so vntill some other can direct his place more fitly, I shall require you to accept of him in this, with this description that followeth, which I must tell you also, is more by relation then knowledge, or sight of the plant it selfe. This Daffodill hath diuers broad leaues, somewhat like vnto the common or ordinary white Daffodill, of a grayish greene colour; from the sides whereof, as also from the middle of them, rise vp sometimes two stalkes together, but most vsually one after another (for very often it flowreth twice in a Summer) and often also but one stalke alone, which is of a faint reddish colour, about a foote high or more, at the toppe whereof, out of a deepe red skinne or huske, commeth forth one flower bending downwards, consisting of sixe long leaues without any cup in the middle, of an excellent red colour, tending to a crimson; three of these leaues that turne vpwards, are somewhat larger then those three that hang downwards, hauing sixe threads or chiuies in the middle, tipt with yellow pendent, and a three forked stile longer then the rest, and turning vp the end thereof againe: the roote is round and bigge, of a brownish colour on the outside, and white within. This is set forth by Aldinus, Cardinall Farnesius his Physitian, that at Rome it rose vp with stalkes of flowers, before any leaues appeared.

#### The Place, Time, and Names.

This naturally growth in the West Indies, from whence it was brought into Spaine, where it bore both in Iune and Iuly, and by the Indians in their tongue named *Azcal Xochiti*, and hath beeene sent from Spaine, vnto diuers louers of plants, into seuerall parts of Christendome, but haue not thriued long in these transalpine colder Countries, so far as I can heare.

#### *Narcissus Trapezunticus flore lateo praeoccissimus.* The early Daffodill of Trebizond.

Because this Daffodill is so like in flower vnto the former, although differing in colour, I thought it the fittest place to ioyne it the next thereunto. This early Daffodill hath three or four short very greene leaues, so like vnto the leaues of the Autumnne Daffodill, that many may easily bee deceiued in mistaking one for another, the difference consisting chiefly in this, that the leaues of this are not so broad or so long, nor rise vp in Autumnne: in the midst of these leaues riseth vp a short green stalke, an handfull high, or not much higher vsually, (I speake of it as it hath often flowred with mee, whether the cause be the coldnesse of the time wherein it flowreth, or the nature of the plant, or of our climate, I am in some doubt; but I doe well remember, that the stalkes of some plants, that haue flowred later with me then the first, haue by the greater strength, and comfort of the Sunne, risen a good deale higher then the first) bearing at the top, out of a whitish thinne skinne striped with greene, one flower a little bending downwards, consisting of sixe leaues, laid open almost in the same manner with the former Indian Daffodill, whereof some doe a little turne vp their points againe, of a faire pale yellow colour, hauing sixe white chiuies within it, tipt with yellow pendent, and a longer pointell: the roote is not very great, but blackish on the outside, so like vnto the Autumnne Daffodill, but that it is yellow vnder the first or outermost coate, that one may easily mistake one for another.

#### The Place.

It was sent vs from Constantinople among other rootes, but as wee may ghesse by the name, it shoulde come thither from Trapezunte or Trebizond.

#### The Time.

It flowreth sometimes in December, if the former part of the Winter haue

1. *Narcissus Nonpareille*. The incomparable Daffodill. 2. *Narcissus Matthei*. The lesser yellow Nonpareille Daffodill. 3. *Narcissus Tazetta* flore rubra. The red Indian Daffodill. 4. *Narcissus Trapezunticus*. The early Daffodill of Trebizond. 5. *Narcissus Nonpareille*, or Peacocke Daffodill. 6. *Narcissus Montanus*, sive *Nonpareille var. albus*. The white winged Daffodill. 7. *Narcissus ellipticus oblongocalyx*. The white Daffodill with a long cup.

## The Garden of pleasant Flowers.

haue been milde; but most vsually about the end of January, or else in Februarie the beginning or the end.

### The Names.

Wee doe vsually call it from the Turkish name, *Narcissus Trapezunticus*, and some also call it *Narcissus vernus precox*, as Clusius doth, in English, The early Daffodill of Trebizond.

*Narcissus Montanus albus apophysis preditus.*  
The white Mountaine Daffodill with eares, or  
The white winged Daffodill.

This Mountaine Daffodill riseth vp with three or fourc broad leaues, somewhat long, of a whitish greene colour, among which riseth vp a stalke a foote and a halfe high, whereon standeth one large flower, and sometimes two, consisting of sixe white leaues a peice, not very broad, and without any shew of yellownesse in them, three whereof haue vsually each of them on the backe part, at the bottome vpon the one side of them, and not on both, a little small white peice of a leafelike an eare, the other three hauing none at all: the cup is almost as large, or not much lesse then the small Nompairelle, small at the bottome, and very large, open at the brimme, of a faire yellow colour, and sometimes the edges or brimmes of the cup will haue a deeper yellow colour about it, like as if it were discoloured with Saffron: the flower is verie sweete, the roote is great and white, couered with a pale coate or skinne, not verie blacke, and is not very apt to encrease, seldome giuing of-sets; neither haue I euer gaithered seede thereof, because it passeth away without bearing any with me.

*Narcissus Montanus, sive Nompairelle totus albus ample calice.*  
The white Nompairelle Daffodill.

This white Nompairelle Daffodill, is in roote and leafe very like vnto the former mountain or winged Daffodill, but that they are a little larger: the stalke from among the leaues riseth vp not much higher then it, bearing at the top one large flower, composed of sixe long white leaues, each whereof is as it were folded halfe way together, in the middle whereof standeth forth a large white cup, broader at the mouth or brims then at the bottome, very like vnto the lesser Nompairelle Daffodill before remembred, which hath caused it to be so entituled: the sent whereof is no lesse sweete then the former.

### The Place.

The naturall places of these Daffodils are not certainly knowne to vs; but by the names they carry, they should seeme to bee bred in the Mountains.

### The Time.

These flower not so early as many other kindes doe, but rather are to bee accounted among the late flowring Daffodils; for they shew not their flowers vntill the beginning of May, or the latter end of Aprill, with the soonest.

### The Names.

The names set downe ouer the heads of either of them be such, whereby they are knowne to vs: yet some doe call the first *Narcissus auriculatus*, that is to say, The Daffodill with eares: and the other, *Narcissus Nompairelle totus albus*, that is to say, The white Nompairelle, or Peerlesse Daffodill.

1. *Narcissus*

## The Garden of pleasant Flowers.

1. *Narcissus albus oblongo calice luteo precox minor.*  
The small early white Daffodill with a long cup.

The leaues of this early Daffodill are broad, very greene, and not whitish as others, three or foure standing together, about a foote long or better, among which riseth vp a greene stalke, not full so high as the leaues, bearing one flower at the toppe thereof of a reasonable bignesse, but not so great as the later kindes that follow are, consisting of six whitish leaues, but not perfect white, hauing a shew of a Creame colour appearing in them; in the middle is a long round yellow cup, about halfe an inch long or better. The smell of this flower is reasonable sweete, the roote is of a reasonable bignesse, yet lesser then the rootes of the later kindes.

2. *Narcissus pallidus oblongo calice flano precox.*  
The early Strawre coloured Daffodill with a long cup.

The leaues of this Daffodill are as greene as the former, but much narrower; and the leaues of the flower are more enclining to yellow, but yet very pale, as if it were a light strawre colour, and seeme to bee a little more narrow and pointed then the former: the cup of this, is as long and yellow as the precedent. The smell whereof is very like the former, yet neither of them being so sweete as those that follow.

3. *Narcissus albus oblongo calice luteo serotinus maior.*  
The great late flowring white Daffodill with a long cup.

This later flowring Daffodill hath his leaues somewhat narrow & long, of a grayish or whitish greene colour, among which the stalke riseth vp a foote and a halfe high, bearing one flower at the toppe, made of six white leaues, hauing the cup in the middle thereof as long as the former, and of a deepe yellow: the edges of this cuppe are sometimes plaine, and sometimes a little crumpled; they are often also circled at the brimmes with a Saffron colour, and often also without it, the smell whereof is very pleasantring, and not heady: the roote hereof is reasonable bigge, and couered euer rather with a pale then blackish skinne. This flower doth sometimes alter his forme into eight leaues, which being narrow and long, seeme like a white starre, compassing a yellow trunke.

4. *Narcissus totus pallidus oblongo calice serotinus minor.*  
The late pale coloured Daffodill with a long cup.

There is another of this kinde, whose flower is wholly of a pale white, or yellowish colour, differing neither in leafe nor roote from the former.

5. *Narcissus pallidus oblongo calice flano serotinus.*  
The Strawre coloured late flowring Daffodill with a long yellow cup.

The chiefe difference of this Daffodill from the former, consisteth in the colour of the top of the flower, which is of a more yellow colour, and a little larger then the former, and the brimmes or edges of the cup of a deeper yellow, or Saffron colour. The smell of this is no lesse sweete then in the former.

6. *Narcissus albus oblongo calice flano serotinus, duobus floribus in caule.*  
The late white Daffodill with a long cup, and two flowers on a stalke.

This Daffodill is surely a kinde of it selfe, although it be so like the former, abiding constant in his forme and manner of flowring, vsually bearing without misling two flowers vpon a stalke, very like vnto the former great white kinde, that one cannot know any greater matter of difference betweene them, then that it beareth two flowers on a stalke: the cuppes whereof are seldome touched with any shew of Saffron colour on them at the brimmes or edges, as some of the former haue.

## The Place.

All these Daffodils doe grow on the Pyrenæan mountaines, and haue been sought out, and brought into these parts, by those curious or covetous searchers of these delights, that haue made vs partakers of them.

## The Time.

The former kindes flower earlier by a fortnight then the later, the one in the later end of March, and the other not vntill the middle of April.

## The Names.

Their names are giuen to every one of them in their severall titles, as fitly as may best agree with their natures ; and therefore I shall not neede to speake any further of them.

*Narcissus mediolanensis vulgaris.*

The common white Daffodill called Primrose Peerlesse.

This Daffodill is so common in every Countrey Garden almost through England, that I doubt I shall but spend my time in vaine, to describe that which is so well knowne, yet for their sakes that know it not, I will set downe the description of it in this manner. It hath long limber and broad leaues, of a grayish greene colour, among which riseth vp a stalke, bearing at the toppe out of a skinne huske sometimes but one flower, but most commonly two flowers, and feldome three or more, but larger for the most part, then any that beare many flowers vpon a stalke, of a pale whitish Creame colour, tending somewhat neare vnto the colour of a pale Primrose (which hath caused our Countrey Gentlewomen, I thinke, to entitle it Primrose Peerlesse) with a small round flat Crowne, ratherthen a cup in the middle, of a pale yellow colour, with some pale chives standing therein, being of a sweete, but stuffing sent : the roote is reasonable great, and encreasing more then a better plant.

*Narcissus mediocrinus serotinus.* The late flowing white Daffodill.

This Daffodill hath much smaller leaues, and shorter then the last, the stalke also riseth not so high by much, and beareth but one flower thereon, of a pure white colour, made of six small leaues, and somewhat narrow, standing severally one from another, and not so close together as the former, but appearing like a starre : the cup is small and round, of a pale yellow colour, but saffrony about the brims, hauing six small pale chives in the middle, the smell whereof is much sweeter then in the former.

## The Place.

The first is thought to grow naturally in England, but I could never heare of his naturall place. I am sure it is plentifull enough in all Country Gardens, so that wee scarce giue it place in our more curious parkes. The second liueth onely with them that delight in varieties.

## The Time.

The first Daffodill flowreth in the middle time, being neither of the earliest, nor of the latest; but about the middle, or end of April. The other flowreth with the latest in May.

## The Names.

I shall not neede to trouble you with further repetitions of names, they hauing been set downe in their titles, which are proper to them.

1. *Narcissus*

1. *Narcissus vulgaris mediolanensis.* The common white Daffodill, or Primrose Peerlesse. 2. *Narcissus mediopurpureus maximus.* The great white purple Daffodill. 3. *Narcissus mediopurpureus præcox.* The early purple ringed Daffodill. 4. *Narcissus mediopurpureus bellarum.* The starry purple ringed Daffodill. 5. *Narcissus pseudonarcissus.* The Persian Daffodill. 6. *Narcissus Arnemalii minor.* The lesser Winter Daffodill. 7. *Narcissus Arnemalii major.* The greater Winter Daffodill.

G 2

*1. Narcissus medio purpureus precox.* The early purple ringed Daffodill.

This early Daffodill hath many long grayish greene leaues, somewhat narrower and stiffer then the former common white Daffodill, among which riseth vp a long naked hollow stalke (as all other Daffodils haue) bearing at the toppe one flower, and seldome two, made of sixe long white leaues, standing close together about the stalke; the cup is yellow, and so flat, that it might rather bee called a crowne: for it standeth very close to the middle, and very open at the brimmes, circled with a reddish or purple coloured ring, hauing certaine chiuies in the middle of it also. The smell hereof is very sweete, exceeding many other.

*2. Narcissus medio purpureus serotinus.* The late purple ringed Daffodill.

The leaues of this Daffodill are alwayes broader then the former early one, and some are very neare twice as broad: the flower is very like the former, being large, and his leaues standing close one to the side of another; the ring likewise that compassesthe yellow coronet, is sometimes of a paler reddish purple, and sometimes as deepe a red as the former: so that it differeth not in any other materiall point, then that it flowreth not vntill the other is past and gone. The sent of this is like the former, the roote hereof is greater, as well as the leafe and flower.

*3. Narcissus medio purpureus maximus.*  
The great white purpleringed Daffodill.

There is another kinde, whose flower (as well as leaues and rootes) is larger then any other of this kinde, which onely maketh it a distinct sort from the other: it flowreth also with the later sort of these purple ringed Daffodils.

*4. Narcissus medio purpureus stellaris.* The starry purple ringed Daffodill.

This Daffodill hath his leaues a little narrower and greener then the former sorts, the flower also of this hath his sixe white leaues not so broad, but narrower, and seeming longer then they, not closing together, but standing apart one from another, making it seeme like a white starre: it hath also a yellow coronet in the middle, circled about with purple, like the former. This doth smell nothing so sweete as the first, but yet hath a good sent.

*The Place.*

The first, third, and fourth of these Daffodils, haue alwayes beene sent vs from Constantinople among other bulbous rootes, so that wee know no further of their naturall places.

The second growth in many places of Europe, both in Germany, France, and Italy, as Clusius hath noted.

*The Time.*

The first flowreth very early in March, euен with the first Daffodils. The second, third, and fourth, about a moneth after.

*The Names.*

The early and starre Daffodils, haue been sent vs by the Turkish name of *Deucobini*, and *Serincade*. But their names, they haue received since, to bee endenizond with vs, are set downe in their sevrall titles.

*Narcissus Persicus.* The Persian Daffodill.

This Persian Daffodill differeth from all other kindes of Daffodils in his manner of growing,

growing, for it never hath leaues and flowers at one time together, wherein it is like vnto a Colchicum, yet in roote and leafe it is a Daffodill. The roote is a little blackish on the outside, somewhat like the roote of the Autumnne Daffodill, from whence riseth vp a naked foote stalke, bearing one pale yellow flower, breaking through a thinne skinne, which first enclosed it, composed of six leaues, the three outermost being a little larger then the rest, in the middle of the flower there are six small chiuies, and a longer pointell. The whole flower is of an vnpleasant sent: After the flower is past, come vp the leaues, sometimes before Winter, but most vsually after the deepe of Winter is past with vs, in the beginning of the yeare, which are broad, long, and of a pale greene colour, like the leaues of other Daffodils, but not greene as the Autumnne Daffodill is, and besides they doe a little twine themselues, as some of the Pancratium, or bastard Sea Daffodils doe.

*Narcissus Autumnalis maior.* The greater Autumnne or Winter Daffodill.

The greater Autumnne Daffodill riseth vp with three or four faire broad and short leaues at the first, but afterwards grow longer, of a very deepe or darke greene colour, in the middle of which riseth vp a short, stiffe, round foote stalke, bearing one faire yellow flower on the head thereof (inclosed at the first in a thinne skinne, or huske) and consisteth of six leaues as the former, with certaine chiuies in the middle, as all or most other Daffodils haue, which passeth away without shew of any seed, or head for seed, although vnder the head there is a little greene knot, which peraduenture would beare seede, if our sharpe Winters did not hinder it: The roote is great and round, couered ouer with a blackish skinne or coate.

*Narcissus Autumnalis minor.* The lesser Autumnne or Winter Daffodill.

Clusius setteth downe, that the manner of the flowring of this lesser Daffodill, is more like vnto the Persian Daffodill, then vnto the former greater Autumnne kind, but I doe finde that it doth in the same sort, as the greater kinde, riseth vp with his leaues first, and the flowers a while after: the flower of this is lesser, and a little paler then the flower of the greater kinde, but consisting in like sort of six leaues, narrow and sharpe pointed; the greene leaues also are almost of as deepe a greene colour, as the greater kinde, but smaller and narrower, and a little hollow in the middle. The roote is also alike, but lesser, and couered with a blackish skinne as the former. This hath sometimes borne blacke round seede in three square heads.

*The Place.*

The Persian Daffodill hath beeene sent sometimes, but very seldome, among other rootes from Constantinople, and it is probable by the name whereby it was sent, that it should naturally grow in Persia.

The other two haue likewise beene sent from Constantinople, and as it is thought, grow in Thracia, or thereabouts.

*The Time.*

They all doe flower much about one time, that is, about the end of September, and in October.

*The Names.*

The first hath been sent by the name of *Serincade Persica*, and thereupon is called *Narcissus Persicus*; The Persian Daffodill.

The other two haue been thought by divers to be Colchica, and so haue they called them, vpon no other ground, but that their flower is in forme and time somewhat like Colchicum, when as if they had marked them better, they might plainly discerne, that in all other things they did resemble Daffodils; but now the names of *Colchicum luteum minus*, & *minus*, is quite lost.

lost, time haung worne them out, and they are called by most Herbarists now adayes, *Narcissus Autumnalis maior & minor*, The greater and the lesser Autumne Daffodill.

Thus farre haue I proceeded with those Daffodils, that haung broad leaues, beare but one single flower, or two at the most vpon a stalke: And now to proceed with the rest, that haue broad leaues, and beare single flowers, but many vpon a stalke.

*Narcissus Africanus aureus maior*. The great yellow Daffodill of Africa.

This braue and stately Daffodill hath many very long and broad leaues, of a better greene colour, then many others that are grayish, among which appeareth a stalke, not rising to the height of the leaues, bearing at the toppe out of a skinnie hose many faire, goodly, and large flowers, to the number of ten or twelue, if the roote bee well growne, and stand in a warme place, every one being larger then any of the French, Spanish, or Turkie Daffodils, that beare many single flowers vpon a stalke, and commeth neere vnto the bignesse of the English Daffodill, called Primrose Peerlesse, before described, or that French kinde hereafter described, that beareth the largest flowers, many vpon a stalke (which some would make to bee a kinde of that English Daffodill, but bearing more flowers) and of a faire shining yellow colour, haung large, round, and open cups or boules, yellower then the outer leaues; and is of so exceeding sweete a sent, that it doth rather offend the sensies by the abundance thereof: the roote is great, and couered with a blackish browne coate or skinne.

*Narcissus Africanus aureus minor*. The lesser Barbary Daffodill.

This lesser kinde is very neere the same with the former, but that it lacketh somewhat of his stateliness of height, largenesse or flower and cup (being of a paler yellow) and beauty of colour, for it beareth neither of these equall vnto the former, but is in them all inferiour. And thus by this priuatiue, you may vnderstand his positio[n], and that shall be sufficient at this time.

*Narcissus Byzantinus totius latens*. Theyellow Turkie Daffodill.

Whereas the last described, came short of the beauty of the former, so this lacketh of that beauty is in the last; for this, although it haue very long leaues, and a high stalke, yet the flowers are neither so many, as not being aboue four or five, nor so large, being not much greater then the ordinary French Daffodill hereafter described, nor the colour so faire, but much paler, and the cup also smaller; and herein consisteth the chiefe differences betweene this, and both the other, but that the sent of this is also weaker:

The Place.

The first and the second grow in Barbary, about Argier, and Fez, as by the relation of them, that haue brought them into these parts; wee haue been enformed.

The last hath been often brought from Constantinople among other varieties of Daffodils, but from whence they received them, I could never learne.

The Time.

These Daffodils do flower very early, euen with the first sort of Daffodils, I meane after they haue been accustomed vnto our climate: for oftentimes vpon their first bringing ouer, they flower in Januari or February, especially if they be preserved from the frosts, and kept in any warme place; for they are very tender, and will loose perishe, being left abroad.

The Names.

The first is called by diuers in French, *Narcise d'Algiers*, and in many places

places of the Low Countries, *Narcissen van Heck*, or *Narcissus Heckium*; by diuers others *Narcissus Africanus aureus maior*, we may call it in English, The great Africke Daffodill, or the great Barbary Daffodill, or the great yellow Daffodill of Argiers, which you please.

The second hath no other variation of name, then a diminutive of the former, as is set downe in the title.

The third is no doubt the same, that Clusius setteth downe in the twelfth Chapter of his second Booke of the History of more rare plants, and maketh the fourth sort, which came from Constantinople, and may also be the same, which he maketh his fifth, which (as he saith) he receiued from Doctour Simor Tonar of Seuill in Spaine. Wee call it, from the place from whence we receiued it, *Narcissus Byzantinus*, with the addition of *totius latens*, to put a difference from other sorts that come from thence also: in English, The yellow single Daffodill of Turkie.

*Narcissus Sulphureus maior*. The greater Lemon coloured Daffodill.

The greater of these Daffodils, beareth three or foure greene and very long leaues, a foote and a halfe long at the least, among which riseth vp a round, yet crested stalke, not so high as the leaues, bearing fve or sixe single flowers thereon, every one of them being greater then the ordinary French or Italian Daffodils, with many flowers vpon a stalke; of a faint, but yet pleasant yellow colour at the first, which after they haue been in flower a fortnight or thereabouts, change into a deeper, or more sulken yellow colour: the cup in the middle is likewise larger, then in those formerly named, and of a deeper yellow colour then the outer leaues, haung onely three chives within it. The smell is very pleasant.

*Narcissus Sulphureus minor*. The lesser Lemon coloured Daffodill.

This lesser Daffodill hath broader and shorter leaues then the former, of the colour of other Daffodils, and not greene like the former: the stalke of this riseth vp higher then the leaues, bearing foure or fve flowers vpon shorter footestalkes, and no bigger then the French Daffodill, of a pale yellow, which most doe call a Brimstone colour, the cup or rather crowne in the middle, is small, and broad open, of a little deeper yellow, haung many chives within it, and is as it were sprinkled ouer with a kinde of mealiness. The smell of this is not full so pleasant as the former.

The Place.

Both these haue been gathered on the Pyrenean Mountaines, and both likewise haue been sent out of Italy.

The Time.

They both flower in the middle time of the Daffodils flowring, that is, in April.

The Names.

They haue their Latine names expressed in their titles, and so are their English also, if you please so to let them passe; or else according to the Latine, you may call them, The greater and the lesser Brimstone coloured Daffodils; some haue called them *Narcissus Italicus*, but the Italians themselves haue sent them by the name of *Narciso Solfarino*.

*Narcissus totius albus polyanthus*. The milke white Daffodill many vpon a stalke.

The leaues of this Daffodill are of a meane size, both for length and breadth, yet somewhat greener then in the ordinary sorts, that haue some whitenesse in them: the flowers

flowers are many vpon the stalke, as small for the most part, as any of these kindes that beare many together, being wholly of a milke, or rather snow white colour, beth the cuppe, which is small, and the outer leaues that compasse it; after which come small heads, wherein is contained round blacke seede, as all other Daffodils doe, although some greater, and others lesser, according to the proportion of the plants: the roote is couered ouer with a blackish skinne or coate; the smell is very sweete.

There are two other sortes more of this kinde, the differences whereof are, that the one hath his leaues somewhat broader, and the flowers greater then the former: And the other smaller leaues and flowers also, whose cups being small, are neuer seene fully open, but as it were halfe closed at the brimmes.

*Narcissus latifolius totus albus, mediocris calice reflexus.*  
The milke white Daffodill with the great cup.

There is yet another sort of these milke white Daffodils, whose leaues are as broad as any of the former, and whose cup in the middle of the flower, is somewhat larger then in any of the lesser sortes, and lesser then in the greater kinde: but the leaues of the flowers doe a little turne themselues vpwards, which maketh a chiefe difference.

The Place.

These Daffodils grow in Spaine, from whence I received many that flourished a while, but perished by some fierce cold Winters: they likewise grow in France, from whence many also have been brought vnto vs. They haue likewise been sent from Constantinople to vs, among other kindes of Daffodils.

The Time.

They that come from Constantinople, for the most part doe flower earlier then the other, euen after they are accustomed to our ayre. Some of them flower notwithstanding in the end of March, the rest in April.

The Names.

They are vsually called *Narcissus totus albus polyanthes*, adding thereunto the differences of *major*, *medius*, and *minor*, that is, The milke white Daffodill, the greater, the middle, and the lesser; for so some doe distinguishe them. The last, for distinction, hath his name in his title sufficient to expresse him.

1. *Narcissus Narbonensis, sive medio latens precox,*  
The early French Daffodill.

The leaues of this Daffodill, spring vp out of the ground a moneth or two sometimes before the other of this kinde, that follow; being also shorter, and narrower: the stalke likewise is not very high, bearing diuers flowers at the top, bteaking through a thinne skinne, as is viall with all the Daffodils, euery one whereof is small, consisting of six white leaues, and a small yellow cup in the middle, which is of a prettie small sent, nothing so strong as many others: the roote is great and round, and selome parteth into of-sets, euen as all the other that follow, bearing many single flowers, doe.

2. *Narcissus Narbonensis vulgaris.* The ordinary French Daffodill.

This Daffodill hath long and broad greene leaues, a little hollowish in the middle, and edged on both sides; the stalke is a foote and a halfe high, bearing at the toppe diuers flowers, somewhat larger then the former, consisting of six white leaues, somewhat round; the cup is yellow in the middle, small and round, like vnto an Acorne cuppe, or a little fuller in the middle: this is the forme of that sort which was first brought

1. *Narcissus Africanus aureus major.* The great yellow Daffodill of Africa. 2. *Narcissus Africanus aureus minor.* The lesser yellow Daffodill of Africa. 3. *Narcissus Narbonensis medio latens.* The French Daffodill. 4. *Narcissus Pisanus, sive totus albus.* The Italian Daffodill, or the all white Daffodill. 5. *Narcissus Major.* Majoris his Daffodill. 6. *Narcissus Anglicus polyanthes.* The great English Daffodill.

## The Garden of pleasant Flowers.

brought vnto vs : But since there is found out some, whose cup is shorter, others flatter, some of a paler, others of a deeper yellow colour, and some that haue their cuppe longer then the rest. The rootes of them all are couered with a blackish skin or coate.

### 3. *Narcissus Narbonensis maior amplio flore.* The French Daffodill with great flowers.

The leaues of this Daffodill are somewhat like vnto the last, but not so broad, yet full as long, and spring sooner out of the ground, yet not so early as the first of these kindes: the stalke hereof is flatter, and riseth higher, bearing foure or five flowers, much larger then any of this kinde; for every one of them doth equall the English Daffodill, before described, but whiter then it, and the yellow cup larger, and more open then in any of the rest. The roote of this is not so great, or round, as the former, but is more plentifull in of-ssets, then any other of these French, or Italian kindes.

### 4. *Narcissus Pisanus.* The Italian Daffodill.

This Italian Daffodill hath his leaues as large, or larger then the second French Daffodill, and his stalke somewhat higher, bearing many white flowers, very like vnto the common French Daffodill, but somewhat larger also; and the yellow cup in the middle likewise is larger, and rounder, then is vsually seen in any of the French kinds, except the last with the greatest flowers.

### 5. *Narcissus mediocris et polyanthos.* The French Daffodill with Saffron coloured cups.

This French Daffodill hath diuers leaues of a grayish greene colour, not so broad or long as the last recited Daffodill, but comming neerer vnto the second French kinde, the flowers likewise are white, and many vpon a stalke, like therunto, but the yellow cup is somewhat large, and circled with a Saffron like brimme or edge, which maketh the chiefeft difference.

### 6. *Narcissus mediocris alter, dictum Mustart.* Mustart his Daffodill.

The affinity between this & the last, (for it is not the same to be expressed vnder one title) hath made me ioyne it next vnto it, yet because it hath a notable difference, it deserueth a place by himselfe. The leaues are large and long, and the flowers, being white, are larger also then in any other, except the greatest, but the cup hereof is small and short, rather seeming a coronet then a cup, of a deepe Saffron colour allabout the brimmes or edges.

### 7. *Narcissus Anglicus polyanthos.* The great English Daffodill.

This Daffodill hath his leaues not much broader or longer, then the French kinde with great flowers, before described, the stalke with flowers riseth not fully so high as it, bearing many flowers theron, not altogether so white, yet whitet then the former English Daffodill, called Primrose Peerlesse, but nothing so large, and with short, broad, and almost round leaues, standing close one vnto another: the yellow cup in the middle is bowle fashion, being somewhat deeper then in any of the former kinds, but not much greater: the smel thereof is very sweete and pleasant.

### 8. *Narcissus Narbonensis, sive medio latius serotinus maior.* The greater late flowring French Daffodill.

The roote as well as the leaues of this Daffodill, are greater, larger, broader, and longer then in any other of the former French, or Italian kindes; the stalke is as high as any of them, bearing at the toppe foure or fixe white flowers, standing open spread like a starre, and not close together, euery one whereof is large, and round pointed,

## The Garden of pleasant Flowers.

the cup is yellow, small and short, yet not lying flat to the flower, but a little standing out with some threads in the middle, as all the former Daffodils haue. This is not so sweete as the earlier kindes.

### 9. *Narcissus medioluteus alter serotinus calice brevi.* The lesser late flowring French Daffodill.

This Daffodill is of the same kinde with the last described, the onely difference is, that it is lesser, and the yellow cuppe in the middle of the flower, is somewhat shorter then the former, although the former be shorter then many others, otherwise it differeth not, no not in time; for it flowreth late as the former doth.

### The Place.

These Daffodils haue been brought vs from diuers places: The first and second grow naturally in many places of Spaine, that are open to the Sea: they grow likewise about Moinpelier, and those parts in France. They haue been likewise sent among many other sorts of Daffodils from Constantynople, so that I may thinke, they grow in some places neere thereto.

The fourth groweth plentifully in Italy, about Pisa in Tuscane, from whence we haue had plants to furnish our Gardens.

The seventh is accounted beyond Sea to be naturall of our Country, but I know not any with vs that haue it, but they haue had it from them.

The rest haue been brought at diuers times, but wee know no further of their naturall places.

### The Time.

The first flowreth earlier then any of the rest by a moneth, even in the beginning of March, or earlier, if the weather be milde. The other in Aprill, some a little before or after another. The late kinds flower not vntill May.

### The Names.

There can be no more said of the names of any of them, then hath beeene set out in their titles, for they distinguishe euery sort as fitly as we can: onely some doe call the first two sorts, by the name of *Donax Narbonensis*.

After all these Daffodils, that hauing broad leaues beare single flowers, either one or many vpon a stalke, I shall now goe on to set forth those broad leaved Daffodils, that carry double flowers, either one or many vpon a stalke together, in the same order that we haue vised before.

### 1. *Narcissus album multiplex.* The double white Daffodill.

The leaues of this Daffodill are not very broad, but rather of a meane size, being of the same largeness with the leaues of the purple ringed Daffodill, the stalke riseth vp to be a foote and a halfe high, bearing out of a thinne white skinne or hose, one flower and no more, consisting of many leaues, of a faire white colour, the flower is larger then any other double white Daffodill, hauing every leafe, especially the outermost, as large almost as any leafe of the singel Daffodill with the yellow cup, or purple ring. Sometimes it happeneth, that the flower is very little double, and almost single, but that is either in a bad ground, or for that it hath stood long in a place without remouing; for then it hath such a great encrease of rootes about it, that it draweth away into many parts, the nourishment that shoulde be for a few: but if you doe transplant it, taking away the of-ssets, and set his rootes single, it will then thrive, and beare his flower as goodly and double, as I haue before described it: and is very sweete.

### 2. *Narcissus mediopurpureas multiplex.* The double purple ringed Daffodill.

There is little difference in the leaues of this kinde, from the leaues of the singel purple

ple ringed Daffodill; for it is probable it is of the same kinde, but by natures gift (and not by any humane art) made more plentiful, which abideth constant, and hath not that dalliance, which oftentimes nature sheweth, to recreate the senses of men for the present, and appeareth not againe in the same forme: the chiefest difference is, that the flower (being but sometimes one on a stake, and sometimes two) consisteth of six white outer leaues, as large as the leaues of the single kinde, hauing many small yellow peeces, edged with purple circles round about them, instead of a cup; and in the middle of these peeces, stand other six white leaues, lesser then the former, and a yellow cup edged with a purple circle likewise, parted into peeces; and they comprehend a few other white leaues, smaller then any of the other, hauing among them some broken peeces of the cup, with a few chives also in the middle of the flower. The flower is very sweete.

There is of this kinde another, whose flower hath not so plaine a distinction, of a triple rowe of leaues in it: but the whole flower is confusedly set together, the outer leaues being not so large, and the inner leaues larger then the former; the broken yellow cuppe, which is tipt with purple, running diuerly among the leaues; so that it sheweth a fairer, and more double flower then the former, as it is indeed.

3. *Narcissus medioluteus corona duplice.*  
The Turkie Daffodill with a double crowne.

This Daffodill hath three or four leaues, as large and long almost, as the great double Daffodill of Constantinople next following hath: the stalke likewise is very neere as great, but as high altogether, bearing at the toppe four or five flowers, the leaues whereof are as large, as of the first or second kinde of French Daffodils, before described, but not altogether of so pure a white colour; and being six in number, stand like the former single French Daffodils, but that the yellow cup in the middle of this is thicke and double, or as it were crumpled together, not standing very high to be conspicuous, but abiding lowe and short, so that it is not presently marked, vntesse one looke vpon it precisely; yet is exceeding sweete. The roote is like vnto the roote of the purple ringed Daffodill, or somewhat bigger.

4. *Narcissus Chalcedonicus flore pleno albo polyanthos.*  
The double white Daffodill of Constantinople.

This beautfull and goodly Daffodill (wherewith all Florists greatly desire to bee acquainted, as well for the beauty of his double flowers, as also for his superabounding sweete smell, one stalke with flowers being instead of a nofegay) hath many very broad, and very long leaues, somewhat greener then gray, among which riseth vp a strong round stalke, being sometimes almost flat, and ribbed, bearing four or five, or more white flowers at the toppe, every one being very great, large, and double, the leaues being confusedly set together, hauing little peeces of a yellow cup running among them, without any shew of that purple ring that is in the former, and fall away without bearing seed, even as all, or most other double flowers doe: the smell is so exceeding sweet and strong, that it will soone offend the senses of any, that shall smell much vnto it: the roote is great and thicke, couered with a blackish coate.

5. *Narcissus Chalcedonicus fimbriatus multiplex polyanthos.*  
The great double purple ringed Daffodill of Constantinople.

This Daffodill differeth very little or nothing in leafe from the former, the onely difference is in the flowers, which although they bee double, and bear many vpon a stalke, like vnto them, yet this hath the peeces of the yellow cuppes tipt with purple, as if they were shred or scattered among the white leaues, whereas the other hath only the yellow, without any shew of purple tips vpon them: the smell of this is as strong as of the other.

6. *Narcissus*

1. *Narcissus albus multiplex.* The double white Daffodill. 2. *Narcissus medioluteus corona duplice.* The Turkie Daffodill with a double crowne. 3. *Narcissus mediopurpureus multiplex.* The double purple ringed Daffodill. 4. *Narcissus chalcedonicus flore pleno albo polyanthos.* The double white Daffodill of Constantinople.

6. *Narcissus Cyprus flore pleno luteo polyanthos.*  
The double yellow Daffodill of Cyprus.

The leaues of this Daffodill are alnaost as broad and long as the former, the stalke is a foot high and more, bearing foure or five flowers on the top, euery one very double, and of a fine pale yellow colour, of a strong heady sent. The root of this is also like the former.

The Place.

The first of these Daffodils, was first brought into England by M<sup>r</sup>. Ioha de Franquicille the elder, who gathered it in his owne Countrey of Cambray, where it groweth wilde, from whose sonne, M<sup>r</sup>. John de Franquicille, now liuing, we all haue had it. The rest haue come from Constantinople at seuerall times; and the last is thought to come from Cyprus. Wee haue it credibly affirmed also, that it groweth in Barbary about Fez and Argiers. Some of the double white kindes grow in Candy, and about Aleppo also.

The Time.

The Turkie kindes doe for the most part all flower early, in the end of March, or beginning of Aprill at the furthest, and the first double, about the middle or end of Aprill.

The Names.

All these Daffodils, except the first, haue had diuers Turkish names set vpon the packets, wherein they haue been sent, but there is small regard of certainty to be expected from them; for that the name *Serincade*, without any more addition, which is a single Daffodill, hath beene imposed vpon that parcell of rootes, that haue borne most of them double flowers of diuers sorts; and the name *Serincade Catamer late*, which signifieth a double flowered Daffodill, hath had many single white flowers, with yellow cups, and some whose flowers haue been wholly white, cuppe and all, and some purple ringed, and double also among them. Their names, whereby they are knowne and called with vs, are, as fitly as may be, imposed in their titles: And this I hope shall suffice, to haue spoken of these sorts of Daffodils.

Hauing finished the discourse of the former sort of broad leafed Daffodils, it is fit to proceede to the next, which are *Angustifolios Narcissos*, those Daffodils that haue narrow leaues, and first to set downe those that bear single flowers, whether one or many flowers vpon a stalke, and then those that beare double flowers in the same manner.

*Narcissus Virginicus. The Virginia Daffodill.*

This plant I thought fittest to place here in the beginning of this *Classis*, not finding where better to shroud it. It hath two or three long, and very narrow leaues, as greene as the leaues of the great *Lewcium bulbosum*, and shining withall, which grow sometimes reddish, especially at the edges: the stalke riseth vp a spanne high, bearing one flower and no more on the head thereof, standing vpright like a little Lilly or Tulipa, made of six leaues, wholly white, both within and without, except that at the bottome next to the stalke, and a little on the backside of the three outer leaues, it hath a small dash or shew of a reddish purple colour: it hath in the middle a few chiuies, standing about a small head pointed; which head groweth to bee small and long, containing small blackish flat seede: the roote is small, long, and round, a little blackish on the outside, and white on the inside.

The

The Place.

This bulbous plant was brought vs from Virginia, where they grow abundantly; but they hardly thriue and abide in our Gardens to beare flowers.

The Time.

It flowreth in May, and seldom before.

The Names.

The Indians in Virginia do call it *Attamisco*, some among vs do call it *Liliorcissus Virginianus*, of the likenesse of the flower to a Lilly, and the leaues and roote to a Daffodill. Wee for breuity doe call it *Narcissus Virginicus*, that is, The Daffodill of Virginia, or else you may call it according to the former Latine name, The Lilly Daffodill of Virginia, which you will; for both names may serue well to expresse the plant.

*Narcissus angustifolius albidos praecox oblongo calice.*  
The early white narrow leafed Daffodill with a long cup.

This Daffodill hath three or foure narrow, long, and very greene leaues, a foote long for the most part: the stalke riseth not vp so high as the leaues, whereon standeth one flower, not altogether so great as the late flowered Daffodill, with a long cuppe, described before among the broad leafed ones, which consisteth of six pale coloured leaues, not pure white, but hauing a wash of light yellow among the white: the cuppe in the middle is round and long, yet not so long as to bee accounted a bastard Daffodill, within which is a middle pointell, compassed with six chiuies, hauing yellow mealy pendents.

The Place.

This Daffodill growtheth with the other sorts of broad leafed ones, on the Pyrenean Mountaines, from whence they haue beene brought vnto vs, to furnish our Gardens.

The Time.

It flowreth early, a moneth before the other sorts of the same fashion, that is, in the beginning of March, if the time be milde, which the other before spoken of doe not.

The Names.

It hath no other name that I know, then is expressed in the title.

2. *Narcissus mediocrceus tenuifolius.* The smal Daffodill with a Saffron crown.

This smal Daffodill hath foure or five narrow leaues about a spanne long, among which riseth vp a stalke some nine inches high, bearing at the toppe one smal white flower, made of six leaues, with a smal yellow cup in the middle, shadowed ouer at the brimmes with a Saffron colour: the roote is smal, round, and little long withall, couered with a blackish skinne or coate.

3. *Narcissus minimus mediopurpureus.* The least purple ringed Daffodill.

This little Daffodill hath small narrow leaues, shorter by much then any of the purple ringed Daffodils, before described: the stalke and flower keepe an equall proportion to the rest of the plant, being in forme and colour of the flower, like vnto the

Starre Daffodill before recited, but vnlke in the greatnessse: this also is to bee obserued, that the purple colour that circleth the brimmes of the cuppe, is so small, that sometimes it is not well perceived.

4. *Narcissus minimus tuncifolij flore.* The least Daffodill of all.

This least Daffodill hath two or three whitish greene leaues, narrower then the two last recited Daffodils, and shorter by halfe, being not aboue two or three inches long, the stalke likewise is not aboue three or four inches high, bearing one single flower at the toppe, somewhat bigger then the smalnesse of the plant should seeme to beare, very like vnto the least Rush Daffodill, and of the same bignesse, or rather somewhat bigger, being of a faint yellow colour, both leaues, and cup, or crowne, (if you please so to call it); for the middle part is spread very much, euen to the middle of the leaues almost, and lyeth flat open vpon the flower: the roote is small, euen the smallest of any Daffodill, and couered with a blackish skinne or coate.

The Place.

The first of these Daffodils haue beeene brought vs from the Pyrenæan Mountaines, among a number of other rare plants, and the last by a French man, called Francis le Veau, the honestest roote-gatherer that euer came ouer to vs. The second was sent to M<sup>r</sup>. Iohn de Franqueuille, before remembred, who imparted it to mee, as hee hath done many other good things; but his naturall place wee know not,

The Time.

They all flower about the latter end of Aptill.

The Names.

Being brought without names, wee haue giuen them their names according to their face and fashion, as they are set downe in their titles.

*Narcissus Autumnalis minor albns.* The little white Autumne Daffodill.

This little Autumne Daffodill riseth with his flowers first out of the grouad, without any leaues at all. It springeth vp with one or two stalkes about a finger long, every one bearing out of a small huske one small white flower, laid open abroad like vnto the Starre white Daffodill, before spoken of: in the middle of the flower is a small yellow cup of a meane size, and after the flower is past, there commeth in the same place a small head, containing small, round, blacke seede, like vnto the Autumne Hyacinth: the leaues come vp after the seede is ripe and gone, being small and narrow, not much bigger then the Autumne Hyacinth: the roote is small and blackish on the outside.

The Place.

This Daffodill groweth in Spaine, where Clusius saw it, and brought it into these parts.

The Time.

It flowreth in the beginning of Autumne, and his seede is ripe in the end of October in those hot Countries, but in ours it will scarce abide to shew a flower.

The Names.

The Spaniards, as Clusius reporteth, call it *Tonada*, and he vpon the sight thereof,

1. *Narcissus Virgineus.* The Virginian Daffodill. 2. *Narcissus minimus tuncifolij flore.* The least Daffodill of all. 3. *Narcissus Autumnalis minor albns.* The little white Autumne Daffodill. 4. *Narcissus alba Autumnalis medis oblongae.* The white Autumne Daffodill with a fallen crown. 5. *Narcissus tuncifolia maxima ample calice.* The great Banquilia with the largest flower or cup. 6. *Narcissus tenuis albns flore pleno Virginianus.* The double white Daffodill of Virginia.

## The Garden of pleasant Flowers.

thereof, *Narcissus autumnalis minor albus*, and wee in English thereafter,  
The little white Autumnne Daffodill.

*Narcissus albus Autumnalis medio obsoletus.*  
The white Autumnne Daffodill with a sullen crowne.

This Autumnne Daffodill hath two or three leaues at the most, and very narrow, so  
that some doe reckon it among the Rush Daffodils, being somewhat broad at the bot-  
tome, and more pointed at the toppe, betweene these leaues commeth vp the stalke,  
bearing vsually two flowers and no more at the toppe, made of sixe white leaues a  
peece, pointed and not round: the cup is small and round, like vnto the cup or crowne  
of the least Rush Daffodill, of a yellow colour at the bottome, but toward the edge of  
a dunne or sullen colour.

*Narcissus angustifolius luteus semper florens Caccini.*  
The yellow Italian Daffodill of Caccini.

This Daffodill beareth a number of small, long, narrow, and very greene leaues,  
broader then the leaues of any Rush Daffodill, among which rise vp diuers stalkes,  
bearing at the head two or three flowers a peece, each of them being small and yellow,  
the cup or crowne is small also, of a deeper yellow then the flower. The Nobleman of  
Florence, who first sent this plant to Christian Porret at Leyden, after the death of Ca-  
rolus Clusius, writeth that every stalke doth beare with him more store of flowers,  
then are formerly set downe, and that it neuer ceafeth to beare flowers, but that after  
one or moe stalkes haue been in flower together, and are past, there succeed other in  
their places.

### The Place.

The first is naturall of Spain, the naturall place of the other is not known  
to vs.

### The Time.

The times of the flowring, are set downe both in the title and in the de-  
scriptions; the one to be in Autumnne, the other to be all the Summer long.

### The Names.

The Latine names are imposed on them, as are fitteſt for them, and the  
laſt by that honourable man that ſent it, which is moſt fit to continue, and  
not to bee changed. But wee, to let it bee knowne by an English name to  
English people, haue entituled it, The yellow Italian Daffodill of Caccini:  
if any man can giue it a more proper name, I ſhall bee therewith right well  
content.

*Narcissus angustifolius, sine Iuncifolius maximus ample calice.*  
The great Iunquilia with the large flower or cup.

Although this Daffodill importeth by his name, not to be of this family, but of the  
next, confidering it ſo like vnto them, but bigger; yet I haue thought good to place  
it in the end of theſe narrow leafed Daffodils, as being indifferent, whether it  
ſhould bee referred to this or to that. For this carrieth diuers long greene leaues,  
like vnto the other Rush Daffodils, but thicker and broader, ſo that it may with-  
out any great errore, bee reckoned among theſe narrow leafed Daffodils, bearing at  
the toppe two or three very faire large flowers, with a large and more open cuppe,  
then in any other of the Rush Daffodils, both of them of a faire yellow colour, yet  
the cuppe a little deeper then the flower, and a little crumpled about the edges, and  
hath a pretty sharpe ſent: the roote is greater and longer then the other Rush Daffo-  
dill, and couered likewife with a blackiſh coate.

The

## The Garden of pleasant Flowers.

### The Place.

We haue this in Gardens onely, and haue not heard of his naturall place.

### The Time.

It flowreth in Aprill.

### The Names.

I leaue it indifferent, as I ſaid, whether you will call it *Narcissus angusti-*  
*folius*, or *Iuncifolius magnocalice*, or *maximus*, because it is the greatest of all  
the reſt of that kinde.

*Narcissus totus albus flore pleno Virginianus.*  
The double white Daffodill of Virginia.

The roote of this Daffodill, is very like vnto the former ſingle Virginia Daffodill,  
ſet forth in the firſt place of this ranke of narrow leafed Daffodils, but that it is a little  
bigger and rounder, being a little long withall, and blackiſh alſo on the outside, as  
that is: from whence riſeth vp two leaues, ſomewhat broader then the former: but of  
a like greenaſſe: the stalke riſeth vp betweene theſe two leaues, about a ſpan high, or  
not much higher, bearing one faire double ſnow white flower, very like in the falſion  
vnto the pale yellow double Daffodill, or baſtard Daffodill of Robinus, hereafter de-  
ſcribed: For it is in the like manner laid open flat, and composed of ſix rowes of  
leaues, every rowe lying in order iuft oppofite, or one before another, whereof those  
ſix leaues that make the firſt or outermoſt courſe, are the greatest, and all the reſt lying,  
as I ſaid, one vpon or before another, are every rowe ſmaller then others from the  
middle of this flower, thrifther forth a ſmall long pointed forke or horne, white as  
the flower is.

### The Place.

The place is named to be Virginia, but in what part it is not known to vs.

### The Time.

It flowreth in the end of Aprill.

### The Names.

It may be that this doth grow among the former ſingle kinde, and called  
by the ſame name Attramusco, for that the plant is not much differing, yet  
hereof I am not certayne: But we, from the forme and countenance of the  
plant, doe call it *Narcissus Virginianus*, The Virginian Daffodill, and be-  
cause it beareth a double flower, it hath the title of double added vnto it.

The third order of Daffodils, I ſaid in the beginning, was of *Iuncifolios*, Rush Daffo-  
dils, which are now next to be eutreated of, I ſhall herein keepe the ſame order I vſed  
in the former; but because I finde none of this order, that beare but one flower vpon a  
ſtalke, I muſt begin with thoſe that beare many.

1. *Narcissus Iuncifolius albus*. The white Iunquilia.

This white Rush Daffodill hath ſmall long leaues, a little broader, and of a whi-  
ter greene colour then the ordinary yellow Rush Daffodils: the stalke riſeth vp  
halfe a foote high or more, bearing two or three ſmall white flowers vpon a  
ſtalke, yet ſomewhat bigger then the common yellow Rush Daffodill, haſing a  
ſmall round cuppe in the middle, white alſo as the leaues are. The ſeede is ſmall,  
blacke,

blacke, and round, as other seedes of Daffodils are: the roote is small and round, couered with a blackish coate.

*Narcissus Iuncifolius albus magno calice.* The white Iunquilia with a great cup.

There is of this kinde another sort, that hath the cup in the middle of the flower, a little larger then the other, but in all other things alike.

2. *Narcissus Iuncifolius flore albo reflexo.*

The white turning Iunquilia, or Rush Daffodill.

This turning white Daffodill hath foure or fve long greene leaues, yet shorter and broader then the ordinary yellow Iunquilia, and fully as greene also, from among which riseth vp a slender greene stalke, a foote high, bearing out of a thinne skinne huske, three or foure, or more snew white flowers, standing vpon long greene foot-stalkes, evry flower hanging downe his head, and turning vp his six narrow and long leaues, even to the very foot-stalke againe: from the middle of the flower hangeth downe a long round cuppe, as white as the leaues, within which are contained three small white chives, tipt with yellow, and a small long pointell, thrusting out beyond the brimmes of the cup: after the flowers are past, there come vp in their places small three square heads, wherein is contained very small, round, and blacke shining seede: the roote is small, round, and a little long withall, couered with a blackish browne coate or skin. The flower is quite without any good sent, or indeed rather none at all.

3. *Narcissus Iuncifolius flore lateo reflexo.*

The yellow turning Iunquilia, or Rush Daffodill.

The leaues of this Rush Daffodill are greater and longer then the former, and of a paler greene colour: the stalke riseth somewhat higher, bearing two or three flowers thereon wholly of a gold yellow colour, both the cuppe and the leaues that turne vp againe.

4. *Narcissus Iuncifolius calice albo reflexis folijs latis.*

The yellow turning Iunquilia with a white cup.

This Daffodill hath his long rush-like leaues standing vpright as the former, betweene which riseth vp a greene stalke, about a foote high or more, bearing two or three flowers thereon, whose turning leaues are of a faire pale yellow, and the cuppe pale white, and not so pure a white as the former.

5. *Narcissus Iuncifolius calice lateo reflexis folijs albis.*

The white turning Iunquilia with a yellow cup.

As the last had the leaues of the flower that turne vp againe yellow, and the cuppe whitish, so this hath contrariwise the turning leaues of a whitish yellow, and the long cup yelow, else in his long green leaues, or any other thing, there is small difference.

6. *Narcissus Iuncifolius latens magno calice.*

The Iunquilia, or Rush Daffodill with a great cup.

This Rush Daffodill bath bigger leaues, and longer then the ordinary yellow Rush Daffodill, being a little flat on the one side, and round on the other, but of the same greennesse with all the rest: the stalke riseth vp two foote high, bearing two, and sometimes three flowers thereon, being of a faire yellow colour, with a large open cup in the middle, of a little deeper yellow colour, like vnto the great Iunquilia with the large flower, before set downe, whereof this is a kinde, no doubt; but that is larger and greater then this, both in leafe, flower, cup, &c. and this onely somewhat lesse in all parts then that.

7. *Narcissus*

1. *Narcissus Iuncifolius albus.* The white Iunquilia. 2. *Narcissus Iuncifolius flore albo reflexo.* The white turning Iunquilia. 3. *Narcissus Iuncifolius calice albo reflexis folijs latis.* The yellow turning Iunquilia. 4. *Narcissus Iuncifolius latens magno calice.* The yellow Iunquilia with a great cuppe. 5. *Narcissus Iuncifolius flore lateo reflexo.* The ordinary yellow Iunquilia. 6. *Narcissus Iuncifolius aureo multiplo.* The golden double-flowered Daffodil. 7. *Narcissus Iuncifolius flore plena.* The double Iunquilia.

7. *Narcissus Iuncifolius luteus vulgaris major.*  
The ordinary Lunquilia, or Rush Daffodill.

This ordinary Rush Daffodill hath foure or five long greene round leaues, like vnto Rushes, whereof it tooke the name : among these leaues riseth vp the stalke, round and greene, a foote and a halfe high very often, bearing at the toppe three or foure flowers all yellow, but much smaller then the last, and so is the cup also : the seede is small and blacke, inclofed in small cornered heads; the roote is blackish on the outside. The smell of the flower is very sweete in all these sorts of Rush Daffodils.

8. *Narcissus Iuncifolius luteus medium.* The smaller Lunquilia, or Rush Daffodill.

The leaues of this Daffodill are like vnto the former, but smaller and rounder, the stalke riseth not vp so high, nor are the flowers so great, but the leaues of the flower are a little rounder, and not so pointed as in the former, in all things else alike, sauing lesser.

9. *Narcissus Iuncifolius luteus minor.* The least Lunquilia, or Rush Daffodill.

This least Daffodill hath five or six small greene leaues, a little broader, and not so long as the last, among which riseth vp a stalke almost a foote high, bearing one or two small flowers at the toppe, of a paler yellow colour then the former, with a yellow open cuppe, or crowne rather in the middle, bigger then in either of the last two : the roote is very small and blacke, like vnto the last in roundnesse and colour.

10. *Narcissus Iuncifolius luteus albanticibus lineis distinctis.*  
The yellow Lunquilia, or Rush Daffodill with white lines.

This Rush Daffodill hath round, greene, and long leaues, like vnto the ordinary Rush Daffodill, with a stalke bearing two or three yellow flowers, hauing leaues somewhat round at the point or end, with a line or stroke of white in the middle of euerie one of them, the cup is short, and crowne fashion, a little crumpled about the brims : the seede, roote, or any thing else differeth not.

11. *Narcissus Iuncifolius Autumnalis flore viridi.*  
The Autumnne Rush Daffodill with a greene flower.

This strange Rush Daffodill (I call it strange, not onely because it differeth from all others of this kinde, but also because there are but few in these parts that haue had it, and fewer that doe still enjoy it, in that it is perished withall that had it) hath but one onely leafe, very long, round, and greene, in all that euer I saw growing, which beareth no flower while that greene leafe is fresh, and to bee seene ; but afterwards the stalke riseth vp, being like vnto the former greene leafe, round, naked, and greene vp to the toppe, where two or three flowers breake forth out of a small thin skinne, every one consisting of six small and narrow greene leaues, very sharpe pointed at the end, and as it were ending in a small pricke or thorne : in the middle whereof is a small round cup, or rather crowne, of the same colour with the leaues and stalke, which flower smellet very sweete, somewhat like vnto the rest of the Rush Daffodils : this sheweth not his flower vntill October, and the frosts quickly following after their flowering, cause them soone to perish.

12. *Narcissus angustifolius aureus multiplex.*  
The golden double narrow leafed Daffodill.

The leaues of this Daffodill are very narrow, and of a whitish greene colour, not aboue foure or five inches long, from among which riseth vp a stalke about a foote high, bearing at the top one flower, consisting of some outer leaues, which are of a yellow

low colour, and of many other leaues in the middle being smaller, and set thicke and round together of a more yellow gold colour, but with some whiter leaues among them, the middle part a little pointing forth : the flower standeth long before it doth perfect his colour, and abideth long in flower before the colour decay : the roote is in fashion almost like the ordinary Lunquilia, or Rush Daffodill. I acknowledge this Daffodill hath not his proper place ; but because the figure is set in this table, let it thus passe at this time.

13. *Narcissus Iuncifolius luteus flore pleno.* The double Lunquilia, or Rush Daffodill.

The double Rush Daffodill hath his long greene leaues round, like the leaues of the common or ordinary Rush Daffodill, and of the same bignesse, among which riseth vp a long slender greene stalke, bearing two or three, seldome more small flowers, yellow and double, that is, with diuers rowes of leaues, hauing the yellow cup such as is in the single flower, broken into small shreads or peeces, running among the leaues of the flower, which peeces in some flowers are not so easily seene, being smaller then in others, this beareth no button or head vnder the flower for seede, his rooté is round and blackish, browne on the outside, so like vnto the common Rush Daffodill, that it is almost impossible to know the one from the other.

There is another of this kinde, whose flowers are smaller, and not so double, one, alter minus, two, or three at the most vpon a stalke, and of lesse beauty by much.

The Place.

All these Rush Daffodils, doe for the most part grow in Spaine and France, and on the Pyrenæan Mountaines, which are betweene Spaine and France, which Mountains are the Nourseries of many of the finest flowers, that doe adorne the Gardens of these louers of natures pride, and gathered in part by industrious, learned, generous men, inhabiting neare thereunto, and in part by such as make a gaine of their labours, bestowed vpon these things. Only that with the greene flower was gathered in Barbary, and imparted vnto vs from France.

The Time.

They flower in the Spring, that is, in March and Aprill, except such whose time is set downe to be in Autumne.

The Names.

Their names are specified in their titles, and therefore I shall not need to set downe any further repetitions.

To conclude therefore this discourse of true Daffodils, there remaineth to speake of the Sea Daffodils, which (as I said in the beginning) is but one, that is frequent, and doth abide with vs. But there bee some others found about the Cape of good Hope, and in the West Indies, and brought into these parts rather for ostentation, then continuall, where they haue flowered onely once (if peraduenture so often) so that being such strangers, of so remote Countries, and of so diuers natures, I shall but shew you some of them, rather cursorily then curiously, and but onely for your satisfaction, giue you knowledge of two or three of them, that there haue beeene seene such in flower, and that they are scarce to bee seene againe, except they bee fetcht a new euery year, that they be seene.

*Narcissus Marinus, sive tertius Matthioli.*  
The great white Sea Daffodill, or Matthiolius his third Daffodill.

The roote of this Daffodill by long continuall, standing in one place without being remoued, groweth to be much greater and larger, then any other Daffodill whatsoeuer,

soeuer, and as bigge as any meane Squilla or Sea Onion roote, hauing many long, thicke, and white fibres, or long rootes, diuersly branched, and spread vnder the vpper part of the earth, beside some others that grow downward, and perish not every yeaer, as the fibres of all, or most of the other Daffodils doe; and therefore this plant will not thriue, and beare flowers, if it be often transplanted, but rather desire to abide in one place without remouing, as I said, and that not to be ouershadowed, or couered with other herbes standing too neare it, which then will flourish, and beare abundantly: from this roote, which is couered with many blackish coates, ariseth six or seuen, or more leaues, twice so broad almost, as any of the former Daffodils, but not so long by halfe as many of them, being but short, in comparision of the breadth, and of a white greene colour, from the middle of which leaues, as also from the fides sometimes, springeth vp one or two, or more stalkes, roundish and thicke, and sometimes a little flat and cornered, a foote high or somewhat more, bearing at the toppe, out of a skinnie huske, eight, ten, twelve, or more very large flowers, consisting of six white leaues a peice, spread or laid open, with a white shart cuppe or crowne in the middle, lying flat vpon the leaues, cut or diuided into six corners (and not whole, as the cuppe or crowne of any other single Daffodill) from every of which edges, or corners of this cup or crowne, standeth one white long thread, a little crooked or turning vp at the end, tipt with a yellow pendent, and some other white threads tipt with yellow pendents, standing also in the middle: after the flower is past, there come vp great three square heads, wherein the seede is contained, which is great, blacke, and round, like vnto the seede of other Daffodils, but greater: the flower hath a reasonable good sent, but not very strong.

#### The Place.

It was first found by the Sea side, in the Isle of Sardinia, and on the high Mountaines also of the same Isle, where it hath borne by report, thirty five flowers vpon a stalke: it growth likewise about Illyricum, and in diuers other places.

#### The Time.

It springeth later out of the ground then any other Daffodill, that is to say, not vntill the later end of March, or beginning of April, and flowreth in the end of May, or the beginning of Iune: the seede is ripe in the end of July, or beginning of August.

#### The Names.

The first that hath made mention of this Daffodill, was Matthiolus, who placed it in the third place among his Daffodils, and is most vsually now adayes called, *Narcissus tertius Matthioli*, Matthiolus his third Daffodill, the rather, because Clusius vpon a more mature deliberation, first referred it thereunto, but called it at the first, *Lilioracissus Hemerocallidis facie*, and, as hee saith, Iacobus Plateau (who first sent him the figure hereof, with the description) called it *Lilioracissus Orientalis*, but Clusius vpon certaine information, that it grew in the places aforesaid, mislikē the name of *Orientalis*, and added *Hemerocallis*, which yet is not fit, for that his *Hemerocallis Valentina*, is a plaine Pancration or Sea bastard Daffodill, whose middle cup is longer then the cup of any true Daffodill, which (as I said in the beginning of this Chapter) is the chiefeſt note of difference, betweene a true and a bastard Daffodill. I received the seede of this Daffodill among many other seedes of rare plants, from the liberality of M<sup>r</sup>. Doctor Flud, one of the Physicians of the Colledge in London, who gathered them in the Vauetutis Garden at Pisa in Italy, and brought them with him, returning home from his trauailes into those parts, by the name of *Martagon rarisimum*, (and hauing sowne them, expected fourteene yeaers, before I saw them beare a flower, which the first year that it did flower, bore foure stalkes of flowers,

1. *Narcissus tertius Matthioli*. The great white Sea Daffodill. 2. *Narcissus Indicus Autumnalis*. The Indian Autumn Daffodill. 3. *Narcissus maurus Africana*. The Sea Daffodill of Africa. 4. *Narcissus maurus ex-similis*. The strange Sea Daffodill.

flowers, with every one of them eight or ten flowers on them) which of all other names, doth least answer the forme or qualities of this plant. It may most fitly be called *Narcissus marinus maximus*, in English, The great Sea Daffodill, both because it is a true Daffodill, and the greatest of all other, and also because it hath not been found, but in Islands, or else in other places neare the Sea. Lobelius entituleth it *Pancratium Indicum alterum vernum*, sive *Narcissus Indicus alter facie Pancratij Monspeliaci*, but all this is wide from the matter, as may easily be known, by that that hath been said before. It is generally (as I said before) called of all *Narcissus tertius Matthiolii*, Matthiolus his third Daffodill, which may either so passe with vs, or as I called it, The great Sea Daffodill, which you will, & so Clusius doth lastly entitle it.

**1. *Pancratium Indicum, aut Narcissus Indicus Autumnalis quorundam Lobeli.***  
The Indian Autumne Daffodill of Lobel.

This plant hath in my opinion, a farre nearer resemblance vnto an Hyacinthus, then vnto any Daffodill: But because Lobel hath so set it forth, I will so publish it vnto you, leauing it to judgement. The roote is, as he saith, a span long, and of the thicknesse of a mans arme, couered with many white shells, whereof the outermost are of a darke red or Chesnut colour: the flowers rise vp in September, and October, being eight or ten in number, every one by it selfe vpon a small footstalke, made of six leaues a peece, somewhat long, narrow, and pointed, like vnto the flowers of the English Colchicum, or Medowe Saffron, of a whitish yellow dunne colour, with six long threads in the middle: the greene leaues are long and broad, and broad pointed.

**2. *Narcissus Marinus Africanius, sine Exoticus Lobeli.***  
The Sea Daffodill of Africa.

The roote of this strange plant (which of some likenesse is called a Daffodill) is very great, made as it were of many scaly cloues, from whence riseth vp a small short stalke, bearing hard aboue the ground two faire broad greene pointed leaues, more long then broad, so compassing the stalke at the bottome, that it seemeth to run through them: the stalke is spotted with diuers discoloured spots, and is bare or naked from these two leaues vnto the toppe, where it beareth one faire double flower, like vnto a double Aueruncle, of a delayed reddish colour, tending to a blush, with many threads set about the middlehead.

**3. *Narcissus Marinus Exoticus.* The strange Sea Daffodill**

This strange Sea Daffodill, hath fife or six large and long leaues of a pale greene colour, from among which riseth vp a strong and bigge stalke, bearing at the toppe, out of a thinne hose or skinne, many very large flowers, made of six long and pointed leaues apeece, of a blewisch purple colour, with a large round open cup in the middle, of a fadder colour then the leaues: the roote is very great, yet like vnto other great Daffodils, the outer skins whereof are of a darke browne colour.

**The Place.**

The Indian Daffodils grew in the vpper part of Hispaniola in the West Indies, and brought hither, where they all soone perisched.

The other grew neare the Cape of good Hope, and was brought into the parts of Holland and thereabouts, from whence we had it, & perished alio.

The last is unknowne where it was gathered.

**The Time.**

The first flowred in Autumne, as it is said.

The other in the first Summer of their bringing.

And so did the last, but the same rootes will not flower with vs againe.

The

**The Names.**

So much hath been said of their names in their titles, as hath come to our knowledge; and therefore let that suffice.

Thus hauing gone through the whole Family of the true Daffodils, (for so much as hath come to our knowledge) and set them downe euery one by his name, and in his order; it is fit that we speake of their bastard brethren, and shew you them also, in the same order held with the former, as neare as the plenty of variety herein, which is not the like with the former, will give leaue, that when you know them both by face and name, you may the better know to place or distinguishe of others, that haue not passed vnder this rod.

***Pseudonarcissus aureus Hispanicus maximus.***  
The great yellow Spanish bastard Daffodill.

The roote of this kinde of Daffodill is reasonable great, and blackish on the outside, desiring to be deepe in the ground; and therefore will runne downe, where it will then encrease into many of-slets, from whence rise vp many thicke, long, and stiffe leaues, of a grayish greene colour, among which riseth vp a round strong stalke, sometimes three foote high or better, bearing at the toppe one onely faire great yellow flower, standing forth right, and not pendulous, consisting of six short and somewhat broad leaues, with a very great, large, and long trunke, of an equall largenesse, but open at the mouth, and turning vp the brimmes a little, which are somewhat crumpled: after the flower is past, there commeth in the place a three square head, containing round blacke seede, like vnto other Daffodils.

***Pseudonarcissus Pyrenaeus Hispanico & Anglico similis.***  
The Mountaine bastard Daffodill of diuers kindes.

There is much variety in this kinde of bastard Daffodill: For one sort hath verie broad and whitish greene leaues, somewhat short in comparison of others, that are of that breadth: the flower is wholly yellow, but a little paler then the former Spanish kinde, hauing the leaues of his flower long, and somewhat narrow, standing like wings about the middle trunke, which is as long as the leaues, and smaller then in many other of this kinde, but a little yellower then the wings. Another sort hath narrower green leaues then this last, and longer, the flower is all yellow, but the trunke is larger, wider, and more open at the mouth then the former, and almost as large as the former Spanish, but not so high as the last. A third hath the wings of the flower of a Straw colour, but the trunke is long and narrow, of a faire yellow. A fourth hath such like flowers, but that it is shorter, both the wings and the trunke: Some likewise haue the wings of the flower longer, then the long trunke, and some shorter. Some also are all yellow, and some haue their wings onely a little more pale or white, like the English kinde: Some againe haue their trunks long and narrow, others haue them larger and wider open, and crumpled at the brimmes; so that it is needlesse, to spend a great deale of time and labour vpon such smally respected flowers, but that in the beholding of them, we may therein admire the worke of the Creatour, who can frame such diuersty in one thing: But this is beside the text, yet not impertinent.

***Pseudonarcissus pallidus praecox.* The early Straw colour'd bastard Daffodill.**

The leaues of this Daffodill are of a meane size, betweene the broadest and the narrower kindes, of a grayish greene colour, and not very long: the stalke riseth vp a foot high or more, wheron standeth one large great flower, equaling the greatest Spanish bastard Daffodill, before described, in the largenesse of his trunke, and hauing the brimmes turned vp a little, which maketh it seeme the larger: the wings or outer leaues are in a maner as short, as they are in the greatest Spanish kinde, (and not long flagging down, like vnto the Mountain kinds) and stand straight upright: all the whole flower is

## The Garden of pleasant Flowers.

of one even colour, that is, of a fine pale yellow, somewhat like vnto the colour of a Lemon peele or rinde, but somewhat whiter, which vsually we call a Straw colour: the greatnessse of the flower, the earlinesse of the flowring, and the difference of colour from all the rest of this kinde, hath made me entreate of it apart by it selfe, as being no lesse worthy.

*Pseudomarcissus Hispanicus* flore albo maior.  
The great white Spanish bastard Daffodill.

This bastard Daffodill hath diuers leaues rising vp together, long and broad, somewhat like vnto the first Spanish kinde, but a little broader, and of a whiter greene colour, yet not so white, as in the lesser Spanish white kindes, hereafter described: among these leaues riseth vp a round strong stalke, about two foote high, bearing one white flower at the toppe, bending downe the head, as all these white kindes doe, but is not of so pure a white, as the lesser kindes that follow, yet whiter then the greatest white Spanish kinde, next of all to be described: the whole flower, as well trunke as wings, is much larger then the lesser white kindes, and almost equalling the first Spanish yellow, but a little longer and narrower, a little crumpled and turning vp at the brimmes: the head and seede are like the first; the roote is greater and thicker then the first Spanish, and doth nor encrease so much, nor is couered with a blacke, but rather with a whitish coate.

*Pseudonarcissus Hispanicus maximus albidus.*  
The greatest Spanish white bastard Daffodill.

This kinde of bastard Daffodill is very like the last mentioned Daffodill , both in leaues and flowers, but larger in both : the flower of this is not full so white, but hath some shew of paleness therein, and more vpon the first opening of the flower then afterwards, and is as great altogether , as the great Spanish yellow , at the least with a longer, and somewhat narrower trunke : the seede is like vnto the former, and so is the roote also, but greater, being white on the outside, and not blacke.

*Pseudonarcissus Hispanicus* flore albo medius & minor.  
The two lesser white Spanish bastard Daffodils.

There are two other of these kindes of white Spatish Daffodils, one greater or lesser then the other, but neither of them so great as the former. The leaues of both are of a whitish greene colour, one a little broader then the other: the flowers of both are pure white, and bending downe the heads, that they almost touch the stalke againe, the greater flower hath the longer and narrower trunke; and the lesser flower, the shorter and wider open, yet both a little crumpled at the edges or brimmes: the rootes of both are like one vnto another, but differ in the greatness. From the seede of these haue sprung much variety, few or none keeping either colour or height with the mother plants.

*Pseudonarcissus Anglicus vulgaris*. Our common English wilde bastard Daffodill.

This bastard Daffodill is so common in all England, both in Cōpses, Woods, and Orchards, that I might well forbear the description thereof, and especially, in that growing wilde, it is of little respect in our Garden: but yet, lest I bee challenged of ignorance in common plants, and in regard of some variety therein worth the marking, I will set downe his description and variety as briefly as I may: It hath three or foure grayish greene leaues, long and somewhat narrow, among which riseth vp the stalke, about a span high or little higher, bearing at the toppe, out of a skinne huske, as all other Dafodils haue, one flower (although sometimes I haue seene two together) somewhat large, hauing the six leaues that stand like wings, of a pale yellow colour, and the long trunke in the middle of a faire yellow, with the edges or brimmes a little crumpled or vneuen: after the flower is past, it beareth a round head, seeming three square, containing round blacke seede; the roote is somewhat blackish on the outside.

## *The Garden of pleasant Flowers.*

<sup>1</sup> *Pseudomericis Hispanicae serena*. The great yellow Spanish bastard Daffodill. <sup>2</sup> *Pseudomericis Pyrenaicae serena*. The Moratina bastard Daffodill of lower states. <sup>3</sup> *Pseudomericis Hisp. maior atra*. The greater white Spanish bastard Daffodill. <sup>4</sup> *Pseudomericis Hispanicae minor atra*. The lesser Spanish white bastard Daffodill. <sup>5</sup> *Pseudomericis tubo scandens*. The fix cornered bastard Daffodill. <sup>6</sup> *Pseudomericis majorina serena*. *H. serena* *Rufa* *Trifolia*. *Ori* Tra-leads-ent great Rose Daffodill. <sup>7</sup> *Pseudomericis serena Anglicus maximus*. Master Wilmers great double Daffodill. <sup>8</sup> *Pseudomericis Hispanicae serena plena*. The double Spanish Daffodill, or Parkinson's double Daffodill. <sup>9</sup> *Pseudomericis Gallicus maior atra plena*. The greater double French Daffodill. <sup>10</sup> *Pseudomericis Anglicus serena plena*. The double English Daffodill, or Gerard's double Daffodill.

## The Garden of pleasant Flowers.

But there is another of this kinde like vnto the former, whose further description you haue here before; the wings of which flower are much more white then the former, and in a manner of a milke white colour, the trunke remaining almost as yellow as the former, and not differing in any thing else.

### *Pseudonarcissus tubo sexangulari.* The six cornered bastard Daffodill.

This kinde of Daffodill hath two or three long, and somewhat broader leaues then the last, between which commeth forth a stalke, bearing one flower somewhat large, hauing the six outer leaues of a pale yellow colour, and the long trunke plaited or cornered all along vnto the very edge into six parts, of a little deeper yellow then the wings.

#### The Place.

The first great Spanish kinde was brought out of Spaine. The rest from the Pyrenæan Mountaines, onely the last sauing one is plentiful in our owne Countrey, but the white sort of that kinde came with the rest from the same Mountaines.

#### The Time.

The pale or third kinde, and the English bee the most early, all the rest flower in Aprill, and the greatest yellow somewhat earlier, then the other greater or lesser white.

#### The Names.

Their settall names are expressed in their titles sufficient to distinguish them, and therefore there needeth no more to be said of them.

### 1. *Pseudonarcissus aureus maximus flore pleno, sive Rosæ Tradescanti.*

The greatest double yellow bastard Daffodill, or John Tradescant his great Rose Daffodill.

This Prince of Daffodils (belongeth primarily to John Tradescant, as the first founder thereof, that we know, and may well bee entituled the Glory of Daffodils) hath a great round roote, like vnto other Daffodils, couered with a brownish outer skinne or peeling, from whence riseth vp four or five somewhat large and broad leaues, of a grayish greene colour, yet not fully so long and large as the next following Daffodill: from the middle whereof riseth vp a stalke almost as high and great as it, bearing at the toppe (out of a skinne huske) one faire large great flower (the budde, before it breaketh open, being shorter and thicker in the middle, and ending in a longer and sharper point then any of the other Daffodils) very much spread open, consisting of smaller and shorter leaues then the next, but more in number, and thicker and rounder set together, making it seeme as great and double as any Prouince Rose, and intermixt with diuers yellow and pale leaues, as were in rowes one vnder another. It abideth long in flower, and spreadeth, by standing long, to be the broadest in compasse of any of the Daffodils, but falleth away at the last without giving any seede, as all double Daffodils doe.

### 2. *Pseudonarcissus aureus Anglicus maximus.* M<sup>r</sup>. Wilmers great double Daffodill.

The other great double Daffodill doth so neare resemble our ordinary English double kinde, that I doe not finde therein any greater difference, then the largenesse both of leaues and flowers, &c. and the statelynesse of growth. It beareth three or four large, long, and broad leaues, somewhat longer and broader then the former, and of a whitish greene colour: the stalke riseth to bee two foote high, growing (in a fruitfull and fat soyle) strong, and somewhat round, bearing at the toppe, out of a thin skinne, one great and faire double flower, each leafe whereof is twice as large and broad

## The Garden of pleasant Flowers.

broad as the former, diuerely intermixt with a rowe of paler, and a rowe of deeper yellow leaues, wholly dispersed throughout the flower, the pale colour as well as the deeper yellow, in this as in the other small English kinde, growing deeper by standing: sometimes the leaues hereof are scattered, and spread wholly, making it shew a faire, broad, open flower: and sometimes the outer leaues stand separate from the middle trunke, which is whole and vnbroken, and very thicke of leaues: and sometimes the middle trunke will bee halfe broken, neither expressing a full open double flower, nor a close double trunke, as it is likewise scene in the small English kinde, as shall bee declared in his place: this beareth no seede; the roote hereof is thicke and great, and increaseth as well as any other Daffodill.

### 3. *Pseudonarcissus aureus Hispanicus flore pleno.*

The great double yellow Spanish bastard Daffodill, or Parkinsons Daffodill.

This double Spanish Daffodill hath diuers leaues rising from the roote, stiffer, narrower, and not of so whitish greene colour as the former, but more full or grayish, plainely resembling the leaues of the single great kinde, from whence this hath risen: the stalke hereof likewise riseth almost as high as it, and neare the height of the last recited double, bearing one double flower at the toppe, alwayes spread open, and never forming a double trunke like the former, yet not so faire and large as it, the outermost leaues whereof being of a greenish colour at the first, and afterward more yellow, doe a little turne themselves backe againe to the stalke, the other leaues are some of a pale yellow, and others of a more gold yellow colour, those that stand in the middle are smaller, and some of them shew as if they were hollow trunked, so that they seeme to be greenish, whitish, yellow, and gold yellow, all mixed one among another: the root is great, round, and whitish on the inside, couered with darke coloured skinnes or peeling. I thinke none ever had this kinde before my selfe, nor did I my selfe euer see it before the yeare 1618. for it is of mine own raising and flowing first in my Garden.

### 4. *Pseudonarcissus Gallicus major flore pleno.*

The greater double French bastard Daffodill.

This greater double Daffodill, hath his whitish greene leaues longer and broader then the smaller French kinde, hereafter following, to bee described, and broader, longer, and more limber then the double English kinde: the stalke riseth vp not much higher, then the smaller French kinde, but a little bigger, bearing at the top one great double flower, which when it is fully and perfectly blowne open (which is but seldeome; for that it is very tender, the leaues being much thianer, and thereby continually subiect, vpon any little distemperature of the time, to cleave so fast one vnto another, that the flower cannot blow open faire) is a faire and a goodly flower, larger by halfe then the smaller kinde, and fuller of leaues, of the same pale whitish yellow, or Lemon colour, with the lesser, or rather a little whiter, and not set in the same order of rowes as it is, but more confusedly together, and turning backe the ends of the outermost leaues to the stalke againe, and hauing the bottome of the flower on the backside somewhat greene, neither of which is found in the lesser kinde: the roote is very like vnto the lesser kinde, but a little bigger and longer.

### 5. *Pseudonarcissus Anglicus flore pleno.*

The double English bastard Daffodill, or Gerrards double Daffodill.

The leaues of this double Daffodill are very like vnto the single kinde, being of a whitish greene colour, and somewhat broad, a little shorter and narrower, yet stiffer then the former French kinde: the stalke riseth vp about a foote high, bearing at the toppe one very double flower, the outermost leaues being of the same pale colour, that is to bee scene in the wings of the single kinde, those that stand next them, are some as deepe a yellow as the trunke of the single, and others of the same pale colour, with some greene stripes on the backe of diuers of the leaues: this is the whole flower variably intermixt with pale and deepe yellow, and some greene stripes among them, when

when it is fully open, and the leaues dispersed and broken. For sometimes the flower sheweth a clofe and round yellow trunke in the middle, separate from the pale outer wings, which trunke is very double, shewing some pale leaues within it, dispersed among the yellow: And sometimes the trunke is more open, or in part broken, shewing forth the same colours intermixt within it: the flower pafseth away without giuing any seede, as all other bulbous rootes doe that beare double flowers: the roote is small, very like vnto the French double kindes, especially the lesser, that it is verie hard to know the one from the other.

#### *The Place.*

The first and greatest kinde, we had first from John Tradescante (as I said before) whether raised from seed, or gained from beyond Sea, I know not.

The second we first had from Vincent Sion, borne in Flanders, dwelling on the Banke side, in his liues time, but now dead; an industrious and worthy louer of faire flowers, who cherished it in his Garden for many yeares, without bearing of any flowers vntill the yeare 1620. that hauing flowered with him, (and hee not knowing of whom hee receiuied it, nor hauing euer feene the like flower before) he sheweth it to M<sup>r</sup>. John de Franqueville, of whom he supposed he had receiuied it, (or from beyond Sea he never received any) who finding it to bee a kinde neuer feene or knowne to vs before, caused him to respect it the more, as it is well worthy. And M<sup>r</sup>. George Wilmer of Stratford Bowe Esquire, in his liues time hauing likewise receiuied it of him (as my selfe did also) would needes appropriate it to himselfe, as if he were the first founder thereof, and call it by his owne name Wilmers double Daffodill, which since hath so continued.

The third is of mine owne fostering or raising, as I said before; for assuredly, it is risen from the seede of the great Spanish single kinde, which I sowed in mine owne Garden, and cherished it, vntill it gaue such a flower as is described.

The fourth is not certainly knowne where his originall shold be: Some thinke it to be of France, and others of Germany.

The last is assuredly first naturall of our owne Countrey, for M<sup>r</sup>. Gerrard first discouered it to the world, finding it in a poore womans Garden in the West parts of England, where it grew before the woman came to dwell there, and, as I haue heard since, is naturall of the Isle of Wight.

#### *The Time.*

They doe all flower much about one time, that is, from the middle or end of March, as the yeare is forward, vnto the middle of Aprill.

#### *The Names.*

Vpon the three first I haue imposed the names in Latine, as they are expressed in their titles: and for the English names, if you please, you may let them passe likewise as they are expressed there also, that thereby every one may be truely distinguisched, and not confounded. The fourth, besidies the name in the title, is called of some *Nartissim Germanicus*, which whether it be of Germany, or no, I know not, but that the name should import so much. The last doth vsually carry M<sup>r</sup>. Gerrards name, and called Gerrards double Daffodill.

#### *1. Pseudonarcissus angustifolius flore flavecente tubo quasi absciso.*

The narrow leaved bastard Daffodill with the clipt trunke.

This kinde of Daffodill hath long and narrow grayish greene leaues, bearing one single flower at the toppe of his stalke, like vnto the former single bastard kindes, before

fore specified, hauing his outer leaues of a pale yellow colour, and his trunke of a deeper yellow: the chiefe differences in this from the former, is in the leaues, being narrow, and then in the trunke of the flower, which is not crumpled or turned vp, as most of the other are; and that the brimmes or edges of the flower is as if it had beene clipt off, or cut eu'en.

#### *2. Pseudonarcissus Hispanicus medius & minor latex.*

The two lesser Spanish yellow bastard Daffodils.

These two lesser kindes of Spanish Daffodils, doe but differ in greatnesse the one from the other, and not in any thing else; so that in declaring the one, you may understand the other to bee a little greater. The lesser then hath three or foure narrow short whitish greene leaues, from among which commeth forth a short stalke, not aboue an hand breadth, or halfe a foote high, bearing one single flower, not fully standing outright, but a little bending downe, consisting of six small leaues, standing as wings about a small, but long trunke, a little crumpled at the brimmes: the whole flower, as well leaues as trunke, are of one deepe yellow colour, like vnto the great Spanish kinde: the roote is but small, and couered with a darkish coate. The other is in all parts greater, and (as I said) differeth not else.

#### *3. Pseudonarcissus Hispanicus latus minimus.*

The least Spanish yellow bastard Daffodill.

The leaues of this small kinde are smaller and shorter then the former, seldome exceeding the length of three inches, and very narrow withall, but of the same grayish greene colour with the former: every flower standeth vpon a small and short footstalke, scarce rising above the ground; so that his nose, for the most part, doth lye or touch the ground, and is made after the same fashion, and of the same colour with the former, but much smaller, as his roote is so likewise.

#### *4. Pseudonarcissus Gallicus minor flore pleno.*

The lesser French double bastard Daffodill.

The rootes of this lesser French kinde (if I may lawfully call it, or the greater kinde before specified, a bastard Daffodill; for I somewhat doubt thereof, in that the flower of either is not made after the fashion of any of the other bastard Daffodils, but doth more nearely reseable the forme of the double white Daffodill, exprefsed before among the true Daffodils) are like vnto the double English kinde, as also to the former double greater French kinde; and the leaues are of the same whitish greene colour alio, but narrower and not longer: the stalke riseth a little higher then the English, and not fully so high as the greater French, bearing one faire double flower thereon, of a pale yellow or Lemon colour, consisting of fix rows of leaues, every rowe growing smaller then other vnto the middle, and so set and placed, that every leafe of the flower doth stand directly almost in all, one vpon or before another vnto the middle, where the leaues are smallest, the outermost being the greatest, which maketh the flower seeme the more beautifull: this and the greater kinde hath no trunke, or shew of any other thing in the middle, as all or most of the other former double bastard Daffodils haue, but are flowers wholly composed of leaues, standing double even to the middle.

#### *The Place.*

The first is vridoubtedly a naturall of the Pyrenean Mountaines.

The Spanish kindes grew in Spaine, and

The French double kinde about Orleans in France, where it is said to grow plentifully.

#### *The Time.*

The first flowreth at the end of March.

The

The Spanish kindes are the most early, flowing betimes in March.  
The French double doth flower presently after.

#### The Names.

More cannot bee said or added, concerning the names of any of these Daffodils, then hath been set downe in their titles: onely the French kinde is most vsually called Robinus his Daffodill.

*Pseudonarcissus Iuncifolius albus.* The white bastard Rush Daffodill, or Iunquilia.

This bastard Rush Daffodill hath two or three long and very greene leaues, very like vnto the small yellow Rush Daffodill, formerly described, but not altogether so round, among which riseth vp a short stalke, seldome halfe a foote high, bearing at the toppe, out of a small skinnie huske, one small white flower, sometime declining to a pale colour, hauing six small and short leaues, standing about the middle of the trunke, which is long, and much wider open at the mouth, then at the botteme: the small outer leaues or wings are a little tending to greene, and the trunk (as I said) is either white, or whitish, hauing the brimmes a little vneuen: the seede is small, blacke, and round, like vnto other Rush Daffodils, but smaller.

*Pseudonarcissus Iuncifolius luteus maior.*  
The greater yellow Iunquilia, or bastard Daffodill.

The leaues of this greater kinde are longer, greater, and a little broader then the former; the stalke also is higher, and the flower larger, more open at the mouth and crumpled, then the white, but wholly of a yellow colour: the seede and the roots are bigger, according to the proportion of the plant.

*Pseudonarcissus Iuncifolius luteus minor.* The lesser yellow bastard Iunquilia.

This is so like vnto the last in all things, that I shall not neede to trouble you with repetitions of the same things formerly spoken; the chiefeſt diſſerence is the ſmalneſſe of the plant in all parts.

*Pseudonarcissus Iuncifolius luteus ferotinus.* The late yellow bastard Iunquilia.

There is likewife a third kinde, as great as the greater yellow, and in all his parts ex- preſſing and equalling it, but is accounted the fairer, and flowreth ſomewhat later.

#### The Place.

The Pyrennean Hills haue afforded vs all theſe varieties, and wee preſerve them carefullie; for they are all tender.

#### The Time.

All theſe flower in Aprill, except the laſt, which is a moneth later.

#### The Names.

The French and Lowe Country men call them *Trompettes*, that is, Trumpets, from the forme of the trunke; wee ſometimes call them alſo by that name, but more uſually bastard Iunquilia's.

*Pseudonarcissus marinus albus, Pancratium vulgo.*

The white Sea-baſtard Daffodill.

The Sea baſtard Daffodill (to conclude this Chapter, and the diſcourse of Daffo- dils)

1 *Pseudonarcissus rubra rusticabifolia.* The baſtard Daffodill with the cloſe trunke. 2 *Pseudonarcissus Hispanicus minor.* The leſſer Spaniſh baſtard Daffodill. 3 *Pseudonarcissus Hispanicus minimus.* The leſſer Spaniſh baſtard Daffodill. 4 *Pseudonarcissus Gallicus minor flava plena.* The leſſer double French baſtard Daffodill. 5 *Pseudonarcissus Iuncifolius luteus albo.* The white Sea baſtard Daffodil. 6 *Pseudonarcissus Iuncifolius luteus maior.* The greater yellow baſtard Iunquilia. 7 *Pseudonarcissus Iuncifolius luteus minor.* The leſſer yellow baſtard Iunquilia. 8 *Pseudonarcissus Iuncifolius luteus ferotinus.* The late yellow baſtard Iunquilia. 9 *Leucosia bulbifera precox major.* The great early bulboſus Violet. 10 *Leucosia bulbifera precox minor.* The leſſer early bulboſus Violet. 11 *Leucosia bulbifera major serotinum.* The great late flowering bulboſus Violet.

*Flore luteo,  
flora rubra.*

dils) hath diuers broad whitish greene leaues, but not very long, among which riseth vp a stiffe round stalke, at the top whereof breaketh out of a great round skinny huske, fve or six flowers, euery one made somewhat of the fashion of the great bastard Rush Daffodill, but greater, and wholly white; the six leaues, being larger and longer then in the Rush kinde, and extending beyond the trunke, are tipt with greene at the point of each leafe, and downe the middle likewise on the backtide. The trunke is longer, larger, and wider open at the mouth, cut in or indented at the brims or edges, and small at the bottome, with diuers white thredes in the middle, and is very sweet: vnder the flower is a round greene head, which groweth very great, hauing within it, when it is ripe, flat and blacke seede: the roote is great and white.

It is reported, that there are found other sorts, some that beare yellow flowers, and others that beare red: but we haue seene none such, and therefore I can say no more of them.

#### The Place.

This kinde groweth neare the Sea side, both in Spaine, Italy, and France, within the Straights, and for the most part, vpon all the Leuant shoare and Islands also, but will seldome either flower, or abide with vs in these colder Countries, as I haue both seene by those that I received from a friend, and heard by others.

#### The Time.

It flowreth in the end of Summer, that is, in August and September.

#### The Name.

Diuers doe call it *Pancratium*, as the leartied of Mompeher, and others, with the addition of *flore Lily*, after they had left their old errore, in taking it to be *Scylla*, and vsing it for *Scylla*, in the *Trochisces* that go into Andromachus Treakle. The learned of Valentia in Spaine, as Clusius faith, doe call it *Hemerocallis*, thinking it to be a Lilly; and Clusius doth thereupon call it, *Hemerocallis Valentina*: but in my opinion, all these are deceiveth in this plant; for it is neither a Lilly, to haue the name of *Hemerocallis* giuen vnto it, nor *Scylla*, nor *Pancratium*, as many doe yet call it: for certainly this is a kinde of Daffodill, the forme both of roote, leafe, and flower, doth assure me that haue seene it, and not *Pancratium*, which (as Dioscorides testifieth) is a kinde of *Scylla*, and in his time called *Scylla*, with a red roote, and a leafe like a Lilly, but longer, and was vsed both with the same preparation and quantity, and for the same diseases that *Scylla* was vsed, but that his force was weaker: all which doth plainly shew the errores that many learned men haue been conuersant in, and that all may see how necessary the knowledge of Herbarisme is to the practice of Physicke; And lest the roote of this Sea bastard Daffodill bee vsed in the stead of an wholsome remedy, which (as Clusius maketh mention) was deadly to him that did but cut his meat with that knife, which had immediately before cut this roote, and done in malice by him, that knew the force thereof, to kill his fellow, it working the more forceably by the euill attracting quality of the iron.

#### The Vertues of Daffodils in general.

Howsoever Dioscorides and others, doe giue vnto some of them speciall properties, both for inward and outward diseases, yet know I not any in these dayes with vs, that apply any of them as a remedy for any griefe, whatsoever Gerrard or others haue written.

#### CHAP.

#### CHAP. X.

##### *Lencois bulbosum*. The bulbous Violet.

**H**Aving thus set downe the whole family, both of the true and bastard Daffodils, I shalld next set in hand with the Hyacinths; but because *Lencois bulbosum*, The bulbous Violet is a plant that doth challenge a place next vnto the Daffodils, as most nearely partaking with them, and a little with the Hyacinthes, I must of necessity interpose them, and shew their descriptions and differences, whereof some are early, of the first Spring, others later, and some of the Autumne.

##### *Lencois bulbosum præcox maius*. The greater early bulbous Violet.

This bulbous Violet hath three or four very greene, broad, flat, and short leaues, among which riseth vp a naked greene stalke bearing out of a small skinny hose, (as the former Daffodil doth) one white flower, hanging downe his head by a very small foot-stalke, made of six leaues, of an equall length, every one whereof is tipt at the end with a small greenish yellow spot: after the flower is past, the head or seed-yefell groweth to be reasonable great, somewhat long and round, wherein is contained hard round seede, which being dry, is cleare, and of a whitish yellow colour: the roote is somewhat like a Daffodil roote, and couered with a blackish outside or skinne.

##### *Lencois bulbosum præcox minus*. The lesser early bulbous Violet.

This lesser kinde riseth vp with two narrow grayish greene leaues, between which commeth forth the stalke, fve or six inches high, bearing one small pendulous flower, consisting of three white leaues, which are small and pointed, standing on the outside, and hauing three other shorter leaues, which seeme like a cup in the middle, being each of them round at the ends, and cut in the middle, making the forme of an heart, with a greene tippe or spot at the broad end or edge: the seede is whitish, inclosed in long and round heads, like the former, but lesser: the roote is like a small Daffodill, with a blackish gray coate, and quickly divideth into many sets.

There is another of this kinde, that came among other bulbous rootes from Constantinople, and differeth in nothing from it, but that it is a little greater, both in root, leafe, and flower.

##### The Place.

The two first are found in many places of Germany, and Hungary. The third, as I said, was brought from Constantinople.

##### The Time.

The two lesser sorts doe most commonly flowre in February, if the weather be any thing milde, or at the furthest in the begining of March, but the first is seldomie in flower, before the other be well neare past, or altogether.

##### The Names.

Lobel and Dodonæus call the lesser kinde *Lencois triphyllum*, and *Lencois solitaria triphyllum*, of the three leaues in the flower. Some doe call it *Viola bulbosa alba*. The first or greater kinde is called by Lobel, *Lencois solitaria paniculibus floribus*; and by Dodonæus, *Lencois bulbosum hexaphyllum*. We doe most vsually call them, *Lencois bulbosum præcox maius*, & *minus*, The greater, or the lesser early bulbous Violet. In Dutch, *Sommer Sottekens*, and not *Drafskens*, which are Grape-flowers, as some haue thought.

1. *Leucoium bulbosum Verum minimum.*  
The small bulbous Violet of the Spring.

This small *Leucoium* sendeth forth his ~~small and long~~ greene leaues, like haire in Autumnne, and before Winter, which abide greene vntill Aprill, and then wither away quite, and about May there ariseth vp ~~a stender~~ stender stalke, at the toppe whereof breake forth two small white flowers, made of six leaues a peice, hanging downe their heads, the three inner leaues being a little larger then the three outward, a little reddish neare the stalke, and very sweet: the root is small and round, and covered with a darke coate.

2. *Leucoium bulbosum Autumne.* The small Autumnne bulbous Violet.

As the former small *Leucoium* sprang vp with his leaues without flowers in Autumnne, so this contrariwise, riseth vp with his slender brownish stalke of flowers in Autumnne, before any greene leaues appearre, whereon stand two or three very small snow white pendulous flowers, consisting of six leaues a peice, and a little reddish at the bottome of the flower next vnto the stalke, so like vnto the former, that one would take them to be both one: after which, there grow small browne heads, containing small, blacke, round seed; after the flower is past, and the seede is ripening, and sometimes after the heads are ripe, the leaues begin to spring vp, which when they are full growne, are long, greene, and as small, or smaller then the leaues of the Autumnne Hyacinth, which abide all the Winter, and Spring following, and wither away in the beginning of Summer: the root is small, long, and white.

3. *Leucoium minus bulbosum scorinum.*  
The great late flowring bulbous Violet.

The late bulbous Violet hath three or four broad flat greene leaues, very like vnto the first, but longer, among which riseth vp a flattish stalke, being thicker in the middle then at both edges, on the toppe whereof stand three or four flowers, hanging downe their heads, consisting of six leaues a peice, all of an equall length and bignesse, wholly white, except that each leaue hath a greene tipp at the end of them: the seede hereof is blacke and round; the root is reasonable great and white.

The Place.

The two former small ones were first found in Spaine, and Portugall, and sent to me by Guillaume Boel; but the first was so tender, that scarce one of a score sprang with me, or would abide. The greatest haue beene found wilde in Germany and Austria.

The Time.

The small ones haue their times expressed in their titles and descriptions, the last flowreth not vntill May.

The Names.

These names that are set downe in their titles, doe passe with all Herbarists in these daies.

The Vertues.

Wee haue not knowne these plants vsed Physically, either inwardly or outwardly, to any purposes in these daies.

CHAP.

CHAP. XI.

*Hyacinthus.* The Hyacinth or Iacynth.

**T**He IacINTHES are next to be entreated of, whereof there are many more kindes found out in these later times, then formerly were knowne, which for order and method sake, I will digest vnder seuerall sorts, as neare as I can, that avoiding confusion, by enterlacing one among another, I may the better put euery sort vnder his owne kinde.

*Hyacinthus Indicus maior tuberosa radice.*  
The greater Indian knobbed Iacynth.

I haue thought fittest to begin with this Iacynth, both because it is the greatest and highest, and also because the flowers hereof are in some likeenesse neare vnto a Daffodill, although his roote be tuberous, and not bulbous as all the rest are. This Indian Iacynth hath a thicke knobbed roote (yet formed into seuerall heads, somewhat like vnto bulbous rootes) with many thicke fibres at the bottome of them; from the diuers heads of this roote arise diuers strong and very tall stalkes, beset with diuers faire, long, and broad leaues, ioyned at the bottome close vnto the stalke, where they are greatest, and grow smaller to the very end, and those that grow higher to the toppe, being smaller and smaller, which being broken, there appere many thredes like wool in them: the toppes of the stalkes are garnished with many faire large white flowers, each whereof is composed of six leaues, lying spread open, as the flowers of the white Daffodill, with some short thredes in the middle, and of a very sweete sent, or rather strong and headie.

*Hyacinthus Indicus minor tuberosa radice.*  
The smaller Indian knobbed Iacynth.

The roote of this Iacynth is knobbed, like the roote of Arum or Wake Robin, from whence doe spring many leaues, lying vpon the ground, and compassing one another at the bottome, being long and narrow, and hollow guttered to the end, which is small and pointed, no lesse woolly, or full of thredes then the former: from the middle of these leaues riseth vp the stalke, being very long and stender, three or four foot long, so that without it be propped vp, it will bend downe, and lye vpon the ground, whereon are set at certaine distances many short leaues, being broad at the bottome, where they doe almost compasse the stalke, and are smaller toward the end where it is sharpe pointed: at the top of the stalke stand many flowers, with a small peice of a green leaue at the bottome of every foot-stalke, which seeme to bee like so many white Orientall IacINTHES, being composed of six leaues, which are much thicker then the former, with six chives or thredes in the middle, tipt with pale yellow pendent.

The Place.

They both grow naturally in the West Indies, from whence being first brought into Spaine, haue from thence been dispersed vnto diuers louers of plants.

The Time.

They flower not in these cold Countries vntill the middle of August, or not at all, if they bee not carefully preserued from the injury of our cold Winters; and then if the precedent Summer be hot, it may be flower a moneth sooner.

The Names.

Clusius calleth the lesser (for I thinke hee never saw the first) *Hyacinthus Indicus*

*Iniclus tuberos*, a radice, that is in English, The Indian Iacinth with a tuberous roote: Some would call these *Hyacinthus Eriophorus Indicus*, that is, The Indian woolly Iacinth, because they haue much wooll in them when they are broken; yet some doe doubt that they are not two plants severall, as of greater and lesser, but that the greatnesse is caused by the fertility of the soyle wherein it grew.

1. *Hyacinthus Botroides maior Moschatus*, sive *Muscaris flore flavo*.

The great yellow Muske Grape-flower, or yellow Muscari.

This Muske Iacinth or Grape-flower, hath five or six leaues spread vpon the ground in two or three heads, which at the first budding or shooting forth out of the ground, are of a reddish purple colour, and after become long, thicke, hollow, or guttered on the vpper side, of a whitish greene colour, and round and darke coloured vnderneath: in the middle of these heads of leaues, rise vp one or two hollow weake brownish stalkes, sometimes lying on the ground with the weight of the flowers, (but especially of the seede) yet for the most part standing vpright, when they are laden towards the toppe, with many bottle-like flowers, which at their first appearing, and vntill the flowers begin to blow open, are of a browne red colour, and when they are blowne, of a faire yellow colour, flowring first below, and so vpwards by degrees, every one of these flowers is made like vnto a little pitcher or bottle, being bigge in the belly, and small at the mouth, which is round, and a little turned vp, very sweete in smell, like vnto Muske, whereof it tooke the name *Muscari*; after the flowers are past, there come three square thicke heads, puffed vp as if it were bladders, made of a spongie substance, wherein are here and there placed blacke round seed: the roote is long, round, and very thicke, and white on the outside, with a little woolliness on them, being broken, and full of a slimie iuice, whereunto are annexed thicke, fat, and long fibres, which perish not as most of the other IacINTHS; and therefore desireth not to bee often remoued, as the other sorts may.

2. *Hyacinthus Botroides maior Moschatus*, seu *Muscaris flore cineritio*.

The Ashcoloured Muske Grape-flower, or Muscari.

This Muscari differeth not in rootes, or forme of leaues or flowers from the former, the chiefe differences are these: the leaues hereof do not appear so red at the first budding out of the ground, nor are so darke when they are fully growne; the stalk also most vsually hath more storie of flowers thereon, the colour whereof at the first budding is a little duskie, and when they are full blowne, are of a bleak, yet bright ash-colour, with a little shew of purple in them, and by long standing change a little more gray; being as sweete, or as somethink, more sweete then the former: the roote (as I said) is like the former, yet yeeldeth more encrease, and will better endure our cold clymate, although it doth more seldom give ripe seede.

3. *Hyacinthus Botroides maior Moschatus*, sive *Muscaris flore rubro*.

The red Muske Grape-flower.

This kinde (if there be any such, for I am in some doubt thereof) doth chiefly differ in the colour of the flower from the first, in that this shoulde haue flowers when they are blowne, of a red colour tending to yellownesse.

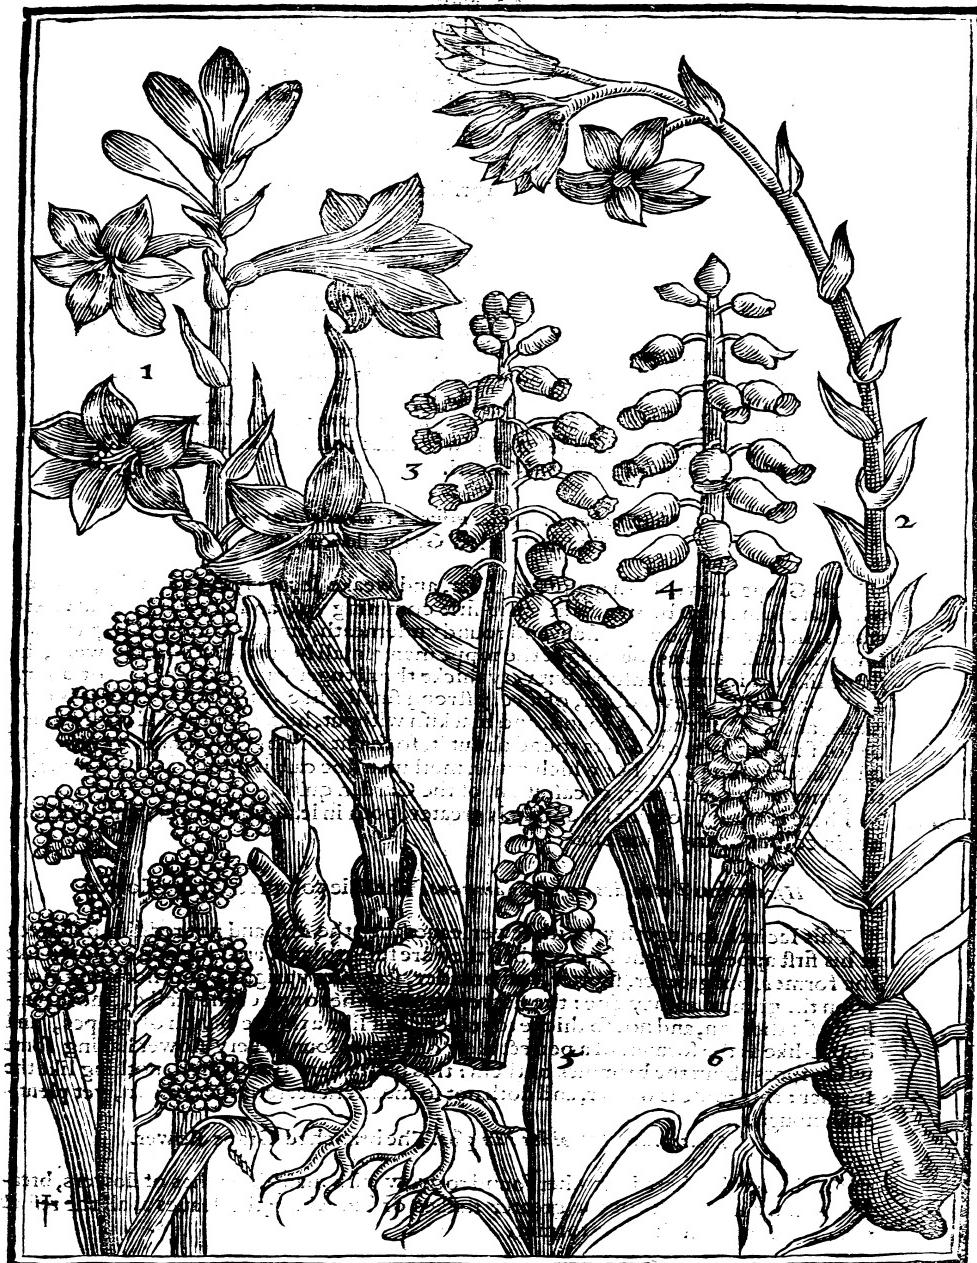

4. *Hyacinthus Botroides maior Moschatus*, sive *Muscaris flore albo*.

The white Muske Grape-flower.

This also is said to haue (if there bee such an one) his leaues like vnto the second kinde, but of a little whiter greene, and the flowers pale, tending to a white: the roots of these two last are said vsually not to grow to be so great as of the former two.

The Place.

The rootes of the two first sorts, haue been often sent from Constantinople,

1. *Hyacinthus Indicus maior tuberosa radice*. The greater Indian knobby Iacinth. 2. *Hyacinthus Indicus minor tuberosa radice*. The lesser Indian knobby Iacinth. 3. *Muscaris flore flavo*. The yellow Muscari. 4. *Muscaris flore cineritio*. The ashcoloured Muscari. 5. *Hyacinthus Botroides flore rubro*. The skin coloured Grape-flower. 6. *Hyacinthus Botroides flore albo*. The white Grapp-flower. † *Hyacinthus Botroides ramosus*. The branched Grape-flower.

## The Garden of pleasant Flowers.

ple, among many other sorts of rootes, and it may be come thither from beyond the Bosphorus in Asia; we haue them in our Gardens.

The other two sorts are sprung (it is probable, if they be in *rurum natura*) from the seede of the two former; for we could neuer get such from Constantinople, as if the Turkes had neuer knowledge of any such.

### The Time.

They flower in March or Aprill, as the yeare is temperate, but the first is soonest vp out of the ground.

### The Names.

The two former haue beene sent from Turkie by the name of *Muscormis* and *Dipcadi*. Matthiolus calleth it *Bulbus vomitorius*, saying that no root doth more prouoke vomit then it. Caspar Bauhinus doth most properly call it *Hyacinthus Muschatus*. It is most generally called *Muscari*, by all Herbarists and Florists, yet because it doth so nearely resemble the Grape-flower, I haue named it *Hyacinthus Botroides maior Muschatus*, to put a difference from the lesser Grape-flowers that follow; in English, The great Muske Grape-flower, or *Muscari*.

*Hyacinthus Botroides minor cernulus obscurus.*  
The darke blew Grape-flower.

This Grape-flower hath many small, fat, and weake leaues lying vpon the ground, which are somewhat brownish at their first comming vp, and of a sad greene afterwards, hollow on the vpperside, and round vnderneath, among which rise vp round, smooth, weake stalkes, bearing at the toppe many small heauie bottle-like flowers, in shape like the former *Muscari*, but very thicke thrust together, smaller, and of a very darke or blackish blew colour, of a very strong smell, like vnto Starch when it is new made, and hot: the root is round, and blackish without, being compassed with a number of small rootes, or of-sets round about it, so that it will quickly choke a ground, if it be suffered long in it. For which cause, most men doe cast it into some by-corner, if they meane to preserue it, or cast it out of the Garden quite.

*Aler maior.* There is another of this kinde that is greater, both in leafe and flower, and differeth not in colour or any thing else.

*Hyacinthus Botroides cernulus amarus.* The skie coloured Grape-flower.

This Iacynth springeth vp with fewer leaues then the first, and not reddish, but green at his first appearing; the leaues, when they are full growne, are long and hollow, like the former, but greener, shorter, and broader, standing vpright, and not lying along vpon the ground as they doe: the flowers grow at the toppe of the stalke, more sparsely set thereon, and not so thicke together, but like a thinne bunch of grapes, and bottle-like as the former, of a perfect blew or skie-colour, every flower having some white spots about the brimmes of them: this hath a very sweet smell, nothing like the former: this roote is whiter, and doth not so much encrease as the former, yet plentifull enough.

*Hyacinthus Botroides ramosus.* The branched Grape-flower.

Of this kinde, there is another found to grow with many branches of flowers, breaking out from the sides of the greater stalkes or branches: the leaues as all the rest of the plant is greater then the former.

*Hyacinthus Botroides flore albo.* The white Grape-flower.

The white Grape-flower hath his greene leaues a little whiter, then the blew or skie

## The Garden of pleasant Flowers.

skie coloured Grape-flower, his flowers are very pure white, alike sparsedly set on the stalkes, but a little lower and smaller then it, in all other things there is no difference.

### *Hyacinthus Botroides flore alborubente.* The blush Grape-flower.

The roote of this Grape-flower growtheth greater, then either the skie coloured, or white Grape-flower, and seldom hath any small rootes or of-ssets, as the other haue: his leaues also are larger, and somewhat broader; the flowers are of a pale, or bleake blush colour out of a white, and are a little larger, and grow a little higher and fuller of flowers then the white.

### The Place.

They naturally grow in many places both of Germany and Hungary; in Spaine likewise, and on Mount Baldus in Italy, and Narbone in France, about the borders of the fields: we haue them in our Gardens for delight.

### The Time.

These flower from the beginning of March, or sooner sometimes, vntill the beginning of May.

### The Names.

They are most commonly called *Botroides*, but more truely *Botryodes*, of *Βοτρύος* the Greeke word, which signifieth a bunch or cluster of grapes: Lobelius calleth the white one, *Dipcadi flore albo*, transferring the name *Dipcadi*, whereby the *Muscari* is called to this Iacinth, as if they were both one. Their severall names, whereby they are knowne and called, are set downe in their titles. The Dutchmen call them *Driekens*, as I said before. Some English Gentlewomen call the white Grape-flower Pearles of Spaine.

#### 1. *Hyacinthus Comosus album.* The white haired Iacinth.

This Iacynth doth more nearely resemble the Grape-flowers, then the faire haired Iacinths that follow, whereof it beareth the name, in that it hath no haire or thredes at the toppe of the stalke or sides, as they: and therefore I haue placed it next vnto them, and the other to follow it, as being of another kinde. The roothereof is blackish, a little long and round, from whence rise vp three or four leaues, being smooth and whitish, long, narrow, and hollow, like a trough or gutter on the vpperside: among which the stalke riseth vp a foote high or more, bearing at the toppe divers small flowers, somewhat like the former, but not so thicke set together, being a little longer, and larger, and wider at the mouth, and as it were diuided into six edges, of a dark whitish colour, with some blacker spots about the brimmes on the inside: the heads or seede-vessels are three square, and somewhat larger, then the heads of any of the former lesser Grape-flowers, wherein is contained round blacke seede.

#### 2. *Hyacinthus Comosus Byzantinus.* The Turkie faire haired Iacinth.

This other Iacynth which came from Constantinople, is somewhat like the former, but that it is bigger, both in roote, and leafe, and flower, and bearing greater store of flowers on the head of the stalke: the lower flowers, although they haue short stalkes at their first florring, yet afterwards the stalkes grow longer, and those that are lower, stand out further then those that are highest, whose foot-stalkes are short, and almost close to the stemme, and of a more perfect purple then any below, which are of a dusky greenish purple colour: the whole stalke of flowers seem like a Pyramis, broad belowe, and small aboue, or as other compare it, to a water sprinkle; yet neither of both these Iacinths haue any thredes at the tops of the stalkes, as the other following haue.

#### 3. *Hyacinthus*

3. *Hyacinthus Comosus major purpureus.*  
The great purple faire haired Iacinth.

This faire haired Iacinth hath his leaues softer, longer, broader, and leſſe hollow then the former, lying for the moſt part vpon the ground: the ſtalke riſeth vp in the midſt of the leaues, being stronger, higher, and bearing a greater and longer head of flowers alſo then they: the flowers of this ſtand not vpon ſuch long foote-ſtales, but are ſhorter below, and cloſe almoſt to the ſtalke aboue, hauiing many bright purpliſh bleu threeds, growing highest aboue the flowers, as it were in a buſh together, every one of theſe threeds hauiing a little head at the end of them, ſomewhat like vnto one of the flowers, but muſt ſmaller: the reſt of the flowers below this buſh, are of a fadder or deader purple, and not ſo bright a colour, and the loweſt worſt of all, rather inclining to a greene, like vnto the laſt Turkiſh kinde: the whole ſtalke with the flowers vpon it, doth ſomewhat reſemble a long Purſe taffell, and thereupon diuers Gentlewo- men haue ſo named it: the heads and ſeede are like vnto the former, but greater: the roote is great and white, with ſome redneſſe on the ouſide.

4. *Hyacinthus Comosus ramosus purpureus.*  
The faire haired branched Iacinth.

The leaues of this Iacinth are broader, shorter, and greener then of the laſt, not lying ſo weakly on the ground, but ſtanding ſomewhat more vpright: the ſtalke riſeth vp as high as the former, but branched out on euery ſide into many tufts of threeds, with knappes, as it were heads of flowers, at the ends of them, like vnto the head of threeds at the toppe of the former Iacinth, but of a little darker, and not ſo faire a bleuiſh purple colour: this Iacinth doth ſomewhat reſemble the next Curld haire Iacinth, but that the branches are not ſo fairely composed altogether of curled threeds, nor of ſo excellent a faire purple or Doue colour, but more diſkisie by much: the roote is greater and ſhorter then of the next, and encreaseth faster.

5. *Hyacinthus Pennatus, ſive Comosus ramosus eleganſior.*  
The faire Curld haire Iacinth.

This admirabile Iacinth riſeth vp with three or four leaues, ſomewhat like vnto the leaues of the Muſke Graue-flower, but leſſer; betweene which riſeth vp the ſtalke about a foote high, or ſomewhat more, bearing at the toppe a buſh or tuft of flowers, which at the firſt appearing, is like vnto a Cone or Pineapple, and afterwards opening it ſelfe, spreadeth into many branches, yet ſtill retaining the forme of a Pyramis, being broad ſpread below, and narrow vp aboue: each of theſe branches is again diuided into many tufts of threeds or ſtrings, twisted or curled at the ends, and of an ex- cellent purple or Doue colour, both ſtales and haireſ. This abideth a great while in his beauty, but afterwards all theſe flowers (if you will ſo call them) do fall away without any ſeede at all, ſpending it ſelfe as it ſhould ſeeme in the abundance of the flow- ers: the roote is not ſo great as the laſt, but white on the ouſide.

The Place.

The two firſt haue been ſent diuers times from Constantinople, the third is found wilde in many places of Europe, and as well in Germany, as in Italy. The two laſt are onely with vs in Gardens, and their naturall places are not knowne vnto vs.

The Time.

The three former kindes doe flower in Aprill, the two laſt in May.

The Names.

The firſt and ſecond haue no other names then are exprefſed in their ti- tles.

1. *Hyacinthus Comosus album.* The white haired Iacinth. 2. *Hyacinthus Comosus Byzantinus.* The Turkiſh faire haired Iacinth. 3. *Hyacinthus Comosus major purpureus.* The purple faire haired Iacinth, or Purſe taffell. 4. *Hyacinthus Comosus ramosus, sive calamistratus.* The faire haired branched Iacinth. 5. *Hyacinthus Pennatus, sive comosus eleganſior.* The faire curld haire Iacinth.

ties. The third is called of some onely *Hyacinthus maior*, and of others *Hyacinthus comosus maior*: We call it in English, The purple faire haired Iacinth, because of his tuft of purple threeds, like haire at the toppe, and (as I said) of diuers Gentlewomen, purple tasse's. The fourth is called by some as it is in the title, *Hyacinthus comosus ramosus*, and of others *Hyacinthus Calamistratus*. And the last or fifth is diuersly called by diuers, Fabius Columna in his *Phytobafanos* the second part, calleth it *Hyacinthus Sannensis*, because hee first saw it in that Cardinals Garden at Rome. Robin of Paris sent to vs the former of the two last, by the name of *Hyacinthus Pennatus*, and *Hyacinthus Calamistratus*, when as others sent the last by the name *Pennatus*, and the other by the name of *Calamistratus*; but I thinke the name *Cincinnatus* is more fit and proper for it, in that the curled threeds which seeme like haire, are better expressed by the word *Cincinnatus*, then *Calamistratus*, this signifying but the bodkin or instrument wherewith they vse to frise or curle the haire, and that the bush of haire it selfe being curled. Some also haue giuen to both these last the names of *Hyacinthus Comosus Parnassi*, the one fairer then the other. Of all these names you may vse which you please; but for the last kinde, the name *Cincinnatus*, as I said, is the more proper, but *Pennatus* is the more common, and *Calamistratus* for the former of the two last.

1. *Hyacinthus Orientalis Brumalis, sive præcox flore albo.*  
The white Winter Orientall Iacinth.

This early Iacynth riseth vp with his greene leaues (which are in all respects like to the ordinary Orientall Iacinths, but somewhat narrower) before Winter, and sometimes it is in flower also before Winter, and is in forme and colour a plaine white Orientall Iacynth, but somewhat lesser, differing onely in no other thing, then the time of his flowering, which is alwayes certaine to be long before the other sorts.

2. *Hyacinthus Orientalis Brumalis, sive præcox flore purpureo.*  
The purple Winter Orientall Iacinth.

The difference of colour in this flower causeth it to bee distinguished, for else it is of the kinde of the Orientall Iacinths, and is, as the former, more early then the rest that follow: Understand then, that this is the same with the former, but hauing fine bleuish flowers.

3. *Hyacinthus Orientalis maior præcox, dictum Zumbul Indi.*  
The greatest Orientall Iacynth, or Zumbul Indi.

The roote of this Orientall Iaciath, is vsually greater then any other of his kinde, and most commonly white on the outside, from whence rise vp one or two great round stalkes, spotted from within the ground, with the lower part of the leaues also vpward to the middle of the stalkes, or rather higher, like vnto the stalkes of Dragons, but darker; being set among a number of broad, long, and somewhat hollow greene leaues, almost as large as the leaues of the white Lilly: at the toppe of the stalkes stand more store of flowers, then in any other of this kinde, every flower being as great as the greatest sort of Orientall Iacynth, ending in six leaues, which turne at the points, of a faire bleuish purple colour, and all standing many times on one side of the stalkes, and many times on both sides.

4. *Hyacinthus Orientalis vulgaris diuersorum colorum.*  
The ordinary Orientall Iacynth.

The common Orientall Iacynth (I call it common, because it is now so plentifull in all Gardens, that it is almost not esteemed) hath many greene leaues, long, somewhat broad and hollow, among which riseth vp a long greene round stalle, beset from the middle thereof almost, with diuers flowers, standing on both sides

of the stalkes, one aboue another vnto the toppe, each whereof next vnto the foote-stalle is long, hollow, round, and close, ending in six small leaues laid open, and a little turning at the points, of a very sweete smell: the colours of these flowers are diuers, for some are pure white, without any shew of other colour in them: another is almost white, but hauing a shew of blewnesse, especially at the brims and bottomes of the flowers. Others againe are of a very faint blush, tending towards a white: Some are of as deepe a purple as a Violet; others of a purple tending to rednesse, and some of a paler purple. Some againe are of a faireblew, others more watchet, and some so pale a blew, as if it were more white then blew: after the flowers are past, there rise vp great three square heads, bearing round blacke seede, great and shining: the roote is great, and white on the outside, and oftentimes purplish also, flat at the bottome, and small at the head.

There is a kinde of these Iacinths, whose flowers are of a deepe purplish Violet colour, hauing whitish lines downe the backe of euery leafe of the flower, which turne themselves a little backwards at the points.

Flore purpureo  
violaceo lineis  
albicans in  
dorso.  
Floribus artrov-  
sum respicien-  
tibus.

There is another, whose floweres stand all opening one way, and not on all sides, but are herein like the great Zumbul Indi, before set out.

There is againe another kinde which flowreth later then all the rest, and the floweres are smaller, standing more vpright, which are either white or blew, or mixt with white and purple.

Serotinus ere-  
ctis floribus  
diuersorum co-  
lorum.

5. *Hyacinthus Orientalis foliis caule.* The bushy stalked Orientall Iacinth.

This strange Iacynth hath his rootes, leaues, and flowers, like vnto the former Orientall Iacinths: the onely difference in this is, that his stalle is not bare or naked, but hath very narrow long leaues, growing dispersedly, and without order, with the floweres thereon, which are blew, and hauing for the most part one leafe, and sometimes two at the foote, or setting on of euery flower, yet sometimes it happeneth, some floweres to be without any leafe at the bottome, as nature, that is very variable in this plant, listeth to play: the heads and seede are blacke and round, like the other also.

6. *Hyacinthus Orientalis flore duplice.* The bleake Orientall Iacynth once double.

This double Iacynth hath diuers long leaues, like vnto the other Orientall Iacinths, almost standing vpright, among which riseth vp a stalle, brownish at the first, but growing greene afterwards, bearing many floweres at the toppe, made like the floweres of the former Iacinths, and ending in six leaues, greene at the first, and of a bleuish white when they are open, yet retaining some shew of greenesse in them, the brims of the leaues being white; from the middle of each flower standeth forth another small flower, consisting of three leaues, of the same colour with the other flower, but with a greene line on the backe of each of these inner leaues: in the middle of this little flower, there stand some threeds tipt with blacke: the smell of this flower is not so sweete as of the forme; the heads, seede, and rootes are like the former.

7. *Hyacinthus Orientalis flore pleno cernuo, vel purpuro violaceo.*  
The faire double blew, or purple Orientall Iacinth.

The leaues of these Iacinths are smaller, then the leaues of most of the other former sorts; the stalkes are shorter, and smaller, bearing but three or four flowers on the heads of them for the most part, which are not composed like the last, but are more faire, full, and double of leaues, where they shew out their full beauties, and of a faire blew colour in some, and purple in others, smelling pretty sweete; but these doe seldom bear out their flowers faire; and besides, haue diuers other flowers that will be either single, or very little double vpon the same stalle.

8. *Hyacinthus Orientalis candidissimus flore pleno.*  
The pure white double Orientall Iacynth.

This double white Iacynth hath his leaues like vnto the single white Orientall Ia-

cinch;

cinth; his stalke is likewise long, slender, and greene, bearing at the toppe two or three flowers at the most, very double and full of leaves, of a pure white colour, without any other mixture therein, hanging downe their heads a little, and are reasonable sweete. I haue this but by relation, not by sight, and therefore I can giue no further assurance as yet.

#### The Place.

All these Oriental IacINTHs, except the last, haue beeene brought out of Turkie, and from Constantinople: but where their true originall place is, is not as yet vnderstood.

#### The Time.

The two first (as is said) flower the earliest, sometimes before Christmas, but more vsually after, and abide a great while in flower, in great beauty, especially if the weather be milde, when as few or no other flowers at that time are able to match them. The other greatest kinde flowreth also earlier then the rest that follow, for the most part. The ordinary kindes flower some in March, and some in Aprill, and some sooner also; and so doth the double ones likewise. The bushy stalked IacINTH flowreth much about the same time.

#### The Names.

The former two sorte are called *Hyacinthus Orientalis Brumalis*, and *Hyacinthus Orientalis precox flore albo*, or *ceruleo*. The third is called of many *Zumbul Indicum*, or *Zumbul Indi*, and corruptly *Simboline*; of others, and that more properly, *Hyacinthus Orientalis maior precox*. The Turkes doe call all IacINTHs *Zumbul*, and by adding the name of *Indi*, or *Arabi*, do shew from what place they are receaved. In English, The greatest Oriental IacINTH, yet some doe call it after the Turkish name *Zumbul Indi*, or *Simboline*, as is said before. The rest haue their names set downe in their titles, which are most fit for them.

#### *Hyacinthus Hispanicus minor Orientalis facta.*

The little Summer-Oriental IacINTH.

Flore carmine.

Flore albo.

Flore rubens.

This little IacINTH hath foure or five long narrow greene leaues, lying vpon the ground, among which riseth vp a slender smooth stalke, about a spanne high or more, bearing at the toppe many slender bleake blew flowers, with some white stripes and edges to be seen in most of them, fashioned very like vnto the flowers of the Oriental IacINTH, but much smaller: the flower hath no sente at all; theseede is like the seede of the English IacINTH, or Haref-bels: the roote is small and white.

There is another of this kinde, differing in nothing but in the colour of the flower, which is pure white.

There is also another, whose flowers are of a fine delayed red colour, with some deeper coloured veines, running along the three outer leaues of the flower, differing in no other thing from the former.

#### The Place.

These plants haue been gathered on the Pyrenæan Mountaines, which are next vnto Spaine, from whence, as is often said, many rare plants haue likewise been gathered.

#### The Time.

They flower very late, euen after all or most of the IacINTHs, in May for the most part.

The

1. *Hyacinthus Orientalis brumalis*. The Winter Oriental IacINTH. 2. *Zumbul Indi*. The greatest Oriental IacINTH. 3. *Hyacinthus Orientalis vulgaris*. The ordinary Oriental IacINTH. 4. *Hyacinthus Orientalis folio caeruleo*. The bushy stalked Oriental IacINTH. 5. *Hyacinthus Orientalis flore duplo*. The Oriental IacINTH once double. 6. *Hyacinthus Orientalis flore pleno carnoso*. The faire double blew Oriental IacINTH.

L

## The Time.

This flowered in the Garden of M<sup>r</sup>. Richard Barnesley at Lambeth, onely once in the moneth of May, in the yeare 1606. after hee had there preferued it a long time: but neither he, nor any else in England that I know, but those that saw it at that time, euer saw it beare flower, either before or since.

## The Names.

It is called by diuers *Bulbus Eriophorus*, or *Laniferus*, that is, Woolly Bulbous; but because it is a Iacinth, both in roote, leafe, and flower, and not a *Narcissus*, or Daffodill, it is called *Hyacinthus Eriophorus*, or *Laniferus*, The Woolly Iacynth. It is very likely, that Theophrastus in his seventh Book & thirteenth Chapter, did meant this plant, where hee declarereth, that garments were made of the woolly substance of a bulbous roote, that was taken from between the core or heart of the roote (which, as hee saith, was vsed to be eaten) and the outermost shels or peelings; yet Clusius seemeth to fasten this woolly bulbous of Theophrastus, vpon the next Iacynth of Spaine.

*Hyacinthus Stellatus Baticus maior, vulgo Peruanus.*  
The great Spanish Starry Iacynth, or of Peru.

This Iacynth (the greatest of those, whose flowers are spread like a starre, except the two first Indians) hath five or six, or more, very broad, and long greene leaues, spread vpon the ground, round about the roote, which being broken are woolly, or full of threeds, like the former: in the middle of these leaues lifeth vp a round short stalke, in comparison of the greatnessse of the plant (for the stalke of the Orientall Iacynth is sometimes twice so high, whose roote is not so great) bearing at the toppe a great head or bush of flowers, fashioned in the beginning, before they bee blowne or separated, very like to a Cone or Pineapple, and begin to flower belowe, and so vpwards by degrees, every flower standing vpon a long blackish blew foote-stalke, which when they are blowne open, are of a perfect blew colour, tending to a Violet, and made of six small leaues, laid open like a starre, the threeds likewise are blewish, tipp'd with yellow pendents, standing about the middle head, which is of a deeper blew, not hauing any good sent to be perceiued in it, but commendable only for the beauty of the flowers: after the flowers are past, there come three square heads, containing round blacke seede: the roote is great, and somewhat yellowish on the outside, with a knobbe or bunch at the lower end of the roote, (which is called the seat of the roote) like unto the Muscari, Scylla, and many other bulbous rootes, at which hang diuers white, thicke, and long fibres, whereby it is fastened in the ground, which perishe not euery yere, but abide continually, and therefore doth not desire much removing.

*Hyacinthus Stellatus Baticus, sive Peruanus flore albo.*  
The great white Spanish starry Iacynth.

This other Spanish Iacynth is in most parts like vnto the former, but that his leaues are not so large, nor so deep a greene: the stalks of flowers likewise hath not so thicke a head, or bulb on it, but fewer and thinner set: the flowers themselves also are whitish, yet hauing a small dash of blush in them: the threeds are whitish, tipp'd with yellow pendents: the seede and rootes are like vnto the former, and herein consisteth the difference betweene this and the other sorts.

*Hyacinthus Stellatus Baticus, sive Peruanus flore carnea.*  
The great blush coloured Spanish Starry Iacynth.

This likewise differeth little from the two former, but onely in the colour of the flowers;

1. *Hyacinthus Orientalis facie*. The little Summer Orientall Iacynth. 2. *Hyacinthus Mauritanicus*. The Barbary Iacynth. 3. *Hyacinthus oblongus Hispanus*. The Spanish dusky Iacynth. 4. *Hyacinthus Hispanicus flore campanula*. The greater Spanish bl. flowered Iacynth. 5. *Hyacinthus Anglicus*. English Iacynth or Harebell. 6. *Hyacinthus Eriophorus*. The Woolly Iacynth. 7. *Hyacinthus Stellatus Baticus maior, sive Peruanus*. The great Spanish Starry Iacynth, or of Peru.

flowers; for this being found growing among both the other, hath h is head of flowers as great and large as the first, but the buds of his flowers, before they are open, are of a deepe blushe colour, which being open, are more delayed, and of a pleasant pale purple, or blushe colour, standing vpon purplish stalkes: the heads in the middle are whitish, and so are the thredds compassing it, tipt with yellow.

#### The Place.

These doe naturally grow in Spaine, in the Medowes a little off from the Sea, as well in the Island Gades, vsually called Cales, as likewife in other parts along the Sea side, as one goeth from thence to Porto Santa Maria, which when they be in flower, growing so thicke together, seeme to couer the ground, like vnto a tapistry of diuers colours, as I haue beeene credibly enformed by Guillaume Boel, a Freeze-lander borne, often before and hereafter remembred, who being in search of rare plants in Spaine, in the yeare of our Lord 1607, after that most violent frosty Winter, which perisched both the rootes of this, and many other fine plants with vs, sent mee ouer some of these rootes for my Garden, and affirmed this for a truth, which is here formerly set downe, and that himselfe gathered those he sent mee, and many others in the places named, with his owne hands; but hee saith, that both that with the white, and with the blushe flowers, are farre more rare then the other.

#### The Time.

They flower in May, the seede is ripe in July.

#### The Names.

This hath beeene formerly named *Eriophorus Peruanus*, and *Hyacinthus Stellatus Peruanus*, The Starry Iacynth of Peru, being thought to haue grown in Peru, a Prouince of the West Indies; but he that gaue that name first vnto it, eyther knew not his naturall place, or willingly imposed that name, to conceale it, or to make it the better esteemed. It is most generally received by the name *Hyacinthus Peruanus*, from the first imposer thereof, that is, the Iacynth of Peru: but I had rather give the name agreeing most fitly vnto it, and call it as it is indeede *Hyacinthus Stellatus Baticus*, The Spanish Starry Iacynth: and because it is the greatest that I know hath come from thence, I call it, The great Starry Iacynth of Spaine, or Spanish Iacynth.

*Hyacinthus Stellatus vulgaris*, sive *Bifolius Fuchsii*.  
The common blew Starry Iacynth.

This Starry Iacynth (being longest knowne, and therefore most common) riseth out of the ground, vsually but with two browne leaues, yet sometimes with three, inclosing within them the stalke of flowers, the buds appearing of a darke whitish colour, as soone as the leaues open themselves, which leaues being growne, are long, and hollow, of a whitish greene on the vpper side, and browne on the vnder side, and halfe round, the browne stalke rising vp higher, beareth five or fixe small starre-like flowers thereon, consisting of six leaues, of a faire deepe blew, tending to a purple. The seede is yellowish, and round, contained in round pointed heads, which by reason of their heauiness, and the weaknesse of the stalke, ly vpon the ground, and often perish with wet and frosts, &c. The roote is somewhat long, and covered with a yellowish coate.

*Hyacinthus Stellatus flore albo*. The white Starry Iacynth.

The white Starry Iacynth hath his leaues like the former, but greene and fresh, not browne, and a little narrower also: the buddes for flowers at the first appearre a little blushe, which when they are blowne, are white, but yet retaine in them a small shew of that blushe colour.

We

We haue another, whose flowers are pure white, and smaller then the other, the *Hyacinthus flore nucum*. leaues whereof are of a pale fresh greene, and somewhat narrower.

*Hyacinthus Stellatus flore rubente*. The blushe coloured Starry Iacynth.

The difference in this from the former, is onely in the flowers, which are of a faire blushe colour, much more eminent then in the others, in all things else alike.

*Hyacinthus Stellatus Martinus*, sive *præcox carnulus*.  
The early blew Starry Iacynth.

This Iacynth hath his leaues a little broader, of a fresher greene, and not browne at all, as the first blew Iacynth of Fuchsius last remembred: the buds of the flowers, while they are enclosed within the leaues, and after, when the stalke is gowne vp, doe remaine more blew then the buds of the former: the flowers, when they are blowne open, are like the former, but somewhat larger, and of a more lively blew colour: the rooto also is a little whiter on the outside. This doth more seldombe bearre seede then the former.

*Hyacinthus Stellatus præcox flore albo*. The white early Starry Iacynth.

There is also one other of this kinde, that beareth pure white flowers, the green leafe thereof being a little narrower then the former, and no other difference.

*Hyacinthus Stellatus præcox flore suave rubente*.  
The early blushe coloured Starry Iacynth.

This blushe coloured Iacynth is very rare, but very pleasant, his flowers being as large as the first of this last kinde, and somewhat larger then the blushe of the other kinde: the leaues and rootes differ not from the last recited Iacynth.

#### The Place.

All these Iacinths haue beeene found in the Woods and Mountaines of Germany, Bohemia, and Austria, as Fuchsius and Gesner do report, and in Naples, as Imperanus and others doe testifie. Wee cherish them all with great care in our Gardens, but especially the white and the blushe of both kindes, for that they are more tender, and often perish for want of due regard.

#### The Time.

The common kindes, which are first expressed, flower about the middle of February, if the weather bee milde, and the other kindes sometimes a fortnight after, that is, in March, but ordinarily much about the same time with the former.

#### The Names.

The first is called in Latine *Hyacinthus Stellatus vulgaris*, and *Hyacinthus Stellatus bifolius*, and *Hyacinthus Stellatus Fuchsii*, and of some *Hyacinthus Stellatus Germanicus*; wee might very well call the other kinde, *Hyacinthus Stellatus vulgaris alter*, but diuers call it *Præcox*, and some *Martius*, as it is in the title. In English they may bee severally called: the first, The common, and the other, The early Starry Iacynth (notwithstanding the first flowreth before the other) for distinction sake.

The *Hyacinthus* seemeth to be called *Vacinium* of Virgil in his Eclogues; for hee alwayes reckoneth it among the flowers that were used to decke Garlands, and never among fruits, as some would haue it. But in that hee calleth it *Vacinium nigrum*, in sevral places, that doth very fitly answer the common

common received custome of those times, that called all deepe blew colours, such as are purples, and the like, blacke; for the Violet it selfe is likewise called blacke in the same place, where he calleth the *Vaciniam* blacke; so that it seemeth thereby, that he reckoned them to be both of one colour, and we know the colour of the Violet is not blacke, as we doe distinguishe of blacke in these dayes. But the colour of this Starry Iacynth, being both of so deepe a purple sometimes, so neare vnto a Violet colour, and also more frequent, then any other Iacynth with them, in those places where Virgil liued, perswadeth me to thinke, that Virgil vnderstood this Starry Iacynth by *Vaciniam*: Let others iudge otherwise, if they can shew greater probability.

1. *Hyacinthus Stellatus Byzantinus nigra radice.*

The Starry Iacynth of Turkie with the blacke roote.

This Starry Iacynth of Constantinople hath three or foure fresh greene, thinnne, and long leaues, of the bignesse of the English Iacynth, but not so long, betweene which riseth vp a slender lowe stalke, bearing fve or six small flowers, dispersedly set thereon, spreading open like a starre, of a pale or bleake blew colour: the leaues of the flowers are somewhat long, and stand as it were somewhat loofly, one off from another, and not so compactely together, as the flowers of other kindes: it seldome beareth ripe seede with vs, because the heads are so hearie, that lying vpon the ground, they rotte with the wet, or are bitten with the frostes, or both, so that they seldome come to good: the roote is small in some, and reasonable bigge in others, round, and long, white within, but couered with deepe reddish or purplish peelings, next vnto it, and darker within, and blacker purple on the outside, with some long and thick white fibres, like fingers hanging at the bottome of them, as is to be seene in many other Iacinths: the roote it selfe for the most part doth runne downwards, somewhat deep into the ground.

2. *Hyacinthus Stellatus Byzantinus maior.*

The greater Starry Iacynth of Constantinople.

This Iacynth may rightly be referred to the former Iacynth of Constantinople, and called the greater, it is so like therelinto, that any one that knoweth that, will soone say, that this is another of that sort, but greater as it is in all his parts, bearing larger leaues by much, and more store, lying vpon the ground round about the roote: it beareth many lowe stalkes of flowers, as bleake, and standing as loofly as the former: only the roote of this, is not black on the outside, as the other, but three times bigger.

3. *Hyacinthus Stellatus Byzantinus alter, sive flore boraginis.*

The other Starry Iacynth of Constantinople.

This other Iacynth hath for the most part onely foure leaues, broader and greener then the first, but not so large or long as the second: the stalke hath fve or six flowers vpon it, bigger and rounder set, like other starry Iacinths, of a more perfect or deeper blew then either of the former, hauing a whitish greene head or vmbone in the middle, beset with six blew chives or thredes, tipt with blacke, so closely compassing the vmbone, that the thredes seeme so many prickes stukke into a clubbe or head; some therefore haue likened it to the flower of Borage, and so haue called it: after the flowers are past, come vp round white heads, wherein is contained round and white seede: the roote is of a darke whitish colour on the outside, and sometimes a little reddish withall.

The Place.

The first and the last haue beene brought from Constantinople; the first among many other rootes, and the last by the Lord Zouch, as Lobel witnesseth. The second hath been sent vs out of the Lowe-Countries, but from whence they had it, we do not certainly know. They growe with vs in our Gardens sufficiently.

## The Time.

These flower in Aprill, but the first is the earliest of the rest, and is in flower presently after the early Starry Iacynth, before described.

## The Names.

The former haue their names in their titles, and are not knowne vnto vs by any other names that I know; but as I said before, the last is called by some, *Hyacinthus Boraginis flore*. The first was sent out of Turkie, by the name of *Sufam giul*, by which name likewise diuers other things haue beeene sent, so barren and barbarous is the Turkish tongue.

*Hyacinthus Stellatus Aestivalis maior.* The greater Summer Starry Iacynth.

This late Iacynth hath diuers narrow greene leaues, lying vpon the ground, somewhat like the leaues of the English Iacynth, but stiffer and stronger; among which riseth vp a round stiffe stalke, bearing many flowers at the toppe thereof, and at every foote-stalke of the flowers a small short leafe, of a purplish colour: the flowers are starre-like, of a fine delayed purplish colour, tending to a pale blew or ash colour, striped on the backe of evry leafe, and hauing a pointed vmbone in the middle, with some whitish purple thredes about it, tipt with blew: the seede is blacke, round, and shining, like vnto the seede of the English Iacynth, but not so bigge: the roote is round and white, hauing some long thicke rootes vnder it, besides the fibres, as is vsuall in many other Iacinths.

*Hyacinthus Stellatus Aestivalis minor.* The lesser Summer Starry Iacynth.

This lesser Iacynth hath diuers very long, narrow, and shining greene leaues, spread vpon the ground round about the roote, among which riseth vp a very short round stalke, not aboue two inches high, carrying six or seuen small flowers thereon, on each side of the stalke, like both in forme and colour vnto the greater before described, but lesser by farre: the seede is blacke, contained in three square heads: the roote is small and white, couered with a browne coate, and hauing some such thicke rootes among the fibres, as are among the other.

## The Place.

Both these Iacinths grow naturally in Portugall, and from thence haue been brought, by such as seeke out for rare plants, to make a gaine and profit by them.

## The Time.

They both flower in May, and not before: and their seed is ripe in July.

## The Names.

Some doe call these *Hyacinthus Lastanicus*. The Portugall Iacynth. Clusi, who first set out the descriptions of them, called them as is expressed in their titles, and therefore we haue after the Latine name giuen their English, according as is set downie. Or if you please, you may call them, The greater and the lesser Portugall Iacynth.

*Hyacinthus Stellatus florae cinereae.* The ash coloured Starry Iacynth.

This ash coloured Iacynth, hath his leaues very like vnto the leaues of the English Iacynth, and spreading vpon the ground in the same manner, among which rise vp one or two stalkes, set at the toppe with a number of small starre-like flowers, bushing big-

ger below then aboue, of a very pale or white blew, tending to an ash colour, and very sweete in smell: the seede is blacke and round, like vnto the seede of the English Iacynth, and so is the roote, being great, round, and white; so like, I say, that it is hard to know the one from the other.

#### The Place.

The certaine originall place of growing thereof, is not knowne to vs.

#### The Time.

It flowreth in Aprill.

#### The Names.

Some doe call this *Hyacinthus Someri*, Somers Iacynth, because as Lobel saith, he brought it first into the Lowe-Countries, eyther from Constanti-nople, or out of Italy.

*Hyacinthus Stellatus Lilifolio & radice carnosa.*  
The blew Lilly leaved Starre Iacynth.

This Iacynth hath six or seuen broad greene leaues, somewhat like vnto Lilly leaues, but shorter (whereof it tooke his name as well as from the roote) spread vpon the ground, and lying close and round: before the stalke riseth out from the middle of these leaues, there doth appere a deepe hollow place, like a hole, to bee scene a good while, which at length is filled vp with the stalke, rising thence vnto a foote or more high, bearing many starre-like flowers at the toppe, of a perfect blew colour, neare vnto a Violet, and sometimes of paler or bleake blew colour, hauing as it were a small cuppe in the middle, diuided into six peeces, without any thirds therein: the seede is blacke and round, but not shinieng: the roote is somewhat long, bigge belowe, and small aboue, like vnto the small roote of a Lilly, and composed of yellow scales, as a Lilly, but the scales are greater, and fewer in number.

*Hyacinthus Stellatus Lilifolius album.* The white Lilly leaved Starre Iacynth.

The likenesse of this Iacynth with the former, causeth me to be briefe, and not to repeate the same things againe, that haue already beene expressed: You may therefore understand, that except in the colour of the flower, which in this is white, there is no difference betweene them.

I haue of one that should beare blush coloured flowers, but I haue not yet scene any such.

#### The Place.

These Iacinths haue been gathered on the Pyrenæan Hils, in that part of France that is called Aquitaine, and in some other places.

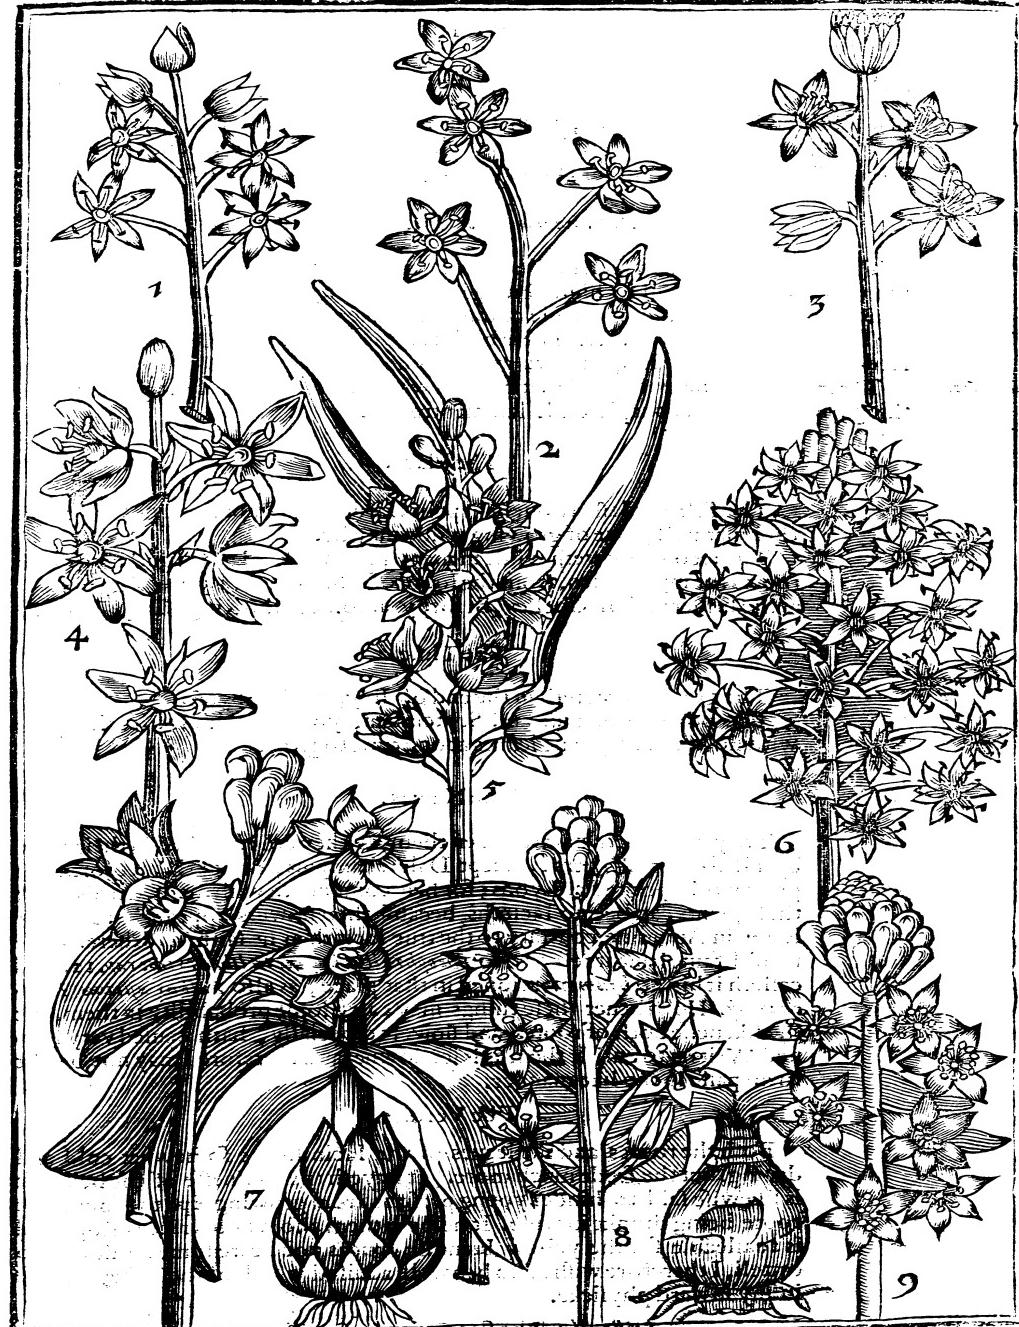

#### The Time.

*Hyacinthus Stellatus Lilifolius & radice carnosa.* These flowre in Aprill, and sometimes later.

#### The Names.

Because the roote is so like vnto a Lilly, as the leafe is also, it haue most properly beeene called *Hyacinthus Stellatus Lilifolio & radice*, or for brevity *Lilifolium*, that is, The Starry Lilly leaved Iacynth. It is called *Sarabug* by the Inhabitants where it groweth, as Clusius maketh the report from Venerius, who further saith, that by experiance they haue found the cattell to swell and dye, that haue eaten of the leaves thereof.

*Hyacinthus*

1. *Hyacinthus bellatus præcox carnosa*. The early blew starry Iacynth. 2. *Hyacinthus bellatus præcox album*. The early white starry Iacynth. 3. *Hyacinthus bellatus* Byzantinus nigra radice. The blacke starry Iacynth with a blacke root. 4. *Hyacinthus* Byzantinus albus sive Rose Radicis. The other starry Iacynth of Constantinople. 5. *Hyacinthus* stellata major. The greater Summer Starry Iacynth. 6. *Hyacinthus* bellatus perfoliatus. The 6th culutured Starry Iacynth. 7. *Hyacinthus* bellatus Lilifolium. The Lilly leaved Starry Iacynth. 8. *Hyacinthus* Autuminalis. The Autumnal Iacynth. 9. *Gilia* alba fine *Hyacinthus magnum*. The Sea Onion or Squill.

*Hyacinthus Autumnalis maior.* The greater Autumne Iacinth.

The greater Autumne Iacynth hath five or six very long and narrow greene leaues, lying vpon the ground; the stalkes are set at the toppe with many starre-like flowers, of a pale blewif purple colour, with some pale coloured thredes, tipt with blew, standing about the head in the middle, which in time growing ripe, containeth therein small blacke seede, and roundish: the roote is great and white on the outside.

*Hyacinthus Autumnalis minor.* The lesser Autumne Iacinth.

This lesser Iacynth hath such like long and small leaues, but narrower then the former: the stalke is not full so high, but beareth as many flowers on it as the other, which are of a pale or bleake purple colour, very like vnto it also: the roote and seede are like the former, but smaller. These both for the most part, beare their flowers and seede before the greene leaues rise vp much aboue the ground.

*Fare alio.* There is a kinde hereof found that beareth white flowers, not differing in any other thing from the smaller purple kinde last mentioned.

## The Place.

The first and last are onely kept in Gardens, and not knowne to vs where their naturall place of growing wilde may be.

The second groweth wilde in many places of England. I gathered divers rootes for my Garden, from the foote of a high banke by the Thames side, at the hither end of Chelsey, before you come at the Kings Barge-house.

## The Time.

The greatest flowreth in the end of July, and in August.

The other in August and September, you shall seldom see this plant with flowers and greene leaues at one time together.

## The Names.

They haue their names giuen them, as they are expressed in their titles, by all former Writers, except Daleschampius, or hee that set forth that great worke printed at Lyons; for hee contendeth with many words, that these plants can bee no Iacinths, because their flowers appeare before their leaues in Autumne, contrary to the true Iacynth, as he saith: and therefore he would faine haue it referred to *Theophrastus bulbis in libro primo cap. 12.* and calleth it his *Tiphyum* mentioned in that place, as also *Bulbus affinis Dalechampij*. Howsoever these things may carry some probability in them, yet the likenesse both of rootes, and flowers especially, hath caused very learned Writers to entitle them as is set downe, and therefore I may not but let them passe in the like manner.

## The Vertues.

Both the rootes and the leaues of the Iacinths are somewhat cold and drying, but the seede much more. It stayeth the loosesse of the belly. It is likewise said to hinder young persons from growing ripe too soone, the roote being drunke in wine. It helpeth them also whiche vrine is stopt, and is auailable for the yellow Iaundise; but as you heare some are deadly to cattell, I therefore wish all to bee well aduised which of these they will vse in any inward physike.

*Scilla alba.* The Sea Onion or Squill.

As I ended the discourse of both the true and the bastard Daffodils, with the Sea kindes

kindes of both sorts; so I thinke it not amisse, to finish this of the Iacinths with the description of a Sea Iacynth, which (as you see) I take to be the *Scilla*, or Sea Onion, all his parts so nearely resembling a Iacynth, that I know not where to ranke him better then in this place, or rather not any where but here. You shal haue the description thereof, and then let the iudicious passe their sentence, as they thinke meetest.

The Squill or Sea Onion (as many doe call it) hath diuers thicke leaues, broad, long, greene, and hollowe in the middle, and with an eminent or swelling ribbe all along the backe of the leafe, (I relate it as I haue seene it, hauing shot forth his leaues in the ship by the way, as the Mariners that brought diuers rootes from out of the Straights, did sell them to mee and others for our vse) lying vpon the ground, somewhat like vnto the leaues of a Lilly: these spring vp after the flowers are past, and the seed ripe, they abiding all the Winter, and the next Spring, vntill the heate of the Summer hath speat and consumed them, and then about the end of August, or beginning of September, the stalke with flowers ariseth out of the ground a foote and a halfe high, bearing many starre-like flowers on the toppe, in a long spike one aboue another, flowring by degrees, the lowest first, and so vpwards, whereby it is long in flowring, very like, as well in forme as bignesse, to the flowers of the great Starre of Bethlehem (these flowers I haue likewise seene shooting out of some of the rootes, that haue been brought in the like manner:) after the flowers are past, there come vp in their places thicke and three square heads, wherin is contained such like flat, black, and round seed, as the Spanish dusky Iacynth before described did bear, but greater: the root is great & white, couered with many peelings or courerings, as is plainly enough seen to any that know them, and that sometimes wee haue had rootes, that haue beeene as bigge as a pretty childe's head, and sometimes two growing together, each whereof was no lesse then is said of the other.

*Scilla rubra sive Pancratium verum.* The red Sea Onion.

The roote of this Squill, is greater oftentimes then of the former, the outer coates or peelings being reddish, bearing greater, longer, stiffer, and more hollow leaues, in a manner vpright: this bringeth such a like stalke and flowers, as the former doth, as Fabianus Ilges, Apothecary to the Duke of Briga, did signifie by the figure thereof drawne and sent to Clusius.

## The Place.

They grow alwayes neare the Sea, and never farre off from it, but often on the very baich of the Sea, where it washeth ouer them all along the coasts of Spaine, Portugal, and Italy, and within the Straights in many places: it will not abide in any Garden farre from the Sea, no not in Italy, as it is related.

## The Time.

The time wherein they flower, is expressed to be in August and September: the seede to be ripe in October and Nouember, and the greene leaues to spring vp in Nouember and December.

## The Names.

These are certainly the true kindes of *Scilla* that should bee vsed in medicines, although (as Clusius reporteth) the Spaniards forbade him to taste of the red Squill, as of a most strong and present poison. Pliny hath made more sorte then can be found out yet to this day with vs: that *Scilla* that is called *Epimenidia*, because it might be eaten, is thought to be the great *Ornitogalum*, or Starre of Bethlehem. *Pancratium* is, I know, and as I said before, referred to that kinde of bastard Sea Daffodill, which is set forth before in the end of the history of the bastard Daffodils; and diuers also would make the *Narcissus tertiarius Matthioli*, which I call the true Sea Daffodill, to be a *Pancratium*; but seeing Dioscorides (and no other is against him) maketh

## The Garden of pleasant Flowers.

maketh *Pancratium* to be a kinde of Squill with reddish rootes, I dare not vphold their opinion against such manifest truth.

### The Vertues.

The Squill or Sea Onion is wholly vsed physically with vs, because wee can receiue no pleasure from the sight of the flowers. Pliny writheth, that Pithagoras wrote a volume or booke of the properties thereof, for the singular effects it wrought; which booke is lost, yet the diuers vertues it hath is recorded by others, to be effectuall for the fpleene, lungs, stomach, liuer, head and heart; and for dropfies, old coughs, laundise, and the wormes; that it cleareth the sight, helpeþ the tooth-ache, cleanseth the head of scurfe, and running sores; and is an especiall Antidote against poison: and therefore is vsed as a principall ingredient into the *Theriaca Andromachi*, which we vsually call Venice Treakle. The Apothecaries prepare hereof, both Wine, Vinegar, and Oxymel or Syrupe, which is singular to extenuate and expectorate tough flegme, which is the cause of much disquiet in the body, and an hinderer of concoction, or digestion in the stomach, besides diuers other wayes, wherein the scales of the rootes, being dried, are vsed. And Galen hath sufficiell explained the qualities and properties thereof, in his eight Booke of Simples.

### CHAP. XII.

#### *Ornithogalum*. Starre of Bethlehem.

**A**fter the Family of the IacINTHS, must needs follow the kindes of Starre-flowers, or Starres of Bethlehem, as they are called, for that they doe so nearely resemble them, that diuers haue named some of them IacINTHS, and referred them to that kindred: all of them, both in roote, leafe, and flower, come nearer vnto the IacINTHS, then vnto any other plant. They shall therefore bee next described, every one in their order, the greatest first, and the rest following.

#### *Ornithogalum Arabicum*. The great Starre-flower of Arabia.

This Arabian Starre-flower hath many broad, and long greene leaues, very like vnto the leaues of the Orientall IacINTH, but lying for the most part vpon the ground, among which riseth vp a round greene stalke, almost two foote high, bearing at the toppe diuers large flowers, standing vpon long foote-stalkes, and at the bottome of euery one of them a small short pointed greene leafe: these flowers are made of six pure white leaues a peece, laid open as large as an ordinary Daffodill, but of the forme of a Starre IacINTH, or Starre of Bethlehem, which close as they doe every night, and open themselfes in the day time, especially in the Sunne, the smell whereof is pretty sweete, but weake: in the middle of the flower is a blackish head, composed with six white thredds, tipt with yellow pendent: the seede hath not beene obserued with vs: the roote is great and white, with a flat bottome, very impatient of our cold Winters, so that it seldom prospereth or abideth with vs; for although sometimes it doe abide a Winter in the ground, yet it often lyeth without springing blade, or any thing else a whole yeare, and then perisheth: or if it doe spring, yet many doe not beare, and most after their first bearing doe decay and perish. But if any be desirous, to know how to preserue the roote of this plant, or of many other bulbous rootes that are tender, such as the great double white Daffodill of Constantinople, and other fine Daffodils, that come from hot Countries, let them keepe this rule: Let either the roote be planted in a large pot, or tubbe of earth, and houed all the Winter, that so it may bee defended from the frosts; Or else (which is the easier way) keepe the roote out of the ground every yeare, from September, after the leaues and stalkes are past, vntill February, in some

## The Garden of pleasant Flowers.

some dry, but not hot or windy place, and then plant it in the ground vnder a South wall, or such like defended place, which will spring, and no doubt prosper well there, in regard the greatest and deepest frosts are past after February, so that seldom any great frosts come after, to pierce so deepe as the roote is to be set, or thereby to doe any great harme to it in such a place.

### The Place.

This hath been often sent out of Turkie, and likewise out of Italy; I had likewise two rootes sent mee out of Spaine by Guillaume Boel before remembred, which (as hee said) hee gathered there, but they prospered not with me, for want of the knowledge of the former rule. It may be likely that Arabia is the place, from whence they of Constantinople receiue it.

### The Time.

It flowreth in May, if it be of the first yeares bringing; or in June, if it haue been ordered after the manner before set downe.

### The Names.

It hath been sent out of Italy by the name of *Lilium Alexandrinum*, The Lilly of Alexandria, but it hath no affinity with any Lilly. Others call it *Hyacinthus Arabicus*; and the Italians, *Iacintbo del paese nostro*: but it is no IacINTH neither, although the flowers be like some of them. Some also would referre it to a *Narcissus* or Daffodill, and it doth as little agree with it, as with a Lilly, although his flowers in largenesse and whitenesse resemble a Daffodill. Clusius hath most fitly referred it to the stocke or kindred of *Ornitogale*, or Starres of Bethlehem, as wee call them in English, and from the Turkish name, *Zumbul Arabi*, entituled it *Ornitogalum Arabicum*, although *Zumbul*, as I haue before declared, is with them, a IacINTH, wee may call it in English, The Arabian Starre-flower, or Starre of Bethlehem, or the great Starre-flower of Arabia.

#### 1. *Ornitogalum maximum album*.

The greatest white Starre-flower, or Starre of Bethlehem.

This great Starre-flower hath many faire, broad, long, and very fressh green leaues, rising vp very early, and are greater, longer, and greener then the leaues of any Orientall IacINTH, which doe abide greene, from the beginning or middle of Januari, or before sometimes, vntill the end of May, at which time they begin to fade, and the stalke with the head of flowers beginneth to rise, so that it will haue either few or no leaues at all, when the flowers are blowne: the stalke is strong, round, and firme, rising two foote high or more, bearing at the toppe a great bush of flowers, seeming at the first to be a great greenie eare of corne, for it is made spike-fashion, which when the flowers are blowne, doth rise to be very high, slender or small at the head above, and broad spread and bushing below, so that it is long in flowing; for they flower below first, and so vpwards by degrees: these flowers are snow white, without any line on the backside, and is therein like vnto the former, as also in whitenesse, but nothing so large, with a white vmbone or head in the middle, beset with many white thredds, tipt with yellow: the seede is blacke and round, contained in three square heads: the roote is great, thicke, and short, and somewhat yellowish on the outside, with a flat bottome, both like the former, and the next that followeth.

#### 2. *Ornitogalum maius spicatum album*.

The great white spiked Starre-flower.

This spiked Starre-flower in his growing, is somewhat like vnto the last described,

but springeth not vp so early, nor hath his leaues so greene, or large, but hath broad, long, whitish greene hollow leaues, pointed at the end, among which riseth vp the stalke, which is strong and high, as the former, hauing a great bush of flowers at the toppe, standing spike-fashon, somewhat like the former, flowering in the same maner by degrees, first below, and so vpwards; but it is not so thicke set with flowers, nor so farre spread at the bottome as it, the flowers also are not so white, and each of the leaues of them haue a greene line downe the backe, leauing the edges on both sides white: after the flowers are past, the heads for seede grow three square, like the other, bearing such like blacke seede therin: the roote hereof is vsually bigger then the last, and whiter on the outside.

3. *Ornithogalum Pannonicum*. The Hungarian Starre-flower.

This Hungarian Starre-flower shootheit out diuers narrow, long, whitish greene leaues, spread vpon the ground before Winter, which are very like vnto the leaues of Gilloflowers, and so abide aboue ground, hauing a stalke rising in the middle of them the next Spring, about halfe a foote high or thereabouts, bearing many white flowers at the toppe, with greene lines downe the backe of them, very like vnto the ordinary Starres of Bethlehem: the roote is greater, thicker, and longer then the ordinary Starres, and for the most part, two ioynted together, somewhat grayish on the outside.

4. *Ornithogalum vulgare*. The Starre of Bethlehem.

The ordinary Starre of Bethlehem is so common, and well knowne in all countries and places, that it is almost needless to describe it, hauing many greene leaues with white lines therein, and a few white flowers set about the toppe of the stalke, with greenish lines downe the backe: the roote is whitish, and encreaeth abundantly.

5. *Asphodelus bulbosus Galeni*, sive *Ornithogalum maius* flave subnitescens.  
The bulbous Asphodill, or great Starre-flower.

Diuers haue referred this plant vnto the Asphodils, because (as I thinke) the flowers hereof are straked on the backe, and the leaues long and narrow, like vnto the Asphodils; but the roote of this being bulbous, I rather (as some others doe) ioyne it with the *Ornithogala*, for they also haue strakes on the backe of the flowers. It hath many whitish greene leaues, long and narrow, spread vpon the ground, which spring vp in the beginning of the yeare, and abide vntill May, and then they withering, the stalke springeth vp almost as high as the first, hauing many pale yellowish greene flowers, but smaller, and growing more sparsely about the stalke vpon short foot-stalkes, but in a reasonable long head spike-fashon: the seede is like vnto the second kinde, but smaller: the roote is somewhat yellowish, like the first great white kinde.

The Place.

The first is onely nurst in Gardens, his originall being not well knowne, yet some attribute it vnto *Pannonia* or Hungary. The second hath been found neare vnto Barcinone, and Toledo in Spaine. The third was found in Hungary by Clusius. Our ordinary every where in the fields of Italy and France, and (as it is said) in England also. And the last growth likewise by the corne fields in the vpper Hungary.

The Time.

They flower in Aprill and May, and sometimes in June.

The Names.

The first is called by Clusius *Ornithogalum maximum album*, because it is greater

1. *Ornithogalum Arabicum*. The great starre-flower of Arabia. 2. *Ornithogalum maximum album*. The greatest white starre-flower. 3. *Ornithogalum maius* spicatum album. The great white spiket starre-flower. 4. *Ornithogalum Pannonicum album*. The Hungarian starre-flower. 5. *Asphodelus bulbosus Galeni*, sive *Ornithogalum maius* subnitescens flora. The bulbous Asphodill, or greene starre-flower. 6. *Ornithogalum Hispanicum minus*. The little starre-flower of Spaine. 7. *Ornithogalum lucidum*. The yellow starre-flower of Bethlehem. 8. *Ornithogalum Neapolitanum*. The starre-flower of Naples.

greater then the next, which hee tooke formerly for the greatest : but it might more fitly, in my iudgement, bee called *Aphodelus bulbosus albus* (if there be any *Aphodelus bulbosus* at all) because this doth so nearly resemble that, both in the early springing, and the decay of the greene leaues, when the stalkes of flowers doe rife vp. Diuers also doe call it *Ornithogalum Pan-nonicum maximum album*.

The second hath his name in his title, as most authors doe set it downe, yet in the great Herball referred to Dalechampius, it is called *Ornithogalum magnum Myconi*.

The third hath his name from the place of his birth, and the other from his popularity, yet Dodonaeus calleth it *Bulbus Lencanthemos*.

The last is called by diuers *Aphodelo-hyacinthinus*, and *Hyacintho-aphodelus Galeni*. Dodonaeus calleth it *Aphodelus farnina*, and *Aphodelus bulbosus*. But Lobel, and Gerrard from him, and Dodonaeus, doe make this to haue white flowers, whereas all that I haue seene, both in mine owne, and in others Gardens, bore greenish flowers, as Clusius setteth it truely downe. Lobel seemeth in the description of this, to confound the *Ornithogalum* of Mompelier with it, and calleth it *Aphodelus hyacinthinus forte Galeni*, and saith that some would call it *Pancratium Monspeliense*, and *Aphodelus Galeni*. But as I haue shewed, the *Ornithogalum spicatum* and this, doe plainly differ the one from the other, and are not both to be called by one name, nor to be reckoned one, but two distin& plants.

#### *Ornithogalum Aethiopicum*. The Starre-flower of Aethiopia.

The leaues of this plant are a foote long, and at the least an inch broad, which being broken, are no lesse woolly then the woolly Iacynth : the stalke is a cubit high, strong and greene, from the middle whereof vnto the toppe, stand large snow white flowers, vpon long, greene, thicke foot-stalkes, and yellowish at the bottome of the flower, in the middle whereof stand six white thredes, tipt with yellow chives, compassing the head, which is three square, and long containing the seede : the roote is thicke and round, somewhat like the *Aphodelus Galeni*.

#### The Place.

This plant was gathered by some Hollanders, on the West side of the Cape of good Hope.

#### The Time.

It flowred about the end of Auguft with those that had it.

#### The Names.

Because it came from that part of the continent beyond the line, which is reckoned a part of Aethiopia, it is thereupon so called as it is set downe.

#### *Ornithogalum Neopolitanum*. The Starre-flower of Naples.

This beautifull plant riseth out of the ground very early, with four or five hollow pointed leaues, standing round together, of a whitish greene colour, with a white line downe the middle of euery leafe on the inside, somewhat narrow, but long, (Fabius Columna saith, three foot long in Italy, but it is not so with vs) in the middle of these leaues riseth vp the stalke, a foote and a halfe high, bearing diuers flowers at the toppe, every one standing in a little cuppe or huske, which is diuided into three or four parts, hanging downe very long abou the heads for seede : after the flower is past, these flowers doe all hang downe their heads, and open one way, although their little foot-stalkes come forth on all sides of the greater stalke, being large, and composed of six long leaues, of a pure white on the inside, and of a blewifh or whitish greene colour on

on the outside, leauing the edges of euery leafe white on both sides : in the middle of these flowers stand other small flowers, each of them also made of six small white leaues a peece, which meeting together, seeme to make the shew of a cuppe, within which are contained six white thredes, tipt with yellow, and a long white pointell in the middle of them, being without any sent at all : after the flowers are past, come vp great round heads, which are too heauie for the stalke to beare ; and therefore lye downe vpon the leaues or ground, hauing certaine lines or stripes on the outside, wherein is contained round, blacke, rough seede : the roote is great and white, and somewhat flat at the bottome, as diuers of these kindes are, and doe multiply as plentifullly into small bulbes as the common or any other.

#### The Place.

This Starre-flower groweth in the Medowes in diuers piaces of Naples, as Fabius Columna, and Ferrantes Imperatus doe testifie, from whence they haue been sent. And Matthiolus, who setteth out the figure thereof among his Daffodils, had (it should seeme) seene it grow with him.

#### The Time.

It flowreth in May, although it begin to spring out of the ground often-times in Nouember, but most vsually in January : the seede is ripe in July.

#### The Names.

Matthiolus reckoneth this (as is said) among the Daffodils, for no other respect, as I conceiue, then that he accounted the middle flower to bee the cuppe or trunke of a Daffodill, which it doth somewhat resemble, and setteth it forth in the fourth place, whereupon many doe call it *Narcissus quartus Matthiolis*, The fourth Daffodill of Matthiolus. Fabius Columna calleth it *Hyacinthus aruorum Ornithogali flore*. Clusius (to whom Imperatus sent it, in stead of the Arabian which hee desired) calleth it of the place from whence he receiuēd it, *Ornithogalum Neopolitanum*, and we thereafter call it in English, The Starre-flower of Naples.

#### *Ornithogalum Hispanicum minus*. The little Starre-flower of Spaine.

Clusius hath set forth this plant among his *Ornithogala* or Starre-flowers, and although it doth in my miade come nearer to a *Hyacinthus*, then to *Ornithogalum*, yet pardon it, and let it passe as he doth. From a little round whitish roote, springeth vp in the beginning of the yeare, fife or six small long green leaues, without any white line in the middle of them, among which rise vp one or two small stalkes, an hand length high or better, bearing seuen or eight, or more flowers, growing as it were in a tuft or vmbell, with small long leaues at the foote of euery stalke, the lower flowers being equall in length with the uppermost, of a pale whitish blew or ash colour, with a stike or line downe the backe of euery leafe of them, with some white thredes standing about a blewifh head in the middle : these flowers passeaway quickly, and giue no seede, so that it is not knowne what seede it beareth.

#### The Place.

This growtheth in Spaine, and from thence hath been brought to vs.

#### The Time.

It flowreth in May.

#### The Names.

It hath no other name then is set downe in the title, being but lately found out.

1. *Ornithogalum album unifolium*. The white starre-flower with one blade.

This little starre-flower I bring into this place, as the fittest in my opinion where to place it, vntill my minde change to alter it. It hath a very small round white roote, from whence springeth vp one very long and round greene leafe, like vnto a rush, but that for about two or three inches aboue the ground, it is a little flat, and from thence springeth forth a small stalke not aboue three or four inches high, bearing at the top thereof three or four small white flowers, consisting of six leaves a peece, within which are six white chives, tipt with yellow pendent, standing about a small three square head, that hath a white pointell sticking as it were in the middest thereof : the flower is pretty and sweete, but not heady.

*Ornithogalum luteum*. The yellow Starre of Bethlehem.

This yellow Starre-flower riseth vp at the first, with one long, round, greenish leafe, which openeth it selfe somewhat aboue the ground, and giueth out another small leafe, lesser and shorter then the first, and afterward the stalke riseth from thence also, being foure or five inches high, bearing at the toppe three or four small green leaves, and among them foure or five small yellow starre-like flowers, with a greenish line or creake downe the backe of every leafe, and some small reddish yellow thredds in the middle : it seldom giueth seede : the roote is round, whitish, and somewhat cleare, very apt to perish, if it bee any little while kept dry out of the ground, as I haue twice tried to my losse.

## The Place.

The first grew in Portugall, and Clusius first of all others desciphers it. The other is found in many places both of Germany and Hungary, in the moister grounds.

## The Time.

The first flowreth in May : the other in Aprill, and sometimes in March.

## The Names.

Carolus Clusius calleth the first *Bulbus unifolium*, or *Bulbine*, but referreth it not to the stocke or kindred of any plant ; but (as you see) I haue ranked it with the small sorts of *Ornithogalum*, and giue it the name accordingly.

The other is referred for likenesse of forme, and not for colour, vnto the *Ornithogala*, or Starres of Bethlehem. It is called by *Tragus* and *Fuchsius* *Bulbus silvestris*, because of the obuiousnesse. *Cordus* taketh it to be *Sisyrinchium*. *Lacuna* calleth it *Bulbus esculentus*. *Lobel* and others in these dayes generally, *Ornithogalum luteum*, and wee thereafter in English, The yellow Starre-flower, or Starre of Bethlehem.

## The Vertues.

The first kinde being but lately found out, is not knowne to be vsed. The rootes of the common or vulgar, are (as *Matthiolus* saith) much eaten by poore people in Italy, either rawe or roasted, being sweeter in taste then any Chestnut, and seruing as well for a necessary food as for delight. It is doubtfull whether any of the rest may be so vsed ; for I know not any in our Land hath made any experiance.

There are many other sorts of Starre-flowers, which are fitter for a generall then this History ; and therefore I referre them thereunto.

## CHAP. XIII.

## Moly. Wilde Garlick.

**V**NTO the former Starre-flowers, must needs bee ioyned another tribe or kindred, which carry their straked flowers Starre-fashion, not spikewise, but in a tuft or vmbell thicke thrust or set together. And although diuers of them smell not as the former, but most of their first Grandfathers house, yet all doe not so ; for some of them are of an excellent sent. Of the whole Family, there are a great many which I must leaue, I will onely selec[t] out a few for this our Garden, whose flowers for their beauty of statelinesse, forme, or colour, are fit to bee entertained, and take place therein, every one according to his worth, and are accepted of with the louers of these delights.

1. *Moly Homericum, vel potius Theophrasti*.  
The greatest Moly of Homer.

Homers Moly (for so it is most vsually called with vs) riseth vp most commonly with two, and sometimes with three great, thicke, long, and hollow guttured leaves, of a whitish greene colour, very neare the colour of the *Tulipa* leafe, having sometimes at the end of some of the leaves, and sometimes apart by it selfe, a whitish round small button, like vnto a small bulbe, the like whereof also, but greater, doth grow betweene the bottome of the leaves and the stalke neare the ground, which being planted when it is ripe, will grow into a roote of the same kinde : among these leaves riseth vp a round, strong, and tall stalke, a yard high or better, bare or naked vnto the toppe, where it beareth a great tuft or vmbell of pale purplish flowers, all of them almost standing vpon equall foot-stalkes, or not one much higher then another, consisting of five leaves a peece, striped downe the backe with a small pale line, having a round head or vmbone with some thredds about it in the midst : These flowers doe abide a great while blowne before they vade, which smell not very strong, like any Onion or Garlick, but of a faint smell : and after they are past come the seede, which is blacke, wrapped in white close huskes : the roote groweth very great, sometimes bigger then any mans closed fist, smelling strong like Garlick, whitish on the outside, and greene at the toppe, if it be but a while bare from the earth about it.

2. *Moly Indicum sive Canacon*. The Indian Moly.

The Indian Moly hath such like thicke large leaves, as the Homers Moly hath, but shorter and broader, in the middle whereof riseth vp a short weake stalke, almost flat, not haing any flowers vpon it, but a head or cluster of greenish scaly bulbes, inclosed at the first in a large thinne skinne, which being open, every bulbe sheweth it selfe, standing close one vnto another vpon his foot-stalke, of the bignesse of an Acorne, which being planted, will grow to bee a plant of his owne kinde : the roote is white and great, couered with a darke coate or skinne, which encreaseth but little vnder ground ; but besides that head, it beareth small bulbes aboue the ground, at the bottome of the leaves next vnto the stalke, like vnto the former.

## The Place.

Both these doe grow in diuers places of Spaine, Italy, and Greece ; for the last hath been sent out of Turkie among other rootes. Ferrantes Imperatus a learned Apothecary of Naples, sent it to diuers of his friends in these parts, and hath described it in his naturall history among other plants, printed in the Italian tongue. It grew also with Iohu Tradescante at Canterbury, who sent me the head of bulbes to see, and afterwards a roote, to plant it in my Garden.

## The Time.

The first flowreth in the end of May, and abideth vnto the midft of July, and sometimes longer. The other beareth his head of bulbes in Iune and July.

## The Names.

We haue receiuied them by their names expressed in their titles, yet the last hath also been sent by the name of *Ornithogalum Italicum*, but as all may easily see, it is not of that kindred.

1. *Moly montanum Pannonicum bulbiferum primum.*

The first bulbed Moly of Hungary.

This first Hungarian Moly hath three or foure broad and long greene leaues, folded together at the first, which after open themfelves, and are carried vp with the stalke, standing thereon one aboue another, which is a foote high; at the toppe whereof doe grow a few sad reddish bulbes, and betweene them long footstalkes, bearing flowers of a pale purplish colour; after which followeth blacke seede, inclosed in roundish heads: the roote is not great, but white on the outside, very like vnto the roote of Serpents Moly, hereafter described, encreasing much vnder ground, & smelling strong.

2. *Moly montanum Pannonicum bulbiferum secundum.*

The secound bulbed Moly of Hungary.

The second Moly bath narrower greene leaues then the former: the stalke is about the same height, and beareth at the toppe a great cluster of small greene bulbes, which after turne of a darker colour, from among which come forth long foot-stalkes, whereon stand purplish flowers: the roote is couered with a blackish purple coate or skinne,

3. *Moly Serpentinum. Serpents Moly.*

This Moly must also be ioyned vnto the bulbous Molies, as of kindred with them, yet of greater beauty and delight, because the bulbes on the heads of the small stalkes are redder, and more pleasant to behold: the stalke is lower, and his graffie winding leaues, which turne themfelves (whereof it tooke the name) are smaller, and of a whiter greene colour: it beareth among the bulbes purplish flowers also, but more beautifull, the sent whereof is nothing so strong: the roote is small, round, and whitish, encreasing into a number of small rootes, no bigger then pease round about the greater roote.

4. *Moly caule & folijs triangularibus. Thethree cornered Moly.*

This three square Moly hath foure or five long, and somewhat broad pale greene leaues, flat on the vpper side, and with a ridge downe the backe of the leafe, which maketh it seeme three square: the stalke which riseth vp a foote and a halfe high or better, is three square or three cornered also, bearing at the toppe out of a skinnie huske diuers white flowers, somewhat large and long, almost bell-fashion, with stripes of greene downe the middle of every leafe, and a few chives tipt with yellow in the middle about the head, wherein when it is ripe, is inclosed small blacke seede: the roote is white on the outside, and very like the yellow Moly; both roote, leafe, and flower hath a smacke, but not very strong of Garlickie.

5. *Moly Narcissinus folijs. Daffodill leaved Moly.*

This Moly hath many long, narrow, and flat greene leaues, very like vnto the leaues of a Daffodill, from whence it tooke his name (or rather of the early greater *Leucium bulbosum*,

<sup>1</sup> Moly Hemeritum vel persic Thesephra. The greatest Moly of Homer. <sup>2</sup> Moly Indicum sive Caucasum. The Indian Moly. <sup>3</sup> Moly Pannonicum bulbiferum. The bulbed Moly of Hungary. <sup>4</sup> Moly Serpentinum. Serpents Moly. <sup>5</sup> Moly purpureum Neapolitanum. The purplish Moly of Naples. <sup>6</sup> Moly caule & folijs triangularibus. The three cornered Moly. <sup>7</sup> Moly Luteolum flore luteo. The yellow Moly. <sup>8</sup> Moly Diaphorum Hispanicum. The Spanish Moly of Diaphorides. <sup>9</sup> Moly Zibeticum vel Mocharatum. The sweete smelling Moly of Mampelier. <sup>10</sup> Moly serotinum conifera. The late Pineapple Moly.

*bulbosum*, or bulbed Violet before described, ioyned next vnto the Daffodils, because it is so like them) among which riseth vp two or three stalkes sometimes, each of a foot and a halfe high, bearing at the toppe, inclosed in a skinny hose, as all the Molyes haue, a number of small purplish flowers, which doe not long abide, but quickly fade: the seede is blacke as others are; the roote is sometimes knobbed, and more often bulbed, hauing in the knobs some marks of the old stalkes to be seene in them, and smelleth somewhat like Garlick, whereby it may be knowne.

6. *Moly montanum latifolium late flore*. The yellow Moly.

The yellow Moly hath but one long and broad leafe when it doth not bear flower, but when it will beare flower, it hath two long and broad leaues, yet one alwaies longer and broader then the other, which are both of the same colour, and neare the bignesse of a reasonable Tulipa leafe: betweene these leaues groweth a slender stalke, bearing at the toppe a tuft or vimbell of yellow flowers out of a skinne hose, which parteth three wayes, made of six leaues a peece, laid open like a Starre, with a greenish backe or outside, and with some yellow thredes in the middle: the seede is blacke, like vnto others: the roote is whitish, two for the most part ioyned together, which encreaseth quickly, and smelleth very strong of Garlick, as both flowers and leaues doe also.

7. *Moly Pyrenaeum purpureum*. The purple mountaine Moly.

This purple Moly hath two or three leaues, somewhat like the former yellow Moly, but not so broad, nor so white: the stalke hath not so many flowers thereon, but more sparingly, and of an vnpleasant purple colour: the roote is whitish, smelling somewhat strongly of Garlick, but quickly perisheth with the extremity of our cold Winters, which it will not abide valesse it be defended.

8. *Moly montanum latifolium purpureum Hispanicum*.  
The purple Spanish Moly.

This Moly hath two broad and very long greene leaues, like vnto the yellow Moly, in this, that they doe compasse one another at the bottome of them, betweene which riseth vp a strong round stalke, two foote high or more, bearing at the toppe, out of a thinne huske, a number of faire large flowers vpon long foot-stalkes, consisting of six leaues a peece, spread open like a Starre, of a fine delayed purple or blushe colour, with diuers thredes of the same colour, tipt with yellow, standing about the middle head: betweene the stalke and the bottome of the leaues it hath some small bulbes growing, which being planted, will soone spring and encrease: the roote also being small and round, with many fibres thereat, hath many small bulbes shooting from them; but neither roote, iacle, nor flower, hath any ill sent of Garlick at all.

9. *Moly purpureum Neapolitanum*. The purple Moly of Naples.

The Neapolitan Moly hath three or four small long greene leaues set vpon the stalke after it is risen vp, which beareth a round head of very fine purple flowers, made of six leaues a peece, but so closing together at the edge, that they seeme like vnto small cuppes, never laying themselues open, as the other doe; this hath some sent of his originall, but the roote more then any part else, which is white and round, quickly encreasing as most of the Molyes doe.

10. *Moly pyxidatum argenteum Hispanicum*.  
The Spanish siluer cupped Moly.

This Spanish Moly hath two or three very long rush like leaues, which rise vp with the stalke, or rather vanishaway when the stalke is risen vp to bee three foote high or more, bearing a great head of flowers, standing close at the first, but afterwards spreading much one from another, every flower vpon a long foote-stalke, being of a white siluer

siluer colour, with stripes or lines on every side, and fashioned small and hollow, like a cuppe or boxe: the seede I could never obserue, because it flowreth so late, that the Winter hindereth it from bearing seede with vs: the roote is small and round, white, and in a manner transparent, at least so shining, as if it were so, and encreaseth nothing so much, as many of the other sorts: this hath no ill sent at all, but rather a pretty smell, not to bee disliked.

11. *Moly scorinum Coniferum*. The late Pineapple Moly.

This late Moly that was sent me with the last described, and others also from Spain, riseth vp with one long greene leafe, hollow and round vnto the end, towards this end on the one side, breaketh out a head of flowers, enclosed in a thinne skinne, which after it hath so stood a good while, (the leafe in the meane time rising higher, and growing harder, becommeth the stalke) breaketh, and sheweth a great bush or head of buds for flowers, thicke thrust together, fashioned very like vnto the forme of a Pineapple (from whence I gaue it the name) of the bigness of a Walnut: after this head hath stood in this manner a moneth or thereabouts, the flowers shew themselues to bee of a fine delayed or whitish purple colour, with diuers stripes in every of them, of the same cup-fashion with the former, but not opening so plainly, so that they cannot bee discerned to bee open, without good heede and obseruation. It flowreth so late in Autumne, that the early frosts doe quickly spoile the beauty of it, and soone cause it to rotte: the roote is small and round, and shining like the last, very tender also, as not able to abide our sharpe Winters, which hath caused it vtterly to perish with me.

12. *Moly Diiscorideum*. Dioscorides his Moly.

The roote of this small Moly is transparent within, but couered with a thicke yelowish skinne, of the bignesse of an Hasell Nut, or somewhat bigger, whiche sendeth forth three or foure narrow grasse leaues, long and hollow, and a little bending downwards, of a whitish greene colour, among which riseth vp a slender weake stalke, a foot and a halfe high, bearing at the toppe, out of a thinne skinne, a tuft of milke white flowers, very like vnto those of Ramsons, which stand a pretty while in their beauty, and then passe away for the most part without giuing any seede: this hath little or no sent of Garlick.

We haue another of this sort that is lesser, and the flowers rounder pointed.

13. *Moly Diiscorideum Hispanicum*. The Spanish Moly of Dioscorides.

This Moly came vnto me among other Molyes from Spaine, and is in all things like vnto the last described, but fairer, larger, and of much more beauty, as hauing his white flowers twice as great as the former, but (as it seemeth) very impatient of our Winters, which it could not at any hand endure, but quickly perished, as some others that came with it also.

14. *Moly Adeschatinum vel Zibettinum Monspeliense*.  
The sweete smelling Moly of Mompelier.

This sweete Moly, which I haue kept for the last, to close vp your senfes, is the smallest, and the finest of all the rest, hauing foure or fve small greene leaues, almost as fine as haires, or like the leaues of the Feather-graffe: the stalke is about a foote high, bearing fve or six or more small white flowers, laid open like Starres, made of six leaues a peece, of an excellent sweete sent, resembling Muske or Ciuet, for diuers haue diuersly censured of it. It flowreth late in the yeare, so that if the precedent Summer bee either ouer moist, or the Autumne ouer early cold, this will not haue that sweete sent, that it will haue in a hot drie time, and besides must be carefully respected: for it will hardly abide the extremity of our sharpe Winters.

## The Place.

The places of these Molyes, are for the most part expressed in their titles, or in their descriptions.

## The Time.

The time is set downe, for the most part to bee in Iune and July, the rest later.

## The Names.

To make further relation of names then are expressed in their tiles, were needlesse; let these therefore suffice.

## The Vertues.

All these sorts of Molyes are small kindes of wilde Garlick, and are to be vied for the same purposes that the great Garden Garlick is, although much weaker in their effects. For any other especiall property is in any of these, more than to furnish a Garden of variety, I haue not heard at all.

And thus much may suffice of these kindes for our Garden, reseruing manie others that might be spoken of, to a generall worke, or to my Garden of Simples, which as God shall enable me, and time giue leaue, may shew it selfe to the world, to abide the iudic peace and critike censures of all.

## C H A P. X I I I I .

*Asphodelus. The Asphodill.*

**T**here remaine some other flowers, like vnto the last described, to be specified, which although they haue no bulbous rootes, yet I thinke them fittest to bee here mentioned, that so I may ioyn those of nearest similitude together, vntill I haue finished the rest that are to follow.

1. *Asphodelus major albus ramosus.* The great white branched Asphodill.

The great white Asphodill hath many long, and narrow, hollow three square leaues, sharpe pointed, lying vpon the ground round about the roote: the stalke is smooth, round, and naked without leaues, which riseth from the midst of them, diuided at the toppe into diuers branches, if the plant bee of any long continuance, or else but into two or three small branches, from the sides of the maine great one, whereon doe stand many large flowers Starre-fashion, made of six leaues a peece, whitish on the inside, and straked with a purplish line downe the backside of every leafe, hauing in the middle of the flowers some small yellow thredes: the seede is blacke, and three square, greater then the seede of Bucke wheate, contained in roundish heads, which open into three parts: the roote is composed of many tuberos long clogges, thickest in the middle, and smaller at both ends, fastened together at the head, of a darke grayish colour on the outside, and yellow within.

2. *Asphodelus albus non ramosus.* The white vnbranched Asphodill.

The vnbranched Asphodill is like vnto the former, both in leaues and flowers, but that the flowers of this are whiter, and without any line or strake on the backside, and

and the stalkes are without branches: the rootes likewise are smaller, and fewer, but made after the same fashion.

3. *Asphodelus major flore carneo.* The blush coloured Asphodill.

This Asphodill is like to the last in forme of leaues and branches, and differeth in this, that his leaues are marked with some spots, and the flowers are of a blush or flesh colour, in all other things alike.

4. *Asphodelus minimus albus.* The least white Asphodill.

This least Asphodill hath foure or five very narrow long leaues, yet seeming three square like the greatest, bearing a small stalke, of about a foote high among them, without any branches, and at the toppe a few white flowers, straked both within and without, with a purplish line in the middle of euery leafe. The rootes are such like tuberous clogges as are in the former, but much lesser.

5. *Asphodelus albus minor sive Fistulosus.* The little hollow white Asphodill.

This little white Asphodill hath a number of leaues growing thicke together, thicker and greener then those of the small yellow Asphodill, or Kings Speare next following, among which riseth vp diuers round stalkes, bearing flowers from the middle to the toppe, Starre-fashion, with small greene leaues among them, which are white on the inside, and striped on the backe with purple lites, like vnto the first described: the seede, and heads containing them, are three square, like the seede of the little yellow Asphodill: the rootes of this kinde are not glandulous, as the former, but stringie, long and white: the whole plant is very impatient of our cold Winters, and quickly perisheth, if it be not carefully preserved, both from the cold, and much wet in the Winter, by housing it; and then it will abide many yeares: for it is not an annual plant, as many haue thought.

6. *Asphodelus luteus minor, sive Hassula regia.*  
The small yellow Asphodill, or Kings speare.

This small yellow Asphodill, which is vsually called the Kings speare, hath many long narrow edged leaues, which make them seeme three square, of a blewifh or whitish greene colour: the stalke riseth vp three foote high oftentimes, beset with small long leaues vp vnto the very flowers, which grow thicke together Spike-fashion one aboue another, for a great length, and wholly yellow, laid open like a Starre, somewhat greater then the last white Asphodill, and smaller then the first, which when they are past yeld round heads, containing blacke cornered seede, almost three square: the rootes are many long yellow strings, which spreading in the ground, doe much encrease.

## The Place.

All these Asphodils doe grow naturally in Spaine and France, and from thence were first brought vnto vs, to furnish our Gardens.

## The Time.

All the glandulous rooted Asphodils doe flower some in May, and some in Iune; but the two last doe flower, the yellow or last of them in July, and the former white one in August and September, and vntill the cold and winter hinder it.

## The Names.

Their severall names are given them in their titles, as much as is fit for this

this discourse. For to shew you that the Greekes doe call the stalke of the great Asphodill *Aσθετός*, and the Latines *Albicum*, or what else belongeth to them, is fitter for another worke, vnto which I leaueth them.

The bastard Asphodils should follow next in place, if this worke were fit for them; but because I haue tyed my selfe to expresse onely those flowers and plants, that for their beauty, or sent, or both, doe furnish a Garden of Pleasure, and they haue none, I leaueth them to a generall History of plants, or that Garden of Simples before spoken of, and will describe the Lilly Asphodils, and the *Phalangia* or Spider-worts, which are remaining of those, that ioyne in name or fashion, and are to be here inserted, before I passe to the rest of the bulbous rootes.

1. *Liliaſphodelus phaniceus*. The gold red Day Lilly.

Because the rootes of this and the next, doe so nearely agree, with the two last recited Asphodils, I haue set them in this place, although some doe place them next after the Lillies, because their flowers doe come nearest in forme vnto Lillies; but whether you will call them Asphodils with Lilly flowers, as I thinke it fittest, or Lillies with Asphodill rootes, or Lillies without bulbous rootes, as others doe, I will not contend.

The red Day Lilly hath diuers broad and long fresh greene leaues, folded at the first as it were double, which after open, and remaine a little hollow in the middle; among which riseth vp a naked stalke three foot high, bearing at the toppe many flowers, one not much distant from another, and flowring one after another, not hauing lightly aboue one flower blowne open in a day, & that but for a day, not lasting longer, but closing at night, and not opening againe, whereupon it had his English name, The Lilly for a day: these flowers are almost as large as the flowers of the white Lilly, and made after the same fashion, but of a faire gold red, or Orange tawny colour. I could neuer obserue any seede to follow these flowers; for they seeme the next day after they haue flowered, (except the time be faire and dry) to bee so rotten, as if they had lyen in wette to rotte them, whereby I thinke no seede can follow: the rootes are many thicke and long yellow knobbed strings, like vnto the small yellow Asphodill rootes, but somewhat greater, running vnder ground in like sort, and shooting young heads round about.

2. *Liliaſphodelus luteus*. The yellow Day Lilly.

I shall not neede to make a repetition of the description of this Day Lilly, hauing given you one so amply before, because this doth agree thereunto so nearely, as that it might seeme the same; these differences onely it hath, the leaues are not fully so large, nor the flower so great or spread open, and the colour thereof is of a faire yellow wholly, and very sweet, which abideth blowne many daies before its fade, and hath giuen blacke round seede, growing in round heads, like the heads of the small yellow Asphodill, but not so great.

Clusius hath set downe, that it was reported, that there should be another Liliaſphodill with a white flower, but we can haere of none such as yet; but I rather thinke, that they that gaue that report might be mistaken, in thinking the Sauoye Spider-wort to be a white Liliaſphodill, which indeede is so like, that one not well experienced, or not well regarding it, may foone take one for another.

The Place.

Their originall is many moist places in Germany.

The Time.

They flower in May and Iunc.

The Names.

They are called by some *Liliago*, and *Lilium non bulbosum*, and *Liliaſphodelus*,

1. *Aſphodelus major gibbus ramoſus*. The great white branched Asphodill. 2. *Aſphodelus minor albiflorus fistulosus*. The little hollow white Asphodill. 3. *Aſphodelus minor luteus; sive Haſpula regia*. The small yellow Asphodill, or Kings spear. 4. *Liliaſphodelus luteus*. The yellow Day Lilly. 5. *Liliaſphodelus phaniceus*. The gold red Day Lilly.

*detus.* In English we call them both Day Lillies, but the name doth not so well agree with the last, as with the first, for the causes aboue specified.

#### The Vertues.

The rootes of Asphodill hath formerly beeene had in great account, but now is vtterly neglected; yet by reason of their sharpenesse they open and cleanse, and therefore some haue of late vsed them for the yellow laundise. The Day Lillies haue no physicall vse that I know, or haue heard.

#### CHAP. XV.

##### *Phalangium.* Spider-wort.

**T**Hese plants doe so nearely resemble those that are last set forth, that I thinke none that knowes them, will doubt, but that they must follow next vnto them, being so like vnto them, and therefore of the fairest of this kinde first.

##### 1. *Phalangium Allobrogicum.* The Sauoye Spider-wort.

The Sauoye Spider-wort springeth vp with foure or fve greene leaves, long and narrow, yet broader at the bottome, narrower pointed at the end, and a little hollow in the middle; among which riseth vp a round stiffe stalke, a foote and a halfe high, bearing at the toppe one aboue another, seuen or eight, or more flowers, every one as large almost as the yellow Day Lilly last described, but much greater then in any other of the Spider-worts, of a pure white colour, with some thredes in the middle, tipt with yellow, and a small forked pointell: after the flowers are past, the heads or seede vessels grow almost three square, yet somewhat round, wherein is contained blackish seede: the rootes are many white, round, thicke, brittle strings, ioyned together at the head, but are nothing so long, as the rootes of the other *Phalangium* or Spider-worts.

##### 2. *Phalangium italicum album.* The great Italian Spider-wort.

This great Spider-wort hath diuers long and narrow leavens spread vpon the ground, and not rising vp as the former, and not so broad also as the former, but somewhat larger then those that follow: the stalke is bigger, but seldom riseth vp so high as the next, whereof this is a larger kinde, hauing a long vnbancherd stalk of white flowers, laid open like starres as it hath, but somewhat greater: the rootes are long and white, like the next, but somewhat larger.

##### 3. *Phalangium non ramosum vulgare.* Vnbrancherd Spider-wort.

The leavens of this Spider-wort doe seeme to bee little bigger or longer then the leavens of grasse, but of a more grayish green colour, rising immediately from the head of tuft of rootes; among which rise vp one or two stalkes, sometimes two or three foot long, beittoward the toppe with many white Starre-like flowers, which after they are past turne into small round heads, containing blacke seede, like vnto the seed of the little yellow Asphodill, but lesser: the rootes are long white strings, running vnder ground.

##### 4. *Phalangium ramosum.* Branched Spider-wort.

The branched Spider-wort hath his leavens somewhat broader then the former, and of a more yellowish green colour: the stalke hereof is diuersly branched at the top, bearing many white flowers, like vnto the former, but smaller: the seedes and rootes are like the former in all things.

The

1. *Phalangium Allobrogicum.* The Sauoye Spider-wort. 2. *Phalangium non ramosum.* Vnbrancherd Spider-wort. 3. *Phalangium ramosum.* Branched Spider-wort. 4. *Phalangium Eptesicum Virginianum.* John Tradescante's Spider-wort.

**The Place.**

The first groweth on the Hills neare vnto Sauoye , from whence diuers, allured with the beauty of the flower, haue brought it into these parts.

The second came vp in my Garden, from the seede received out of Italy. The others grow in Spaine, France, &c.

**The Time.**

The vnbranched Spider-wort most commonly flowreth before all the other , and the branched a moneth after it : the other two about one time, that is, towards the end of May, and not much after the vnbranched kinde.

**The Names.**

The first (as I said before) hath beeene taken to be a white Lilliasphodill, and called *Liliaſphodetus flore albo*; but Clusius hath more properly entituled it a *Phalangium*, and from the place of his originall, gave him his other denomination, and so is called of most, as is set downe in the title.

The other haue no other names then are expressed in their titles, but only that Cordus calleth them *Liliago*; and Dodonæus, lib. 4. hist. plant. would make the branched kinde to bee *Moly alterum Plinij*, but without any good ground.

**The Vertues.**

The names *Phalangium* and *Phalangites* were imposed on these plants, because they were found effectuall, to cure the poyon of that kinde of Spider, called *Phalangium*, as also of Scorpions and other Serpents. Wee doe not know, that any Phyfitian hath vsed them to any such, or any other purpose in our dayes.

*5. Phalangium Ephemeron Virginianum Ioannis Tradescant.*

The soon fading Spider-wort of Virginia, or Tradescant his Spider-wort.

This Spider-wort is of late knowledge, and for it the Christian world is indebted vnto that painfull industrious searcher, and louer of all natures varieties, John Tradescant (sometimes belonging to the right Honourable Lord Robett Earle of Salisbury, Lord Treasurer of England in his time, and then vnto the right Honourable the Lord Wotton at Canterbury in Kent , and lastly vnto the late Duke of Buckingham) who first received it of a friend, that brought it out of Virginia, thinking it to bee the Silke Grasse that groweth there, and hath imparted hereof, as of many other things, both to me and others ; the description whereof is as followeth :

From a stringie roote, creeping farre vnder ground, and rising vp againe in many places , springeth vp diuers heads of long folded leaues, of a grayish oner-worne greene colour, two or three for the most part together, and notable, compassing one another at the bottome, and abiding greene in many places all the Winter, otherwise perishing , and rising anew in the Spring, which leaues rise vp with the great round stalke, being set thereon at the ioynts , vsually but one at a ioynt , broad at the bottome where they compasse the stalke, and smaller and smaller to the end : at the vpper ioynt, which is the toppe of the stalke, there stand two or three such like leaues, but smaller, from among which bræketh out a dozen, sixteene, or twenty, or more round green heads, hanging downe their heads by little foot-stalkes, which when the flower beginneth to blow open, growth longer, and standeth vpright, having three small pale greene leaues for a huske, and three other leaues within them for the flower, which lay themselves open flat, of a deepe blew purple colour, hauing an vmbone or small head in the middle, closely set about with six reddish, hairy, or feathered bladdes, tipt with yellow pendent : this flower openeth it selfe in the day, & shutteth vsually at night,

night, and neuer openeth againe, but perisheth , and then hangeth downe his head againe ; the greene huske of three leaues, closing it selfe againe into the forme of a head, but greater , as it was before , the middle vmbone growing to bee the seede vessell, wherein is contained small , blackish, long seede : Seldome shall any man see above one, or two at the most of these flowers blowne open at one time vpon the stalke, whereby it standeth in flowring a long time , before all the heads haue giuen out their flowers.

**The Place.**

This plant groweth in some parts of Virginia, and was deliuere to Iohn Tradescant.

**The Time.**

It flowreth from the end of May vntill July , if it haue had greene leaues all the Winter, or otherwise, vntill the Winter checke his luxuriosnesse:

**The Names.**

Vnto this plant I confesse I first imposed the name, by considering duely all the parts thereof, which vntill some can finde a more proper, I desire may still continue, and to call it *Ephemeron Virginianum Tradescanti*, Iohn Tradescante's Spider-wort of Virginia, or *Phalangium Ephemeron Virginianum*, The soone fading or Day Spider-wort of Virginia.

**The Vertues.**

There hath not beeene any tryall made of the properties since wee had it, nor doe we know whether the Indians haue any vse thereof.

**C H A P. X V I.***Colchicum. Medowe Saffron.*

**T**O retorne to the rest of the bulbous and tuberous rooted plants , that remaine to bee entreated of, the *Colchica* or Medowe Saffrons are first to bee handled, whereof these later dayes haue found out more varieties, then formerly were knowne ; some flowring in the Spring , but the most in Autumne , and some bearing double, but the greatest part singele flowers : whereof every one in their order, and first of our owne Country kindes.

*1. Colchicum Anglicum album. The white English Medowe Saffron.*

It is common to all the Medowe Saffrons, except that of the Spring, and one other, to beare their flowers alone in Autumne or later, without any green leaues with them, and afterwards in February, their greene leaues : So that I shall not neede to make manie descriptions, but to shew you the differences that consist in the leaues, and colours of the flowers ; and briefly to passe (after I haue giuen you a full description of the first) from one vnto another, touching onely those things that are note worthy. The white English Medowe Saffron then doth beare in Autumne three or foure flowers at the most, standing severally vpon weake foote-stalkes, a fingers length or more aboue the ground, made of six white leaues, somewhat long and narrow, and not so large as most of the other kindes, with some thredes or chives in the middle , like vnto the Saffron flowers of the Spring, wherein there is no colour of Saffron , or vertue to that effect : after the flowers are past and gone, the leaues doe not presently follow, but the roote remaineth in the ground without shew of leafe aboue ground, most part of the Winter, and then in February there spring vp three or foure large and long greene leaues,

leaves, when they are fully growne vp, standing on the toppe of a round, weake, green, and short foote-stalke, somewhat like the leaves of white Lillies, but not so large, and in the middest of these leaves, after they haue been vp sometime, appeare two or three loose skinny heads, standing in the middle of the leaves vpon short, thicke, greene stalkes, and being ripe, conteine in them round small brownish seede, that lyce as it were loose therein, and when the head is dry, may bee heard to rattle being shaken: the roote is white within, but couered with a thicke blackish skinne or coat e, hauing one side thereof at the bottome longer then the other, with an hollownesse also on the one side of that long eminence, where the flowers rise from the bottome, and shooting downe from thence a number of white fibres, whereby it is fastened in the ground: the greene leaves afterwards rising from the top or head of the roote.

2. *Colchicum Anglicum purpureum*. The purple English Medowe Saffron.

There is no difference at all in this Medowe Saffron from the former, but only in the colour of the flowers, which as they were wholly white in the former, so in this they are of a delayed purple colour, with a small shew of veines therein.

3. *Colchicum Pannonicum album*. The white Hungary Medowe Saffron.

The greatest difference in this *Colchicum* from the former English white one, is, that it is larger both in roote, leafe, and flower, and besides, hath more store of flowers together, and continuing longer in beauty, without fading so soone as the former, and are also somewhat of a fairer white colour.

4. *Colchicum Pannonicum purpureum*. The purple Hungary Medowe Saffron.

This purple Medowe Saffron is somewhat like vnto the white of this kinde, but that it beareth not so plentifully as the white, nor doth the roote grow so great; but the flowers are in a manner as large as they, and of the like pale delayed purple colour, or somewhat deeper, as is in the purple English, with some veines or markes vpon the flowers, making some shew of a checker on the out side, but not so conspicuous, as in the true checkerd kindes. Wee haue a kinde hereof is party coloured with white streakes and edges, which abide constant, and hath been raised from the seede of the former.

5. *Colchicum Byzantinum*. Medowe Saffron of Constantinople.

This Medowe Saffron of Constantinople hath his leaves so broad and large, that hardly could any that never saw it before, judge it to be a *Colchicum*, for they are much larger then any Lilly leaves, and of a darke greene colour: the flowers are correspondent to the leaves, larger and more in number then in any of the former purple kindes, of the same colour with the last purple kinde, but of a little deeper purple on the inside, with diuers markes running through the flowers, like vnto it, or vnto checkers, but yet somewhat more apparently: the roote is in the middle greater and rounder then the others, with a longer eminence, whereby it may easilly bee knowne from all other sorts.

6. *Colchicum Lusitanicum Fritillaricum*.

The checkerd Medowe Saffron of Portugall.

The flowers of this Medowe Saffron are larger and longer then the flowers of either the English or Hungarian, and almost as large as the last before mentioned, and of the same colour, but a little deeper, the spots and markes whereof are somewhat more easie to be seene even a farre off, like vnto the flower of a *Fritillaria*, from whence it tooke his significatiue name: the leaves of this Medowe Saffron doe rise vp sooner then in any other of the Autumnie kindes; for they are alwayes vp before Winter, and are foure or fve in number, short rather then long, broad belowe, and pointed at the end, canaled or hollow, and standing round aboue the ground, one encompassing another at the bottome, like the great Spanish Starre Iacinth, called the Iacinth of Peru, but

1. *Colchicum Pannonicum*. The Hungarian Medow Saffron. 2. *Colchicum Byzantinum*. Medow Saffron of Constantinople. 3. *Colchicum Lusitanicum Fritillaricum*. The checkerd Medow Saffron of Portugall. 4. *Colchicum Neapolitanum Fritillaricum*. The checkerd Medow Saffron of Naples. 5. *Colchicum Fritillaricum Chiosc*. The checkerd Medow Saffron of Chios or Sis. 6. *Colchicum Heratium*. Phrygian Medow Saffron.

but shorter, and of a pale or grayish Greene colour, differing from the colour of all the other Medowe Saffrons: the roote is like the roote of the English or Hungarian without any difference, but that it groweth somewhat greater. It is one of the first Medowe Saffrons that flower in the Autumne.

7. *Colchicum Neapolitanum Fritillaricium.*  
The checkerd Medowe Saffron of Naples.

This checkerd Medowe Saffron of Naples, is very like vnto the last recited checkerd Saffron of Portugall, but that the flower is somewhat larger, yet sometimes very little, or not at all: the greatest marke to distinguish them is, that the flowers of this are of a deeper colour, and so are the spots on the flowers likewise, which are so conspicuous, that they are discerned a great way off, more like vnto the flowers of a deepe Fritillaria, then the former, and make a goodlier and a more glorious shew: the leaues of this doe rise vp early after the flowers, and are somewhat longer, of a darker Greene colour, yet bending to a grayish colour as the other, not lying so neatly or round, but stand vp one by another, being as it were folded together: neither of both these last named checkerd Medowe Saffrons haue giuen any seede in this Countrey, that euer I could learne or heare of, but are encreased by the roote, which in this is like the former, but a little bigger.

8. *Colchicum Fritillaricium Chioense.*  
The checkerd Medowe Saffron of Chio or Sio.

This most beautifull Saffron flower riseth vp with his flowers in the Autumne, as the others before specified doe, although not of so large a size, yet farre more pleasant and delightfull in the thicke, deepe blew, or purple coloured beautifull spots therein, which make it excell all others whatsoeuer: the leaues rise vp in the Spring, being smaller then the former, for the most part three in number, and of a paler or fresher Greene colour, lying close vpon the ground, broad at the bottome, a little pointed at the end, and twining or folding themselves in and out at the edges, as if they were indented. I haue not seeny any seede it hath borne: the roote is like vnto the others of this kinde, but small and long, and not so great: it flowreth later for the most part then any of the other, even not vntill November, and is very hard to be preserued with vs, in that for the most part the roote waxeth lesse and lesse every yeare, our cold Country being so contrary vnto his naturall, that it will scarce shew his flower; yet when it flowreth any thing early, that it may haue any comfort of a warme Sunne, it is the glorie of all these kindes.

9. *Colchicum vericolor.* The party coloured Medowe Saffron.

The flowers of this Medowe Saffron most vsually doe not appearre, vntill most of the other Autumne sorts are past, except the last, which are very lowe, scarce rising with their stalkes three fingers breadth aboue the ground, but oftentimes halfe hid within the ground: the leaues whereof are smaller, shorter, and rounder, then in any of the other before specified, some being altogether white, and others wholly of a very pale purple, or flesh colour; and some againe parted, the one halfe of a leafe white, and the other halfe of the same purple, and sometimes striped purple and white, in diuers leaues of one and the same flower: and againe, some will be the most part of the leafe white, and the bottome purple, thus varying as nature list, that many times from one roote may be seene to arise all these varieties before mentioned: these flowers doe stand long before they fade and passe away; for I haue obserued in my Garden some that haue kept their flower faire vntill the beginning of January, vntill the extremities of the Winter frosts and snowes haue made them hide their heads: the leaues therefore accordingly doe rise vp after all other, and are of a brownish or darke Greene colour at their first springing vp, which after grow to be of a deepe Greene colour: the roote is like the former English or Hungarian kindes, but thicker and greater for the most part, and shorter also.

10. *Colchicum*

10. *Colchicum variegatum alterum.* Another party coloured Medowe Saffron.

There is another, whose party coloured flowers rise a little higher, diuersly striped and marked, with a deeper purple colour, and a pale or whitish blush throughout all the leaues of the flower.

11. *Colchicum montanum Hispanicum minus.* The little Spanish Medowe Saffron.

The flowers of this little Medowe Saffron are narrower and smaller then any of the former, and of a deeper reddish purple colour then either the English or Hungarian kindes: the Greene leaues also are smaller then any other, lying on the ground, of a deepe or sad Greene colour, rising vp within a while after the flowers are past, and doe abide Greene all the Winter long: the roote is small and long, according to the rest of the plant, and like in forme to the others.

12. *Colchicum montanum minus versicolor flore.*  
The small party coloured Medowe Saffron.

This little kinde differeth not from the Spanish kinde last set forth, but in the varietie of the flower, which is as small as the former, the three inner leaues being almost all white, and the three outer leaues some of them pale or blush, and some party coloured, with a little Greene on the backe of some of them.

13. *Colchicum Hermodactilem.* Physicall Medowe Saffron.

This Physicall Medowe Saffron springeth vp with his leaues in Autumne, before his flowers appeare beyond the nature of all the former kindes, yet the flower doth, after they are vp, shew it selfe in the middle of the Greene leaues, consisting of six white leaues, with diuers chives in the middle, and passeth away without giving any seede that euer I could obserue: the Greene leaues abide all the Winter and Spring following, decaying about May, and appeare not vntill September, when (as I laid) the flowers shew themselves presently after the leaues are sprung vp.

14. *Colchicum atropurpureum.* The darke purple Medowe Saffron.

The greatest difference in this kinde consisteth in the flower, which at the first appearing is as pale a purple, as the flower of the former Hungarian kinde: but after it hath stood in flower two or three dayes, it beginneth to change, and will after a while become to bee of a very deepe reddish purple colour, as also the little foot-stalke whereon it doth stand: the flower is of the bignesse of the Hungarian purple, and so is the Greene leafe: the seede and roote is like the English kinde.

15. *Colchicum atropurpureum variegatum.*  
The party coloured darke purple Medowe Saffron.

We haue of late gained another sort of this kinde, differing chiefly in the flower, which is diuersly striped thorough every leafe of the flower, with a paler purple colour, whereby the flower is of great beauty: this might seeme to bee a degeneration from the former, yet it hath abiden constant with me diuers yeares, and giuen seede as plentifully as the former.

16. *Colchicum flore pleno.* Double flowered Medowe Saffron.

The double Medowe Saffron is in roote and leafe very like vnto the English kinde: the flowers are of a fine pale or delayed purple colour, consisting of many leaues set thicke together, which are somewhat smaller, as in the English flower, being narrow and long, and as it were round at the points, which make a very double flower, having some

some chives with their yellow tips, dispersed as it were among the leaues in the middle: it flowreth in September, a little after the first shew of the earlier Medowe Saffrons are past.

17. *Colchicum variegatum pleno flore.*  
The party coloured double Medowe Saffron.

We haue another of these double kinds (if it be not the very same with the former, varying in the flower as nature pleaseth oftentimes, for I haue this flower in my garden, as I here set it forth, every yeare) whose flowers are diuersified in the partition of the colours, as is to be seene in the single party coloured Medowe Saffron before described, hauing some leaues white, and others pale purple, and some leaues halfe white and halfe purple, diuersly set or placed in the double flower, which doth consist of as many leaues as the former, yet sometime this party coloured flower doth not shew it selfe double like the former, but hath two flowers, one rising out of another, making each of them to be almost but single flowers, consisting of eight or ten leaues a peece: but this diuersty is not constant, for the same roote that this yeare appeareth in that manner, the next yeare will retorne to his former kinde of double flowers againe.

18. *Colchicum Vernum.* Medowe Saffron of the Spring.

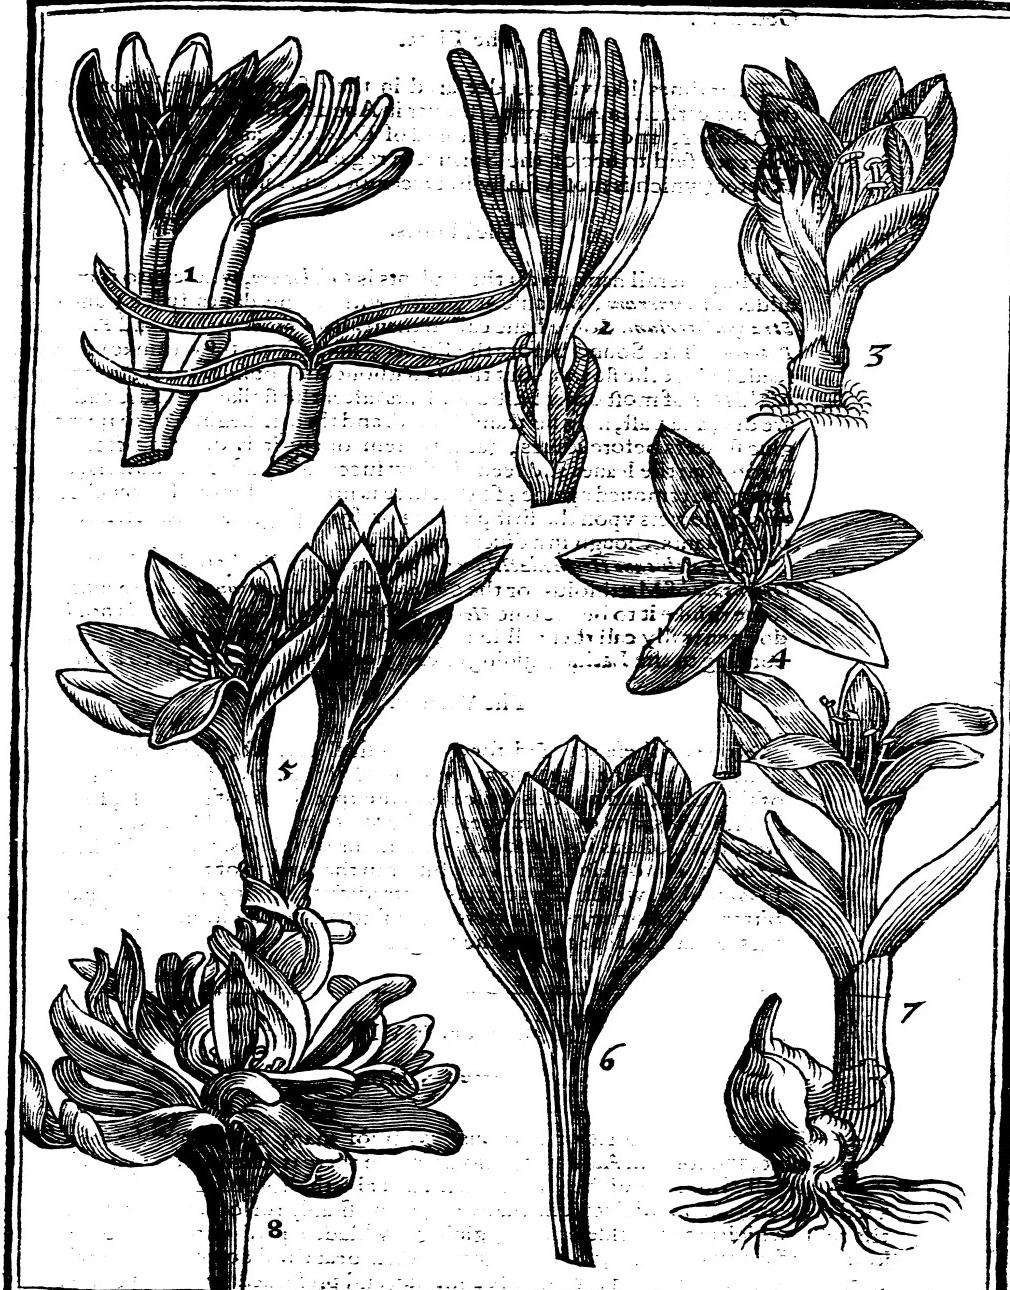

This Medowe Saffron riseth vp very early in the yeare, that is, in the end of Ianuarie sometimes, or beginning, or at the furthest the middle of February, presently after the deepe Frosts and Snowes are past, with his flowers inclosed within three greene leaues, which opening themselves as soone almost as they are out of the ground, shew their buds for flowers within them very white oftentimes, before they open farre, and sometimes also purplish at their first appearing, which neuer shew aboue two at the most vpon one roote, and neuer rise aboue the leaues, nor the leanes much higher then they, while they last: the flower consisteth of six leaues, long and narrow, every leaf being diuided, both at the bottomme and toppe, each from other, and ioyned together onely in the middle, hauing also six chives, tipt with yellow in the middle, euery chive being ioyned to a leaf, of a pale red or deepe blushe colour, when it hath stood a while blowne, and is a smaller flower then any Medowe Saffron, except the small Spanish kindes only, but continueth in his beauty a good while, if the extremity of sharpe Frosts and Windes doe not spoile it: the leaues wherein these flowers are enclosed, at their first comming vp, are of a brownish greene colour, which so abide for a while, especially on the outside, but on the inside they are hollow, and of a whitish or grayish greene colour, which after the flowers are past, grow to bee of the length of a mans longest finger, and narrow withall: there riseth vp likewise in the middle of them the head or seede vessell, which is smaller and shorter, and harder then any of the former, whereto is contained small round browne seede: the roote is small, somewhat like unto the rootes of the former, but shorter, and not having so long an eminence on the one side of the bottomme.

19. *Colchicum Vernum atropurpureum.* Purple Medowe Saffron of the Spring.

The flower of this Medowe Saffron, is in the rising vp of his leaues and flowers together, and in all things else, like vnto the former, onely the flowers of this sort are at their first appearing of a deeper purple colour, and when they are blowne also are much deeper then the former, diuided in like manner, both at the bottomme and toppe as the other, so that they seeme, like as if six loose leaues were ioyned in the middle part, to make one flower, and hath his small chives tipt with yellow, cleaving in like manner to every leaf.

The Place.

All these Medowe Saffrons, or the most part of them, haue their places expressed in their titles; for some grow in the fields and medowes of the champion grounds, others on the mountaines and hilly grounds. The English kindes grow in the West parts, as about Bathe, Bristow, Warmister,

1. *Colchicum monanthum Bipartitum.* The little Spanish Medowe Saffron. 2. *Colchicum monanthum versicolor.* The party coloured Medowe Saffron. 3. *Colchicum monanthum minus versicolor.* The small party coloured Medowe Saffron. 4. *Colchicum variegatum alternans.* Another party coloured Medowe Saffron. 5. *Colchicum vernum atropurpureum variegatum.* The variable dark purple Medowe Saffron. 7. *Colchicum vernum.* Medowe Saffron of the Spring. 8. *Colchicum flore pleno.* Double Medowe Saffron.

ster, and other places also. The double kindes are thought to come out of Germany.

#### The Time.

Their times likewise are declared in their severall descriptions: those that are earliest in Autumne, flower in August and September; the later in October, and the latest in the end of October, and in November. The other are said to bee of the Spring, in regard they come after the deepe of Winter (which is most usually in December and Januari) is past.

#### The Names.

The generall name to all these plants is *Colchicum*, whereunto some haue added *Ephemerum*, because it killeth within one dayes space, and some *Strangulatorum*. Some haue called them also *Bulbus agrestis*, and *Filium ante Patrem*. The Sonne before the Father, because (as they thinke) it giueth feede before the flower: but that is without due consideration, for the root of this (as of most other bulbous plants) after the stalke of leaues and feede are dry, and past, may be transplanted, and then it beginneth to spring and giue flowers before leaues, (and therein onely it is differing from other plants) but the leaues and feede follow successuely after the flowers, before it may be remoued againe; so that here is not feede before flowers, but contrarily flowers vpon the first planting or springing, and feede after, as in all other plants, though in a diuers manner.

The *Colchicum Hermodactylum* may seeme very likely to bee the *Colchicum Orientale* of Matthiolus, or the *Colchicum Alexandrinum* of Lobelius: And some thinke it to be the true *Hermodactylum*, and so call it, but it is not so. We doe generally call them all in English Medowe Saffrons, or *Colchicum*, according to the Latine, giuing to every one his other adjunct to know it by.

#### The Vertues.

None of these are vsed for any Physicall respect, being generally held to be deadly, or dangerous at the least. Only the true *Hermodactile* (if it be of this tribe, and not this which is here expressed) is of great vsse, for paines of the ioynts, and of the hippes, as the *Sciatica*, and the like, to be taken inwardly. Costaeus in his Booke of the nature of plants, saith, that the rootes of our common kindes are very bitter in the Spring of the yeare, and sweet in Autumne, which Camerarius contradiceth, saying, that he found them bitter in Autumne, which were (as he saith) giuen by some imposters to diuers, as an antidote against the Plague.

### CHAP. XVII.

#### *Crocus. Saffron.*

There are diuers sorts of Saffrons, whereof many doe flower in the Spring time, and some in Autumne, among whom there is but one only kinde, that is called tame or of the Garden, which yeeldeth the blades or chuires that are vsed in meates and medicines, and many wayes profitable for other respects, none of the rest, which are all wilde kindes, giuing any blade euall vnto those of the tame kinde, or for any other vsse, then in regard of their beautifull flowers of severall varieties, and as they haue been carefully sought out, and preserued by diuers, to furnish a *Garden of divers curiosities*. To entreate therefore of these, I must, to obserue an orderly declaration, diuide them into two primary families: the former shall be of those that yeeld their pleasant flowers in the Spring of the yeare, and the other that send out their

their colours in the Autumne, among whom that *Rex pomary* (as I may so call it) the tame or manured kinde, properly called of the Garden, is to be comprehended, for that it giueth his pleasant flowers at that time among others. I shall againe distribute those of the Spring time into three chiefe colours, that is, into white, purple, and yellow, and vnder every one of them, comprehend the severall varieties that doe belong vnto them; which course I will also hold with those of the Autumne, that thus being rightly ranked, they may the more orderly be described.

#### 1. *Crocus vernus albus purus minor.*

The smaller pure white Saffron flower of the Spring.

This small Saffron flower springeth vp in the beginning of the year, with three or foure small greene leaues, somewhat broader, but much shorter then the true Saffron leaues, with a white line downe the middle of every leafe: betweene these leaues, out of a white skinne, riseth vp one or two small flowers, made of six leaues a peece, as all the rest in generall are, of a pure white colour, without any mixture in it, which abide not in flower aboue a weeke, or rather lesse, so sodainly is the pleasure of this, and the purple lost: it flowreth not for the most part, vntill a moneth after the yellow Crocus appeareth in flower, and the ordinary stript Crocus is past: the seede is small, round, and reddish, yet not so red as the seede of the yellow, contained in three square heads, yet seldom beareth, but increaseth by the roote plentifully enough, which is small, round, and flat at the bottome, somewhat white on the outside, but whiter within, shooting out small sprouts on every side of the roote, which is the best note to know this kinde and the lesser purple, which are both alike, from all other rootes of Saffron flowers.

#### 2. *Crocus albus major multiflorus.* The great snow white Crocus.

This greater Saffron flower riseth vp vsually with three or foure greene leaues, larger then the former, with a white line in every one of them: the flowers are greater, and more in number, rising together, but flowring one after another, of a pure snow white colour, and abiding but little longer in flower then the former.

#### 3. *Crocus albus major alter dictus Mesiacus.*

The great white Saffron flower or Crocus of Mesia.

This great white Crocus of Mesia, riseth vp out of the ground, almost as early as the first sort of the yellow, with foure or five leaues, being very like vnto the leaues of the yellow Crocus, and as large, with white lines in them: the flowers also are as large as the flowers of the yellow, and many also rising one after another like vnto it, but not of so pure a white colour, as the former or last described, but rather tending to a Milky or Creame colour: the roote is not couered with any reddish, but rather pale skinnes or coates.

#### 4. *Crocus albus Mesiacus fundo violaceo.*

The great white Crocus of Mesia with a blewe bottome.

There is another of this kinde, like vnto the former in all things, sauing that the bottomes of the flowers of this kinde, with some part of the stalke next the flower, are of a pale shining purple colour, and rising vp a pretty way into the flower; whereas another also of this kind, hath a little shew or marke of blewe, and not purple, at the bottome of the flower only, which maketh a difference.

#### 5. *Crocus albus fundo parpureo.* The white Crocus with a purple bottome.

This Saffron flower is of the same kinde with the first, both in roote, leafe, and flower, in none of them differing from it, but in that the bottome of this flower, with that part of the short foote-stalke next vnto it, is of a violet or purple colour, and sometimes having here and there some purple small lines, or spots on the white leaues: it flowreth also with the first white, or somewhat later.

6. *Crocus vernus album striatus*. The white strip Crocus.

This strip Saffron flower is likewise neare the same first kind, or first white Crocus, haing the like leaues and flowers, somewhat larger, but as soone fading almost as it: but herein this flower differeth, that it hath pale blewish lines and spots in all the leaues thereof, and more principally in the three outer leaues: the root is also white on the outside, like the first white, but greater, with young ones growing round about it.

7. *Crocus vernus album polyanthos versicolor*.  
The greater party coloured white Crocus.

The greater party coloured Saffron flower, hath his greene leaues like vnto the second great white Crocus before mentioned, haing more flowers then any of the former, except the first great white, the leaues whereof haue greater stripes then the last recited Crocus, but of a purple Violet colour, making each leafe seeme oftentimes to haue as much purple as white in them: the roote hereof is somewhat like the second white, but of a little more dusky colour on the outside, and not budding out on the sides at all, or very little.

8. *Crocus vernus album versicolor*. The lesser party coloured white Crocus.

The leaues and flowers of this other party coloured Crocus, are for bignesse in a manner equall with the last, but hath not so many flowers rising together from the roote: the flower is finely marked with blew stakcs on the white flower, but nothing so much as in the former: the roote also is like the last.

9. *Crocus Episcopalis*. The Bishops Crocus.

This party coloured or Bishops Saffron flower, is very like both in leaues and rootes vnto the Neapolitan blew Crocus, but somewhat greater: the flowers doe abide not so long time blowne, and hath all the leaues either wholly white, with blew stripes on both sides of them, or wholly of a fine delayed blew Violet colour, and the three innermost more blew and finely striped, both on the inside and outside of them, and sometimes it hath been seen to haue three leaues white, and three leaues of a pale blew.

10. *Crocus vernus striatus vulgaris*. The ordinary strip Crocus.

There is another sort of strip Saffron flower, which is most common and plentifull in most Gardens, which I must needs bring vnder the ranke of these white kinds, although it differre very notably, both in roote, leafe, and flower, from all of them: the leaues of this rite vp sooner then the yellow or white Crocus, lying spread vpon the ground for the most part, but narrower then any of the former: among these leaues spring vp diuers flowers, almost as large as the former great white Crocus, of a very bleake or pale purple colour, tending to white on the inside, and in many almost white, with some small whitish chives tipt with yellow in the middle: the three outer leaues are of a yellowish white colour on the backe side of them, stripe every one of them with three broad stripes, of a darke murrey or purple colour, and a little sprinkled with some small purple lines, on both sides of those stripes, but on the inside, of the same pale purple or white colour with the rest: the seede hereof is somewhat darker coloured then of the white, and is more liberall in bearing: the roote is differing from all the former, being rounder and bigger then any of them, except the kindes of Misia, yet somewhat flat withall, not hauing any shooetes from the sides, but setting off into rootes plentifullie, haing a round circle compassing the botome of the roote, which easly falleth away, when it is taken vp out of the ground, and cotered with a browne coate, somewhat neare the colour of the yellow Crocus, but not altogether so bright: it flowreth vsually the first of all these sorts, or with the first of the early yelowes.

## 11. CROCI

1. *Crocus vernus album minor*. The small white Saffron flower of the spring. 2. *Crocus vernus Misianus album*. The great white Crocus of Misia. 3. *Crocus vernus striatus*. The white strip Crocus. 4. *Crocus vernus album polyanthos versicolor*. The party coloured white Crocus. 5. *Crocus albus fundo purpureo*. The white Crocus with a purple bottom. 6. *Crocus vernus Neapolitanus*. The great blew Crocus of Naples. 7. *Crocus vernus purpureus maximus*. The great purple Crocus. 8. *Crocus vernus purpureus striatus*. The purple strip Crocus. 9. *Crocus vernus purpureus Capituliferus*. The purple Crocus with small leaves. 10. *Crocus vernus luteus striatus*. The yellow strip Crocus. 11. *Crocus vernus luteus striatus*. The cloth of gold Crocus.

11. *Crocus vernus briatus Turcicum*. The Turkie stript Crocus.

There is another of this kinde, whose flower is a little larger, and of a deeper purple colour, both on the inside and outside; the greene leafe also is bigger, and of a more whitish colour.

12. *Crocus vernus Capillaris folio albus*. The white Crocus with small leaues.

This white Crocus is in all things like vnto the purple of the same kinde, but that the flower of this is wholly white: the full description therefore hereof, you shall haue in that purple with small leaues, of this kinde hereafter set downe, wherunto I referre you.

13. *Crocus vernus purpureus minor*. The smaller purple Crocus.

The smaller purple Saffron flower of the Spring, hath his greene leaues so like vnto the first white flowred Saffron, that they can hardly be distinguished, onely they seem to bee a little narrower: the flower is also much about the same bignesse, or a little bigger, and seldom beareth aboue one flower from a roote, even as the first doth, of a deepe purple Violet colour, the bottome of the flower, with the upper part of the stalke next thereunto, being of a deeper or blacker purple; in the middle of the flower are some pale chives tipped with yellow pendent, and a longer pointell, diuided or forked at the toppe: the roote of this is in all things so like vnto the first white, that it is impossible for the most cunning and conueriant in them, to know the one from the other. This beareth seede very sparingly, as the white doth, and is reddish like vnto it, but recompenseth that defect with a plentifull encrease by the roote: it likewife flowreth at the very same time with the white, and endureth as small a time.

14. *Crocus vernus purpureus maximus*. The greatest purple Crocus.

This great purple Crocus is of the same kinde with the next described, as well in rooteas leafe, but greater; for the greene leaues hereof are the greatest and broadest of all other Crocus, with a large white line in the middle of every one: it springeth vp much later then the former, and doth not shew his flower vntill the other bee past a good while: the flowers also are the largest of all these Crocus of the Spring time, and equalling, if not surpassing that purple kinde that flowreth in Autumne, hereafter set forth, of a very faire and deepe Violet colour, almost as deepe as the former: the seed vessels are large also and white, wherein is contained pale reddish seede, like vnto the next blew kinde, but somewhat greater: the roote is (as I said before) like vnto the next, that is, flat and round, with a dusky coloured outside, whose head for springing in it is as hardly discerned.

We haue one of this kinde, the topes onely of whose purple flower are whitish, for the breadth of halfe the naile of a mans hand, which abideth constant every yeare in that manner, and therefore is a difference fit to be remembred.

15. *Crocus vernus Neapolitanus sive ceruleus maior*.

The greater blew Crocus of Naples.

This great blew Crocus riseth vp with diuers greene leaues, broader then any of the former (except the last) with a white line running downe the inside of every leafe, as in the former, among which riseth vp, out of diuers great long white skinnes, diuers large flowers, but not fully so great as the former, consisting of six leaues, of a paler blew or Violet colour then in the former, hauing in the middle of the flowers a few pale thredds, tipped with yellow, and a longer pointell of a gold yellow colour, forked or diuided at the toppe, smelling sweeter then in the former, and abiding a great while longer, being in flower vsually euuen with the stript yellow Crocus, or before the former purple, and yeelding more plenty of seede: the roote hereof is not very great, but a little darke on the outside, being round and flat withall, that one can hardly know which is the vpper side thereof.

This

This kinde differeth very little from the former, either in roote, leafe, or flower, for the bignesse or colour, but that it seemeth to be a little bleaker or paler blew, because it flowreth a little earlier.

16. *Crocus vernus purpureus briatus*. The stript purple Crocus.

The leaues of this stript purple Saffron flower, are as large and broad as the last, or rather a little longer: the flowers also are as plentifull, and as large, of a fine delayed purple colour on the outside, with three broad strakes or lines downe the backe of the three outer leaues, and of a little deeper purple on the inside, as the other three leaues are also of a deeper purple colour, and are striped with the same deepe purple about the ground, or bottome of the leaues: this sometimes yeeldeth three square heads, containing in them brownish seede: the roote is like vnto the last, and flowreth much about the time of the former.

17. *Crocus vernus purpureus versicolor*. The siluer stript purple Crocus.

This stript Saffron flower, is in leaues and flowers somewhat like vnto the last stript purple, but a little smaller: the flowers are of a little deeper purple through the whole leaues, striped with white lines, both on the leaues, and towards the edges, which maketh a peculiar difference from all the rest: the roote of this is not so flat, though like it, and couered with a darke ash coloured skinne: it flowreth about the same time.

18. *Crocus purpureus flammens maior*. The greater purple flame coloured Crocus.

The greene leaues of this Crocus or Saffron flower, are of a reasonable breadth and length, and of a pleasant fresh greenneesse, with a faire broad white line downe the middle of them, but rising not out of the ground, so early as the next described Crocus: the flowers are likewise of a meane bignesse, of a pale purple on the outside, somewhat whitish, especially the three outer leaues; but on the inside of a deeper purple, and striped with great stripes like flames, hauing some chives in the middle, and a longer one also feathered a little at the toppe: the roote is white on the outside, somewhat flat and round, but not so flat as the Neapolitane Crocus before described.

19. *Crocus purpureus flammens minor*. The lesser purple flame coloured Crocus.

This Crocus hath almost as broad and long greene leaues as the former, and of the same verdure, which rise vp earlier then it, and is in flower likewise somewhat before it, being smaller for size by a little, but of as deepe a purple on the outside, as on the inside, flamed with faire broad stripes from the middle of the leaues, or somewhat lower vnto the edges: each of these giue seed that is of a pale reddish colour: the root is very like vnto the former, but a little lesser.

20. *Crocus vernus purpureus Capillaris folio*. The purple Crocus with small leaues.

This small kinde of Saffron flower riseth out of the ground, with two or three long and small green leaues, very like vnto the leaues of the fine Fether-Graffe hereafter described, standing vpright at the first, but afterwards lying vpon the ground; among which come the flowers, sometimes three, but most vsually two vpon one stalke, if the roote be not young, which then will bear but one on a stalke, which is very short, so that the flowers scarce arise aboue the ground, yet laying themselves open in the day time, if it be faire, and the Sunne doe shine, otherwise they keepe close, and doe not open at all: and after one flower is past, which doth not last aboue three or four days at the most, the others follow, which are of a bleake blewish purple in the middle of the flower, and of a deeper purple towards the ends or points of the leaues, but of a more fallen or darke purple on the outside of them, and yellowish at the bottome, with some yellow chives in the middle: the seede is small and darker coloured then any of the former Crocus, contained also in smaller heads, standing one by another vpon

vpon the same short foote-stalke, whiche then riseth vp a little higher, shewing the manner of the standing of the flowers, which in their flowing time could not so easily bee discerned: the roote is very small and round, haing one side at the bottome lower then the other, very like the roote of a *Colchicum* or Medowe Saffron, and somewhat neare resembling also the hoofe of an horse foote, couered with a very thicke skinne, of a darke or blackish browne colour: this flowreth the last of all the former sorts of Saffron flowers, euen when they are all past.

21. *Crocus vernus purpureus striatus Capillarifolius.*  
The stript purple Crocus with small leaues.

This small stript purple Saffron flower hath such like leaues, as the last described hath, betweene which riseth the flower vpon as short a foote-stalke, consisting of six leaues like the former, of a faire purple colour on the outside of the three outer leaues, with three lines or strakes downe euery leafe, of a deeper purple colour, and on the inside of a paler purple, as the other three leaues are also, with some chiuies tipt with yellow pendent, and a forked pointell in the middle: the roote of this is somewhat bigger then the former, and rounder, but couered with as thicke and as browne a skinne: it flowreth about the same time with the former.

22. *Crocus vernus luteus sive Alsatium.* The yellow Crocus.

The yellow Crocus or Saffron flower, riseth vp with three or foure leaues out of the ground, being somewhat neare the breadth of the great purple kindes, with a white line in them, as in most of the rest: the flowers stand in the middle of these leaues, and are very large, of a gold yellow colour, with some chiuies, and a forked pointell in the middle: the seede hereof is of a brighter colour then in any of the other: the roote is great and round, as great or greater then a Wall Nut sometimes, and couered with reddish skinnes or coates, yeelding more store of flowers then most of the former, and beginning to blowe with the first sorts, or presently after, but outlast many of them, and are of a pleasant good sent.

*Flore aureo.* Of this kinde we haue some, whose flowers are of a deeper gold yellow colour then others, so that they appere reddish withall.

*Flore pallido.* And we haue also another sort, whose flowers are very pale, betweene a white and a yellow, not differing in any thing else.

*Flore virideante luteo.* And another smaller, whose flower hath a shew of greenesse in the yellow, and more greene at the bottome.

23. *Crocus vernus flavus striatus.* The yellow stript Crocus.

This kinde of yellow stript Crocus or Saffron flower, riseth vp with more store of narrower and greener leaues then the former, and after the leaues are spread, there rise vp many yellow flowers from among them, which are not of so faire and bright a yellow colour, but more dead and sullen, haing on the backside of each of the three outermost leaues, three small stripes, of an ouer-worne or dull purple colour, with some chiuies and a pointell in the middle: the roote of this kinde, is very like the roote of the former yellow, but somewhat smaller and shorter, and couered with the like reddish skinnes, but a little fadder: it flowreth not so early as the former yellow, but abideth almost as long as it.

24. *Crocus vernus luteus versicolor primus.* The best cloth of gold Crocus.

The fairest cloth of gold Crocus or Saffron flower, riseth vp very early, euen with the first, or the first of all other Crocus, with three or foure very narrow and short leaues, of a whiter colour then any of the former, which by and by after doe shew forth the flowers, rising from among them out of the same white skinne, which includeth the leaues, but are not so plentifull as the former yellow, being but two or three at the most, of a faire gold yellow colour, yet somewhat paler then the first, haing

ving on the backe of euery of the three outer leaues, three faire and great stripes, of a faire deepe purple colour, with some small lines at the sides or edges of those purple stripes; on the inside of these flowers, there is no signe or shew of any line or spot, but wholly of a faire gold yellow, with chiuies and a fether-tipt pointell in the middle: the seede hereof is like the former, but not so red: the roote of this kinde is easily knowne from the roote of any other Saffron flower, because the outer peelinges or shels being hard, are as it were netted on the outside, haing certaine ribbes, rising vp higher then the rest of the skinnes, diuided in the forme of a net-worke, of a darke browne colour, and is smaller and rounder then the former yellow, and not encresing so plentifullly by the roote.

25. *Crocus vernus luteus versicolor alter.*  
The second cloth of gold, or Duke Crocus.

There is no difference either in roote, leafe, or colour of flower, or time of flowing in this sort from the last before mentioned; for the flower of this is of the same bignesse and colour, the only note of difference is in the marking of the three outer leaues, which haue not three stripes like the former, but are wholly of the same deepe purple colour on the backe of them, sauing that the edges of them are yellow, which is the forme of a Duke Tulipa, and from thence it tooke the name of a Duke Crocus.

26. *Crocus vernus versicolor pallidelutens.* The pale cloth of gold Crocus.

We haue a third sort of this kinde of cloth of gold Crocus, which hath leaues and flowers like the former, but differeth in this, that the colour of the flower is of a paler yellow by much, but stript in the same manner as the first, but with a fainter purple colour: the roote also is netted like them, to shew that this is but a variation of the same kinde.

27. *Crocus vernus versicolor albidoluteus.* The cloth of siluer Crocus.

The chiefest note of difference in this Saffron flower is, that being as large a flower as any of the former of this kinde, it is of so pale a yellowish white, that it is more white then yellow, which some doe call a butter colour: the three outer leaues are striped on the backe of them, with a paler purple blew shining colour, the bottome of the flower, and the vpper part of the stalke, being of the same purple blew colour: the roote of this is also netted as the other, to shew it is a variety of the same kinde.

And thus much for thole Saffron flowers that come in the Spring time; now to those that flower in Autumne onely: and first of the true Saffron.

1. *Crocus vernus sativus Autumalis.* The true Saffron.

The true Saffron that is vsed in meates and medicines, shooteth out his narrow long green leaues first, and after a while the flowers in the middle of them appere about the end of August, in September and October, according to the soile, and climate where they growe; these flowers are as large as any of the other former or later sorts, composed of six leaues a peece, of a murrey or reddish purple colour, haing a shew of blew in them: in the middle of these flowers there are some small yellow chiuies standing vpright, which are as unprofitable, as the chiuies in any other of the wilde Saffrons, before or hereafter specified; but besides these, each flower hath two, three, or foure greater and longer chiuies, hanging downe vpon or betweene the leaues, which are of a fierie red colour, and are the true blades of Saffron, which are vsed physically or otherwise, and no other: All these blades being pickt from the severall flowers, are laid and pressed together into cakes, and afterwards dried very warily on a Kill to preserue them; as they are to be seene in the shops where they are sold. I never heard that ever it gaue seede with any: the roote growtheth often to be as great, or greater then a green Wall Nut, with the outer shell on it, couered with a grayish or ash-coloured skin, which breaketh into long hairy thredds, otherwise then in any other roote of Crocus.

2. *Crocus Byzantinus argenteus*. The siluer coloured Autumne Crocus.

This Saffron flower springeth vp in October, and seldome before, with three or foure short greene leaues at the first, but growing longer afterwards, and in the midst of them, presently after they haue appeared, one flower for the most part, and seldome two, consisting of six leaues, the three outermost whereof are somewhat larger then the other three within, and are of a pale bleake blew colour, almost white, which many call a siluer colour, the three innermost being of a purer white, with some yellow chiuies in the middle, and a longer pointell ragged or fethered at the toppe: this very seldome beareth seede, but when the yeare falleth out to bee very milde; it is small, round, and of a darke colour: the roote is pretty bigge, and rounder then any other Crocus, without any flat bottome, and couered with a darke russet skinne.

3. *Crocus Pyrenaeus purpureus*. The purple mountaine Crocus.

This purple Saffron flower of the Autumne, riseth vp but with one flower vsually, yet sometimes with two one after another, without any leaues at all, in Septembre, or sometymes in August, standing vpon a longer foote-stalke then any kinde of Saffron flower, either of the Spring or Autumne, and is as large as the flower of the greatest purple Saffron flower of the Spring, of a very deepe Violet purple colour, which decayeth after it hath stood blowne three or foure dayes, and becommeth more pale, hauing in the middle some yellow chiuies, and a long fether topt pointell, branched, and rising sometimes aboue the edges of the flowers: about a moneth after the flowers are past, and sometimes not vntill the first of the Spring, there riseth vp three or foure long and broad greene leaues, with a white line in every one of them, like vnto the first purple Vernal kindes, which abide vntill the end of May or June: the roote is small and white on the outside, so like vnto the roote of the lesser Vernal purple or white Crocus, that it cannot be distinguished, vntill about the end of August, when it doth begin to shooe, and then by the early shooting vp a long white sprout for flower, it may be knowne. I never could obserue it to giue any seede, the Winter (as I thinke) comming on it so quickly after the flowring, being the cause to hinder it.

4. *Crocus montanus Autumnalis*. The Autumne mountaine Crocus.

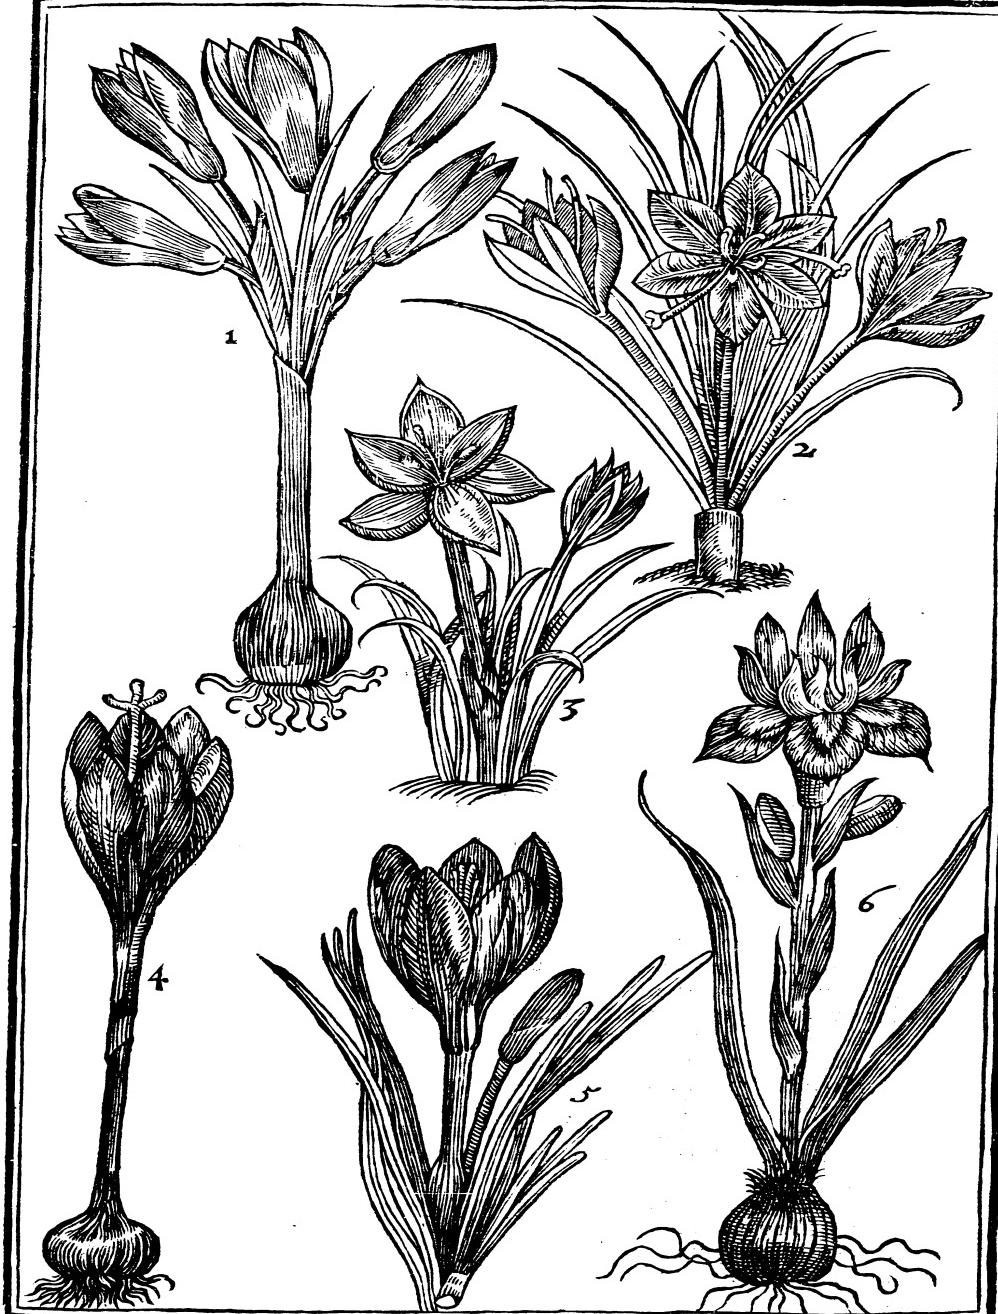

The mountaine Saffron flower springeth vp later then any of the former, and doth not appeare vntill the middle or end of October, when all the flowers of the former are past, appearing first with three or foure short greene leaues, like vnto the Byzantine Crocus, and after wards the flowers betweene them, which are of a pale or bleake blew tending to a purple, the foote-stalkes of them being so short, that they scarce appear aboue ground at the first, but after two or three dayes they grow a little higher: the roote is very great and flat bottomed, couered with a grayish duskie coate or skinne, and increaseth very little or seldome.

## The Place.

The seuerall places of these Saffron flowers, are in part set downe in their titles; the others haue beene found out, some in one Countrey, and some in another, as the small purple and white, and stript white in Spaine: the yellow in Mesia about Belgrade, the great purple in Italy; and now by such friends helpe as haue sent them, they prosper as well in our Gardens, as in their naturall places. Yet I must giue you this to vnderstand, that some of these formerly expressed, haue been raised vp vnto vs by the sowing of their seede.

## The Time.

Their seuerall times are likewise expressed in their descriptions; for some shew forth their pleasant flowers in the Spring, wherein for the three first moneths,

1. *Crocus vernus luteus vulgaris*. The common yellow spring Crocus. 2. *Crocus vernus sativus Autumnalis*. The true Saffron. 3. *Crocus Byzantinus argenteus*. The siluer coloured Autumne Crocus. 4. *Crocus Pyrenaeus purpureus*. The purple mountaine Crocus. 5. *Crocus montanus Autumnalis*. The Autumne mountaine Crocus. 6. *Sisyrinchium maius*. The greater Spanish Iris.

moneths, our Gardens are furnished with the varietie of one sort or another: the rest in Autumn, that so they might procure the more delight, in yeelding their beauty both early and late, when scarce any other flowers are found to adorne them.

#### The Names.

I shall not neede to trouble you with an idle tale of the name of Crocus, which were to little purpose, nor to reiterate the former names imposed vpon them; let it suffice that the fittest names are giuen them, that may distinguish them one from another; onely this I must give you to vnderstand, that the gold yellow Crocus or Saffron flower, is the true *Crocus Mescacus*, as I shewed before; and that neither the yellow stript, or cloth of gold (which wee so call after the Dutch name *Gaud Laken*) is the true *Mescacus*, as some suppose; and that the great white Saffron flower, by reason of his likeneſſe vnto the gold yellow, is called *Crocus albus Mescaci facie*, or *facie lutei*; that is, The white Saffron flower that is like the *Mescacus* or yellow.

#### The Vertues.

The true Saffron (for the others are of no vſe) which wee call English Saffron, is of very great vſe both for inward and outward diseases, and is very cordiall, vſed to expell any hurtfull or venomous vapours from the heart, both in the small Pockes, Measels, Plague, Iaundise, and many other diseases, as also to strengthen and comfort any cold or weake members.

### C H A P. X V I I I.

#### *Sisyrinchium*. The Spanish Nut.

I can doe no otherwise then make a peculiar Chapter of this plant, because it is neither a *Crocus*, although in the roote it come somewhat neare vnto that kinde that is netted; but in no other part agreeing with any the delineaments of a Saffron flower, and therefore could not be thrust into the Chapter amongst them: neither can I place it in the forefront of the Chapter of the *Iris bulbosa*, or bulbous Flowerdeluces, because it doth not belong to that Family: and although the flower thereof doth most resemble a Flowerdeluce, yet in that no other parts thereof doe fitly agree thereunto, I haue rather chosen to seate it by it ſelue betweene them both, as partaking of both natures, and so may ſerue in stead of a bridge, to paſſe from the one to the other, that is, from the *Crocus* or Saffron flower, to the *Iris bulbosa* or bulbous rooted Flowerdeluce, which ſhall follow in the next Chapter by themſelues.

The Spanish Nut hath two long and narrow, ſoft and ſmooth greene leaues, lying for the moft part vpon the ground, and ſometimes ſtanding vp, yet bending downewards, betwene these leaues riſeth vp a ſmall ſtalle, halfe a foote high, hauing diuers ſmooth ſoft greene leaues vpon it, as if they were ſkinnes, through which the ſtalle paſſeth, at the toppe whereof ſtand diuers flowers, riſing one after another, and not all flowring at once: for ſeldome ſhall you haue aboue one flower blowne at a time, each whereof doth ſo quickly paſſe and fade away, that one may well ſay, that it is but one dayes flower, or rather the flower of a few hours: the flower it ſelue hath nine leaues, like vnto a Flowerdeluce, whereof the three that fall downe, haue in each of them a yellow ſpot: the other three, which in the Flowerdeluces are hollow and ridged, couering the other three that fall downe, in this ſtand vpright, and are parted at the ends: the three that ſtand vp in the middle are ſmall and ſhort: the whole flower is ſmaller then any Flowerdeluce, but of ſundry colours; for ſome are of an excellent ſkie colour blew, others of a Violet purple, oþers of a darker purple colour, and ſome white, and many others mixed, either pale blew and deepe purple, or white and blew mixed

mixed or striped together very variably, quickly fading as I ſaid before: the ſeede is enclosed in ſmall cods, ſo thinn and transparent, that one may eaſily ſee, and tell the ſeeds as they ly, which are of a browniſh red colour: the roote is ſmall, blackiſh and round, wrapped in a thiſke ſkinne or huske, made like vnto a net, or ſomewhat like vnto the roote of the cloth of gold Crocus: when the plant is in flower, it is found to haue two rootes one aboue another, whereof the uppermoſt is firme and ſound, and the vndermoſt loſe and ſpongie, in like manner as is found in the rootes of diuers Orchides or Satyrians, Bee-flowers and the like, and without any good taste, or ſweetneſſe at all, althoſh Cluſius ſaith otherwiſe.

#### *Sisyrinchium Mauritanicum*. The Barbary Nut.

There is another of this kinde, not differing from the former in any other notable part, but in the flower, which in this is of a delayed purpliſh red colour, hauing in each of the three lower leaues a white ſpot, in ſtead of the yellow in the former, but are as ſoon fading as they.

#### The Place.

The former doe grow very plentifullly in many parts both of Spaine and Portugall, where Guillaume Boel, a Dutch man heretofore remembred often in this Booke, found them, of the ſundry colours ſpecified, whereas Cluſius maketh mention but of one colour that he found.

The other was found in that part of Barbary, where Fez and Morocco do ſtand, and brought firſt into the Lowe-Countries: but they are both very tender, and will hardly abide the hard Winters of theſe colder regions.

#### The Time.

The firſt flowreth in May and June, the laſt not vntill August.

#### The Names.

The name *Sisyrinchium* is generally imposed vpon this plant, by all au-thors that haue written thereof, thinking it to bee the right *Sisyrinchium* of Theophrastus: but concerning the Spanish name *Nozelha*, which Cluſius ſaith it is called by in Spaine, I haue beeſen credibly enformed by the afore-named Boel, that this roote is not ſo called in theſe parts; but that the ſmall or common ſtript Crocus is called *Nozelha*, which is ſweete in taste, and desired very greedily by the ſhepheards and Children, and that the roote of this *Sisyrinchium* or Spanish Nut, is without any taste, and is not eaten. And againe, that there is not two kindeſs, althoſh it grow greater, and with more flowers, in theſe places that are neare the Sea, where both the waſhing of the Sea water, and the moisture and ayre of the Sea, cauſeth the ground to bee more fertile. This I thought good, from the true relation of a friend, to giue the world to vnderſtand, that truthe might expell errore.

#### The Vertues.

These haue not been knowne to bee vſed to any Phyſicall purpose, but wholly neglected, vñleſſe ſome may eate them, as Cluſius reporteth.

## C H A P. X I X.

*Iris bulbosa*. The bulbous Flowerdeluce.

**T**He Flowerdeluces that haue bulbous rootes are of two sorts, the one greater then the other: the greater bearing larger and broader leaues and flowers, and the lesser narrower. But before I giue you the descriptions of the vsuall greater kindes, I must needs place one or two in the fore-front that haue no fellowes; the one is called of Clusius, his broad leaved Flowerdeluce, and the other a Persian, somewhat like vnto it, which although they differ notably from the rest, yet they haue the nearest resemblance vnto those greater kindes, that come next after them.

*Iris bulbosa prima latifolia Clusij.*  
Clusius his first great bulbous Flowerdeluce.

This Flowerdeluce hath diuers long and broad leaues, not stiffe, like all the other, but soft and greenish on the vpper side, and whitish vnderneath; among which riseth vp sometimes seuerall small, short, slender stalkes, and sometimes but one, not aboue halfe a foote high, bearing at the top one flower a peece, somewhat like vnto a Flowerdeluce, consisting of nine leaues, whereof those three that stand vp right, are shorter and more closed together, then in other sorts of Flowerdeluces; the other three that fall downe, turne vp their ends a little, and thole three, that in other Flowerdeluces doe couer them at the bottome, stand like the vp right leaues of other Flowerdeluces, but are parted into two ends, like vnto two small eares: the whole flower is of a faire blew, or pale skie colour in most, with a long stripe in the middle of each of the three falling leaues, and in some white, but more seldom: the roote is reasonable great, round and white, vnder the blackish coates wherewith it is couered, hauing many long thicke white rootes in stead of fibres, which make them seeme to be Alphodill rootes. The flower is very sweete.

*Iris bulbosa Persica*. The Persian bulbous Flowerdeluce.

This Persian Flowerdeluce is somewhat like vnto the former, both in roote and in leafe, but that the leaues are shorter and narrower, and the flower being much about the same fashion, is of a pale blew russetish colour, each of the three lower falling leaues are almost wholly of a browne purple colour, with a yellow spot in the middle of them: this as it is very rare, so it seldom beareth flowers with vs.

## The Place.

The first groweth in many places of Spaine and Portugall, from whence I and others haue often had it for our Gardens, but by reason of the tenderesse thereof, it doth hardly endure the sharpeesse of our cold Winters, vlesse it be carefully preserued.

The other is said to come from Persia, and therefore it is so entituled, and is as tender to be kept as the other.

## The Time.

The first flowreth most vsually not vntill May with vs, yet many times sooner: but in January and February, as Clusius saith, in the naturall places thereof.

The other is as early oftentimes when it doth flower with vs.

## The Names.

Because Clusius by good iudgement referreth the first to the greater kindes

kindes of Flowerdeluces, and placeth it in the fore ranke, calling it *Iris bulbosa latifolia prima*, that is, The first broad leaved Flowerdeluce, and all others doe the like, I haue (as you see) in the like manner put it before all the other, and keepe the same name. The Spaniards, as he saith, called it *Lirio espadanal*, and they of Corduba, *Lirios azules*.

The other hath no other name then as it is in the title.

1. *Iris bulbosa maior fuscæ Anglicæ cerulea.*  
The blew English bulbous Flowerdeluce.

This bulbous Flowerdeluce riseth vp early, even in January oftentimes, with fve or six long and (narrow, in comparison of any great breadth, but in regard of the other kinde) broad whitish green leaues, crested or straked on the backside, and halfe round, the inside being hollow like a trough or gutter, white all along the inside of the leafe, and blunt at the end; among which riseth vp a stiffe round stalk, a cubit or two foot high, at the toppe whereof, out of a skinne huske, commeth forth one or two flowers, consisting of nine leaues a peece, three whereof that are turned downwards, are larger and broader then the other, hauing in each of them a yellow spot, about the middle of the leafe, other three are small, hollow, ridged or arched, covering the lower part next the stalk of those falling leaues, turning vp their ends, which are diuided into two parts, other three stand vp right, and are very small at the bottome of them, and broader toward the toppe: the whole flower is of a faire blew colour; after the flowers are past, come vp three square heads, somewhat long, and lanke, or loose, containing in them round yellowish seede, which when it is ripe, will rattle by the shaking of the winde in the dry huskes: the roote of this kinde is greater and longer then any of the smaller kindes with narrow leaues, couered with diuers browne skinnes, which seeme to be fraught with long thredds like haire, especially at the small or vpper end of the roote, which thing you shall not finde in any of the smaller kindes.

2. *Iris bulbosa maior purpurea & purpurea violacea.*  
The paler or deeper purple great bulbous Flowerdeluce.

These purple Flowerdeluces differ not from the last described, either in roote or leafe: the chiefest difference consisteth in the flowers, which in these are somewhat larger then in the former, and in the one of a deepe blew, or Violet purple colour, and in the other of a deepe purple colour, in all other things alike.

There is also another, in all other things like vnto the former, but only in the flower, *Flore cinereo*, which is of a pale or bleake blew, which we call an ash-colour.

3. *Iris bulbosa maior purpurea variegata fuscæ striata.*  
The great purple striped bulbous Flowerdeluce.

There is another of the purple kinde, whose flower is purple, but with some veiales or stripes of a deeper Violet colour, diuersly running through the whole leaues of the flower.

And another of that bleake blew or ash-colour, with *lineæ et veines* of purple in *flore cinereo* *striata purpurea* the leaues of the flowers, some more or lesse then other.

And againe another, whose flower is of a purple colour like vnto the second, but that round about that yellow spot, in the middle of each of the three falling leaues (as *or be cinereo* is vsually in all the bulbous Flowerdeluces) there is a circell of a pale blew or ash-colour, the rest of the leafe remaining purple, as the other parts of the flower is.

4. *Iris bulbosa maior floræ rubente.*  
The great peach coloured bulbous Flowerdeluce.

There is another of these greater kindes, more rare then any of the former, not differing in roote, leafe, or flower, from the former, but only that the flower in this is of a pale reddish purple colour, comming somewhat neare vnto the colour of a peach blossome.

5. *Iris bulbosa major sine latifolia alba.*  
The great white bulbous Flowerdeluce.

The great white bulbous Flowerdeluce, riseth not vp so early out of the ground as the blew or purple doth, but about a moneth or more after, whose leaues are somewhat larger, and broader then of the others: the stalke is thicker and shorter, bearing vsually two very large and great flowers, one flowing a little before the other, yet oftentimes both in flower together in the end, of a bleake blewish white colour, which wee call a siluer colour, while they are in the budde, and before they be blowne open, but then of a purer white, yet with an eye or shew of that siluer colour remaining in them, the three falling leaues being very large, and hauing that yellow spot in the middle of each of them: the seedes are likewise inclosed in heads, like vnto the blew or purple kindes, but larger, and are of a reddish yellow colour like them: the roote likewise is not differing, but greater.

6. *Iris bulbosa major alba variegata.*  
The great white stript bulbous Flowerdeluce.

This white stript Flowerdeluce, is in roote, leafe, and flower, and in manner of growing, like vnto the former white Flowerdeluce; the onely difference is in the marking of the flower, being diuers from it: for this hath in the white flower great veines, stripes, or markes, of a Violet blew colour, dispersed through the leaues of the flower very variably, which addeth a superexcellent beauty to the flower.

7. *Iris bulbosa major sine latifolia versicolor.*  
The great party coloured bulbous Flowerdeluce.

There is no difference in this from the former, but in the flower, which is of a whitish colour in the three falling leaues, hauing a circle of ash-colour about the yellow spot, the three rigged leaues being likewise whitish, but ridged and edged with that ash-colour, and the three vpright leaues of a pale blewish white colour, with some veines therin of a blewish purple.

Varietie.

Flore luteo.

There hath beene brought vnto vs diuers rootes of these kindes, with the dried flowers remaining on them, wherein there hath beene seene more varieties, then I can well remember to expresse, which variety it is very probable, hath risen by the sowing of the seeds, as istruely obserued in the narrower leaved kinde of Flowerdeluce, in the Tulipa, and in some other plants.

Wee haue heard of one of this kinde of broad leaved Flowerdeluces, that should beare a yellow flower, in the like manner as is to be seene in the narrow leaved ones: but I haue not seene any such, and therefore I dare report no further of it, vntill time hath discouered the truth or falsehood of the report.

The Place.

Lobelius is the first reporter, that the blew Flowerdeluce or first kinde of these broad leaved Flowerdeluces, growtheth naturally in the West parts of England; but I am in some doubt of the truth of that report: for I rather thinke, that some in their trauels through Spaine, or other parts where it growtheth, being delighted with the beauty of the flower, did gather the rootes, and bring them ouer with them, and dwelling in some of the West parts of England, planted them, and there encreasing so plentifullly as they doe, they were imparted to many, thereby in time growing common in all Countrey folkes Gardens thereabouts. They grow also, and all the other, and many more varieties, about Thoulouse, from whence Plantinianus Gasparus both sent and brought vs them, with many other bulbous rootes, and rare plants gathered thereabouts.

The

1. *Iris bulbosa major sine latifolia prima Clavis.* Clavis his first great bulbous Flowerdeluce. 2. *Iris bulbosa major sine latifolia alba.* The great white or English bulbous Flowerdeluce. 3. *Iris bulbosa major purpurea variegata.* The great purple stript bulbous Flowerdeluce. 4. *Iris bulbosa angustifolia major alba.* The greater white narrow leaved bulbous Flowerdeluce. 5. *Iris bulbosa angustifolia Africana.* The party coloured narrow leaved bulbous Flowerdeluce. 6. *Iris bulbosa angustifolia Africana.* The purple African narrow leaved Flowerdeluce.

## The Time.

These doe flower vsually in the end of May, or beginning of June, and their seede is ripe in the end of July or August.

## The Names.

Lobel calleth the first English blew Flowerdeluce, *Hyacinthus Poetarum* *Aure Iridis, & propter Hyacinthum colorum, id est violaceum dictum*: but I know not any great good ground for it, morethen the very colour; for it is neither of the forme of a Lilly, neither hath it those mourning markes imprinted in it, which the Poet faineth to bee in his Hyacinth. It is most truely called an *Iris*, or Flowerdeluce (and there is great difference betweene a Lilly and a Flowerdeluce, for the formes of their flowers) because it answreth thereunto very exactly, for the flower, and is therefore called vsually by most, either *Iris bulbosa Anglica*, or *Iris bulbosa major sine latifolia*, for a difference betweene it, and the lesser with narrow leaues: In English, eyther The great English bulbous Flowerdeluce, or the great broad leaved bulbous Flowerdeluce, which you will, adding the other name, according to the colour.

And thus much for these broad leaved bulbous Flowerdeluces, so much as hath come to our knowledge. Now to the feuerall varieties of the narrow leaved bulbous Flowerdeluces, so much likewise as we haue been acquainted with.

*Iris bulbosa minor sine angustifolia alba.*  
The smaller white or narrow leaved bulbous Flowerdeluce.

This first Flowerdeluce, which beareth the smaller flower of the two white ones, that are here to bee described, springeth out of the ground alwaies before Winter, which after breaketh forth into foure or fife small and narrow leaues, a foote long or more, of a whitish greene on the inside, which is hollow and chanelled; and of a bleuifh greene colour on the outside, and round withall: the stalke of this kinde is longer and slenderer then the former, with some shorter leaues vpon it, at the toppe whereof, out of short skinny leaues, stand one or two flowers, smaller, shorter, and rounder then the flowers of the former broad leaved Flowerdeluces, but made after the same proportion with nine leaues, three falling downewards, with a yellow spot in the middle, other three are made like a long arch, which couer the lower part next the stalke of those falling leaues, and turne vp at the ends of them, where they are diuided into two parts: the other three stand vpright, betweene each of the three falling leaues, being somewhat long and narrow: the flower is wholly (saueing the yellow spot) of a pure white colour, yet in some hauing a shew of some blew throughout, and in others towards the bottome of the three vpright leaues: after the flowers are past, there rise vp so many long cods or seede vessels, as there were flowers, which are longer and smaller then in the former, and a little bending like a Corner, with three round squares, and round pointed also, which diuiding it selfe when the seede is ripe into three parts, doe shew six feuerall cells or places, wherein is contained such like round reddish yellow seedes, but smaller then the former: the rootte is smaller and shorter then the former, and without any haires or thredes, couered with browne thin skinnes, and more plentifull in giuing encrasshe.

*Iris bulbosa angustifolia alba flore maiore.*  
The greater white narrow leaved bulbous Flowerdeluce.

I shall not neede to make a feuerall description to every one of these Flowerdeluces that follow, for that were but to make often repetition of one thing, which being once done, as it is, may well serue to expresse all the rest, and but onely to add the seuerall

ciall differences, either in leafe or flower, for bignesse, colour, or forme, as is expedient to expresse and distinguish them feuerally. This greater white bulbous Flowerdeluce is like vnto the last described in all parts, sauing that it is a little larger and higher, both in leafe, stalke, and flower, and much whiter then any of these mixed sortes that follow, yet not so white as the former: the roote hereof is likewise a little bigger and rounder in the middle.

*Albiflora.*  
Milke white.

There is another, whose falling leaues haue a little shew of yellownesse in them, and so are the middle ridges of the arched leaues, but the vpright leaues are more white, not differing in roote or leafe from the first white.

*Argentea.*  
Saucer colour.

And another, whose falls are of a yellowish white, like the last, the arched leaues are whiter, and the vpright leaues of a bleuifh white, which we call a filuer colour.

*Albida.*  
Whitish.

Another hath the fals yellowish, and sometimes with a little edge of white about them, and sometimes without; the vpright leaues are whitish, as the arched leaues are, yet the ridge yellower.

*Albida lutea.*  
Iutea.  
White with  
yellow fals.

Another hath his fals yellow, and the vpright leaues white, all these flowers are about the same bignesse with the first.

*Albida angu-*  
*floria.*  
The narrow  
white.

But we haue another, whose flower is smaller, and almost as white as the second, the lower leaues are small, and doe as it were stand outright, not hauing almost any fal at all, so that the yellow spot seemeth to be the whole leafe, the arched leaues are not halfe so large as in the former, and the vpright leaues bowe themselues in the middle, so that the tops doe as it were meeet together.

And another of the same, whose falling leaues are a little more eminent and yellow, with a yellower spot.

*Aurea fusa lu-*  
*tea Hispanica.*  
The Spanish  
yellow.

We haue another kinde that is called the Spanish yellow, which riseth not vp so high, as ordinarily most of the rest doe, and is wholly of a gold yellow colour.

*Pallida lutea.*  
Straw colour.

There is another, that vsually riseth higher then the former yellow, and is wholly of a pale yellow, but deeper at the spot.

*Albida lutea.*  
Pale Straw co-  
lour.

There is also another like vnto the pale yellow, but that the falling leaues are whiter then all the rest of the flower.

*Mauritanica*  
*fusca siroina*  
*minor.*  
The small Bar-  
barie yellow.

There is a smaller or dwarfe kinde, brought from the backe parts of Barbary, neare the Sea, like vnto the yellow, but smaller and lower, and instead of vpright leaues, hath small short leaves like haire: it flowreth very late, after all others haue almost givien their seede.

*Vericolor His-  
panica cerulea*  
*labris alba.*

We haue another sort is called the party coloured Spanish bulbous Flowerdeluce, whose falling leaues are white, the arched leaues of a whitish filuer colour, and the vpright leaues of a fine bleuifh purple.

*Diversitas.*  
The diversity  
or variation of  
this flower.

Yet sometimes this doth vary; for the falling leaues will haue either an edge of blew, circling the white leaues, the arched leaues being a little blewer, and the vpright leaues more purple.

Or the fals will be almost wholly blew, edged with a bleuer colour, the arched leaues pale blew, and the vpright leaues of a purplish blew violet colour.

Or the fals white, the arched leaues pale white, as the vpright leaues are. Or not of so faire a bleuifh purple, as the first sort is.

*Cerulea fusa*  
*purpurea minor*  
*Lusitanica pra-*  
*cox.*  
The small  
early purple  
Portugall.

Some of them also will haue larger flowers then others, and be more liberall in bearing flowers: for the first sort, which is the most ordinary, seldeome beareth one flower on a stalke, yet sometimes two. And of the others there are some that wil beare vsually two and three flowers, yet some againe will beare but one. All these kindes smell sweeter then many of the other, althoough the most part be without sent.

There is another kinde, that is smaller in all the parts thereof then the former, the stalke is slender, and not so high, bearing at the toppe one or two small flowers, all wholly of a faire bleuifh purple, with a yellow spot in

*Purpurea major.*  
The greater  
purple.

*Purpurea late purple.*

*Purpurea rubrifrons*

*Labiata carolin.*

A reddish purple

with blew flos.

lour.

*Altera obsoletior.*

A dull haire co-

lour.

in every one of the three falling leaues, this vsually flowreth early, even with the first bulbous Flowerdeluces.

We haue another purple, whose flower is larger, and stalke higher, and is of a very reddish purple colour, a little aboue the ground, at the foote or bottome of the leaues and stalke : this flowreth with the later sort of Flowerdeluces.

There is another, whose flower is wholly purple, except the yellow spot, and flowreth later then any of the other purples.

There is yet another purple, whose vpright leaues are of a reddish purple, and the falling leaues of a blew colour.

And another of a reddish purple, whose falling leaues are of a whitish blew colour, in nothing else differing from the last.

Another hath his falling leaues of a faire gold yellow, without any stripe, yet in some there are veines running through the yellow leaues, and some haue an edge of a fullen darke colour about them : the vpright leaues in every of these, are of a Violet purple.

Another is altogether like this last, but that the falling leaues are of a pale blew and yellow, trauersing one the other, and the arched leaues of a pale purplish colour.

Another hath his vpright leaues of a paler purple, and the falling leaues yellow.

And another little differing from it, but that the arched leaues are whitish.

Another whose vpright leaues are of a pale blew, and the falling leaues yellow.

And another of the same sort, but of a little paler blew.

We haue another sort, whose vpright leaues are of a faire brownish yellow colour, which some call a *Fuille mort*, and others an haire colour ; the falling leaues yellow.

And another of the same colour, but somewhat deader.

### *Iris balboae Africana serpens arie caule.*

#### The purple or murkey bulbous Barbary Flowerdeluce.

This Flowerdeluce as it is more strange (that is, but lately knowne and possessed by a few) so it is both more desired, and of more beauty then others. It is in all respects, of roote, leafe, and flower, for the forme like vnto the middle sort of these Flowerdeluces, onely the lowest part of the leaues and stalke, for an inch or thereabouts, next vnto the ground, are of a reddish colour, spotted with many spots, and the flower, being of a meane size, is of a deepe purplish red or murrey colour the whole flower throughout, except the yellow spot in the middle of the three lower or falling leaues, as is in all others.

And lastly, there is another sort, which is the greatest of all these narrow leafed Flowerdeluces, in all the parts of it ; for the roote is greater then any of the other, being thicke and short : the leaues are broader and longer, but of the same colour : the stalke is stronger and higher then any of them, bearing two or three flowers, larger also then any of the rest, whose falling leaues are of a dusky yellow, and sometimes with veines and borders about the brimmes, of another dunne colour, yet hauing that yellow spot that is in all : the arched leaues are of a fullen pale purplish yellow, and the vpright leaues of a dull or dusky blewish purple colour : the heads or hornes for seede are likewise greater, and so is the seede also a little.

#### The Place.

These Flowerdeluces haue had their originall out of Spaine and Portugall, as it is thought, except those that haue risen by the sowing, and those which are named of Africa.

The

#### The Time.

These flower in June, and sometimes abide vnto July, but vsually not so early as the former broad leaved kindes, and are soone spoiled with wet in their flowring.

#### The Names.

The severall names, both in Latine and English, are sufficient for them as they are set downe, for we know no better.

#### The Vertues.

There is not any thing extant or to be heard, that any of these kindes of Flowerdeluces hath been vsed to any Physicall purposes, and serue onely to decke vp the Gardens of the curious.

And thus much for these sorts of bulbous Flowerdeluces, and yet I doubt not, but that there are many differences, which haue risen by the sowing of the seede, as many may obserue from their owne labours, for that every yeare doth shew forth some varietie that is not seene before. And now I will conuert my discourse a while likewise, to passe through the severall rankes of the other kindes of tuberous rooted Flowerdeluces, called Flagges.

#### C H A P. X X.

#### *Iris latifolia tuberosa.* The Flagge or Flowerdeluce.

**T**here are two principall kindes of tuberous or knobby rooted Flowerdeluces, that is, the tall and the dwarfe, or the greater and the lesser ; the former called *Iris major* or *latifolia*, and the other *Iris minor*, or rather *Chameiris* ; and each of these haue their lesser or narrow leafed kindes to bee comprehended vnder them : Of all which in their order. And first of that Flowerdeluce, which for his excellent beautie and rarite, deserueth the first place.

#### *Iris Chalcedonica sine Sufiana maior.* The great Turkie Flowerdeluce.

The great Turkie Flowerdeluce, hath diuers heads of long and broad fresh green leaues, yet not so broad as many other of those that follow, one folded within another at the bottome, as all other of these Flowerdeluces are : from the middle of some one of those heads (for euery head of leaues beaith not a flower) riseth vp a round stiffe stalke, two foote high, at the toppe whereof standeth one flower (for I never obserued it to beare two) the largest almost, but rarest of all the rest, consisting of nine leaues, like the others that follow, but of the colour almost of a Snakes skinne, it is so diuersly spotted ; for the three lower falling leaues are very large, of a deepe or darke purple colour, almost blacke, full of grayish spots, strakes, and lines through the whole leaues, with a blacke thrume or freezein the middle of each of them : the three arched leaues that couer them, are of the same darke purple colour, yet a little paler at the sides, the three vpper leaues are very large also, and of the same colour with the lower leaues, but a little more liuely and fresh, being speckled and straked with whiter spots and lines, which leaues being laid in water, will colour the water into a Violet colour, but if a little Allome be put therein, and then wrung or pressed, and the iuice of these leaues dried in the shadow, will giue a colour almost as deepe as Indico, and may serue for shadowes in limming excellent well : the flower hath no sent that can be perceived, but is onely commendable for the beauty and rarity thereof : it seldom beareth seedes in these cold Countries, but when it doth, it is contained in great heads, being

being brownish and round, but not so flat as in other sorts, the roots are more browne on the outside, and growing tuberous thicke, as all other that are kept in Gardens.

*Iris Chalcedonica sine Sufiana minor.* The lesser Turkie Flowerdeluce.

There is another hereof little differing, but that the leafe is of a more yellowish greene colour, and the flower neither so large or faire, nor of so perspicuous markes and spots, nor the colour of that liuely (though darke) lustre.

The Place.

These haue been sent out of Turkie diuers times among other things, and it shold seeme, that they haue had their originall from about Sufis, a chiefe Citie of Persia.

The Time.

They flower in May most vsually, before any of the other kindes.

The Names.

They haue been sent vnto vs, and vnto diuers other in other parts, from Constaatinople vnder the name of *Alia Sufiana*, and thereupon it hath been called, both of them and vs, either *Iris Chalcedonica*, or *Sufiana*, and for distinction *major* or *minor*: In English, The Turkie Flowerdeluce, or the Ginnie Hen Flowerdeluce, the greater or the lesser.

*Iris alba Florentina.* The white Flowerdeluce.

*Iris pallida.*

The great white Flowerdeluce, hath many heads of very broad and flat long leaves, enclosing or folding one within another at the bottome, and after a little diuided one from another toward the top, thin edged, like a sword on both sides, and thicker in the middle: from the middle of some of these heads of leaves, riseth vp a round stiffe stalk, two or three foot high, bearing at the top one, two, or three large flowers, out of seuerall huskes or skins, consisting of nine leaves, as all the other do, of a faire white colour, hauing in the middle of each of the three falling leaves, a small long yellow frize or thrume, as is most vsuall in all the sorts of the following Flowerdeluces, both of the greater and smaller kindes: after the flowers are past, come the seed, inclosed in thicke short pods, full fraught or stored with red roundish and flat seede, lying close one vpon another: the roote is tuberous or knobby, shooting out from every side such like tuberous heads, lying for the most part vpon or aboue the ground, and fastened within the ground with long white strings or fibres, which hold them strongly, and encrafesth the stalk. There is another like vnto this last in all things, sauing that the colour of the flower is of a more yellowish white, which we vsually call a Straw colour.

*Iris alba major Vericolor.* The white party coloured Flowerdeluce.

This variable Flowerdeluce is like vnto the former, but that the leaves are not so large and broad, the flower hereof is as large almost, and as white as the former, but it hath a faire list or line of a blewifh purple downe the backe of euery one of the three upright leaves, and likewise round about the edges, both of the vpper and lower leaves, and also a little more purplish vpon the ridge of the arched leaves, that couer the falling leaves: the roote hereof is not so great as of the former white, but a little slenderer and brownier.

*Iris Dalmatica major.* The great Dalmatian Flowerdeluce.

This greater Flowerdeluce of Dalmatia, hath his leaves as large and broad as any of the Flowerdeluces whatsoeuer, his stalke and flower doe equall his other proportion,

tion, onely the colour of the flower is differing, being of a faire wachet or bleake blew colour wholly, with the yellow frize or thrum downe the middle of the lower or falling leaues, as before is said to be common to all these sorts of Flowerdeluces, in all other parts it little differeth, sauing onely this is obserued to haue a small shew of a purplish red about the bottome of the greene leaues.

*Iris purpurea sine vulgaris.* The common purple Flowerdeluce.

This Flowerdeluce, which is most common in Gardens, differeth nothing at all from those that are formerly described, either in roote, leafe, or flower for the forme of them, but onely that the leaues of this are not so large as the last, and the flower it selfe is of a deep purple or Violet colour, and sometimes a little declining to rednesse, especially in some places.

Sometimes this kinde of Flowerdeluce will haue flowers of a paler purple colour, *Purpurea pala-* comming neare vnto a blew, and sometimes it will haue veines or stripes of a deeper *tior verisco-* blew, or purple, or ash-colour, running through all the vpper and lower leaues.

There is another like vnto this, but more purple in the fals, and more pale in the *Cerulea labris;* upright leaues. *Purpurea.*

*Iris Asatica caerulea.* The blew Flowerdeluce of Asia.

This Flowerdeluce of Asia, is in largenesse of leaues like vnto the Dalmatian, but beareth more store of flowers on severall branches, which are of a deeper blew colour, and the arched leaues whitish on the side, and purplish on the ridges, but in other things like vnto it.

There is another neare vnto this, but that his leaues are a little narrower, and his *Purpurea* flowers a little more purple, especially the vpper leaues.

*Iris Damascena.* The Flowerdeluce of Damasco.

This is likewise altogether like the Flowerdeluce of Asia, but that it hath some white veines in the upright leaues.

*Iris Lusitanica biflora.* The Portugall Flowerdeluce.

This Portugall Flowerdeluce is very like the common purple Flowerdeluce, but that this is not so large in leaues, or flowers, and that it doth often flower twice in a yeare, that is, both in the Spring, and in the Autumne againe, and besides, the flowers haue a better or sweeter sent, but of the like purple or Violet colour as it is, and comming forth out of purplish skins or huskes.

*Iris Camerarij sine purpurea vericolor maior.*  
The greater variable coloured purple Flowerdeluce.

The greater of the variable purple Flowerdeluces, hath very broad leaues, like vnto the leaues of the common purple Flowerdeluce, and so is the flower also, but differing in colour, for the three lower leaues are of a deepe purple colour tending to rednesse, the three arched leaues are of the colour with the vpper leaues, which are of a pale or bleake colour tending to yellownesse, shadowed ouer with a smooake purplish colour, except the ridges of the arched leaues, which are of a more liuely purple colour.

*Iris purpurea vericolor minor.* The lesser variable purple Flowerdeluce.

This Flowerdeluce differeth not in any thing from the last, but onely that it hath narrower greene leaues, and smaller and narrower flowers, else if they be both conffered together, the colours will not seeme to varie the one from the other any whit at all.

There is another somewhat neare vnto these two last kindes, whose huskes from *Altera minus fuliginea;* whence

whence the flowers doe shooe forth, haue purple veines in them, and to haue the falling purplish leaues, and the three vpright leaues are not so smoakie, yet of a dun purplish colour.

*Iris cerealea versicolor.* The blew party coloured Flowerdeluce.

This party coloured Flowerdeluce hath his leaues of the same largenesse, with the lesser variable purple Flowerdeluce last described, and his flowers diuersly marked: for some haue the fals blew at the edges, and whitish at the bottome, the arched leaues of a yellowish white, and the vpright leaues of a whitish blew, with yellowish edges. Some againe are of a darker blew, with brownish spots in them. And some are so pale a blew, that we may well call it an ash colour: And lastly, there is another of this sort, whose vpright leaues are of a faire pale blew, with yellowish edges, and the falling leaues parted into two colours, sometimes equally in the halfe, each side suitable to the other in colour: And sometimes hauing the one leafe in that manner: And sometimes but with a diuers coloured list in them; in the other parts both of flower and leafe, like vnto the other.

*Iris lutea variegata.* The yellow variable Flowerdeluce.

This yellow variable Flowerdeluce loseth his leaues in Winter, contrary to all the former Flowerdeluces, so that his roote remaineth vnder ground without any shew of leafe vpon it: but in the beginning of the Spring it shooteth out faire broad leaues, falling downwards at the points or ends, but shorter many times then any of the former, and so is the stalle likewise, not rising much aboue a foote high, whereon are set two or three large flowers, whose falling leaues are of a reddish purple colour, the three that stand vpright of a smoakie yellow, the arched leaues hauing their sides of a bleake colour tending to purple, the sides being of the former smoakie yellow colour, with some purplish veines at the foote or botrone of all the leaues: the roote growth somewhat more slender and long vnder ground, and of a darker colour then manie of the other.

Another sort hath the vpright leaues of a reasonable faire yellow, and stand more vpright, not bowing downe as most of the other, and the purple fals haue pale edges. Some haue their greene leaues party coloured, white and greene, more or lesse, and so are the huskes of the flower, the arched leaues yellow as the vpright leaues are, with purplish veines at the bottome. And some haue both the arched and vpright leaues of so pale a yellow, that we may almost call it a straw colour, but yellower at the bottome, with purple veines, and the falling leaues purple, with two purple spots in them.

And these are the sorts of the greater tuberous or Flagge Flowerdeluces that haue come to our knowledge: the next hereunto are the lesser or narrow leafed kindes to be described; and first of the greatest of them.

*Iris angustifolia Tripolitana aurea.* The yellow Flowerdeluce of Tripoly.

This Flowerdeluce I place in the forefront of the narrow leafed Flowerdeluces, for the length of the leaues, compared with the breadth of them; it may fitly bee called a narrow leafed Flowerdeluce, although they be an inch broad, which is broader then any of them that follow, or some of those are set downe before, but as I said, the length make them seem narrow, and therfore let it take vp his roome in this place, with the description that followeth. It beareth leaues a yard long, or not much lesse, and an inch broad, as is said before, or more, of a sad greene colour, but not shining: the stalle riseth vp to be foure or fife foote high, being strong and round, but not very great, bearing at the toppe two or three long and narrow gold yellow flowers, of the fashion of the bulbous Flowerdeluces, as the next to bee described is, without any mixture or variation therein: the heads for seede are three square, containing within them many flat cornered seedes: the roote is long and blackish, like vnto the rest that follow, but greater and fuller.

1. *Iris chalcedonica sive Sibirica maior.* The great Turke Flowerdeluce. 2. *Iris alba Florentina.* The white Flowerdeluce. 3. *Iris latifolia variegata.* The variable Flowerdeluce. 4. *Iris chamaeiris latifolia maior.* The greater dwarfe Flowerdeluce.

2. *Iris angustifolia maior carulea.*

The greater blew Flowerdeluce with narrow leaues.

This kinde of Flowerdeluce hath his leaues very long and narrow, of a whitish greene colour, but neither so long or broad as the last, yet broader, thicker and stiffer then any of the rest with narrow leaues that follow: the stalke riseth sometimes no higher then the leaues, and sometimes a little higher, bearing diuers flowers at the top, successively flowering one after another, and are like vnto the flowers of the bulbous Flowerdeluces, but of a light blew colour, and sometimes deeper: after the flowers are past, rise vp six cornered heads, which open into three parts, wherein is contained browne seede, almost round: the roote is small, blackish and hard, spreading into many long heads, and more closely growing or matting together.

3. *Iris angustifolia purpurea marina.* The purple narrow leaved Sea Flowerdeluce.

This Sea Flowerdeluce hath many narrow hard leaues as long as the former, and of a darke greene colour, which doe smell a little strong: the stalke beareth two or three flowers like the former, but somewhat lesse, and of a darke purple or Violet colour: in seede and roote it is like the former.

4. *Iris angustifolia purpurea versicolor.*

The variable purple narrow leaved Flowerdeluce.

The leaues of this Flowerdeluce are very like the former Sea Flowerdeluce, and do a little stink like them; the flowers are differing, in that the vpper leaues are wholly purple or violet, and the lower leaues haue white veines, and purple running one among another: the seede and rootes differ not from the former purple Sea kinde.

5. *Iris angustifolia minor Pannonica fine versicolor Clusij.*

The small variable Hungarian Flowerdeluce of Clusius.

This Hungarian Flowerdeluce (first found out by Clusius, by him described, and of him tooke the name) riseth vp with diuers small tufts of leaues, very long, narrow, and greene, growing thicke together, especially if it abide any time in a place; among which riseth vp many long round stalkes, higher then the leaues, bearing two or three, or foure small flowers, one aboue another, like the former, but smaller and of greater beauty: for the lower leaues are variably striped with white and purple, without any thrume or fringe at all: the vpper leaues are of a bleuish fine purple or Violet colour, & so are the arched leaues, yet haung the edges a little paler: the heads for seede are smaller, and not so cornered as the other, containing seedes much like the former, but smaller: the roote is blacke and small, growing thicker and closer together then any other, and strongly fastened in the ground, with a number of hard stringie rootes: the flowers are of a reasonable good sent.

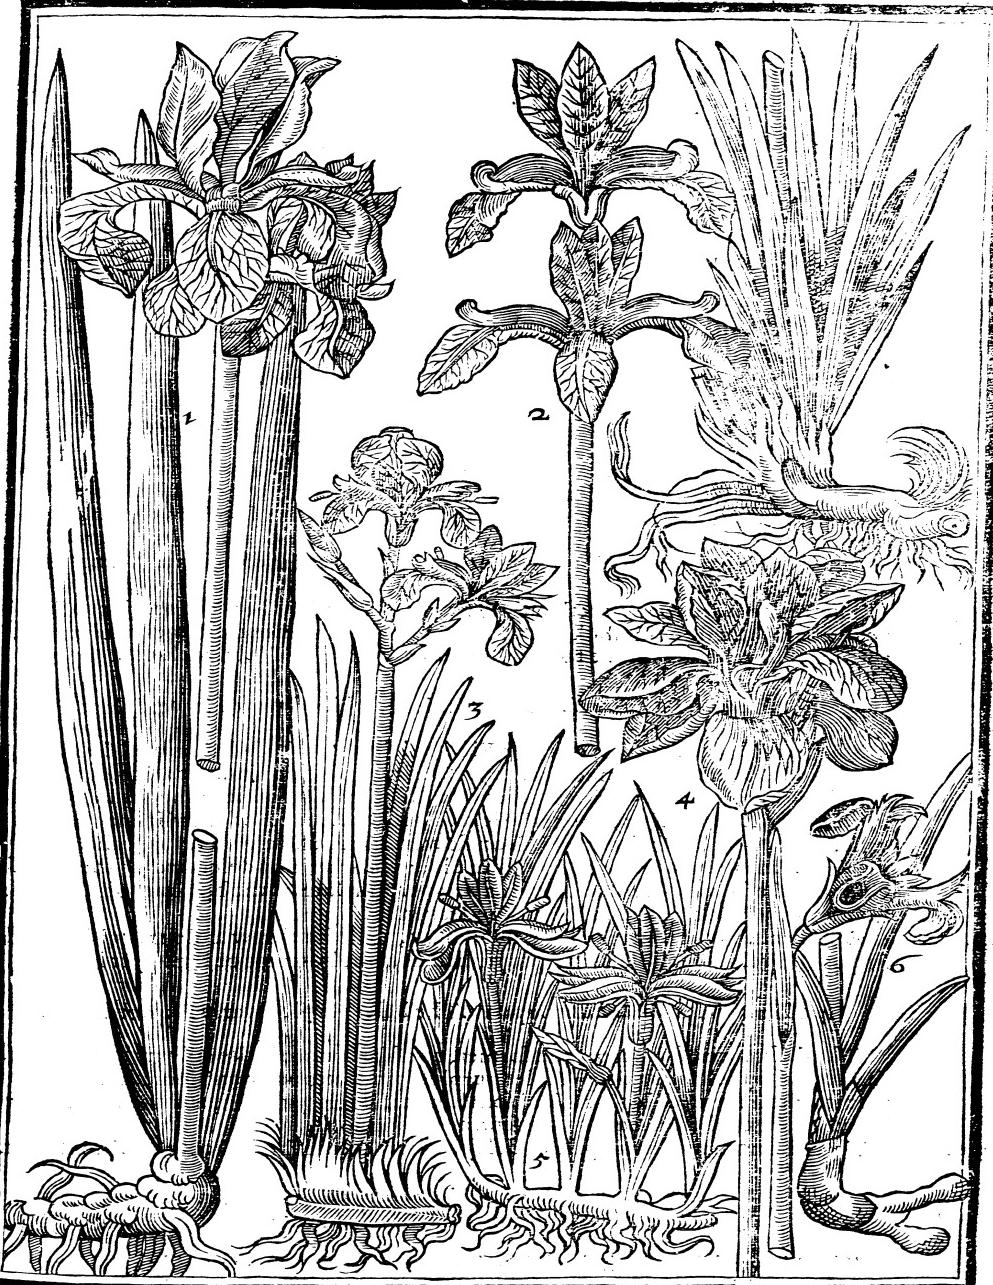

6. *Iris angustifolia maior flore duplo.* The greater double blew Flowerdeluce.

This Flowerdeluce, differeth not either in roote or leafe from the first great blew Flowerdeluce of Clusius, but only in that the leaues grow thicker together, and that the flowers of this kinde are as it were double with many leaues confusedly set together, without any distinct parts of a Flowerdeluce, and of a faire blew colour with many white veines and lines running in the leaues; yet oftentimes the stalke of flowers hath but two or three small flowers distinctly set together, rising as it were out of one huske.

7. *Iris angustifolia minor alba Clusij.*

The small white Flowerdeluce of Hungary.

This likewise differeth little from the former Hungarian Flowerdeluce of Clusius, but

1. *Iris angustifolia Tripolitana.* The yellow Flowerdeluce of Tripoli. 2. *Iris angustifolia maior carulea.* The greater blew Flowerdeluce with narrow leaues. 3. *Iris angustifolia minor Pannonica fine versicolor Clusij.* The small variable Hungarian Flowerdeluce of Clusius. 4. *Iris angustifolia maior flore duplo.* The greater double blew Flowerdeluce. 5. *Chamaeris angustifolia minor.* The lesser Grasse Flowerdeluce. 6. *Iris angustifolia minor alba Clusij.* The white Flowerdeluce.

but that the leafe is of a little paler greene colour, and the flower is of a faire whitish colour, with some purple at the bottome of the leaues.

Nex: after these narrow leaved Flowerdeluces, are the greater and smaller sorts of dwarfe kindes to follow; and lastly, the narrow or grasse leaved dwarfe kindes, which will finish this Chapter of Flowerdeluces.

*1. Chameiris latifolia maior alba.* The greater white dwarfe Flowerdeluce.

This dwarfe Flowerdeluce hath his leaues as broad as some of the lesser kindes last mentioned, but not shorter; the stalke is very short, not aboue halfe a foote high or thereabouts, bearing most commonly but one flower, seldome two, which are in some of a pure white, in others paler, or somewhat yellowish through the whole flower, except the yellow frize or thrume in the middle of every one of the falling leaues: after the flowers are past, come forth great heads, containing within them round pale seed: the roote is small, according to the proportion of the plant aboue ground, but made after the fashion of the greater kindes, with tuberous peeces spreading from the sides, and strong fibres or strings, whereby they are fastened in the ground.

*2. Chameiris latifolia maior purpurea.* The greater purple dwarfe Flowerdeluce.

There is no difference either in roote, leafe, or forme of flower in this from the former dwarfe kinde, but onely in the colour of the flower, which in some is of a very deepe or blacke Violet purple, both the toppes and the fals: in others the Violet purple is more liuely, and in some the vpper leaues are blew, and the lower leaues purple, yet all of them haue that yellow frize or thrume in the middle of the falling leaues, that the other kindes haue.

There is another that beareth purple flowers, that might be reckoned for the smalnesse and shortnesse of his stalke, to the next kinde, but that the flowers and leaues of this are as large as any of the former kindes of the smaller Flowerdeluces.

*3. Chameiris latifolia minor alba.* The lesser white dwarfe Flowerdeluce.

There is also another sort of these Flowerdeluces, whose leaues and flowers are lesse, and wherein there is much variety. The leaues of this kinde, are all for the most part somewhat smaller, narrower, and shorter then the former: the stalke with the flower vpon it scarce riseth aboue the leaues, so that in most of them it may be rather called a foote-stalke, such as the Saffron flowers haue, and are therefore called of manie *azures*, without stalkes, the flowers are like vnto the first described of the dwarfe kindes, and of a whitish colour, with a few purplish lines at the bottome of the vpper leaues, and a list of greene in the falling leaues.

Another hath the flowers of a pale yellow, called a Straw colour, with whitish stripes and veines in the fals, and purplish lines at the bottome of the vpper leaues.

*4. Chameiris latifolia minor purpurea.* The lesser purple dwarfe Flowerdeluce.

The difference of this from the former, consisteth more in the colour then forme of the flower, which is of a deep Violet purple, sometimes paler, and sometimes so deep, that it almost seemeth blacke: And sometimes the fals purplish, and the vpper leaues blew. Some of these haue a sweete sent, and some none.

There is another of a fine pale or delayed blew colour throughout the whole flower.

*5. Chameiris latifolia minor suaverubens.*  
The lesser blush coleured dwarfe Flowerdeluce.

This Flowerdeluce hath the falling leaues of the flower of a reddish colour, and the thrumes blew: the vpper and arched leaues of a fine pale red or flesh colour, calld a blush colour; in all other things it differeth not, and smellethe little or nothing atall.

*6. Chameiris latifolia minor latea vericolor.*  
The lesser yellow variable dwarfe Flowerdeluce.

The falling leaues of this Flowerdeluce are yellowish, with purple lines from the middle downewards, sometimes of a deeper, and sometimes of a paler colour, and white thrumes in the middle, the vpper leaues are likewise of a yellowish colour, with purple lines in them: And sometimes the yellow colour is paler, and the lines both in the vpper and lower leaues of a dull or dead purple colour.

*7. Chameiris latifolia minor carulea vericolor.*  
The lesser blew variable dwarfe Flowerdeluce.

The vpper leaues of this flower are of a blewish yellow colour, spotted with purple in the broad part, and at the bottome very narrow: the falling leaues are spread ouer with pale purplish lines, and a small shew of blew about the brimmes: the thrume is yellow at the bottome, and blewish aboue: the arched leaues are of a blewish white, being a little deeper on the ridge.

And sometimes the vpper leaues are of a paler blew rather whitish, with the yellow: both these haue no sent at all.

*8. Chameiris marina purpurea.* The purple dwarfe Sea Flowerdeluce.

This small Flowerdeluce is like vnto the narrow leaved Sea Flowerdeluce before described, both in roote, leafe, and flower, hauing no other difference, but in the finalnesse and lownesse of the growing, being of the same purple colour with it.

*9. Chameiris angustifolia major.* The greater Grasse Flowerdeluce.

This Grasse Flowerdeluce hath many long and narrow darke greene leaues, not so stiffe as the former, but lither, and bending their ends downe againe, among which rise vp diuers stalkes, bearing at the toppe two or three sweete flowers, as small as any of them set downe before, of a reddish purple colour, with whitish yellow and purple strakes downe the middle of the falling leaues: the arched leaues are of a horse flesh colour all along the edges, and purple vpon the ridges and tips that turne vp againe: vnder these appeare three browne aglets, like vnto birds tongues: the three vpper leaues are small and narrow, of a perfect purple or Violet colour: the heads for seede haue sharper and harder cornered edges then the former: the seedes are somewhat grayish like the former, and so are the rootes, being small, blacke, and hard, growing thicke together, fastened in the ground with small blackish hard strings, which hardly shooe againe if the roote be remoued.

*10. Chameiris angustifolia minor.* The lesser Grasse Flowerdeluce.

This Flowerdeluce is in leaues, flowers, and rootes so like the last described, that but onely it is smaller and lower, it is not to be distinguisched from the other. And this may suffice for these sorts of Flowerdeluces, that furnish the Gardens of the curious louers of these varieties of nature, so farre forth as hath passed vnder our knowledge. There are some other that may be referred hereunto, but they belong to another history; and therefore I make no mention of them in this place.

The Place.

The places of most of these are set downe in their severall titles; for some are out of Turkie, others out of Hungaria, Dalmatia, Illyria, &c. as their names doe import. Those that grow by the Sea, are found in Spaine and France.

## The Time.

Some of these do flower in Aprill, some in May, and some not vntill June.

## The Names.

The names expressed are the fittest agreeing vnto them, and therefore it is needlesse againe to repeate them. Many of the rootes of the former or greater kindes, being dried are sweete, yet some more then other, and some haue no sent at all: but aboue all the rest, that with the white flower, called of Florence, is accounted of all to be the sweetest root, fit to be vsed to make sweete powders, &c. calling it by the name of *Orris* rootes.

*Iris tuberosa*. The Velvet Flowerdeluce.

Vnto the Family of Flowerdeluces, I must needs ioyne this peculiar kinde, because of the neare resemblance of the flower, althoough it differ both in roote and leafe; lest therefore it shold haue no place, let it take vp a roome here in the end of the Flowerdeluces, with this description following. It hath many small and foure square leaues, two foote long and aboue sometimes, of a grayish greene colour, stiffe at the first, but afterwards growing to their full length, they are weak and bend downe to the ground: out of the middle, as it were of one of these leaues, breaketh out the stalke, a foot high and better, with some leaues thereon, at the toppe whereof, out of a huske riseth one flower, (I never saw more on a stalke) consisting of nine leaues, whereof the three that fall downe are of a yellowish greene colour round about the edges, and in the middle of so deepe a purple, that it seemeth to be blacke, resembling blacke Velvet: the three arched leaues, that couer the lower leaues to the halfe, are of the same greenish colour that the edges and backside of the lower leaues are: the three uppermost leaues, if they may be called leaues, or rather short peeces like eares, are green also, but wherein a glimpe of purple may be seene in them: after the flower is past, there followeth a round knob or whitish seede vessel, hanging downe by a small foote-stalke, from betweene the huske, which is diuided as it were into two leaues, wherein is contained round white seede. The roote is bunched or knobbed out into long round rootes, like vnto fingers, two or three from one peice, one distant from another, and one longer then another, for the most part of a darkish gray colour, and reddish withall on the outside, and somewhat yellowish within.

## The Place.

It hath beene sent out of Turkie oftentimes (as growing naturally therabouts) and not knowne to grow naturally any where else.

## The Time.

It flowreth in Aprill or May, sometimes earlier or later, as the Spring falleth out to be milde or sharpe.

## The Names.

Matthiolus contendeth to make it the true *Hermodactylus*, rather from the shew of the rootes, which (as is said) are like vnto fingers, then from any other good reason: for the rootes hereof eyther dry or greene, do nothing resemble the true *Hermodactylus* that are vsed in Physicke, as any that knoweth them may easily perceiue, either in forme or vertue. It is more truely referred to the Flowerdeluces, and becauise of the tuberous rootes, called *Iris tuberosa*, although all the Flowerdeluces in this Chapter haue tuberous rootes,

rootes, yet this much differing from them all. In English it is vsually calld, The Velvet Flowerdeluce, because the three falling leaves seeme to be like smooth blacke Velvet.

## The Vertues.

Both the rootes and the flowers of the great Flowerdeluces, are of great vse for the purging and cleansing of many inward, as well as outward diseases, as all Authors in Physicke doe record. Some haue vsed also the greene rootes to cleane the skinne, but they had neede to be carefull that vsing them, lest they take more harme then good by the vse of them. The dried rootes called *Orris* (as is said) is of much vse to make sweete powders, or other things to perfume apparrell or linnen. The iuice or decoction of the green rootes doth procure both neezing to be snuft vp into the nostrils, and vomiting very strongly being taken inwardly.

## C H A P. XXI.

*Gladiolus*. Corne Flagge.

**N**ext vnto the Flagges or Flowerdeluces, come the *Gladioli* or Corne Flagges to bee entreated of, for some resemblance of the leaues with them. There are hereof diuers sorts, some bigger and some lesser, but the chiefeſt difference is in the colour of the flowers, and one in the order of the flowers. Of them all in their ſeverall orders.

*Gladiolus Narbonensis*. The French Corne Flagge.

The French Corne Flagge riseth vp with three or foure broad, long, and stiffe greene leaues, one as it were out of the ſide of another, being ioyned together at the bottome, ſomewhat like vnto the leaues of Flowerdeluces, but ſtiffer, more full of ribbes, and longer then many of them, and sharper pointed: the stalke riseth vp from among the leaues, bearing them on it as it riseth, hauing at the toppe diuers huskes, out of which come the flowers one aboue another, all of them turning and opening themſelues one way, which are long and gaping, like vnto the flowers of Foxeglowe, a little arched or bunching vp in the middle, of a faire reddish purple colour, with two white ſpots within the mouth thereof, one on each ſide, made like vnto a Lozenge that is ſquare and long pointed: after the flowers are past, come vp round heads or ſeede vefſels, wherein is contained reddish flat ſeede, like vnto the ſeede of the Fritillaria, but thicker and fuller: the roote is ſomewhat great, round, flat, and hard, with a ſhew as if it were netted, hauing another ſhort ſpongiſe one vnder it, which when it hath done bearing, and the stalke dry, that the roote may be taken vp, ſticheth close to the bottome, but may be eaſily taken away, hauing vſually a number of ſmall rootes encreased about it, the leaſt whereof will quickly grow, ſo that if it be ſuffered any long time in a Garden, it will rather choake and pefte it, then be an ornament vnto it.

*Gladiolus Italicus binis floribus ordinibus*. The Italian Corne Flagge.

The Italian Corne Flagge is like vnto the French in roote, leafe, and flower, without any other difference, then that the roote is ſmaller and browner, the leafe and stalke of a darker colour, and the flowers (being of a little darker colour like the former, and ſomewhat ſmaller) ſtand out on both ſides of the stalke.

*Gladiolus Byzantinus*. Corne Flagge of Constantinople.

This Corne Flagge that came first from Constantinople, is in all things like vnto the French Corne Flagge last described, but that it is larger, both in rootes, leaues, and flowers,

flowers, and likewise that the Flowers of this, which stand not on both sides, are of a deeper red colour, and flower later, after all the rest are past: the roote hereof being netted as plainly as any of the former, is as plentifull also to giue encrease, but is more tender and lesse able to abide our sharpe cold Winters.

*Gladiolus flore rubente.* Blush Corne Flagge.

This blush kinde is like vnto the French Corne Flagge in all respects, sauing onely that the flowers are of a pale red colour, tending to whitenesse, which wee vsually call a blush colour.

*Gladiolus flore albo.* White Corne Flagge.

This white Corne Flagge also differeth not from the last, but onely that the rootes are whiter on the outside, the leaues are greener, without any brownnesse or darknesse as in the former, and the flowers are snow white.

*Gladiolus purpureus minor.* The small purple Corne Flagge.

This also differeth not from any of the former, but onely in the smalnesse both of leafe, stalk, and flowers, which stand all on the one side, like vnto the French kinde, and of the same colour: the roote of this kinde is netted more then any other.

The Place.

They grow in France and Italy, the least in Spaine, and the Byzantine, as it is thought, about Constantinople, being (as is said) first sent from thence. Iohn Tradescante assured mee, that hee saw many acres of ground in Barbary spread over with them.

The Time.

They all flower in June and July, and the Byzantine latest, as is said before.

The Names.

It hath diuers names; for the Latines call it *Gladiolus*, of the forme of a sword, which the leafe doth resemble. The Romanes *Segestalis*, because it groweth in the Corne fields. Some call it *Victorialis rotunda*, to put a difference between it, and the *longa*, which is a kinde of Garlick. Plinie saith, that *Gladiolus* is *Cyprae*, but to decide that controuersie, and many others, belongeth to another discourse, this being intended only for pleasure. Gerard mistaketh the French knade for the Italian.

The Vertues.

The roote being bruised, and applyed with Frankincense (and often of it selfe without it) in the manner of a pulsis or plaister, is held of diuers to be singular good to draw out splinters, thornes, and broken bones out of the flesh. Some take it to be effectuall to stirre vp Venerie, but I somewhat doubt thereof: For Galen in his eighth Booke of Simples, giueth vnto it a drawing, digesting, and drying faculty.

1. *Gladiolus Narbonensis.* The French Corne Flagge. 2. *Gladiolus Italica.* The Italian Corne Flagge. 3. *Gladiolus Byzantinus.* Corne Flagge of Constantinople. 4. *Palma Christi mar.* The great male handed Satyrion. 5. *Orchis Hermaphrodites candida.* The white Butterflie Orchis. 6. *Orchis Canina flore purpurea.* Dogges tooth Violet with a pale purplish flower. 7. *Dens Canina flore albo.* Dogges tooth Violet with a white flower. 8. *Dens Canina flore rubente.* Dogges tooth Violet with a red flower.

## C H A P. X X I I.

*Orchis sive Satyrium. Bee flowers.*

**A**lthough it is not my purpose in this place, to give a generall history of all the sorts of Orchides, Satyrions, and the rest of that kinde; yet because many of them are very pleasant to behold, and, if they be planted in a conuenient place, will abide some time in Gardens, so that there is much pleasure taken in them: I shall intrude some of them for curiosities sake, to make vp the prospet of natures beautiful variety, and only entreate of a few, leauing the rest to a more ample declaration.

1. *Satyrium Basilicum sive Palma Christi mas.*

The greater male handed Satyrian.

This handed Satyrian hath for the most part but three faire large greene leaues, neare vnto the ground, spotted with small blackish markes: from among which riseth vp a stalke, with some smaller leaues thereon, bearing at the toppe a bush or spike of flowers, thicke set together, every one whereof is made like a body, with the belly broader belowe then aboue, where it hath small peeces adioyned vnto it: the flower is of a faire purple colour, spotted with deeper purple spots, and hauing small peeces like hornes hanging at the backes of the flowers, and a small leafe at the bottome of the foote-stalke of every flower: the rootes are not round, like the other Orchides, but somewhat long and flat, like a hand, with small diuisions belowe, hanging downe like the fingers of a hand, cut short off by the knockles, two alwayes growing together, with some small fibres or strings aboue the heads of these rootes, at the bottome of the stalke.

2. *Satyrium Basilicum sive Palma Christi femina.*

The female handed Satyrian.

This female Satyrian hath longer and narrower leaues then the former, and spotted with more and greater spots, compassing the stalke at the bottome like the other: this beareth likewise a bush of flowers, like vnto the other, but that each of these haue heads like hoods, whereas the former haue none: in some they are white with purple spots, and in others of a reddish purple, with deep or darke coloured spots: the roots are alike.

3. *Orchis Hermaphroditica candida.* The white Butterfie Orchis.

The rootes of this kinde take part with both the sorts of *Orchis* and *Satyrium*, being neither altogether round, nor fully handed, and thereupon it tooke the name, to signifie both kindes: the leaues are two in number, seldom more, being faire and broad, like vnto the leaues of Lillies, without any spot at all in them: at the toppe of the stalke stand many white flowers, not so thicke set as the first or seconde, every one being fashioned like vnto a white Butterfie, with the wings spread abroad.

4. *Orchis Melitaea sive apifera.* The Bee flower or Bee Orchis.

This is a small and lowe plant for the most part, with three or four small narrow leaues at the bottome: the stalke is seldom aboue halfe a foote high, with four or five flowers thereon one aboue another, hauing round bodies, and somewhat flat, of a kind of yellowish colour, with purple wings aboue them, so like vnto an honey Bee, that it might deceiue one that never had seene such a flower before: the roots are two together, round and white, hauing a certaine mucilage or clampingesse within them, without any taste almost at all, as all or the most part of these kindes haue.

5. *Orchis Sphegodes.* Gnats Satyrian.

The leaues of this Orchis are somewhat larger then of the Bee flower, the stalke also somewhat

somewhat higher: the flowers are fewer on the toppe, but somewhat larger then of the Bee flowers, made to the resemblance of a Gnat or great long Flie: the rootes are two round bulbes, as the other are.

6. *Orchis Myodes.* Flie Orchis.

The Flie Orchis is like vnto the last described, both in leafe and roote, the difference is in the flower, which is neither so long as the Gnat Satyrian, nor so great as the Bee Orchis, but the nearer part of the Flie is blacke, with a list of ash-colour crossing the backe, with a shew of legges hanging at it: the naturall Flie seemeth so to bee in loue with it, that you shall seldom come in the heate of the day, but you shall finde one sitting close thereon.

## The Place.

These grow in many places of England, some in the Woods, as the Butterfie, and the two former handed Satyrions: others on dry bankes and barren balkes in Kent, and many other places.

## The Time.

They flower for the most part in the beginning or middle of May, or thereabouts.

## The Names.

Their severall names are exprested in their titles, so much as may suffice for this discourse.

## The Vertues.

All the kindes of Orchis are accounted to procure bodily lust, as well the flowers distilled, as the rootes prepared.

The rootes boyled in red Wine, and afterwards dried, are held to bee a singular good remedie against the bloody Flux.

## C H A P. X X I I.

*Dens Caninus. Dogs tooth Violet.*

**V**NTO the kindes of Orchides, may fitly be ioyned another plant, which by many is reckoned to be a *Satyrium*, both from the forme of roote and leafe, and from the efficacy or vertue correspondent thereunto. And although it cannot be the *Satyrium Erythronium* of Dioscorides, as some would entitle it, for that as I haue shewed before, his *Satyrium tryphillum* is the *Tulipa* without all doubt; yet because it differeth very notably, and carrieth more beauty and respect in his flower then they, I shall entreate thereof in a Chapter by it selfe, and set it next vnto them.

*Dens Caninus flore albo.* Dogs tooth Violet with a white flower.

The white Dogs tooth hath for his roote a white bulbe, long and small, yet vsually greater then either of the other that follow, bigger belowe then aboue, with a small pece adioyning to the bottome of it, from whence rise vp in the beginning of the Spring, after the Winter frosts are past, two leaues for the most part (when it will flower, or else but one, and never three together that I saw) clost together when they first come vp out of the ground, which inclose the flower betweene them: the leaues when they are opened do lay themselves flat on the ground, or not much aboue it, one opposite vnto the other, with the stalke and the flower on it standing betweene them, which leaues are of a whitish greene colour, long and narrow, yet broader in the middle

middle then at both ends, growing lesse by degrees each way, spotted and striped all ouer the leaues with white lines and spots : the stalk riseth vp halfe a foote high or more, bearing at the toppe one flower and no more, hanging downe the head, larger then any of the other of this kinde that follow, made or consisting of six white long and narrow leaues, turning themselves vp againe, after it hath felt the comfort of the Sunne, that they doe almost touch the stalk againe, very like vnto the flowers of *Cyclamen* or Sowebread : it hath in the middle of the flower six white chives, tipt with darke purple pendent, and a white three forked stile in the middle of them: the flower hath no sent at all, but commendable onely for the beauty and forme thereof: after the flower is past, commeth in the place a round head seeming three square, containing therein small and yellowish seede.

*Dens Caninum flore purpureo*. Dogs tooth with a pale purple flower.

This other Dogs tooth is like vnto the former, but lesser in all parts, the leafe whereof is not so long, but broad and short, spotted with darker lines and spots: the flower is like the other, but smaller, and of a delayed purple colour, very pale sometimes, and sometimes a little deeper, turning it selfe as the other, with a circle round about the vmbone or middle, the chives hereof are not white, but declining to purple: the roote is white, and like vnto the former, but lesser, as is said before.

*Dens Caninum flore rubro*. Dogs tooth with a red flower.

This is in all things like vnto the last, both for forme and bignesse of flower and leafe: the chiefe difference consisteth in this, that the leaues hereof are of a yellowish mealy greene colour, spotted and streaked with redder spots and stripes, and the flower of a deeper reddish purple colour, and the chives also more purplish then the last, in all other things it is alike.

#### The Place.

The sorts of *Dens Caninum* doe growe in diuers places; some in Italy on the Euganean Hills, others on the Apennine, and some about Gratz, the chiefe Citie of Stiria, and also about Bayonac, and in other places.

#### The Time.

They flower in March most vsually, and many times in Aprill, according to the seasonablenesse of the yeare.

#### The Names.

Clusius did call it first *Densali*, and *Lobel*, and from him some others *Syrianum*, and *Erythronium*, but I haue said enough hereof in the beginning of the Chapter. It is most commonly called *Dens Caninum*, and we in English, either Dogs tooth, or Dogs tooth Violet. Gesner called it *Hermodecylis*, and Matthiolus *Pseudodermatostylis*.

#### The Vertues.

The roote hereof is held to bee of more efficacy for venereous effects, then any of the Orchides and Satyrions.

They of Stiria vse the rootes for the falling sicknesse.

We haue had from Virginia a roote sent vnto vs, that wee might well ludge, by the forme and colour thereof being dry, to be either the roote of this, or of an Orchis, which the naturall people hold not onely to be singular to procure lust, but hold it as a secret, loth to reueale it.

#### C H A P. XXIIII.

##### *Cyclamen*. Sowebread.

**T**He likenesse of the flowers, and the spotting of the leaues of the *Dens Caninum*, with these of the *Cyclamen* or Sowebread, maketh mee ioyne it next thereunto: as also that after the bulbous rooted plants I might begin with the tuberos that remaine, and make this plant the beginning of them. Of this kinde there are diuers sorts, differing both in forme of leaues and time of flowring: for some doe flower in the Spring of the yeare, others afterwards in the beginning of Summer: but the most number in the end of Summer, or beginning of Autumne or Haruest, whereof some haue round leaues, others cornered like vnto Iuie, longer or shorter, greater or smaller. Of them all in order, and first of those that come in the Spring.

##### 1. *Cyclamen Vernal flore purpureo*. Purple flowred Sowebread of the Spring.

This Sowebread hath a smaller roote then most of the others, yet round and blac-kish on the outside, as all or most of the rest are (I speake of them that I haue seene; for Clusius and others doe report to haue had very great ones) from whence rise vp diuers round, yet pointed leaues, and somewhat cornered withall, greene aboue, and spotted with white spots circlywise about the leafe, and reddish vnderneath, which at their first comming vp are folded together; among which come the flowers, of a reddish purple colour and very sweete, every one vpon a small, long, and slender reddish foot-stalke, which hanging downe their heads, turne vp their leaues againe: after the flowers are past, the head or seede vessell shrinketh downe, winding his footestalke, and coylling it selfe like a cable, which when it toucheth the ground, there abideth hid among the leaues, till it be growne great and ripe, wherein are contained a few small round seedes, which being presently sowne, will growe first into round rootes, and afterwards from them shoothe forth leaues.

##### 2. *Cyclamen Vernal flore albo*. White flowred Sowebread of the Spring.

The white flowring Sowebread hath his leaues like the former, but not fully so much cornered, bearing small snow white flowers, as sweete as the other: and herein consisteth the chiefest difference, in all other things it is alike.

##### 3. *Cyclamen Vernalum Creticum flore albo*. White Candy Sowebread of the Spring.

This Sowebread is somewhat like the former white kinde, but that the leaues grow much larger and longer, with more corners at the edges, and more eminent spots on them: the flowers also somewhat longer and larger, and herein consisteth the whole difference.

##### 4. *Cyclamen Estivum*. Summer Sowebread.

Summer Sowebread hath round leaues like vnto the Romane Sowebread, but somewhat cornered, yet with shorter corners then the Iuie leaved Sowebread, full of white spots on the vpper side of the leaues, and very purple vnderneath, sometimes they haue fewer spots, and little or no purple vnderneath: the flowers hereof are as small, as purple, and as sweete, as the purple Sowebread of the Spring time: the roote hereof is likewise small, blacke, and round.

##### 5. *Cyclamen Romanum rotundifolium*. Romane Sowebread with round leaues.

The Romane Sowebread hath round leaues, somewhat like vnto the common Sowebread, but not fully so round pointed at the ends, a little cornered sometimes also, or as it were indented, with white spots round about the middle of the leaues, and

and very conspicuous, which make it seeme the more beautifull : the flowers appearre in Autumne, and are shorter, and of a deeper purplish red colour then the Iuie Sowebread, rising vp before the leaues for the most part, or at least with them, and little or nothing sweete : the roote is round and blacke, vsually not so flat as it, but growing sometimes to bee greater then any other kinde of Sowebread. There is sometimes some variety to be seene, both in the leaues and flowers of this kinde ; for that sometime the leaues haue more corners, and either more or lesse spotted with white: the flowers likewise of some are larger or lesser, longer or rounder, paler or deeper coloured one then another. This happeneth most likely from the sowing of the seede, causing the like variety as is seene in the Iuie leaved Sowebread. It doth also many times happen from the diuersity of soyles and countries where they grow : the seed of this, as of all the rest, is small and round, contained in such like heads as the former, standing almost like the head of a Snake that is twined or folded within the body thereof. This and the other Autumnall kindes, presently after their sowing in Autumne, shooe forth leaues, and so abide all the Winter, according to their kinde.

*6. Cyclamen folio hederae autumnale.* Iuie leaved Sowebread.

The Iuie leaved Sowebread groweth in the same manner that the former doth, that is, bringeth forth flowers with the leaues sometimes, or most commonly before them, whose flowers are greater then the common round leaved Sowebread, somewhat longer then the former Romane or Italian Sowebreads, and of a paler purple colour, almost blush, without that sweete sent as is in the first kinde of the Spring : the greene leaues hereof are more long then round, pointed at the ends, and hauing also one or two corners on each side, sometimes much spotted on the vpper side with white spots and marks, and sometimes but a little or not at all ; and so likewise sometimes more or lesse purple vnderneath : all the leaues and flowers doe stand vsually euery one severally by themselues, vpon their owne slender foote-stalkes, as most of all the other kindes doe: but sometimes it happeneth, that both leaues and flowers are found growing from one and the same stalk, which I rather take to be accidental, then natural so to continue : the seede hereof is like the former kindes, which being sowne produceth variety, both in the forme of the leaues, and colour and smell of the flowers: some being paler or deeper, and some more or lesse sweete then others : the leaues also, some more or lesse cornered then others: the root groweth to be great, being round and flat, and of a blackish browne colour on the outside.

*7. Cyclamen autumnale hederaefolio flore albo.*  
Iuie leaved Sowebread with white flowers.

There is one of this kinde, whose leaues are rounder, and not so much cornered as the former, flowing in Autumne as the last doth, and whose flowers are wholly white, not hauing any other notable difference therein.

*8. Cyclamen autumnale angustifolium.* Long leaved Sowebread.

This kinde of Sowebread may easily be knowne from all the other kindes, because his leafe is longer and narrower then others, fashioned at the bottome thereof with points, somewhat like vnto *Arum* or Wake Robin leaues : the flowers are like the former sorts for forme, but of a purple colour. There is also another of this kinde in all things like the former, but that the flowers are white.

*9. Cyclamen Antiochenum Autumnae flore purpureo duplo.*  
Double flowered Sowebread of Antioch.

This Sowebread of Antioch with double flowers, hath his leaues somewhat round, like vnto the leaues of the Summer Sowbread, but with lesse notches or corners, & full of white spots on them: it beareth flowers on stalks, like vnto others, & likewise some stalks that haue two or three flowers on them, which are very large, with ten or twelve leaues

<sup>1</sup> *Cyclamen Verroneum flore purpureo.* Purple flowered Sowebread of the Spring. <sup>2</sup> *Cyclamen autumnale.* Summer Sowebread. <sup>3</sup> *Foliolum Cyclaminis Creticis var. Hederaefolium.* A leafe of Candie Sowebread. <sup>4</sup> *Cyclamen Romanum Autumnae.* Romane Sowebread of the Autumne. <sup>5</sup> *Cyclamen hederaefolium.* Iuie leaved Autumnal Sowebread. <sup>6</sup> *Foliolum Cyclaminis Autumnae flore albo.* A leafe of the white flowered Sowebread. <sup>7</sup> *Foliolum Cyclaminis angustifolium Autumnae.* A leafe of the long leaved Sowebread. <sup>8</sup> *Cyclamen Antiochenum Autumnae, flore amplio purpureo duplo.* The double flowered Sowebread of Antioch. <sup>9</sup> *Cyclamen vulgaris foliis rotundatis.* The common round leaved Sowebread.

leaves a peece, of a faire Peach colour, like vnto the flowers of purple Sowebread of the Spring, and deeper at the bottome.

There are of this kinde some, whose flowers appeare in the Spring, and are as large and double as the former, but of a pure white colour.

There are of these Sowebreads of Antioch, that haue but singlie flowers, some appearing in the Spring, and others in Autumnne.

#### 10. *Cyclamen vulgare folio rotundo*. The common Sowebread.

The common Sowebread (which is most vsed in the Apothecaries Shops) hath many leaves spread vpon the ground, rising from certaine small long heads, that are on the greater round rootes, as vsually most of the former sorts doe, being in the like manner folded together, and after spread themselues into round greene leaves, somewhat like vnto the leaves of *Ajrum*, but not shining, without any white spots on the upperrsides for the most part, or but very seldome, and reddish or purplish vnderneath, and very seldome greener: the flowers stand vpon small foot stalkes, and shew themselves open for the most part, before any leaves doe appeare, being smaller and shorter then those with Iuie leaves, and of a pale purple colour, yet sometimes deeper, hanging downe their heads, and turning vp their leaves againe, as all others doe, but more sweete then many other of the Autumnne flowers: after the flowers are past, come the heads turning or winding themselves downe in like manner as the other do, haing such like seede, but somewhat larger, and more vncuen, or not so round at the least: the roote is round, and not flat, of a browner colour, and not so blacke on the outside as many of the others.

#### The Place.

The Sowebreads of the Spring doe both grow on the Pyrenæan Mountains in Italy, and in Candy, and about Mompelier in France; Antioch in Syria also hath yeelded some both of the Spring and Autumnne. Those with round and Iuie leaves grow in diuers places both of France and Italy: and the common in Germany, and the Lowe-Countries. But that Autumnne Sowebread with white flowers, is reported to grow in the Kingdome of Naples. I haue very curiously enquired of many, if euer they found them in any parts of England, neare or farther off from the places where they dwell: but they haue all affirmed, that they never found, or euer heard of any that haue found of any of them. This only they haue assured, that there growth none in the places, where some haue reported them to grow.

#### The Time.

Those of the Spring doe flower about the end of Aprill, or beginning of May. The other of the Summer, about the end of June or in July. The rest some in August, and September, others in October.

#### The Names.

The Common Sowebread is called by most Writers in Latine, *Panis Porinus*, and by that name it is knowne in the Apothecaries shops, as also by the name *Archanita*, according to which name, they haue an ointment so called, which is to be made with the iuice hereof. It is also called by diuers other names, not pertinent for this discourse. The most vsuall name, whereby it is knowne to most Herbarists, is *Cyclamen* (which is the Greek word) or as some call it *Cyclamisus*, adding thereto their other seuerall titles. In English, Sowebread.

#### The Vertues.

The leaves and rootes are very effectuall for the spleene, as the Ointment before remembred plainly proueth, being vsed for the same purpose, and

and that to good effect. It is vsed also for women in long and hard trauels, where there is danger, to accelerate the birth, either the roote or the leafe being applyed. But for any amorous effects, I hold it meere fabulos.

#### CHAP. XXV.

##### *Anemone*. Windeflower and his kindes.

The next tuberous rooted plants that are to follow (of right in my opinion) are the *Anemones* or Windeflowers, and although some tuberous rooted plants, that is, the Asphodils, Spiderworts, and Flowerdeluces haue beene before inserted, it was, both because they were in name or forme of flowers suitable to them whom they were ioyned vnto, and also that they should not be seuered and entreated of in two seuerall places: the rest are now to follow, at the least so many of them as be beautifull flowers, fit to furnish a Florists Garden, for natures delight some varieties and excellencies. To distinguish the Family of *Anemones* I may, that is, into the wilde kindes, and into the tame or manured, as they are called, and both of them nourised vp in Gardens; and of them into those that haue broader leaves, and into those that haue thinner or more iagged leaves: and of each of them, into those that beare singlie flowers, and those that beare double flowers. But to describe the infinite (as I may so say) variety of the colours of the flowers, and to giue to each his true distinction and denomination, *Hic labor, hoc opus est*, it farre passeth my ability I confesse, and I thinke would grauell the best experienced this day in Europe (and the like I said concerning Tulips, it being as contingent to this plant, as is before said of the *Tulipa*, to be without end in yeielding varieties:) for who can see all the varieties that haue sprung from the sowing of the seede in all places, seeing the variety of colours risen from thence, is according to the variety of ayres & grounds wherein they are sowne, skill also helping nature in ordering them aright. For the seede of one and the same plant sowne in diuersayres and grounds, doe produce that variety of colours that is much differing one from another; who then can display all the mixtures of colours in them, to set them downe in so small a roome as this Book? Yet as I haue done (in the former part of this Treatise) my good will, to expresse as many of each kinde haue come to my knowledge, so if I endeavour the like in this, I hope the courteous wil accept it, and hold me excused for the rest: otherwise, if I were or could be absolute, I should take from my self and others the hope of future augmentation, or addition of any new, which never will be wanting. To begin therefore with the wilde kinds (as they are so accounted) I shall first entreate of the *Pulsatilla* or Pasque flowers, which are certainly kindes of wilde *Anemones*, both in leafe and flower, as may well be discerned by them that are iudicious (although some learned men haue not so thought, as appeareth by their writings) the rootes of them making one speciaall note of difference, from the other sorts of wilde *Anemones*.

##### 1. *Pulsatilla Anglica purpurea*. The purple Pasque flower.

The Pasque or Passe flower which is of our owne Country, hath many leaves lying on the ground, somewhat rough or hairie, hard in feeling, and finely cut into many small leaves, of a darke greene colour, almost like the leaves of Carrets, but finer and smaller, from among which rise vp naked stalkes, rough or hairie also, set about the middle thereof with some small diuided leaves compassing them, and rising aboue these leaves about a spanne, bearing every one of them one pendulous flower, made of six leaves, of a fine Violet purple colour, but somewhat deepe withall, in the middle whereof stand many yellow thredds, set about a middle purple pointell: after the flower is past, there commeth vp in the stead thereof a bushie head of long seedes, which are small and hoarie, haing at the end of euery one a small haire, which is gray likewise: the roote is small and long, growing downewards into the ground, with a tuft of haire at the head thereof, and not lying or running vnder the upper crust thereof, as the other wilde *Anemones* doe.

2. *Pulsatilla Danica*. The Passe flower of Denmarke.

There is another that was brought out of Denmarke, very like vnto the former, but that it is larger boch in roote and leafe, and flower also, which is of a fairer purple colour, not so deepe, and besides, will better abide to bee manured then our English kinde will, as my selfe haue often proued.

*Pulsatilla flore albo et flore duplice.*  
Of both these sortes it is said, that some plants haue bin found, that haue borne white flowers. And likewise one that bore double flowers, that is, with two rowes of leaues,

3. *Pulsatilla flore rubro*. The red Passe flower.

Lobel, as I take it, did first set forth this kinde, being brought him from Syria, the leaues whereof are finer cut, the flower smaller, and with longer leaues, and of a red colour.

4. *Pulsatilla florulauteo*. The yellow Passe flower.

The yellow Passe flower hath his leaues cut and diuided, very like vnto the leaues of the first kinde, but somewhat more hairie, greene on the vpperfide, and hairie vnderneath: the stalke is round and hoary, the middle whereof is beset with some small leaues, as in the other, from among which riseth vp the stalke of the flower, consisting of six leaues of a very faire yellow colour on the inside, and of a hoary pale yellow on the outside; after which followeth such an head of hairie thrummes as in the former: the roote is of the bignesse of a mans finger.

5. *Pulsatilla flore albo*. The white Passe flower.

The white Passe flower (which Clusius maketh a kinde of *Anemone*, and yet as hee saith himselfe, doth more nearely resemble the *Pulsatilla*) hath, from amongst a tuft or head of haires, which grow at the toppe of a long blacke roote, many leaues standing vpon long stalkes, which are diuided as it were into three wings or parts, and each part finely cut and diuided, like vnto the Passe flower of Denmarke, but somewhat harder in handling, greenish on the vpperfide, and somewhat gray vnderneath, and very hairie all ouer: among these leaues rise vp the stalkes, beset at the middle of them with three leaues, as finely cut and diuided as those belowe, from above which standeth the flower, being smaller, and not so pendulous as the former, but in the like manner consisting of six leaues, of a snow white colour on the inside, and a little browner on the outside, with many yellow thrummes in the middle: after the flower is past, riseth vp such a like hoary head, composed as it were of many haires, each whereof hath a small seede fastened vnto it, like as the former Passe flowers haue.

## The Place.

The first is found in many places of England, vpon dry bankes that lye open to the Sunne.

The second was first brought, as I take it, by Doctor Lobel from Denmarke, & is one of the two kinds, that Clusius saith are common in Germanie, this bearing a paler purple flower, and more early then the other, which is the same with our English, whose flower is so darke, that it almost seemeth blacke.

The red kinde, as Lobel saith, came from Syria.

The yellow Passe flower, which Clusius maketh his third wilde *Anemone*, was found very plentifully growing at the foote of St. Bernards Hill, neare vnto the Cantons of the Switzers.

The white one groweth on the Alpes neare Austria, in France likewise, and other places.

The

1. *Pulsatilla persicae foliis finitis, & radice*. The purple Passe flower with leafe, seed, and root. 2. *Pulsatilla tenuifolia*. The yellow Passe flower. 3. *Pulsatilla tenuifolia*. Red Passe flower of Lobel. 4. *Pulsatilla rubra Swertz*. His red Passe flower. 5. *Pulsatilla florulauteo*. White Passe flower. 6. *Anemone fluitans Marthiol*. The wilde white be ad leafe Windflower. 7. *Anemone fluitans tenuifolia alba*. The wilde single white Windflower. 8. *Anemone fluitans tenuifolia tenuifolia*. The yellow wilde thin leafe Windflower. 9. *Anemone fluitans trifolia Dodonei*. The three-leaved wilde Windflower. 10. *Anemone fluitans flore pleno alba*. The double white wilde Windflower. 11. *Anemone fluitans flore pleno purpureo*. The double purple wilde Windflower. \* *Sennaria oreganioides divaricata*. The seed separated. † *Radicem filio inferiore*. The roote with a lower leafe.

## The Time.

All of them doe flower early in the yeare, that is, in the beginning of Aprill, about which time most commonly Easter doth fall.

## The Names.

Their proper names are giuen to each in their senerall titles, being all of them kindes of wilde *Anemones*, as I said in the beginning of the Chapter, and so for the most part all Authors doe acknowledge them. We call them in English, because they flower about Easter, Pasque Flower, which is the French name for Easter, or *Euphonia gratia*, Passe Flower, which may passe currant, without any further descant on the name, or else *Pasifilla*, if you will, being growne old by custome.

## The Vertues.

The sharpe biting and exulcerating quality of this plant, causeth it to be of little vise, notwithstanding Ioachimus Camerarius saith in his *Hortus Medicus*, that in Borussia, which is a place in Italy, as I take it, the distilled wafer hereof is vsed with good successe, to be gauen to them that are troubled with a Tertian Ague; for he saith that it is *medicamentum expunctum*, that is, a medicine of force to helpe obstructions.

*Anemone filifera latifolia alba sine tertia Matthiolis.*  
The white wilde broad leaved Windflower.

This Windflower hath diuers broad greene leaues, cut into diuisions, and dented about, very like vnto a broad leaved Crowfoote, among which riseth vp a stalke, hauing some such like cut leaues in the middle thereof, as growe below, but smaller; on the toppe whereof standeth one large white flower, consisting of fve leaues for the most part, with some yellow threads in the middle, standing about such a greene head as is in the tame or garden *Anemones*, which growing greater after the flower is past, is composed of many small seedes, wrapped in white wooll, which as soone as they are ripe, raise themselues vp from the bottome of the head, and fye away with the wind, as the other tame or garden kindes doe: the roote is made of a number of long blacke strings, encreasing very much by running vnderground, and shooting vp in diuers places.

*Anemone filifera tenuifolia lutea.* The yellow wilde thin leaved Windflower.

The yellow wilde *Anemone* riseth vp with one or two small round naked stalkes, bearing abou the middle of them, small, soft, and tender iagged leaues, deeply cut in and indented on the edges about, from aboue which doth grow the stalke, bearing small yellow flowers, standing vpon weake foote-stalkes, like vnto a small Crowfoot, with some threads in the middle: the roote is long and small, somewhat like vnto the roote of Pollipodie, creeping vnder the upper crust of the earth: this kinde is lower, and springeth somewhat earlier then the other wilde kindes that follow.

*Anemone filifera tenuifolia alba simplex.*  
The single white thin leaved wilde Windflower.

This white wilde *Anemone* riseth vp with diuers leaues vpon seuerall long stalkes, which are somewhat like vnto the former, but that they are somewhat harder, and not so long, nor the diuisions of the leaues so finely snipt about the edges, but a little broader, and deeper cut in on every side: the flowers hereof are larger and broader then the former, white on the inside, and a little purplish on the outside, especially at

the bottome of the flower next vnto the stalke: the roote of this is very like vnto the last.

There is another of this kinde, whose flowers are purple, in all other things it is like *Purpurea* vnto the white.

And likewise another, with a blush or carnation coloured flower.

There is one that is onely nurfed vp with vs in Gardens, that is somewhat like vnto these former wilde *Anemones* in roote and leafe, but that the flower of this, being pure white within, and a little purplish without, consisting of eight or nine small round pointed leaues, hath sometimes sonie leaues vader the flower, partly coloured white and greene: the flower hath likewise a greene head, like a Strawberry, compassed about with white threads, tipt with yellow pendent.

And another of the same kinde with the last, whose flower consisting of eight or nine leaues, is of a greenish colour, except the fourre outermost leaues, which are a little purplish, and diuided at the points into three parts; the middle part is of a greenish white colour, with a greene head in the middle as the other.

*Anemone filifera trifolia Dodonaei.* The three leafed wilde Windflower.

This wilde *Anemone* hath his rootes very like vnto the former kindes, the leaues are alwaies three set together at the toppe of slender stalkes, being small and indented about, very like vnto a three leafed Grasse, but smaller: the flower consisteth of eight small leaues, somewhat like vnto a Crowfoote, but of a whitish purple or blush colour, with some white threads, and a greene rough head in the middle.

*Anemone filifera flore pleno albo.* The double white wilde Windflower.

This double kinde is very like vnto the single white kinde before described, both in his long running rootes, and thin leaues, but somewhat larger: the flowers hereof are very thicke and double, although they be small, and of a faint sweete sent, very white after it is full blowne for fve or six dayes, but afterwards it becommeth a little purplish on the inside, but more on the outside: this never giueth seede (although it haue a small head in the middle) like as many other double flowers doe.

*Anemone filifera flore pleno purpurea.* The double purple wilde Windflower.

This double purple kinde hath such like iagged leaues as the last described hath, but more hoarie vnderneath: the flower is of a fine light purple toward the points of the leaues, the bottomes being of a deeper purple, but as thicke, and full of leaues as the former, with a greene head in the middle, like vnto the former: this kinde hath small greene leaues on the stalkes vnder the flowers, cut and diuided like the lower leaues.

## The Place.

The first broad leaved *Anemone* groweth in diuers places of Austria and Hungary. The yellow in diuers woods in Germany, but not in this Countrey that euer I could learne. The other single wilde kindes, some of them are very frequent throughout the most places of England, in Woods, Groues, and Orchards. The double kindes were found, as Clusius saith, in the Lowe-Countries, in a Wood neare Louaine.

## The Time.

They flower from the end of March (that is the earliest) and the beginning of Aprill, vntill May, and the double kindes begin within a while after the single kinds are past.

## The Names.

They are called *Ranunculus filiformis*, and *Ranunculus nemorum*, and as Clusius

sus would haue them, *Leimonia* of *Theophrastus*; they are generally called of most Herbarists *Anemones silvestres*, Wilde *Anemones* or Windflowers. The Italians call them *Gengeno salnatico*, that is, Wilde Ginger, because the rootes are, besides the forme, being somewhat like small Ginger, of a biting hot and sharpe taste.

*Anemone Lusitanica* sive *hortensis latifolia* flore simplici luteo.  
The single Garden yellow Windflower or Anemone.

This single yellow Anemone or Windflower hath diuers broad round leaues, somewhat diuided and entended withall on the edges, brownish at the first rising vp out of the ground, and almost folded together, and after of a sad greene on the vpper side, and reddish vnderneath; among which rise vp small slender stalkes, beset at the middle of them with two or three leaues, more cut and diuided then those belowe, with small yellow flowers at the toppe of them, consisting of ten or twelue leaues a piece, hauing a few yellow threads in the middle of them, standing about a small greene head, which in time growing ripe hath small flat seede, inclosed within a soft wooll or downe, which is easily blowne away with the winde: the roote groweth downward into the ground, diuersly spread with branches here and there, of a brownish yellow on the outside, and whitish within, so brittle, that it can hardly bee touched without breaking.

*Anemone latifolia* flore luceo duplo. The double yellow Anemone or Windflower.

This double yellow Anemone hath such broad round leaues as the single kinde hath, but somewhat larger or ranker: the stalkes are beset with larger leaues, more deeply cut in on the edges: the flowers are of a more pale yellow, with some purplish veines on the outside, and a little round pointed; but they are all on the inside of a faire yellow colour, consisting of two rowes of leaues, whereof the innermost is the narrower, with a small greene head in the middle, compassed with yellow threads as in the former: the roote is like the roote of the single; neither of these haue any good sent, and this springeth vp and flowreth later then the single kinde.

*Anemone latifolia purpurea* sibyllata sive papaveracea.  
The purple Starre Anemone or Windflower.

The first leaues of this purple Anemone, which alwayes spring vp before Winter, (if the roote be not kept too long out of the ground,) are somewhat like the leaues of *Sanicle* or *Selfe-heale*, but the rest that follow are more deeply cut in and jagged; among which rise vp diuers round stalkes, beset with jagged leaues as all other Anemones are, aboue which leaues, the stalkes rising two or three inches high, beare one flower a piece, composed of twelue leaues or more, narrow and pointed, of a bleake purple or whitish ash-colour, somewhat shining on the outside, and of a fine purple colour tending to a murrey on the inside, with many blackish blew threads or thrummes in the middle of the flower, set about a head, whereon groweth the seede, which is small and blacke, inclosed in soft wooll or downe, which flieth away with the winde, carrying the seede with it, if it be not carefully gathered: the roote is blackish on the outside, and white within, tuberous or knobby, with many fibres growing at it.

*Anemone purpurea Stellata altera*. Another purple Starre Anemone.

There is so great diuersity in the colours of the flowers of these broad leaved kinds of Anemones or Windflowers, that they can very hardly be expressed, although in their leaues there is but little or no difference. I shall not neede therefore to make severall descriptions of every one that shall be set downe; but it will be sufficient, I thinke, to give you the distinctions of the flowers: for as I said, therein is the greatest and chiefeſt difference. This other Starre Anemone differeth not from the former in leafe or flower, but onely that this is of a more pale fullen colour on the outside, and of a paler purple colour on the inside.

There  
2. *Anemone latifolia* flore luceo simplici. The single yellow Anemone. 3. *Anemone latifolia* flore luceo Stellata. The purple Starre Anemone. 4. *Anemone latifolia* purpurea duplo. The double yellow Anemone. 5. *Anemone latifolia* flore minato dilute. The pale red Anemone. 6. *Anemone latifolia* vescica Cardinallis. The Cardinall Anemone. 7. *Anemone latifolia* incarnata Hispanica. The Spanish incarnate Anemone. 8. *Anemone latifolia* Pomo simplex duplo. The lesser Orange tawney Anemone. 9. *Anemone Superba* sive *Cypria*. The carnation Anemone. 10. *Anemone latifolia* Arantia sive *Fauo maior*. The double Orange tawney Anemone. 11. *Anemone Chrysanthemum*. The double Anemone of Cyprus. 12. *Anemone latifolia* flore pleno albicans. The double pale blissh Anemone. 13. *Anemone Chrysanthemum maxima*. The great Spanish Marigold Anemone. 14. *Anemone Caucasica* sive *Persica*. The double Persian Anemone. 15. *Anemone latifolia* radix. The roots of a great Anemone.

*Viola purpurea*

There is another, whose flower hath eight leaues, as many of them that follow haue (although diuers sorts haue but six leaues in a flower) and is of a Violet purple, and therefore is called, The Violet purple Anemone.

*Varietas.*

Of all these three sorts last described, there be other that differ only in ha-  
ving white bottomes, some smaller and some larger.

*Purpurea striata*

There is also another of the same Violet purple colour with the former, but a little paler, tending more to rednesse, whose flowers haue many white lines and stripes through the leaues, and is called, The purple stript Anemone.

*Cornuta vivipara*

There is another, whose greene leaues are somewhat larger, and so is the flower likewise, consisting of eight leaues, and sometimes of more, of the colour of Carnation silke, sometimes pale and sometimes deeper, with a whitish circle about the bottome of the leaues, which circle in some is larger, and more to be seenne then in others, when the flower layeth it selfe open with the heate of the Sunne, haing blewish threads in the middle. This may be called, the Carnation Anemone.

*Perficiolacea.*

We haue another, whose flower is betweene a Peach colour and a Vio-  
let, which is vsually called a Gredeline colour.

*Cochenille.*

And another of a fine reddish Violet or purple, which we call, The Co-  
chenille Anemone.

*Cardinalis.*

And another of a rich crimson red colour, and may be called, The Car-  
dinall Anemone.

*Sanguinea.*

Another of a deeper, but not so liuely a red, called, The bloud red Ane-  
mone.

*Crame fina.*

Another of an ordinary crimson colour, called, The crimson Anemone.

*Coccinea.*

Another of a Stamell colour, neere vnto a Scarlet.

*Incarnata.*

Another of a fine delayed red or flesh colour, and may bee called, The Incarnadine Anemone.

*Incarnata Hispanica.*

Another whose flower is of a liuely flesh colour, shadowed with yellow,  
and may be called, The Spanish Incarnate Anemone.

*Rubescens.*

Another of a faire whitish red, which we call, The Blush Anemone.

*Atroschutella.*

Another whose flower consisteth of eight leaues, of a darke whitish col-  
our, stript all ouer with veines of a fine blushe colour, the bottomes being  
white, this may be called, The Nutmegge Anemone.

*Enfumata.*

Another whose flower is of a pale whitish colour, tending to a gray, such  
as the Monkes and Friers were wont to weare with vs, and is called, A Monkes gray.

*Pano major*

There is another, whose leafe is somewhat broader then many or most  
of the Anemones, comming neare vnto the leafe of the great double O-

*simpliciflora.*

range coloured Anemone; the flower whereof is single, consisting of eight large or broad leaues, very neare vnto the same Orange colour, that is in  
the double flower hereafter described, but somewhat deeper. This is vsu-  
ally called in Latine, *Pano major simpliciflora*, and we in English, The great  
single Orange tawny Anemone.

*Pano minor.*

There is likewise of this kinde another, whose flower is lesser, and called,  
The lesser Orange tawny Anemone.

*Varietas magna ex seminaria.*

There is besides these expressed, so great a variety of mixt colours in the  
flowers of this kinde of Anemone with broad leaues, arising every yeare  
from the sowing of the seede of some of the choicest and fittest for that  
purpose, that it is wonderfull to obserue, not onely the variety of single  
colours, but the mixture of two or three colours in one flower, besides the  
diuersity of the bottomes of the flowers, some haing white or yellowish  
bottomes, and some none, and yet both of the same colour; and likewise  
in the thrums or threads in the middle: But the greatest wonder of beauty  
is in variety of double flowers, that arise from among the other single ones,  
some haing two or three rows of leaues in the flowers, and some so thicke  
of leaues as a double Marigold, or double Crowfoote, and of the same  
seuerall colours that are in the single flowers, that it is almost impossi-  
ble to expresse them seuerally, and (as is said before) some falling out to  
bee double in one yeare, which will proue single or lesse double in an-  
other,

other, yet very many abiding constant double as at the first; and therefore  
let this briefe recitall be sufficient in stead of a particular of all the colours.

*Anemone Chalcedonica maxima var. scicolor.*

The great double Windflower of Constantinople.

This great Anemone of Constantinople hath broader and greener leaues then any  
of the former kindes, and not so much diuided or cut in at the edges, among which  
rise vp one or two stalkes, (seldome more from one roote) haing some leaues about  
the middle of the stalke, as other Anemones haue, and bearing at the toppe of the  
stalkes one large flower a peece, very double, whose outermost leaues being broadest,  
are greenish at the first, but after wards red, haing sometimes some greene abiding still  
in the leaues, and the red striped through it: the other leaues which are within these  
are smaller, and of a perfect red colour; the innermost being smallest, are of the same  
red colour, but turned somewhat inward, haing no thrummie or threads in the mid-  
dle, as the former haue, and bearing no seede: the roote is blackish on the outside, and  
white within, thicke and tuberos as the other kindes, but thicker set and close toge-  
ther, not shooting any long slender rootes as others doe. Some Gentlewomen call this  
Anemone, The Spanish Marigold.

*Anemone Chalcedonica altera sive Pano maior florè duplicit.*

The great double Orange tawney Anemone.

This other great Anemone of Constantinople hath his large leaues so like vnto  
the last, that one can hardly distinguishe them asunder; the stalke hath also such like  
leaues set vpon it, bearing at the toppe a faire large flower, consisting of many leaues  
set in two or three rowes at the most, but not so thicke or double as the last, yet seeming  
to be but one thicke rowe of many small and long leaues, of an excellent red or crim-  
son colour, wherein some yellow is mixed, which maketh that colour is called an O-  
range tawney; the bottomes of the leaues are red, compasseid with a whitish circle,  
the thrummie-head in the middle being beset with many darke blackish threads: the  
roote is like the former.

*Anemone Saperitica sive Cypriensis. The double Anemone of Cyprus.*

This Anemone (which the Dutchmen call Superitz, and as I haue bee ne informed;  
came from the Isle of Cyprus) hath leaues very like the last double Anemone, but not  
altogether so large: the flower consisteth of smaller leaues, of colour very neare vnto  
the last double Orange coloured Anemone, but more thicke of leaues, and as double  
as the first, although not so great a flower, without any head in the middle, or thrums  
about it as is in the last, and differeth not in the roote from either of them bothe.

Somewhat like vnto this kinde, or as it were betweene this and the fift kinde of  
these great double Anemones, we haue diuers other sorts, bearing flowers very thicke  
and double; some of them being white, or whitish, or purple, or per or paler, and some  
of a reddish colour tending to Scarlet or a Carnation colour, and some also of a blushe  
or flesh colour, and diuers other colours, and all of them continue constant in their  
colours.

*Anemone Cacumen Alaringi sive Persica. The double Persian Anemone.*

This rare Anemone, which is said to come out of Persia to Constantinople; and  
from thence to ys, is in leaue and roote very like vnto the former double Anemones  
before described; onely the flower hereof is rather like vnto the second great double  
Orange coloured Anemone, vsually called *Pano major florè plena*, being composed of  
three rowes of leaues, the outermost rowe consisting of tow or twelve larger leaues,  
and those more inward lesser and more in number, but all of them variably mixed  
with white, red, and yellow, haing the bottomes of the leaues white but instead of  
a middle head with thrums about it, as the other hath, this hath a few narrow leaues,  
of a deepe yellow colour in the middle of the flower, standing upright.

## The Garden of pleasant Flowers.

Having thus farre proceeded in the two parts of the kindes of Anemones or Windflowers, it remaineth to entreate of the rest, which is those Anemones which haue thin cut leaues, whereof some haue reckoned vp thirty sorts with single flowers, which I confesse I haue not seene; but so many as haue come to my knowledge, I shall here set downe.

*Anemone tenuifolia* sive *Geranifolia cervina*.

The Water Anemone or Storkes bill leaved Windflower.

This first Windflower with thin cut leaues, riseth not out of the ground vntil the great Winter frost be past, that is, about the middle or end of February, and are somewhat brownish at their first appearing, but afterwards spread into wings of greene leaues, broader than the rest that follow, diuided into three parts, & each part into three leaues, every one cut in about the edges, one standing against another vpon a long slender footie stalk, and the end leafe by it selfe: among these riseth vp two or three greene stalkes, garnished with such like thin leaues as are at the bottome, from aboue which rise the flowers, but one vpon a stalk, consisting of fourteene or fifteene small pale blew or wachet leaues, lesser then any of the single kindes that follow, compassing many whitish threads, and a small greene head in the middle, somewhat like the head of the wilde Crowfoote, wherein is contained such like seede: the roote is blackish without, thrusting out into long tuberous peeces, somewhat like vnto some of the broad leaved Anemones.

Of this kinde there is another, whose leaues are not browne at their first rising, but greene, and the flowers are white, in other things not differing.

*Anemone tenuifolia purpurea vulgaris*.

The ordinary purple Anemone with thin leaues.

This purple Anemone which is most common, and therefore the lesse regarded, hath many winged leaues standing vpon severall stalkes, cut and diuided into diuers leaues, much like vnto the leaues of a Carrot; among which rise vp stalkes with some leaues thereon (as is vnto the whole Family of Anemones, both wilde and tame, as is before said;) at the topes whereof stand the flowers, made of six leaues most vsually, but sometimes they will haue sevene or eight, being very large, and of a perfect purple Viole colour, very faire and liuely: the middle head hath many blackish blew thrums or threads about it, which I could neuer obserue in my Gardens to beare seed: the roote is smaller, and more spreading euery way into small long flat tuberous parts, then any other kindes of single or double Anemones.

*carnea pallida*. There is another very like in leafe and roote vnto the former, but the flower is nothing so large, and is whitish, tending to a blush colour, and of a deeper blush colour toward the bottome of the flower, with blackish blew thrums in the middle, and giueth no seede that I could euer obserue.

*carnea violacea*. There is likewisewise another like vnto the last in leafe and flower, but *angustioribus aliis*, that the flower is larger then it, and is of a liuely blush colour, the leaues hauing white bottomes.

*Alba venusta*. And another, whose flower is white, with purple coloured veines and stripes through euery leafe, and is a lesset flower then the other.

*Anemone tenuifolia coccinea simplex*. The single Scarlet Anemone with thin leaues.

The leaues of this Scarlet Windflower are somewhat like vnto the former, but a little broader, and not so finely cut, and diuided: the flower consisteth of six reasonable large leaues, of an excellent red colour, which we call a Scarlet, the bottomes of the leaues are large and white, and the thrums or threads in the middle of a blackish purple colour: the roote is tuberous, but consisting of thicker peeces, somewhat like vnto the rootes of the broad leaved Anemones, but somewhat browne, and not so blacke, and most like vnto the roote of the double Scarlet Anemone.

*coccinea tenuis*. There is another of this kinde, whose flower is neare vnto the same colour, but this hath no white bottomes at all in his leaues.

We

## The Garden of pleasant Flowers.

*F. 6. - b. roseo-ruco.* We haue another which hath as large a flower as any singule, and is of an Orient deepe red crimson Velvet colour.

*Sanguinea.* There is another of a deeper red colour, and is called, The bloud red single Anemone.

*Rubra fundo luteo.* And another, whose flower is red with the bottomes yellow.

*coccinea dilutior.* Another of a perfect crimson colour, whereto some haue round pointed leaues, and others sharpe pointed, and some a little lighter or deeper then others.

*Alba staminibus purpureis.* There is also one, whose flower is pure white with bleuish purple thrums in the middle.

*carnea tenuis patens.* And another, whose flower is very great, of a kinde of sullen blush colour, but yet pleasant, with bleuish threads in the middle.

*Alba carnearia verna.* And another with blush veines in every leafe of the white flower.

*Alba purpureis angustioris.* And another, the flower whereof is white, the bottomes of the leaues being purple.

*Purpurascens.* Another whose flower consisteth of many small narrow leaues, of a pale purple or blush colour on the outside, and somewhat deeper within.

*Facie florum pomif simplex.* There is another like in leafe and roote vnto the first Scarlet Anemone, but the flower hereof consisteth of seuen large leaues without any bottomes, of a white colour, haing edges, and some large stripes also of a carnation or flesh colour to bee seene in them, marked somewhat like an Apple blossome, and thereupon it is called in Latine, *Anemone tenuifolia simplex alba in Star florum pomif*, or *facie florum pomif*, that is to say in English, The single thin leaved Anemone with Apple blossome flowers.

*Multiplex.* I haue heard that there is one of this kinde with double flowers.

### 1. *Anemone tenuifolia flore coccineo pleno vulgaris.*

The common doubled or Scarlet Anemone.

The leaues of this double Anemone are very like vnto the leaues of the single Scarlet Anemone, but not so thin cut and diuided as that with the purple flower: the flower hereof when it first openeth it selfe, consisteth of fix and sometimes of seuen or eight broad leaues, of a deepe red, or excellent Scarlet colour, the middle head being thick closed, and of a greenish colour, which after the flower hath stood blowne some time, doth gather colour, and openeth it selfe into many small leaues, very thicke, of a more pale red colour, and more Stamell like then the outer leaues: the root of this is thicke and tuberous, very like vnto the root of the single Scarlet Anemone.

### 2. *Anemone tenuifolia flore coccineo pleno variegata.*

The party coloured double Crimson Anemone.

We haue a kinde hereof, varying neither in roote, leafe, or forme of flower from the former, but in the colour, in that this will haue sometimes the outer broad leaues party coloured, with whitish or blush coloured great streakes in the red leaues both inside and outside; as also diuers of the middle or inner leaues striped in the same manner: the roote hereof giueth fairer flowers in some yeares then in others, and sometimes giue flowers all red againe.

### 3. *Anemone tenuifolia flore coccineo saturo pleno.*

The double crimson Velvet Anemone.

We haue another also, whose flower is of a deepe Orange tawny crimson colour, neare vnto the colour of the outer leaues, of the lesser French Marigold, and not differing from the former in any thing else.

### 4. *Anemone tenuifolia flore pleno sauerbante.* The greater double blush Anemone.

There is small difference to be discerned, either in the roote or leaues of this from the

the former double Scarlet Anemone, sauing that the leaues hereof are a little broader, and seeme to bee of a little fresher greene colour: the flower of this is as large almost, and as double as the former, and the inner leaues likewise almost as large as they, being of a whitish or flesh colour at the first opening of them, but afterwards become of a most liuely blush colour; the bottomes of the leaues abiding of a deeper blush, and with long standing, the tops of the leaues will turne almost wholly white againe.

5. *Anemone tenuifolia flore albo pleno.* The double white Anemone.

This double white Anemone differeth little from the former blush Anemone, but in that it is smaller in all the parts thereof, and also that the flower hereof being wholly of a pure white colour, without any shew of blush therein, hath the middle thrummes much smaller and shorter then it, and not rising vp so high, but seeme as if they were chipped off even at the topes.

6. *Anemone tenuifolia flore pleno albicante.* The lesser double blush Anemone.

This small double blush Anemone differeth very little from the double white last recited, but onely in the colour of the flower: for they are both much about the bignesse one of another, the middle thrums likewise being as small and short, and as even aboue, onely the flower at the first opening is almost white, but afterwards the outer leaues haue a more shew of blush in them, and the middle part a little deeper then they.

7. *Anemone tenuifolia flore pleno purpureo violaceo.* The double purple Anemone.

This double purple Anemone is also of the same kindred with the first double red or Scarlet Anemone for the form or doublenesse of the flower, consisting but of six or seven leaues at the most in this our Country, although in the hotter it hath ten or twelve, or more as large leaues for the outer border, and as large small leaues for the inner middle also, and almoſt as double, but of a deepe purple tending toward a Violet colour, the outer leaues being not ſo deepe as the inner: the roote and leafe commeth neare vnto the ſingle purple Anemone before described, but that the roote spreadeth not ſo ſmall and ſo much.

8. *Anemone tenuifolia flore pleno purpureo cerasico.*  
The double blew Anemone.

This Anemone differeth not in any thing from the former double purple, but onely that the flower is paler, and more tending to a blew colour.

9. *Anemone tenuifolia flore pleno roſeo.* The double Rose coloured Anemone.

The double Rose coloured Anemone differeth also in nothing from the former double purple, but onely in the flower, which is ſomewhat ſmaller, and not ſo thickē and double, and that it is of a reddiſh colour, neare vnto the colour of a pale red Rose, or of a deepe coloured Damaske.

10. *Anemone tenuifolia flore pleno carneo viuacissimo.*  
The double Carnation Anemone.

This Anemone, both in roote, leafe, and flower, commeth neareſt vnto the former double white Anemone, for the largenesſe and doublenesſe of the flower, and in the ſmalnesſe of the middle thrums, and euuenenesſe at the topes of them, being not ſo large and great a flower as the double purple, either in the inner or outer leaues, but yet is very faire, thiſe and double, and of a moſt liuely Carnation filke colour, very deepe, both the outer leaues and middle thrums alſo ſo bright, that it doth as it were amaze, and yet delight the minde of the beholder, but by long ſtanding in the Sun, waxe a little paler, and ſo paſſe away as all the moſt beauteuill flowers doe.

II. ANEMONE

1. *Anemone tenuifolia simplex purpurea.* The ſingle purple Anemone with thin cut leaues. 2. *Anemone tenuifolia simplex alba plena.* The ſingle pure white Anemone. 3. *Anemone tenuifolia simplex cermeſina.* The ſingle bright Crimson Anemone. 4. *Anemone tenuifolia simplex scarletina.* The ſingle purplish red Anemone. 5. *Anemone tenuifolia simplex facie florae pomo.* The ſingle Apple bloom Anemone. 6. *Anemone tenuifolia simplex rubra.* The ſingle purplish blush Anemone. 7. *Anemone tenuifolia simplex alba vnguis carmine.* The ſingle white Anemone with bluſh botones. 8. *Anemone tenuifolia flore pleno coccinea.* The double red or ordinary Scarlet Anemone. 9. *Anemone tenuifolia flore pleno rubrofusca carnatica.* The double purple Velvet Anemone. 10. *Anemone tenuifolia flore pleno purpureo violaceo.* The double blewish purple Anemone. 11. *Anemone tenuifolia flore pleno incarnatini coloris carnatica vivacissima.* The double Carnation Anemone, or of a liuely Carnation-like colour.

11. *Anemone tenuifolia flore rubroasco pleno coma Amarantina.*  
The double purple Velvet Anemone.

This double Velvet Anemone is in all things like the last described Carnation Anemone, but somewhat larger, the difference consisteth in the colour of the flower, which is this is of a deep or sad crimson red colour for the outer leaves, and of a deep purple Velvet colour in the middle thrums, resembling the colour of the lesser *Amaranthus purpureus*, or Purple flower gentle hereafter described, whereof it tooke the name, which middle thrums are as fine and small, and as even at the topes as the white or last Carnation Anemones.

12. *Anemone tenuifolia flore pleno tricolor.*  
The double purple Velvet Anemone of three colours.

This double Anemone also is very like the last described Anemone, but that in the middle of the purple thrums, there thrusteth forth a tuft of threads or leaves of a more light crimson colour.

And thus much for the kindes of Anemones or Windflowers, so farre forth as haue hitherto come to our knowledge; yet I doubt not, but that more varieties haue beeene elsewhere collected, and will be also in our Countrey daily and yearly obserued by diuers, that raise them vp from sowing the seede, wherein lyeth a pretty art, not yet familiarly knowne to our Nation, although it be very frequent in the Lowe-Countries, where their industry hath bred and nourished vp such diuersities and varieties, that they haue valued some Anemones at such high rates, as most would wonder at, and none of our Nation would purchase, as I thinke. And I doubt not, if wee would be as curious as they, but that both our ayre and soyle would produce as great variety, as euer hath beene seene in the Lowe-Countries, which to procure, if any of our Nation will take so much paines in sowing the seedes of Anemones, as diuers haue done of Tulipas: I will set them downe the best directions for that purpose that I haue learned, or could by much search and tryall attaine vnto, yet I must let them understand thus much also, that there is not so great variety of double flowers raised from the seede of the thin leafed Anemones, as from the broad leaved ones.

First therefore (as I said before) concerning Tulipas, there is some speciaall choice to be made of such flowers, whose seede is fitteſt to be taken. Of the *Latisfolias*, the double Orange tawney seede being sowne, yeeldeth pretty varieties, but the purples, and reds, or crimsons, either *Latisfolias* or *Tenuifolias*, yeeld small variety, but such as draw nearest to their originall, although some be a little deeper or lighter then others. But the light colours be they which are the chiefe for choice, as white, ash-colour, blush or carnation, light orange, simple or party coloured, single or double, if they beare seede, which must bee carefully gathered, and that not before it bee thorough ripe, which you shall know by the head; for when the seede with the woolliness beginneth to rise a little of it selfe at the lower end, it must bee then quickly gathered, lest the winde carry it all away. After it is thus carefully gathered, it must be laid to dry for a weeke or more, which then being gently rubbed with a little dry land or earth, will cause the seede to be somewhat better separated, although not thoroughly from the woolliness or downe that compasseth it.

Within a moneth at the most after the seede is thus gathered and prepared, it must be sowne; for by that meanes you shall gaine a yeaer in the growing, ouer that you should doe if you sowed it in the next Spring.

If there remaine any woolliness in the seede, pull it in sunder as well as you can, and then sowe your seede reasonable thin, and not too thicke, vpon a plaine smooth bed of fine earth, or rather in pots or tubbes, and after the sowing, sift or gently straw ouer them some fine good fresh mould, about one fingers thicknesse at the most for the first time: And about a moneth after their first springing vp, sift or straw ouer them in like manner another fingers thicknesse of fine earth, and in the meane time if the weather prove dry, you must water them gently and often, but not to ouerglyt them with moisture; and thus doing, you shall haue them spring vp before Winter, and grow

grow pretty strong, able to abide the sharpe Winter in their nonge, in vsing some little care to cover them loofely with some fearene, or furfe, or beane shame, or straw, or any ſuch, which yet muſt not lye cloſe vpon them, nor too farre from them neither.

The next Spring after the ſowing, if you will, but it is better if you stay vntill Auguft, you may then remoue them, and ſet them in order by rowes, with ſufficient diſtance one from another, where they may abide, vntill you ſee what manner of flower each plant will beare, which you may diſpoſe of according to your minde.

Many of them being thus ordered (if your mould be fine, loofe, and fresh, not ſtonie, clayiſh, or from a middin) will beare flowers the ſecond yeaer after the ſowing, and moſt or all of them the third yeaer, if the place where you ſowe them, be not annoyed with the smoake of Brewers, Dyers, or Maultkils, which if it be, then will they neuer thriue well.

Thus much haue I thought good to ſet downe, to incite ſome of our owne Nation to be induſtrious, and to helpe them forward, haue giuen ſuch rules of direccons, that I doubt not, but they will vpon the tryall and view of the variety, proceede as well in the ſowing of Anemones as of Tulipas.

I cannot (Gentlewomen) withhold one other ſecret from you, which is to informe you how you may ſo order Anemones, that after all others ordinarily are paſt, you may haue them in flower for two or three moneths longer then are to be ſene with any other, that vſeth not this course I direct you.

The ordinary time to plant Anemones, is moſt commonly in Auguft, which will beare flower ſome peraduenture before Winter, but moſt viually in February, March, and Aprill, few or none of them abiding vntill May; but if you will keepe ſome roots out of the ground vnpanted, vntill February, March, and Aprill, and plant ſome at one time, and ſome at another, you ſhall haue them beare flower according to their planting, thoſe that ſhall be planted in February, will flower about the middle or end of May, and ſo the reſt accorſingly after that manner: And thus may you haue the pleaſure of theſe plants out of their natuſal ſeasons, which is not permitted to be enjoyed in any other that I know, Nature being not ſo prone to bee furthered by art in other things as in this. Yet regard, that in keeping your Anemone rootes out of the ground for this purpose, you neither keep them too dry, nor yet too moist, for ſprouting or rotting; and in planting them, that you ſet them not in too open a ſunny place, but where they may be ſomewhat shadowed.

#### The Place.

I ſhall not need to ſpend much time in relating the ſeverall places of theſe Anemones, but onely to declare that the moſt of them that haue not beeene raised from ſeede, haue come from Constantinople to vs; yet the firſt broad leaved or yellow Anemone, was firſt found in Portugall, and from thence brought into theſe parts. And the firſt purple Starre Anemone in Germanie, yet was the ſame ſent among others from Constantinople alſo. And the firſt thin cut leaved Anemone came firſt out of Italy, although many of that ſort haue come likewife from Constantinople. And ſo haue the double red or Scarlet Anemones, and the great double bluſh, which I firſt had by the gift of Mr. Humphrey Packington of Worceſterſhire Esquire, at Haruington.

#### The Time.

The times of their flowring are ſufficiently exprefſed in the deſcriptiōns, or in the rules for planting.

#### The Names.

The Turkish names whereby the great double broad leaved kindes haue beene ſent vnto vs, were *Gial Catamer*, and *Gial Catamer late*; And *Bizimade*, *Bizimante*, and *Galipoli late* for the thinne cut leaved Anemones. All Authors haue called them *Anemones*, and are the true *Herbe venti*. We

Wee call them in English eyther Anemones, after the Greeke name, or Windflowers, after the Latine.

#### The Vertues.

There is little vse of these in Physicke in our dayes, eyther for inward or outward diseases; onely the leaues are vsed in the Ointment called *Marcia-*  
*tam*, which is composed of many other hot herbes, and is vsed in cold  
grieses, to warme and comfort the parts. The roote, by reason of the  
sharpenesse, is apt to drawe downe rheame, if it be tasted or chewed in the  
mouth.

#### CHAP. XXVI.

##### *Aconitum. Wolfebane.*

Here be diuers sorts of Wolfebanes which are not fit for this booke, but are referred for a generall History or Garden of Simples, yet among them there are some, that notwithstanding their euill quality, may for the beauty of their flowers take vp a roome in this Garden, of whom I meane to entreate in this place: And first of the Winter Wolfsbane, which for the beauty, as well as the earlinesse of his flowers, being the first of all other, that shew themselues after Christmas, deserueth a prime place; and therefore for the likenesse of the rootes vnto the Anemones, I ioyne it next vnto them.

##### 1. *Aconitum Hyemale.* The Winters Wolfsbane.

This little plant thrusteth vp diuers leaues out of the ground, in the deepe of Winter oftentimes, if there be any milde weather in January, but most commonly after the deepe frosts, bearing vp many times the snow vpon the heads of the leaues, which like vnto the Anemone, doe euery leafe rise from the roote vpon seuerall short footed stalkes, not aboue foure fingers high, some hauing flowers in the middle of them, (which come vp first most vsually) and some none, which leaues stand as it were round, the stalke rising vp vnder the middle of the leafe, deeply cut in and gashed to the middle stalke almost, of a very faire deepe greene colour, in the middle whereof, close vnto the leafe, standeth a small yellow flower, made of six leaues, very like a Crowfoote, with yellow threads in the middle: after the flower is fallen, there rise vp diuers small hornes or cods set together, wherein are contained whitish yellow round seede. The roote is tuberous, so like both for shape and colour vnto the rootes of Anemones, that they will easily deceiue one not wel experient, but that it is brownet and smoother without, and yellow within, if it be broken.

##### 2. *Aconitum flore albido, sive Aconitum lateum Ponticum.*

The whitish yellow Wolfsbane.

This Wolfsbane shooteth not out of the ground vntill the Spring be well begun, and then it sendeth forth great broad greene leaues, deeply cut in about the edges, not much vnlke the leaues of the great wilde Crowfoote, but much greater; from among which leaues riseth vp a strong stiffe stalke, three foote high, hauing here and there leaues set vpon it, like vnto the lowest, but smaller; the toppe of the stalke is diuided into three or foure branches, whereon are set diuers pale yellow flowers, which turne at the last to bealmost white, in fashion like almost vnto the flowers of the Helmet flower, but much smaller, and not gaping so wide open: after the flowers are past come vp diuers short poddes, wherein is contained blacke seede: the roote is made of a number of darke browne strings, which spread and fasten themselues strongly in the ground.

3. *Napellus*

##### 3. *Napellus versus flore ceraso.* Blew Helmet flower or Monkes hood.

The Helmet flower hath diuers leaues of a fresh greene colour on the vpper side, and grayish vnderneath, much spread abroad, and cut into many slits and notches, more then any of the Wolfebanes; the stalke riseth vp two or three foot high, beset to the top with the like leaues, but smaller: the toppe is sometimes diuided into two or three branches, but more vsually without, wheron stand many large flowers one aboue another, in forme very like vnto a Hood or open Helmet, being composed of fve leaues, the vppermost of which and the greatest, is hollow, like vnto an Helmet or Headpeece, two other small leaues are at the sides of the Helmet, closing it like cheekes, and come somewhat vnder, and two other which are the smallest hang down like labels, or as if a close Helmet were opened, and some pieces hung by, of a perfect or faire blew colour, (but grow darker, haing stood long) which causeth it to be so nourished vp in Gardens, that their flowers, as was vsuall in former times, and yet is in many Countrey places, may be laid among greene herbes in windowes and roomes for the Summer time: but although their beauty may be entertained for the vses aforesaid, yet beware they come not neare your tongue or lippes, lest they tell you to your cost, they are not so good as they seeme to be: in the middest of the flower, when it is open and gapeth wide, are seene certaine small threads like beards, standing about a middle head, which when the flower is past, groweth into three or four, or more small blackish pods, containing in them blacke seede: the rootes are brownish on the outside, and white within, somewhat bigge and round aboue, and small downwards, somewhat like vnto a small shart Carrot roote, sometimes two being ioyned at the head together. But the name *Napellus* anciently giuen vnto it, doth shew they referred the forme of the roote vnto a small Turnep.

##### 4. *Anthora.* The wholesome Helmet flower, or counterpoisen Monkes hood.

This wholesome plant I thought good to insert, not onely for the forme of the flower, but also for the excellent properties thereof, as you shall haue them related hereafter. The rootes hereof are small and tuberous, round and somewhat long, ending for the most part in a long fibre, and with some other small threads from the head downward: from the head whereof riseth vp diuers greene leaues, every one seuerally vpon a stalke, very much diuided, as finely almost as the leaues of Larkes heele or spurres: among which riseth vp a hard round stalke, a foote high and better, with some such leaues thereon as grow belowe, at the toppe whereof stand many small yellowish flowers, formed very like vnto the former whitish Wolfsbane, bearing many blacke seedes in pods afterwards in the like manner.

Many more sorts of varieties of these kindes there are, but these onely, as the most specious, are nourised vp in Florists Gardens for pleasure; the other are kept by such as are Catholike obseruers of all natures store.

#### The Place.

All these grow naturally on Mountaines, in many shadowie places of the Alpes, in Germany, and elsewhere.

#### The Time.

The first flowreth (as is said) in January, and February, and sometimes vntill March be well spent, and the seede is soone ripe after.

The other three flower not vntill June and July.

#### The Names.

The first is vsually called *Aconitum hyemale Belgarum*. Lobelius calleth it *Bulbiferus*

*Balbosus unifolius Batrachoides*, *Aconitum Eleboracum*, and *Ranunculus Mo-*  
*nephyllos*, and some by other names. Most Herbarists call it *Aconitum hy-*  
*male*, and we in English thereafter, Winters Wolfsbane; and of some, Yel-  
low Aconite.

The second is called by most Writers, *Aconitum Inteum Ponticum*: Some  
also *Lapidea*, *Laparia*, and *Canidea*, of the effect in killing Wolues and  
Dogs: And some, because the flower is more white then yellow, doe call  
it *Aconitum flore albido*, we call it in English, The whitish yellow Aconite,  
or Wolfsbane, but some after the Latine name, The yellow Wolfsbane.

The third is called generally *Napellus*, and *Veras*, because it is the true  
*Napellus* of the ancient Writers, which they so termed from the forme of a  
Turnep, called *Napus* in Latine.

The fourth is called *Aconitum Salutiferum*, *Napellus Moysis*, *Antora* and  
*Anthora*, quasi *Antithora*, that is, the remedy against the poisonfull herbe  
*Thora*, in English according to the title, eyther wholesome Helmet flower,  
or counterpoison Monkes hood.

#### The Vertues.

Although the first three sorts of plants be very poisonfull and deadly, yet  
there may bee very good vse made of them for sore eyes (being carefully  
applied, yet not to all sorts of sore eyes neither without discretion) if the  
distilled water be dropped therein.

The rootes of the counterpoison Monkes hood are effectuall not only  
against the poison of the poisonfull Helmet flower, and all others of that  
kinde, but also against the poison of all venomous beasts, the plague or pe-  
stilence, and other infectious diseases, which raise spots, pockes, or markes  
in the outward skinne, by expelling the poison from within, and defending  
the heart as a most soueraigne Cordiall. It is vsed also with good successe  
against the wormes of the belly, and against the paines of the Wind collick.

#### C H A P. XXVII.

##### *Ranunculus*. The Crowfoote.

**N**ext vnto the Aconites, of right are to follow the *Ranunculi*, or Crowfeete, for  
the nearenesse both of forme, of leaues, and nature of the plants, although lesse  
hurtfull, yet all of them for the most part being sharpe and exulcerating, and  
not without some danger, if any would be too bold with them. The whole Family of  
the *Ranunculi* is of a very large extent, and I am constrained within the limits of a Gar-  
den of Pleasure; I must therefore select out onely such as are fit for this purpose, and  
set them here downe for your knowledge, leauing the rest for that other generall  
worke, which time may perfect and bring to light, if the couetous mindes of some  
that should be most affected towards it, doe not hinder it: or if the helpe of generous  
spirits would forward it.

##### 1. *Ranunculus montanus albus humilior*. The lowe white mountaine Crowfoot.

This lowe Crowfoote hath three or four broad and thicke leaues, almost round,  
yet a little cut in and notched about the edges, of a fine greene and shining colour on  
the vpper side, and not so green vnderneath, among which riseth a small short stalke,  
bearing one snow white flower on the toppe, made of five round pointed leaues, with  
diuers yellow threads in the middle, standing about a greene head, which in time  
groweth to be full of seede, in forme like vnto a small greene Strawberry: the roote is  
composed of many white strings.

*Duglici florae.* There is another of this lowe kinde, whose leaues are somewhat more deeply cut  
in on the edges, and the flower larger, and sometimes a little double, as it were with  
two rowes of leaues, in other things not differing from the former.

##### 2. *Ranunculus*

##### 2. *Ranunculus montanus albus maior vel elatior*.

The great single white mountaine Crowfoote.

The leaues of this Crowfoote are large and greene, cut into three, and sometimes  
into five speciall diuisions, and each of them besides cut or notched about the edges,  
somewhat resembling the leaues of the Globe Crowfoote, but larger: the stalke is  
two foote and a halfe high, hauing three small leaues set at the ioynt of the stalke,  
where it brancheth out into flowers, which stand foure or five together vpon long  
foote-stalkes, made of five white leaues a peece, very sweete, and somewhat larger  
then the next white Crowfoote, with some yellow threads in the middle compassing  
a greene head, which bringeth seede like vnto other wilde Crowfeete: the roote  
hath many long thicke whitish strings, comming from a thicke head.

##### 3. *Ranunculus montanus albus minor*. The lesser single white Crowfoote.

This Crowfeote hath faire large spread leaues, cut into five diuisions, and some-  
what notched about the edges, greene on the vpper side, and paler vnderneath, hauing  
many veines running through the leaues: the stalke of this riseth not so high as the  
former, although this be reasonable tall, as being neare two foote high, spread into  
many branches, bearing such like white flowers, as in the former, but smaller: the  
seede of this is like the former, and so are the rootes likewise.

##### 4. *Ranunculus albus flore pleno*. The double white Crowfoot.

The double white Crowfoote is of the same kinde with the last single white Crow-  
foote, hauing such like leaues in all respects: the onely difference is in the flowers,  
which in this are very thicke and double. Some doe make mention of two sorts of  
double white Crowfeete, one somewhat lower then another, and the lower like-  
wise bearing more store of flowers, and more double then the higher: but I con-  
fesse, I haue never seene but one sort of double, which is the same here expressed,  
not growing very high, and reasonably well stored with flowers.

##### 5. *Ranunculus præcox Rutafolio sive Coriandrifolio*.

The early Coriander leafed Crowfoote.

This Crowfoote hath three or four very greene leaues, cut and diuided into many  
small peeces, like vnto the wing of leaues of Rue, or rather like the lower leaues of the  
Coriander (for they well resemble either of them) euery of them standing vpon a long  
purplish stalke, at the toppe whereof groweth the flower alone, being composed or  
made of twelve small white leaues, broad pointed, and a little endented at the ends,  
somewhat purplish on the outside, and white on the inside, sustainted by diuers small  
greene leaues, which are in stead of a cup or huske: in the middle of the flower are  
many small white threads, tipt with yellow pendent, standing about a small greene  
head, which after growth to bee full of seede like a Strawberry, which knobs giue  
small blackish seede: the roote is white and fibrous.

##### 6. *Ranunculus Thalictrifolio maior*. The great columbine leafed Crowfoot.

The lower leaues of this Crowfoote haue long stalkes, and are very like vnto the  
smaller leaues of Colombines, or the great Spanish *Thalictrum*, which hath his leaues  
very like vnto a Columbine, foure or five rising from the roote: the stalke riseth ab-  
out a foote and a halfe high, somewhat reddish, beset here and there with the  
like leaues, at the toppe whereof stand diuers small white flowers, made of five  
leaues a peece, with some pale white threads in the middle: the seede is round  
and reddish, contained in small huskes or hornes: the roote is made of a bush or  
tuft of white strings.

7. *Ranunculus Thalictrifolius minor Asphodeli radice.*  
The small white Colombine leaved Crowfoote.

This small Crowfoote hath three or four winged leaues spread vpon the ground, standing vpon long stalkes, and consisting of many small leaues set together, spreading from the middle ribbe, every leafe somewhat resembling both in shape and colour the smalles and youngest leaues of Colombines: the flowers are white, standing at the toppe of the stalkes, made of fve round leaues: the root hath three or four thick, short, and round yellowish clogs hanging at the head, like vnto the Asphodill roote. The great Herball of Lyons, that goeth vnder the name of *Dalechampius*, saith, that Dr. Myconus found it in Spaine, and sent it vnder the name of Oenanthes; and therefore Ioannes Molineus who is thought to haue composed that booke, set it among the umbelliferous plants, because the Oenanthes bear umbels of flowers and seede, and haue tuberous or cloggy rootes; but with what judgement, let others say, when they haue compared the umbels of flowers and seede of the Oenanthes, with the flowers and seede of this plant, and whether I haue not more properly placed it among the *Ranunculi* or Crowfeete, and gauen it a denomination agreeable to his forme.

8. *Ranunculus Globosus*. The Globe Crowfoot.

This Crowfoote (which in the Northerne countries of England where it groweth plentifully, is called Locker goulous) hath many faire, broad, darkc greene leaves next the ground, cut into fve, sixe, or seuen diuisions, and iagged besidest at the edges; among which riseth vp a stalke, wherenon are set such like leaues as are belowe, but smaller, diuided toward the toppe into some branches, on the which standeuerall large yellow flowers, alwayes folded inward, or as a close flower neuer blowing open, as other flowers doe, consisting of eleuen leaues for the most part, set or placed in three rowes, with many yellow threads in the middle, standing about a greene rough head, which in time groweth to be small knops, wherin are contained blacke seede: the roote is composed of many blackish strings.

9. *Ranunculus proteinus flore multipliciti*. The double yellow field Crowfoot.

There is little or no difference in the leaues of this double Crowfoot, from those of the single kindes that growe in every medow, being large and diuided into four or five parts, and indented about the edges, but they are somewhat smaller, and of a fresher greene: the flowers stand on many branches, much diuided or separated, being not very great, but very thicke and double: the roote runneth and crecchet vnder ground like as the single doth.

10. *Ranunculus Anglicus maximus multiplex*.  
The Garden double yellow Crowfoot or Batchelours buttons.

This great double Crowfoote, which is common in every Garden through England, hath many great blackish greene leaues, iagged and cut into three diuisions, each to the middle ribbe: the stalkes haue some smaller leaues on them, and those next vnder the branches long and narrow: the flowers are of a greenish yellow colour, very thicke and double of leaues, in the middle whereof riseth vp a small stalke, bearing another double flower, like to the other, but smaller: the roote is round, like vnto a small white Turnep, with diuers other fibres annexed vnto it.

11. *Ranunculus Gramineus*. Grasse leaved Crowfoot.

The leaues of this Crowfoote are long and narrow, somewhat like vnto Grasse, or rather like the leaues of single Gilloflowers or Pinckes, being small and sharpe pointed, a little hollow, and of a whitish greene colour: among these leaues rise vp diuers slender stalkes, bearing one small flower at the toppe of each, consisting of fve yellow leaues,

1. *Aconitum Ferox*. Winter Wolfsbane. 2. *Aconitum ferox albidum flore luteo Dentatum*. The whitish yellow Wolfsbane. 3. *Ranunculus humilis simplex*. The single white low Crowfoot. 4. *Aconitum*. The counterpoison Monkshood. 5. *Ranunculus humilis albus duplo maior*. The double low white Crowfoot. 6. *Ranunculus humilis albus duplo maior*. The double low white Crowfoot. 7. *Ranunculus Coriandrifolius*. The early Coriander-leaved Crowfoot. 8. *Ranunculus montanus albus*. The great single white mountain Crowfoot. 9. *Ranunculus montanus albus flore pleno*. The double white mountain Crowfoot. 10. *Ranunculus Thalictrifolius minor*. The lesser Colombine leaved Crowfoot. 11. *Ranunculus globosus*. The globe Crowfoot.

leaves, with some threads in the middle : the roote is composed of many thicke, long, round white strings.

There is another of this kinde that beareth flowers with two rowes of leaves, as if it were double, differing in nothing else.

12. *Ranunculus Lusitanicus Autumnalis*. The Portugall Autumnne Crowfoot.

This Autumnne Crowfoote hath diuers broad round leaves lying on the ground, set vpon short foote-stalkes, of a faire greene colour aboue, and grayish vnderneath, snipt all about the edges, hauing many veines in them, and sometimes swelling as with blisters or bladders on them ; from among which rise vp two or three slender and hairy stalkes, bearing but one small yellow flower a peece, consisting of fve and sometimes of six leaves, and sometimes of seuen or eight, hauing a few threads in the middle, set aboue a small greene head, like vnto many of the former Crowfeete, which bringeth small blacke seede : the roote is made of many thicke short white strings, which seeme to be grumous or kernaly rootes, but that they are somewhat smaller, and longer then any other of that kinde.

13. *Ranunculus Creticus latifolius*. The broad leaved Candy Crowfoot.

This Crowfoote of Candy, hath the greatest and broadest leaves of all the sorts of Crowfeete, being almost round, and without any great diuisions, but onely a few notches about the edges here and there, as large or larger sometimes then the palme of a mans hand, among which riseth vp the stalke, not very high when it doth first flower, but afterwards, as the other flowers doe open themselues, the stalke groweth to be a foote and a halfe high, or thereabouts, hauing some leaves on it, deeply cut in or diuided, and bearing many faire yellow flowers, consisting of fve leaves a peece, being somewhat whitish in the middle, when the flower hath stood blowne a little time : the roote is composed of a number of small kernaly knobs, or long graines, set thicke together. This flowreth very early, being vsually in flower before the end of March, and oftentimes about the middle thereof.

14. *Ranunculus Creticus albus*. The white Candy Crowfoote.

The leaves of this Crowfoote are very like vnto the leaves of the red Crowfoote of Tripoli or Asia, hereafter set downe, being somewhat broad and indented about the edges, some of the leaves being also cut in or gashed, thereby making it as it were three diuisions, of a pale greene colour, with many white spots in them : the stalke riseth vp a foote high, with some leaves on it, more diuided then the lower, and diuided at the toppe into two and sometimes into three branches, each of them bearing a faire know white flower, somewhat large, included at the first in a brownish huske or cup of leaves, which afterwards stand vnder the flowers, consisting of fve white large round pointed leaves, in the middle whereof is set many blackish purple thrums, compassing a small long greene head, composed of many scales or chaffie whitish huskes, when they are ripe, which are the seede, but vnproufitable in all that euer I could obserue : the rootes are many small graines or kernels, set together as in the former, and much about the same colour, that is, of a darke or duskie grayish colour, but much smaller.

There is another of this kinde, whose flowers haue purple edges, and sometimes some veines of the same purple in the leaves of the flowers, not differing in any other thing from the former.

And another, whose edges of the flowers are of a bright red colour.

15. *Ranunculus Creticus flore argenteo*. The Argentine, or cloth of siluer Crowfoot.

The greene leaves of this Crowfoote are as small and thinne, cut in or diuided on the edges, as the last two sorts ; the stalke riseth vp somewhat higher, and diuided into some branches, bearing at the toppe of every of them one flower, somewhat smaller then the former, composed of six, seuen, and sometimes of eight small round pointed leaves,

*Alba purpureis  
bris & venis.*

*Alba et rufa  
bris.*

1. *Ranunculus gramineus* flore simplici & duplo. The single and the double straffe Crowfoote. 2. *Ranunculus Lusitanicus Autumnalis*. The Portugall Autumnne Crow foot. 3. *Ranunculus Creticus latifolius*. The broad leaved Candy Crowfoot. 4. *Ranunculus Aquilegia maximum multipes*. The double English Crowfoot. 5. *Ranunculus pruriens* flore multiplo. The double yellow field Crowfoot. 6. *Ranunculus Creticus albus*. The white Candy Crowfeete. 7. *Ranunculus Africicus* flore albo vel pallido varia. The white or the straw coloured Crowfoot with red tops, redges. 8. *Ranunculus* *Turcicus*. *Ranunculus* *Africicus* flore simplici. The single red Crowfoot of Tripoli. 9. *Ranunculus Africicus* flore rubro ample. The large single red Crow foot of Asia. 10. *Ranunculus Africicus* flore rubro pleno. The double red Crowfoot of Asia. 11. *Calceolaria palaestina*. Double March Marigold, or Batchesbury buttons.

leaves, of a whitish yellow bluish colour on the intide wholly, except sometimes a little stript about the edges : but the outside of euery leafe is finely stript with crimson stripes, very thicke, somewhat like vnto a Gilloflower : in the middle riseth vp a small blacke head, compassed about with blackish blew threads or thrums, which head is as vnfruitfull for seede in our Countrey as the former. This flower hath no such greene leaves vnder it, or to enclose it before it be blowne open as the former : the rootes are in all things like the former.

16. *Ranunculus Asiaticus flore Tripolitanus flore rubro.*  
The single red Crowfoote of Asia or Tripoli.

The lower leaves of this red Crowfoote are alwayes whole without diuisions, being onely somewhat deeply indented about the edges, but the other that rise after them are more cut in, sometimes into three, and lometimes into fve diuisions, and notched also about the edges : the stalke riseth higher then any of the former, and hath on it two or three smaller leaves, more cut in and diuided then those belowe : at the toppe whereof standeth one large flower, made of fve leaves, every one being narrower at the bottome then at the toppe, and not standing close and round one to another, but with a certaine distance betweene, of a dusky yellowish red colour on the outside, and of a deepe red on the inside, the middle being set with many thrums of a darke purple colour : the head for seede is long, and scaly or chaffie, and idle in like manner as the rest : the roote is made of many graines or small kernels set together, and closing at the head, but spreading it selfe, if it like the ground, vnder the vpper crust of the earth into many rootes, encreasing from long strings, that runne from the middle of the small head of graines, as well as at the head it selfe.

17. *Ranunculus Asiaticus flore amplior rubro.* The large single red Crowfoot of Asia.

There hath come to vs out of Turkie, together with the former, among many other rootes, vnder the same title, a differing sort of this Crowfoote, whose leaves ware broader, and much greater; the flower also larger, and the leaves thereof broader, sometimes eight in a flower, standing round and close one to another, which maketh the fairer shew : in all other things it is like the former.

18. *Ranunculus Asiaticus flore rubro vario simplici.*  
The red stript single Crowfoote of Asia.

This party coloured Crowfoote differeth not eyther in roote or leafe from the former, the chiefeſt difference is in the flower, which being red, somewhat like the former, hath yet ſome yellow ſtripes or veines through euery leafe, ſometimes but little, and ſometimes ſo much, that it ſeemeth to bee party coloured red and yellow : this ſort is very tender ; for we haue twice had it, and yet perished with vs.

19. *Ranunculus Asiaticus flore luteo vario simplici.*  
The yellow stript single Crowfoote of Asia.

There is little difference in the roote of this Crowfoote from the laſt deſcribed, but the leaves are much diſſerent, being very muſt diuided, and the flower is large, of a fine pale greeniſh yellow colour, conſiſting of ſix and ſeven, and ſometimes of eight or nine round leaves, the toppes whereof haue reddiſh ſpots, and the edges ſometimes alſo, with ſuch purliſh thrums in the middle that the other haue. None of theſe former Crowfooteſ with kernelly rootes, haue euer beeſt found to haue giuen ſo good ſeed in England, as that being ſowne, any of them would ſpring vp ; for hereof tryall hath been often made, but all they haue loſt their labour, that haue beſtoſed their paines thereiſ, as farre as I know.

20. *Ranunculus Asiaticus flore rubro pleno.*  
The double red Crowfoote of Asia.

The double red Crowfoote hath his rootes and leaves ſo like vnto the ſingle red kind, that none can perceiue any diſference, or know the one from the other, vntill the budde of the flower doe appeare, which after it is any thing forward, may be perceiued to be greater and fuller then the budde of the ſingle kind. This kind beareth moſt vſually but one faire large double flower on the toppe of the stalke, compoſed of many leaves, ſet cloſe together in three or four rows, of an excellent crimson colour, declining to Scarlet, the outer leaves being larger then the inner ; and in stead of thrummes, hath many ſmall leaves ſet together : it hath likewiſe ſix ſmall narrow greene leaves on the backſide of the flower, where the stalke is fastened to the flower.

There is of this double kind another ſort, whose flower is of the ſame colour with *Polifero flore*, the former, but out of the middle of the flower arifeth another double flower, but ſmaller.

The Place.

These plants grow naturally in diuers Countries ; ſome in France, and Germany, and ſome in England, ſome in Spaine, Portugall, and Italy, and ſome haue beeſt ſent out of Turkie from Constantinople, and ſome from other parts, their titles for the moſt part deſcriyng their Countries.

The Time.

Some of them flower early, as is ſet downe in their deſcriptions, or titles. The others in Aprill and May. The white Candy Crowfoote, and the other ſingle and double ſorts of Asia, about the ſame time, or ſomewhat later, and one in Autumne, as it is ſet downe.

The Names.

The names that are giuen ſeverally to them may well ſerue this worke, that thereby they may bee diſtinguiſhed one from another : For to ſet downe any further controverſie of names, how fitly or vnfitly they haue beeſt called, and how variably by diuers former Writers, is fitter for a geuerall History, vnto which I leauē what may be ſaid, both conuerning theſe and the reſt : Onely this I would giue you to vnderſtand, that the Turkie kindes haue beeſt ſent to vs vnder the names of *Terebolas* for the ſingle, and *Terebolas Catamerale* for the double, and yet oftentimes, thoſe that haue beeſt ſent for double, haue proued ſingle, ſo little fidelity is to bee found among them.

The Vertues.

All or moſt of theſe plants are very ſharpe and exulcerating, yet the care and industry of diuers learned men haue found many good effects in many of them. For the rootes and leaves both of the wilde kindes, and of ſome of theſe of the Garden, ſtamped and applied to the wrists, haue driven away the fits in Feuers. The roote likewiſe of the double English kind is applied for pefilient ſores, to helpe to breake them, by drawing the venome to the place. They helpe likewiſe to take away ſcarres and markes in diuers places of the body.

## C H A P. XXVIII.

*Caltha palustris flore pleno.* Double Marsh Marigold.

**A**S an appendix to the Crowfeete, I must needs adde this plant, yet seuerally by it selfe, because both it and his single kinde are by most adioyned thereunto, for the neare resemblance both in shape and sharpenesse of quality. The single kinde I leue to the Ditch sides, and moist grounds about them, as the fittest places for it, and onely bring the double kinde into my Garden, as fittest for his goodly proportion and beauty to be entertained, and haue place therein.

The double Marsh Marigold hath many broad and round greene leaues, a little entended about the edges, like vnto the single kinde, but not altogether so large, especially in a Garden where it standeth not very moist: the stalkes are weake, round, hollow, and greene, diuided into three or four branches at the toppe, with leaues at the severall ioynts, whereon stand very double flowers, of a gold yellow colour: the fwe outer leaues being larger then any of the rest that are encompassed by them, which fall away after they haue stood blowne a great while (for it endureth in flower a moneth or more, especially if it stand in a shadowie place) without bearing any seed: the rootes are composed of many thicke, long, and round whitish strings, which runne downe deep into the ground, and there are fastened very strongly.

## The Place.

This plant groweth naturally in diuers Marshes, and moist grounds in Germany, yet in some more double then in others; it hath long agoe beeene cherisched in our Gardens.

## The Time.

It flowreth in Aprill or May, as the yeare proueth earlier or later: all his leaues doe in a manner quite perish in Winter, and spring anew in the end of February, or thereabouts.

## The Names.

There is great controuersie among the learned about the single kinde, but thereof I shall not neede to speake in this place; if God permit I may in a fitter. This is called generally in Latine, *Caltha palustris multiplex*, or *flore pleno*. And wee in English (after the Latine, which take *Caltha* to be that which wee vsually call *Calendula*, a Marigold) The double Marsh Marigold.

## The Vertues.

The roote hereof is sharpe, comming neare vnto the quality of the Crowfeete, but for any speciall property, I haue not heard or found any.

## C H A P.

## C H A P. XXIX.

*Hepatica nobilis sine trifolia.* Noble Liverwort.

**N**ext vnto the Crowfeete are to follow the Hepaticas, because of the likenesse with them, seeming to be small Crowfeete in all their parts, but of another and more wholsome kiade. Their diversity among themselves consisteth chiefly in the colour of the flowers, all of them being single, except one which is very thicke and double.

1. *Hepatica flore ceraleo simplici major.*  
The great single blew Hepatica or noble Liverwort.

The flowers of this Hepatica doe spring vp, blow open, and sometimes shed and fall away, before any leaues appere or spread open. The rootes are composed of a bush of blackish strings, from the severall heads or buttons wherof, after the flowers are risen and blowne, arise many fresh greene leaues, each seuerally standing vpon his foot-stalke, folded together, and somewhat browne and hairy at their first coming, which after are broad, and diuided at the edges into three parts: the flowers likewise stand every one vpon his owne severall foote-stalke, of the same height with the leaues for the most part, which is about four or five fingers breadth high, made of six leaues most vsually, but sometimes it will haue seven or eight, of a faire blew colour, with many white chiuies or threads in the middle, standing about a middle green head or vmbone, which after the flower is fallen growth greater, and sheweth many small graine or seede set close together (with three small greene leaues compassing them vnderneath, as they did the flower at the bottome) very like the head of seed of manie Crowfeete.

2. *Hepatica minor flore pallido caruleo.* The small blew Hepatica.

The leaues of this Hepatica are smaller by the halfe then the former, and grow more abundantly, or bushing thicke together: the flowers (when it sheweth them, for I haue had the plant halfe a score yeares, and yet never saw it haue flower aboue once or twice) are of a pale or bleake blew colour, not so large as the flowers of the former.

3. *Hepatica flore purpureo.* Purple Hepatica or noble Liverwort.

This Hepatica is in all things like vnto the first, but onely the flowers are of a deeper blew tending to a Violet purple: and therefore I shall not neede to reiterate the former description.

4. *Hepatica flore alba minor.* The lesser white Hepatica.

The flowers of this Hepatica are wholly white, of the bignesse of the red or purple, and the leaues somewhat smaller, and of a little whiter or paler greene colour, else in all other things agreeing with the former.

5. *Hepatica alba magno flore.* The great white Hepatica.

There is no other difference herein from the last, but that the flower being as white, is as large as the next.

6. *Hepatica albida sine argentea.* Ash-coloured or Argentine Hepatica.

Both the leaues and the flowers of this Hepatica are larger then any of the former, except the last: the flowers hereof at the first opening seeme to bee a of blushe ash-colour, which doe so abide three or four dayes, decaying still vntill it turne almost white,

white, hauing yet still a shew of that blushe ash-colour in them, till the very last.

7. *Hepatica alba straminibus rubris.* White Hepatica with red threads.

There is no difference between this Hepatica and the first white one, sauing that the threads in the middle of the flower, being white, as in the former, are tipt at the ends with a pale reddish colour, which adde a great beauty to the flowers.

8. *Hepatica flore rubro.* Red Hepatica or noble Liverwort.

The leaues of this Hepatica are of a little browner red colour, both at their first comming vp, and afterwards, especially in the middle of the leafe more then any of the former: the flowers are in forme like vnto the rest, but of a bright blushe, or pale red colour, very pleasant to behold, with white threads or chives in the middle of them.

9. *Hepatica flore purpureo multiplici fuce pleno.*

The double purple Hepatica.

The double Hepatica is in all things like vnto the single purple kinde, sauing only that the leaues are larger, and stand vpon longer foote-stalkes, and that the flowers are small buttons, but very thicke of leaues, and as double as a flower can be, like vnto the double white Crowfoote before described, but not so bigge, of a deepe blew or purple colour, without any threads or head in the middle, which fall away without gowing any seede.

10. *Hepatica flore caraleo pleno.* The double blew Hepatica.

In the colour of this flower, consisteth the chiefeſt diſſerence from the laſt, except one may ſay it is a little leſſe in the bignesse of the flower, but not in doublenesſe of leaues.

The Place.

All these plants with ſingle flowers grow naturally in the Woods, and shadowie Mountaines of Germany in many places, and ſome of them in Italy alſo. The double kinde likewiſe hath been ſent from Alphonsus Pan-tius out of Italy, as Cluſius reporteth, and was also found in the Woods, neare the Caſtle of Starnbeg in Austria, the Lady Heuſenſtains poſſeſſion, as the ſame Cluſius reporteth alſo.

The Time.

These plants doe flower very early, and are of the firſt flowers that ſhew themſelves preſently after the deepe froſts in January, ſo that next vnto the Winter Wolfsbane, theſe making their pride appear in Winter, are the moſt welcome early guests. The double kinde flowreth not altogether ſo early, but ſheweth his flower, and abideth when the others are paſt.

The Names.

They haue obtained diuers names; ſome calling them *Hepatica*, *Hepatica nobilis*, *Hepaticum trifolium*, *Trifolium nobile*, *Trifolium aureum*, and ſome *Tri-nitæ*, and *Herbe Trinitatis*. In English you may call them either *Hepatica*, after the Latine name, as moſt doe, or *Noble Liverwort*, which you pleafe.

The Vertues.

These are thought to coole and ſtrengthen the liuer, the name importing as much; but I never ſaw any great uſe of them by any the Phyſicians of our London Colledge, or eſſet by them that haue uſed them in Phyſick in our Country.

CHAP.

1. *Hepatica flore albo amolo simplici.* The large white Hepatica. 2. *Hepatica flore rubro simplici.* The red Hepatica. 3. *Hepatica flore purpureo pleno.* The double purple Hepatica. 4. *Geranium tuberosum.* Knobbed Cranes bill. 5. *Geranium pratense flore albo caruleo.* The blew or white Crowfoote Cranes bill. 6. *Geranium Hematoide.* The red Rofft Cranes bill. 7. *Geranium sanguineum.* The variable striped Cranes bill. 8. *Geranium Creticum.* Candy Cranes bill.

## C H A P. XXX.

*Geranium.* Storkes bill or Cranes bill.

**A**S was said before concerning the Crowfeet, of their large extent and restraint, the like may be said of the Storkes bils or Cranes bils; for euen of these as of them, I must for this worke set forth the descriptions but of a few, and leue the rest to a generall worke.

1. *Geranium tuberosum vel bulbosum.* Bulbous or knobbed Cranes bill.

The knobbed Cranes hath three or four large leaues spread vpon the ground, of a grayish or rather dusty greene colour, every one of them being as it were of a round forme, but diuided or cut into six or seuen long parts or diuisions, euen vnto the middle, which maketh it seeme to be so many leaues, each of the cuts or diuisions being deeply notched or indented on both sides, among which riseth vp a stalke a foote high or better, bearing thereon diuers pale but bright purple flowers, made of five leaues a peece, after which come small heads with long pointed beakes, resembling the long bill of a Storke or Crane, or such like bird, which after it is ripe, parteth at the bottome where it is biggest, into four or five seedes, every one whereof hath a peece of the beake head fastened vnto it, and falleth away if it bee not gathered: the roote is tuberous and round, like vnto the roote of the *Cyclamen* or ordinary Sowbread almost, but smaller, and of a darke russet colour on the outside, and white within, which doth encrease vnder ground, by certaine strings running from the mother root into small round bulbes, like vnto the rootes of the earth Chefnut, and will presently shooe leaues, and quickly grow to beare flowers, but will not abide to be kept long dry out of the ground, without danger to be vtterly spoiled.

*Geranium Batrachoides flore caruleo.* The blew Crowfoote Cranes bill.

This Crowfoote Cranes bill hath many large leaues, cut into five or six parts or diuisions, euen to the bottome, and iagged besides on the edges, set vpon very long slender foote-stalkes, very like the leaues of the wilde Crowfoot; from among which rise vp diuers stalkes with great ioynts, somewhat reddish, set with leaues like the former: the topes of the stalkes are spread into many branches, whereon stand diuers flowers, made of five leaues a peece, as large as any of the wilde or field Crowfeete, round pointed, of a faire blew or watchet colour, which being past, there doe arise round heads or bils, as other of the Cranes bils haue: the roote is composed of many reddish strings, spreading in the ground, from a head made of diuers red heads, which lye oftentimes eminent aboue the ground.

*Geranium Batrachoides flore albo.* The white Crowfoote Cranes bill.

This Cranes bill is in leafe and flower altogether like the former, the onely difference betweene them consisteth in the colour of the flower, which in this is wholly white, and as large as the former: but the roote of this hath not such red heads as the other hath.

*Geranium Batrachoides flore albo & ceruleo vario.*

The party coloured Crowfoote Cranes bill.

The flowers of this Cranes bill are variably striped and spotted, and sometimes diuided, the one halfe of every leafe being white, and the other halfe blew, sometimes with lesser or greater spots of blew in the white leafe, very variably, and more in some years then in others, that it is very hard to expresse all the varieties that may be obserued in the flowers, that blow at one time. In all other parts of the plant, it is so like vnto the former, that vntill it be in flower, the one cannot be knowne from the other.

*Geranium*5. *Geranium Batrachoides alterum flore purpureo.*  
Purple Crowfoote Cranes bill.

This purple Cranes bill hath many leaues rising from the roote, set vpon long foot-stalkes, somewhat like vnto the other, yet not so broad, but more diuided or cut, that is, into seuen or more slits, euen to the middle, each whereof is likewise cut in on the edges more deeply then the former; the stalkes are somewhat knobbed at the ioynts, set with leaues like vnto the lower, and bearing a great tuft of buds at the topes of the branches, which break out into faire large flowers, made of five purple leaues, which doe somewhat resemble the flower of a Mallow, before it be too full blowne, each whereof hath a reddish pointell in the middle, and many small threads compassing it, this vmbell or tuft of buds doe flower by degrees, and not all at once, and every flower abideth open little more then one day, and then sheddeth, so that every day yeeldeth fresh flowers, which because they are so many, are a long while before they are all past or spent: after the flowers are past, there arise small beake heads or bils, like vnto the other Cranes bils, with small turning feede: the roote is composed of a great tuft of strings, fastened to a knobby head.

6. *Geranium Romanum versicolor sive striatum.* The variable stript Cranes bill.

This beautifull Cranes bill hath many broad yellowish greene leaues arising from the roote, diuided into five or six parts, but not vnto the middle as the first kindes are: each of these leaues hath a blackish spot at the bottome corners of the diuisions, the whole leafe as well in forme as colour and spots, is very like vnto the leafe of the *Geranium fuscum*, or spotted Cranes bill, next following to be described, but that the leaues of this are not so large as the other: from among these leaues spring vp slender stalkes a foote high and better, ioynted and knobbed here and there, bearing at the tops two or three small white flowers, consisting of five leaues a peece, so thickly & variably striped with fine small reddish veines, that no green leafe that is of that bignesse can shew so many veines in it, nor so thick running as every leafe of this flower doth: in the middle of the flower standeth a small pointell, which when the flower is past doth grow to be the seed vessell, wheron is set diuers small seeds, like vnto the small seeds of other Cranes bils: the root is made of many small yellow threads or strings.

7. *Geranium fuscum sive maculatum.* Swart tawny or spotted Cranes bill.

The leaues of this Cranes bill are in all points like the last described, as well in the forme and diuisions as colour of the leaues, being of a yellowish greene colour, but larger and stronger by much: the stalkes of this rise much higher, and are ioynted or knobbed with reddish knees or ioynts, on the tops whereof stand not many although large flowers, consisting of five leaues a peece, each whereof is round at the end, and a little saipt round about, and doe bend or turne themselves backe to the stalkewards, making the middle to be highest or most eminent, the colour of the flower is of a darke or deepe blackish purple, the bottome of every leafe being whiter then the rest; it hath also a middle pointell standing out, which afterwards bring forth feede like vnto others of his kinde: the roote consisteth of diuers great strings, ioyned to a knobby head.

8. *Geranium Hematodes.* The red Rose Cranes bill.

This Cranes bill hath diuers leaues spread vpon the ground, very much cut in or diuided into many parts, and each of them againe slit or cut into two or three peeces, standing vpon slender long foote-stalkes, of a faire greene colour all the Spring and Summer, but reddish in Autumne: among these leaues spring vp slender and weake stalkes, beset at every ioynt (which is somewhat reddish) with two leaues for the most part, like vnto the lower: the flowers grow severally on the toppe of the stalkes, and not many together in bunches or branches, as in all other of the Cranes bils, every flower being as large as a single Rose Campion flower, consisting of five large leaues,

of a deeper red colour then in any other Cranes bill at the first opening, and will change more bleuish afterwards: when the flower is past, there doth arise such like beakes as are in others of the same kinde, but small: the roote is hard, long, and thick, with diuers branches spreading from it, of a reddish yellow colour on the outside, and whitish within, which abideth and perisheth not, but shooteth forth some new greene leaues, which abide all the Winter, although those that turne red doe fall away.

*Geranium Creticum*. Candy Cranesbill.

**Candy Cranes** bill beareth long and tender stalkes, whereon growe diuers broad and long leaues, cut in or iagged on the edges: the toppes of the stalkes are branched into many flowers, made of ffe leaues of a reasonable bignesse, and of a faire blew or watchet colour, with a purplish pointell in the middle, which being past, there follow beake heads like other Cranes bils, but greater, containing larger, greater, and sharper pointed seede, able to pierce the skinne, if one be not warie of it: the roote is white and long, with some fibres at it, and perisheth when it hath perfected his seede, and will spring of it owne sowing many times, if the Winter be not too sharpe, otherwise (being annuall) it must be sowen in the Spring of the yeare.

## The Place.

Most of these Cranes bils are strangers vnto vs by nature, but endenizond  
in our English Gardens. It hath beeene reported vnto mee by some of good  
credit, that the second or Crowfoot Cranes bill hath been found naturally  
growing in England, but yet I never saw it, although I haue seen many sorts  
of wilde kindes in many places. Matthiolus saith that the first groweth in  
Dalmatia and Illyria very plentifully. Camerarius, Clusius, and others, that  
most of the rest grow in Germany, Bohemia, Austria, &c. The last hath  
his place recorded in his title.

The Time.

All these Cranes bills doe for the most part flower in Aprill, and May, and vntill the middle of June. The variable or stript Cranes bill is vsually the latest of all the rest.

## The Names.

The first is vsually called *Geranium tuberosum*, of some *Geranium bulbosum*, of the likenesse of the roote vnto a bulbe: It is without controuersie *Geranium primum* of Dioscorides. The second is called *Geranium Gratia Det.*, of others, *Geranium ceruleum*. The blew Cranes bill Lobel calleth it *Batrachoides*, because both leafe and flower are like vnto a Crowfoote; and the affinity with the Cranes bils in the seede causeth it rather to be referred to them then to the Crowfeete. The stript Cranes bill is called by some *Geranium Romanum*. The last sauing one is called *Geranium Hematodes*, or *Sanguineum*, of Lobel *Geranium Grinale Hematodes sanguinum radice repente*. In English it may be called after the Greek and Latine, The bloody Cranes bill, but I rather call it, The Rose Cranes bill, because the flowers are as large as single Roses, or as the Rose Campion. Some of them are called in many places of England Baffinets.

## The Vertues.

All the kindes of Cranes bils are accounted great wound herbes, and effectuall to stay bleedings, yet some more then others. The Emperickes of Germanie, as Camerarius saith, extoll it wonderfully, for a singular remedie against the Stone, both in the reines and bladder.

C H A P . X X X I .

*Sanicula gattata major*. Spotted Sanicle.

**H**Aving long debated with my selfe, where to place this & the other plants that follow in the two next Chapters, I haue thought it not amisse for this worke to set them downe here, both before the Beares eares, which are kindes of Sanicle, as the best Authors doe hold, and after the Cranes bils, both for some qualities somewhat resembling them, and for some affinity of the flowers with the former.

The spotted Sanicle hath many small round leaues, bluntly endented about the edges, somewhat like vnto the leaues of our white Saxifrage, of a full greene colour aboue, and whitish hairy, and somewhat reddish withall vnderneath: the stalkes are set here and there with the like leaues, rising a foote and a halfe high or more, very much diuided at the toppe into sundry small branches, bearing many very small white flowers, consisting of fve small leaues, wherein are many small red spots to be seene, as small as pins points, of a pretty sweete sent, almost like Hawthorne flowers, in the middle whereof are many small threads compassing a head, which when it is ripe containeth small blacke seede: the roote is fealy, or couered with a chaffie matter, hauing many small white fibres vnderneath, whereby it is fastened in the ground.

There is another of this kinde, like both in roote, leafe, and flower to the former, Minor non gus-  
tata. the onely difference is, that this is lesser then the former, and hath no spots in the flower, as the other hath.

We haue also another smaller kinde then the last, both in leafe and flower, the leaues ~~minus~~  
whereof are smaller, but rounder, and more finely ~~swept~~ or indented about the edges,  
like the teeth of a fine sawe: the stalke is little aboue a span high, hauing many small  
white flowers spotted as the first, but with fewer spots.

## The Place.

These growe in the shadowie Woods of the Alpes, in diuers places; and  
with vs they more delight in the shade then the sunne.

The Times.

All these Sanicles doe flower in May, and continue flowring vntill June, and the seede soone ripeneth after: the rootes abide all the Winter, with some leaues on them, springing a fresh in the beginning of the yeare.

## The Names.

The former two are called by Clusius *Sanicula montana*, and by others *Sanicula gustata*: by Lobel *Genus Alpinum*. The third or last hath been sent vs vnder the name of *Sanicula montana altera minor*.

## The Vertues.

The name imposed on these plants doe certainly assurevs of their vertues, from the first founders, that they are great healers, and from their taste, that they are great binders.

## CHAP. XXXII.

*Cotyledon altera Matthioli.* Spotted Nuelwort.

This spotted Nuelwort, as many doe call it, hath many thicke small leaues, not so broad as long, of a whitish greene colour, lying on the ground in circles, after the manner of the heads of Houſeſtēeke, and dented about the edges; from the middle whereof ſometimes (for it doth not flower every year in many places) arifeth vp a ſtalle, scarce a foote high, beſet with ſuch like leaues as are belowe, but ſome-what longer: from the middle of the ſtalle vp to the top it brancheth forth diuersly, with a leaue at every ioynt, bearing three or four flowers on euery branch, coniſting of ſue white leaues, ſpotted with ſmall red ſpots, like vnto the ſpotted Sanicle, but with fewer and greater ſpots, hauiing a yellowiſh circle or eye in the bottome of every flower, and many whitish threads with yellowiſh tips in it: the ſeede is ſmall and blacke, contained in ſmall round heads: the roote is ſmall, long, and threadie, ſhooting out ſuch heads of leaues, which abide all the Winter, thoſe that beare flower periſhing.

*Cotyledon altera minor.* Small dented Nuelwort.

There is another like vnto that before deſcribed in moſt things, the diſferences be theſe: It hath ſhorter leaues then the former, and dented about the edges in the like manner: the flowers hereof are white, but greater, made of ſix leaues, and moſt viually without any ſpots at all in them, ſome are ſcene to haue ſpots alſo: the heads or ſeede veſſels are moſt cornered then the former.

*Cotyledon altera flore rubroſellato.* Small red flowered Nuelwort.

This hath alſo many heads of leaues, but moſt open, which are longer, greener, and ſharper pointed then eyther of the former, ſomewhat reddiſh alſo, and not dented about the edges, but yet a little rough in handling: the ſtalle arifeth from among the leaues, being ſomewhat reddiſh, and the leaues thereon are reddiſh pointed, diuided at the toppe into many branches, with diuers flowers thereon, made of twelve ſmall long leaues, ſtanding like a ſtaſtre, of a reddiſh purple colour, with many threads therein, ſet about the middle head, which is diuided at the toppe into many ſmall ends, like pods or horns, containing therein very ſmall ſeede: the root is ſmall like the former.

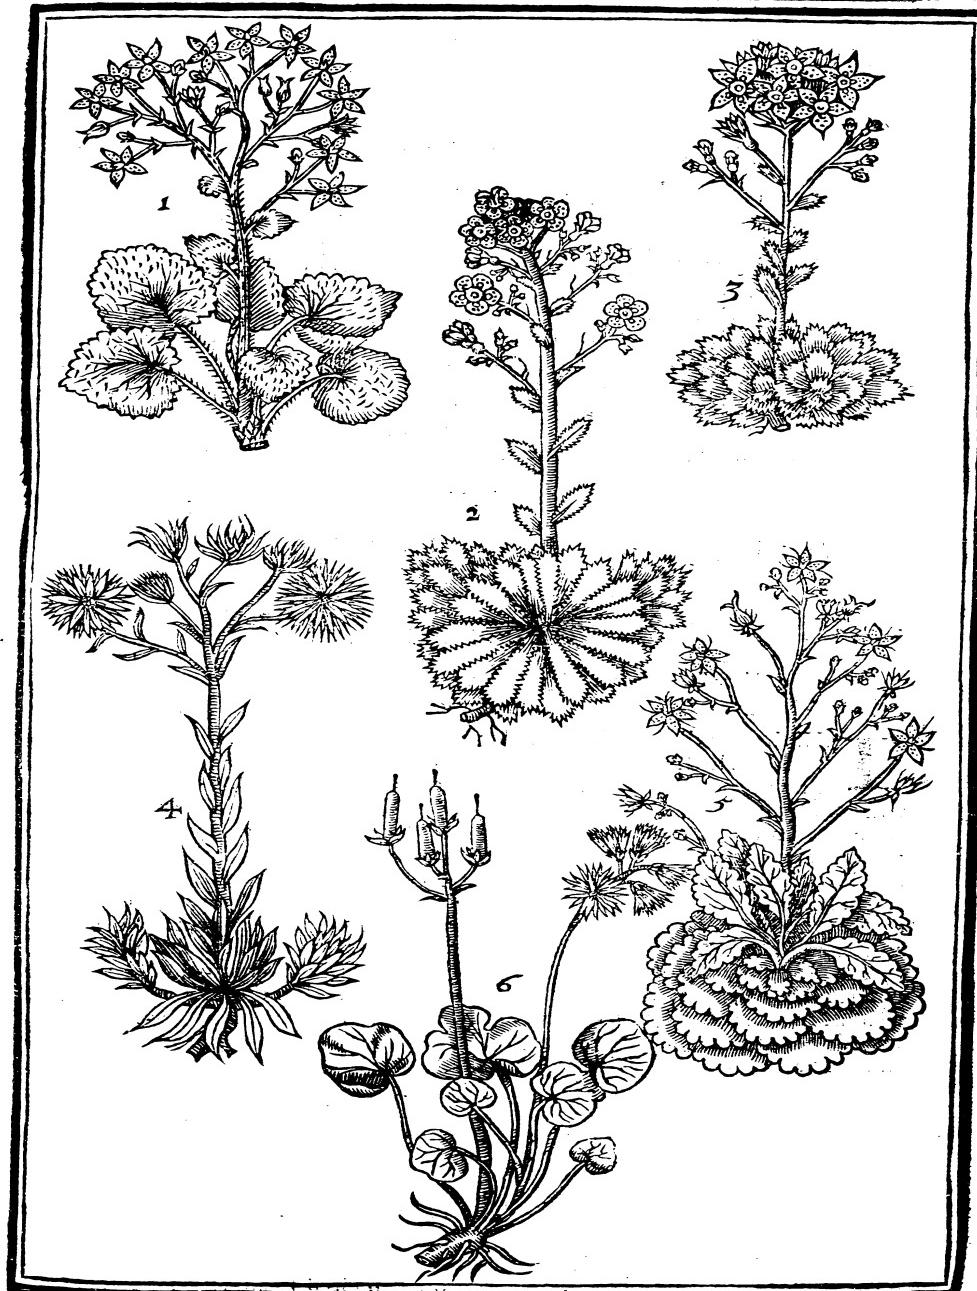

*Sedum serratum flore rubente maculato.* The Princes Feather.

This kinde of Sengreene is coſpoſed of heads of larger, broader, and thinner leaues then any of the former, of a fadde greene colour, ſomewhat vneuenly endent about the edges, and not ſo cloſe ſet together, but ſpreading forth into ſeuall heads like as the former ſorts doe, although not ſo plentifullie; from the middle of diuers of which heads riſe vp browniſh or reddiſh ſtalleſ, ſet with ſmaller leaues thereon to the middle thereof, and then brancheth forth into ſeuall ſprigs, ſet with diuers ſmall reddiſh flowers coniſting of ſue leaues a pece, the innerſide of which are of a pale red, ſomewhat whitish, ſpotted with many ſmall bloud red ſpots, as ſmall almoſt as pins points, with ſome ſmall threads in the middle, ſtanding about a ſmall greene head, which turneth into the ſeede veſſel, parted fourte wayes at the head, wherein is contained ſmall blackiſh ſeede: the rooteſ are ſmall threads, which ſpread vnder the ground, and ſhoote vp ſeuall heads round about it.

The Place.

All theſe growe in Germany, Hungarie, Austria, the Alpes, and other ſuch like places, wherethey cleave to the rocke itſelfe, that hath but a crust of earth on it to nouriſh them. They will abide in Gardens reaſonable well, if they be planted in shadowie places, and not in the ſun.

The

<sup>1</sup> *Sanicle guttata.* Spotted Sanicle. <sup>2</sup> *Cotyledon altera Matthioli.* Spotted Nuelwort. <sup>3</sup> *Cotyledon altera minor.* Small dented Nuelwort. <sup>4</sup> *Cotyledon altera flore rubroſellato.* Small red flowered Nuelwort. <sup>5</sup> *Sedum serratum flore rubente maculato.* The Princes Feather. <sup>6</sup> *Soldanella Alpina.* Blew Moonwort.

## The Time.

They flower for the most part in the end of May, and sometimes sooner or later, as the yeare falleth out.

## The Names.

The first is called by Matthiolus, *Cotyledon altera Dioscoridis*, and *Vmbilicus alter*, but it is not the true *Cotyledon altera* of Dioscorides; for *Scaevula vulgaris marina*, Our common Houslecke, by the consent of the best moderate Writters, is the true *Cotyledon altera* of Dioscorides, or *Vmbilicus Veneris alter*. I hold it rather to bee a kinde of small Houslecke, as the other two likewise are. The second is called by some *Aizoom* or *Sedum minus serratum*. The third hath his name in his title. Wee doe call them Naclworts in English rather then Houslecke, *Erophila gratia*. The last may be called dented Sengreene with reddish spotted flowers, but some of our English Gentlewomen haue called it, The Princes Feather, which althoug it be but a by-name, may well serue for this plant to distinguish it, and whereby to be knowne.

## The Vertues.

They are all held to be cold and moist, like vnto other Houslecke.

## CHAP. XXXIII.

*Soldanella Alpina*. Mountaine Soldanella or blew Moonewort.

This beautifull plant hath many round and hard leaues, set vpon long foote stalkes, a little vneuenly cut about the edges, greene on the vpper side, and of a grayish greene vnderneath, and sometime reddish like the leaues of Sowbread, which because they doe somewhat resemble the leaues of *Soldanella marina*, which is the Sea Bindweede, tooke the name thereof: the stalkes are slender, small, round, and reddish, about a span high, bearing foure or five flowers at the toppe, every one hanging downe their heads, like vnto a Bell flower, consisting but of one leafe (as most of the Bindweeds doe) plated into five folds, each of them ending in a long point, which maketh the flower seem to haue five leaues, each whereof is deeply cut in on the edges, and hauing a round greene head in the middle, with a pricke or pointell at the end thereof: the flower is of a faire blew colour, sometimes deeper or paler, or white, as nature listeth without any smell at all: the middle head, after the flower is fallen, riseth to be a long round pod, bearing that pricke it had at the end thereof, wherein is contained small greenish seede: the roote hath many fibres shooting from a long round head or roote.

## The Place.

This groweth on the Alpes, which are couered with snow the greatest part of the yeare, and will hardly abide transplanting.

## The Time.

In the naturall places it flowreth not vntill the Summer moneths, Iune, July, and August, after the snow is melted from the Hills, but being brought into Gardens, it flowreth in the beginning of April, or thereabouts.

The

## The Names.

This plant, by reason of the likenesse of leaues with *Soldanella*, as was before said, is called by many *Soldanella*, but yet is no Bindweede; and therefore I rather call it in English a Mountaine Soldanella, then as Gerrard doth, Mountaine Bindweede. It is likewise called by some, *Lanaria minor cerulea*, The lesser blew Lunary or Moonwort, and so I would rather haue it called.

## The Vertues.

They that imposed the name of *Lanaria* vpon this plant, seeme to referre it to the wound or consolidating herbes, but because I haue no further relation or experience, I can say no more thereof vntill tryall hath taught it. Some also from the name *Soldanella*, which is giuen it, because of the likenesse of the leaues, haue vsed it to help the Dropit, for which the Sea plant is thought to be effectuall.

## CHAP. XXXIV.

*Auricula Vrsi*. Beares eares.

Here are so many sundry and severall sorts of Beares eares, the variety confesting as well in the differing colours of the flowers, as the forme and colour of the leaues, that I shall not comprehernd and set downe vnto you all the diversities by many, that are risen vp to those that haue beeene industrious in the sowing of the seedes of the severall sorts of them; yet if you accept of these that I doe here offer vnto you, I shall giue you the knowledge of others, as time, occasion, and the view of them shall enable me. And because they are without all question kinds of Cowslips, I haue set them downe before them in the first place, as being of more beautie and greater respect, or at the least of more rarity vnto vs. To dispose them therefore into order, I shall ranke them vnder three principall colours, that is to say, Red or Purple, White, and Yellow, and shew you the varieties of each of them (for so many as are come to my knowledge) apart by themselves, and not promiscuously as many others haue done.

1. *Auricula Vrsi flore purpureo*. Purple Beares eare, or The Murrey Cowslip.

This purple Beares eare or Cowslip hath many greene leaues, somewhat long and smooth, narrow from the bottome of the leafe to the middle, and broad from thence to the end, being round pointed, and somewhat snipt or endented about the edges; in the middle of these leaues, and sometimes at the fides also, doe spring round greene stalkes foure or five fingers high, bearing at the top many flowers, the buds wherof, before they are blowne, are of a very deepe purple colour, and being open, are of a bright, but deepe purple, vsually called a Murrey colour, consisting of five leaues a peece, cut in at the end as it were into two, with a whitish ring or circle at the bottome of each flower, standing in small greene cups, wherein after the flowers are fallen, are contained very small heads, not rising to the height of the cups, bearing a small pricke or pointell at the toppe of them, wherein is little blackish seede: the roote hath many whitish strings fastened to the maine long roote, which is very like vnto a Prismrose or Cowslip roote, as it is in all other parts besidies.

2. *Auricula Vrsi purpurea absq; orbe*. The murrey Cowslip without eyes.

There is another of this kinde, whose leaue is somewhat lesse, as the flower is also, but

but of the same colour, and sometimes somewhat redder, tending to a Scarlet, without any circle at the bottom of the flower, in no other things differing from it.

3. *Auricula Vrſi minor flore tanneto.* Tawney Beares eares.

The leaues of this kinde haue a greater shew of mealiness to be feene in them, and not much smaller then the former, yet snipt or endented about the ends like vnto them : the flowers are many, of the same fashion with the former, but smaller, each whereof is of as deepe a murrey or tawnie colour when it is blowne, as the buds of the former are before they are blowne, hauing a white circle at the bottom of the flower, and yellowish in the middle belowe the circle.

4. *Auricula Vrſi flore rubro fato rubato lateo.*  
Deepe or bloud red Beares eares with eyes.

This kinde hath small and long greene leaues, nothing mealy, but snipt about the edges, from the middle of the leaues forwards to the ends : the flowers hereof are of a deepe red colour, tending to a bloud red, with a deepe yellow circle, or rather bottom in the middle.

There is another of this kinde, whose leaues are somewhat mealy, and smaller then any (that I haue feene) that haue mealy leaues : the flowers are of the same deepe red colour with the last described, yet hath no circle or bottoine of any other colour at all.

*Auricula Vrſi  
flore rubro fato  
tunc abque  
orbis.*

5. *Auricula Vrſi flore purpuro ceruleo.* The Violet coloured Beares eare.

We haue another, whose leaues are somewhat mealy and large ; the flowers whereof are of a paler purple then the first, somewhat tending to a blew.

6. *Auricula Vrſi flore oblateo magno.* The Spaniards blush Beares eare.

This great Beares eare hath as large leaues as any other of this kindred whatsoeuer, and whitish or mealy withall, somewhat snipt about the edges, as many other of them are : the flowers stand at the toppe of a strong and tall stalke, larger then any of the other that I haue feene, being of a duskie blush colour, resembling the blush of a Spaniard, whose tawney skinne cannot deciare so pure a blush as the English can ; and therefore I haue called it the Spaniards blush.

7. *Auricula Vrſi flore rabello.* Scarlet or light red Beares eares.

The leaues of this kinde are very like the leaues of the first purple kinde, but that they are not so thicke, of a little paler greece colour, and little or nothing snipt about the edges : the flowers are of a bright, but pale reddish colour, not halfe so deepe as the two last with white circles in the bottomes of them, in other things this differeth not from others.

8. *Auricula Vrſi Roseo colore.* The Rose coloured Beares eare.

We haue another, whose leafe is a little mealy, almost as large as any of the former, whose flowers are of a light red colour, very neare the colour of an ordinary Damaske Rose, with a white eye at the bottom.

9. *Auricula Vrſi flore ceruleo folio Boraginis.*  
Blew Beares eares with Borage leaves.

This plant is referred to the kindred or family of the Beares eares, onely for the forme of the flower sake, which euuen therein it doth not assimilate to the halfe ; but because it hath passed others with that title, I am content to insert it here, to give you the

1. *Auricula Vrſi flore purpureo.* Purple Cowslips or Beates eares. 2. *Auricula Vrſi flore tanneto.* Tawney Beares eare. 3. *Auricula Vrſi flore & folio Boraginis.* Blew Beares eares with Borage leaves. 4. *Auricula Vrſi Rose carnis.* Blush Beares eare. 5. *Auricula Vrſi maxima latea flore eleganti.* The greatest faire yellow Beares eares with eyes. 6. *Auricula Vrſi latera flore luteo.* The yellow Beares eare. 7. *Auricula Vrſi crinitis coloris fulvo fulvo.* The haire coloured Beares eare. 8. *Cornuta Massilioli.* Beares eare Sanicle.

the knowledge thereof, and rather to satisfie others then my selfe with the place thereof: the description whereof is as followeth: It hath diuers broad rough hairy leaues spread vpon the ground, somewhat like vnto the leaues of Borage for the roughnesse, but not for the largenesse; the leaues hereof being somewhat rent in some places at the edges: from among these leaues rise vp one, or two, or more brownish, round, and hairy stalkes, a span high or thereabouts, bearing at the topes three or foure flowers a peice, consisting of fve large pointed leaues, of a faire blew or light azur colour, with some small yellow threads in the middle, standing in small greene cups: the roote is long and brownish, hauing many small fibres annexed vnto it.

**10. *Auricula Vrſi major flore albo.* The great white Beares eare.**

This white Beares eare hath many faire whitish greene leaues, somewhat paler then the leaues of any of the kindes of Beares eares, and a little snipt about the ends, as manie other are: among these leaues rise vp stalkes foure or fve inches high, bearing at the toppe many flowers like vnto the small yellow Beares eare hereafter set downe, of a pale whitish colour, tending to yellow at the first opening of the flower, which after two or three dayes change into a faire white colour, and so continue all the while it bloweth: the roote is like the purple kinde, as all or most of the rest are, or very little differing.

**11. *Auricula Vrſi minor flore albo.* The lesser white Beares eare.**

The lesser Beares eare hath smaller leaues, of a little darker green colour: the stalkes and flowers are likewise lesser then the former, and haue no shew of yellownesse at all, eyther in budde or flower, but is pure white, differing not in other things from the rest.

**12. *Auricula Vrſi maxima lutea flore eleganti.***

The greatest faire yellow Beares eare with eyes.

This yellow Beares eare hath many faire large thicke leaues, somewhat mealy or hoary vpon the greenesse, being larger then any other kinde, except the sixth, and the next yellow that followeth, smooth about the edges, and without any endenting at all: the stalk is great, round, and not higher then in other of the former, but bearing manie more flowers thereon then in any other kinde, to the number of thirty many times, standing so round and close together, that they seeme to be a Nosegay alone, of the same fashion with the former, but that the leaues are shorter and rounder, yet with a notch in the middle like the rest, of a faire yellow colour, neither very pale nor deepe, with a white eye or circle in the bottome, about the middle of every flower, which giueth it the greater graece: the seede is of a blackish browne colour, like vnto others, but contained in greater round heads then any other, with a small pointell sticking in the middle: the roote is greater and thicker then any other, with long strings or fibres like vnto the other sorts, but greater.

**13. *Auricula Vrſi major lutea folio in cano.* The greater yellow Beares eare.**

This greater yellow Beares eare hath his leaues larger, and more mealy or hoarie then the last, or any other of these kindes: the flowers are not so many, but longer, and not so thicke thrusting together as the first, but of a deeper yellow colour, without any eye or circle in the middle.

**14. *Auricula Vrſi major flore pallido.* The great Straw coloured Beares eare.**

This hath almost as mealy leaues as the last, but nothing so large; the flowers are of a faire strawe colour, with a white circle at the bottome of them, these three last haue no shew or shadow of any other colour in any part of the edge, as some others that follow haue.

**15. *Auricula***

**15. *Auricula Vrſi minor flore pallente.* The lesser straw coloured Beares eare.**

We haue another, whose leafe is lesse mealy, or rather pale green, and a little mealy withall; the flowers whereof are of a paler yellow colour then the last, and beareth almost as many vpon a stalke as the first great yellow.

**16. *Auricula Vrſi minor lutea.* The lesser yellow Beares eares.**

The leaues of this Beares eare are nothing so large as either of the three former yelow kindes, but rather of the bignesse of the first white kinde, but yet a little larger, thicker, and longer then it, hauing vnder the greenesse a small shew of mealiness, and somewhat snipt about the edges: the flowers are of a pale yellow colour, with a little white bottome in them: the seed and rootes are like vnto the other kindes.

**17. *Auricula Vrſi flore flavo.* The deepe yellow or Cowslip Beares eare.**

This kinde hath somewhat larger leaues then the last, of a yellowish greene colour, without any mealiness on them, or endenting about the edges, but smooth and whole: the flowers are not larger but longer, and not laide open so fully as the former, but of as deepe a yellow colour as any Cowslip almost, without any circle in the bottome: neither of these two last haue any shew of other colour then yellow in them, sauing the white in the eye.

**18. *Auricula Vrſi versicolor prima fine flore rubescente.* The blush Beares eare.**

The blush Beares eare hath his leaues as large, and as hoary or mealy as the third greater yellow, or straw coloured Beares eare, among which riseth vp a stalke about four inches high, bearing from six to twelve, or more faire flowers, somewhat larger then the smaller yellow Beares eare before described, hauing the ground of the flower of a darke or dunne yellow colour, shadowed ouer a little with a shew of light purple, which therefore we call a blush colour, the edges of the flower being tipt with a little deeper shew of that purple colour, the bottome of the flower abiding wholly yellow, without any circle, and is of very great beauty, which hath caused me to place it in the forefront of the variable coloured Beares eares. And although some might thinke it should be placed among the first ranke of Beares eares, because it is of a blush colour, yet seeing it is assuredly gained from some of the yellow kindes by sowing the seede, as many other sorts are, as may be seene plainly in the ground of the flower, which is yellow, and but shadowed ouer with purple, yet more then any of the rest that follow; I thinke I haue giuen it his right place: let others of skill & experience be judges herein.

**19. *Auricula Vrſi crinis coloris.* Haire coloured Beares eares.**

The leaues of this kinde are more mealy like then the last blush kinde, but somewhat longer and larger, and snipt about the edges in the same manner, from the middle of the leafe forwards: the flower is vsually of a fine light browne yellow colour, which wee doe vsually call an Haire colour, and sometimes browner, the edges of the flower haue a shew or shadow of a light purple or blush about them, but more on the outside then on the inside.

**20. *Auricula Vrſi versicolor lutea.* The yellow variable Beares eare.**

This variable Beares eare hath his greene leaues somewhat like vnto the deepe yelow, or Cowslip Beares eare before described, but somewhat of a fresher greene, more shining and smaller, and snipt about the edges towards the ends, as many of those before are: the flowers are of a faire yellow colour, much laid open when it is full blowne, that it seemeth almost flat, daft about the edges onely with purple, being more yellow in the bottome of the flower, then in any other part.

**21. *Auricula***

21. *Anicula Vrsi varicolor lutescente viridis flore.* The variable green Beares eare.

This kinde of Beares eare hath greene leaues, very like vnto the last described, and snipt in the like manner about the edges, but in this it differeth, that his leaues do turne or fold themselues a little backwards: the flo vers are of a yellowish greene colour, more closed then the former, having purplish edges, especially after they haue stood blowne some time, and haue little or none at the first opening: these haue no circles at all in them.

Many other varieties are to be found, with those that are curious conseruers of these delights of nature, either naturally growing on the mountaines in seuerall places, from whence they (being searched out by diuers) haue been taken and brought, or else raised from the seede of some of them, as it is more probable: for seuerall varieties haue beeene obserued (and no doubt many of these before specified) to bee gotten by sowynge of the seedes, every yeare lightly shewing a diuersity, not obserued before, either in the leafe, diuers from that from whence it wastaken, or in the flowers. I haue onely set do wne those that haue come vnder mine owne view, and not any by relation, euen as I doe with all or most of the things contained in this worke.

The Place.

Many of these goodly plants growe naturally on mountaines, especially the Alpes, in diuers places; for some kindes that growe in some places, doe not in others, but farre distant one from the other. There hath likewise some beeene found on the Pyrenæan mountaines, but that kinde with the blew flower and Borage leafe, hath beeene gathered on the mountaines in Spaine, and on the Pyrenæans next vnto Spaine.

The Time.

They all flower in Aprill and May, and the seede is ripe in the end of June, or beginning of July, and sometimes they will flower againe in the end of Summer, or in Autumne, if the yeare prouet temperate, moist, and rainie.

The Names.

It is very probable, that none of these plants were euer knowne vnto the ancient Writers, because we cannot be assured, that they may be truly referred vnto any plant that they name, vnlesse we beleue Fabius Columna, that it should be *Alisma* of Dioscorides, for thereunto hee doth referreit. Diuers of the later Writers haue giuen vnto them diuers names, euy one according to his owne conceit. For Gesner calleth it *Lunaria arthritica*, and *Paralytica Alpina*. Matthiolus accounteth it to bee of the kinred of the Sanicles, and saith, that in his time it was called by diuers Herbarists, *Anicula Vrsi*, which name hath since bin received as most vsuall. We in English call them Beares eares, according to the Latine, or as they are called by diuers women, French Cowslips; they may be called Mountaine Cowslips, if you will, for to distinguish betweene them and other Cowslips, wherof these are seuerall kindes.

*Sanicula Alpina sive Cortusa Matthiolii.* Beares eare Sanicle.

I cannot chuse but insert this delicate plant in the end of the Beares eares, for that it is of so neare affinity, although it differ much in the forme of the leaues, the description whereof is in this manner: The leaues that spring vp first are much crumpled, and as it were folded together, which afterwards open themselues into faire, broad, and roundish leaues, somewhat rough or hairy, not onely cut into fine diuisions, but somewhat notched also about the edges, of a darke greene colour on the vpperside, and more

more whitish greene vnderneath; amongst these leaues riseth vp one or two naked round stalkes, fife or six inches high, bearing at the topes diuers small flowers, somewhat sweete, like vnto the first purple Beares eare, hanging downe their heads, consisting of fife small pointed leaues a peece, of a darke reddish purple colour, with a white circle or bottome in the middle, and some small threads therein: after the flowers are past, there come small round heads, somewhat longer then any of the Beares eares, standing vpright vpon their small foot-stalkes, wherein is contained small round and blackish seede: the roote consisteth of a thicke tuft of small whitish threads, rather then rootes, much enterlaced one among another: the leaues of this plant dye downe every yeare, and spring vp anew in the beginning of the yeare, whereas all the Beares eares doe hold their leaues greene all the Winter, especially the middlemost, which stand like a close head, the outermost for the most part perishing after seed time.

The Place.

This growtheth in many shadowie Woods both of Italy and Germany; for both Clusius hath described it, finding it in the Woods of Austria and Stiria; and Matthiolus setteth it downe, hauing receiued it from Anthonus Cortusius, who was President of the Garden at Padua, and found it in the woody mountaines of Vicenza, neare vnto Villestagna, whereon (as Matthiolus saith) there is found both with white flowers as well as with blew, but such with white flowers or blew we never could see or heare further of.

The Time.

It flowreth much about the time of the Beares eares, or rather a little later, and the seede is ripe with them.

The Names.

Clusius calleth it *Sanicula montana*, and *Sanicula Alpina*, and referreth it to the *Anicula Vrsi*, or Beares eare, which it doth most nearly resemble: but Matthiolus referreth it to the *Cariophyllata* or *Avens*, making it to be of that tribe or family, and calleth it *Cortusa* of him that first sent it him. Wee may call it eyther *Cortusa*, as for the most part all Herbarists doe, or Beares eare Sanicle as Gerrard doth.

The Vertues.

All the sortes of Beares eares are Cephalicall, that is, conducing helpe for the paines in the head, and for the giddiness thereof, which may happen, eyther by the sight of steepe places subiect to danger, or otherwise. They are accounted also to be helping for the Palsey, and shaking of the ioynts; and also as a Sanicle or wound-herbe. The leaues of the *Cortusa* taste a little hot, and if one of them bee laide whole, without bruising, on the cheeke of any tender skind woman, it will raise an orient red colour, as if some fucus had beeene laide thereon, which will passe away without any manner of harme, or marke where it lay: This is Cortusius his obseruation. Camerarius in his *Hortus Medicus* saith, that an oyle is made thereof, that is admirable for to cure wounds.

## C H A P. XXX V.

*Primula veris & Paralyfi.* Primroses and Cowslips.

WE haue so great variety of Primroses and Cowslips of our owne Country breeding, that strangers being much delighted with them, haue beeene often furnished into diuers Countries, to their good content: And that I may set them downe in some methodicall manner, as I haue done other things, I will first set downe all the sorts of those we call Primroses, both single and double, and afterwards the Cowslips with their diuerseities, in as ample manner as my knowledge can direct me. And yet I know, that the name of *Primula veris* or Primrose, is indifferently conferred vpon those that I distinguish for *Paralyfi* or Cowslips. I doe therefore for your better vnderstanding of my distinction betweene Primroses and Cowslips, call those onely Primroses that carry but one flower vpon a stalle, be they single or double, except that of Master Hesketh, and that with double flowers many vpon a stalle, set out in Gerard's Herball, which is his onely, not found (as I thinke) *in rerum natura*, I am sure, such a one I could neuer heare of: And those Cowslips, that beare many flowers vpon a stalle together constantly, be they single or double also. I might otherwise distinguish them also by the leafe, that all the Primroses beare their long and large broad yellowish greene leaves, without stakes most vsually; and all the Cowslips haue small stakes vnder the leaves, which are smaller, and of a darker greene, as vsually, but that this distinction is neither so certaine and generall, nor so well knowne.

1. *Primula veris flore albo.* The single white Primrose.

The Primrose that groweth vnder euery bush or hedge, in all or most of the Woods, Groues, and Orchards of this Kingdome, I may well leauue to his wilde habitation, being not so fit for a Garden, and so well knowne, that I meane not to gine you any further relation thereof: But we haue a kinde hereof which is somewhat smaller, and beareth milke white flowers, without any shew of yellownesse in them, and is more vsually brought into Gardens for the rarity, and differeth not from the wilde or ordinary kinde, either in roote or leafe, or any thing else, yet hauing those yellow spots, but smaller, and not so deepe, as are in the other wilde kinde.

2. *Primula veris flore viridi simplici.* The single greene Primrose.

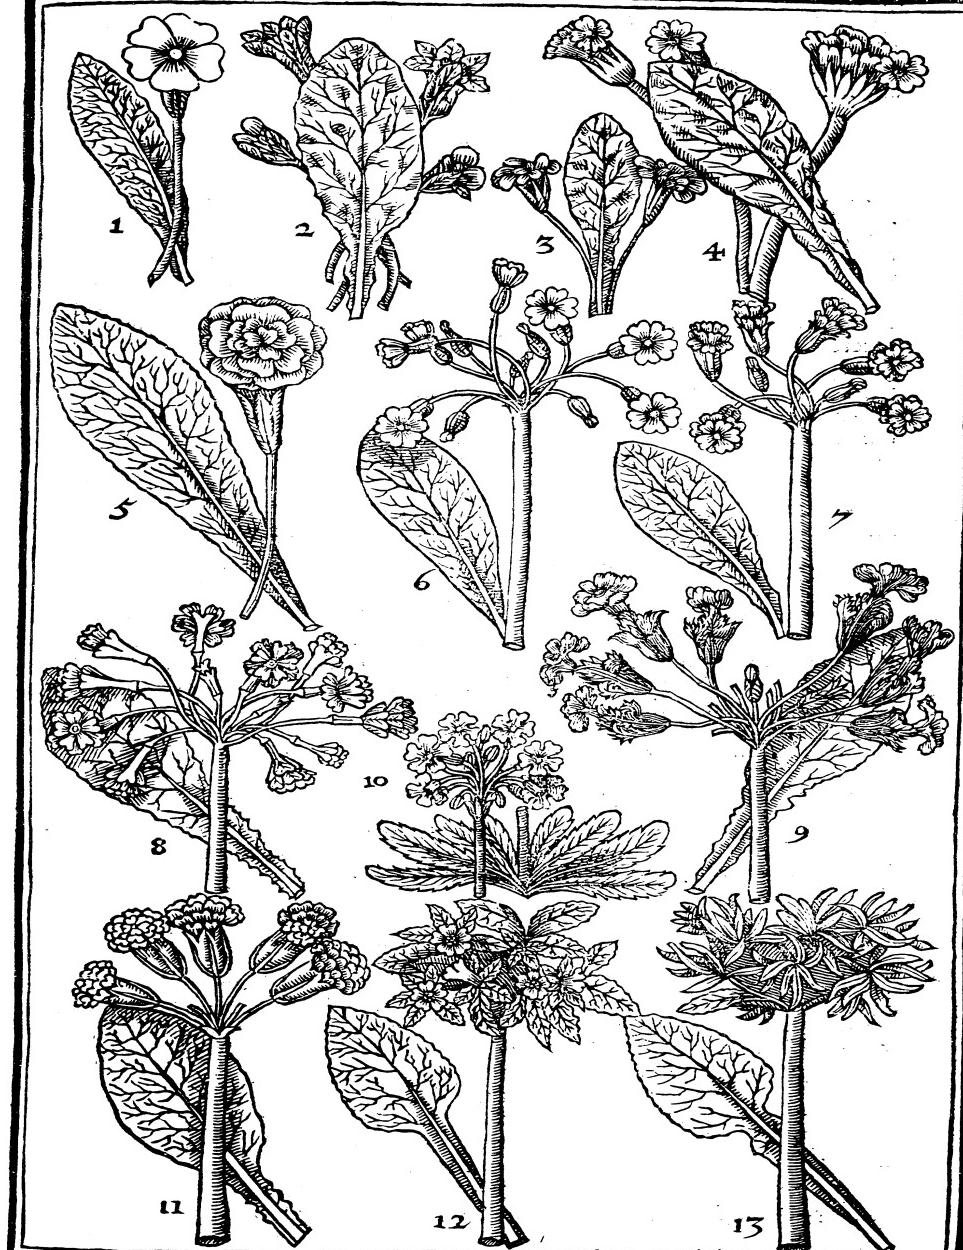

The single greene Primrose hath his leaves very like vnto the greater double Primrose, but smaller, and of a fadder greene colour: the flowers stand seuerally vpon long foot-stalkes, as the first single kinde doth, but larger then they, and more laide open, of the same, or very neare the same yellowish greene colour that the huske is of, so that at the first opening, the huske and the flower seeme to make one double greene flower, which afterwards separating themselues, the single flower groweth aboue the huske, and spreadeth it selfe open much more then any other single Primrose doth, growing in the end to be of a paler greene colour.

3. *Primula veris flore viridante & albo simplici.*  
The single greene and white Primrose.

The leaves of this differ in a manner nothing from the former, neither doth the flower but only in this, that out of the large yellowish green huskes, which contain the flowers of the former, there commeth forth out of the middle of each of them either a small peece of a whitish flower, or else a larger, sometimes making vp a whole flower, like an ordinary Primrose.

4. *Primula veris flore viridi duplo.* The double greene Primrose.

This double Primrose is in his leaves so like the former single greene kindes, that

1. *Primula veris flore albo.* The white Primrose. 2. *Primula veris flore viridi & albo simplici.* The green and white Primrose. 3. *Primula veris flore viridi duplo.* The double green Primrose. 4. *Primula veris Heskerti.* Master Hesketh's double Primrose. 5. *Primula veris flore plana & glabra.* The ordinary Primrose. 6. *Paralyfi veris flore viridante simplici.* The single greene Cowslip. 7. *Paralyfi flore geminata adusta.* Double Cowslip or holsie hole. 8. *Paralyfi inodora flore geminata.* Double Oxelips hole in hole. 9. *Paralyfi flore viridi simplici.* Curled Cowslip or Gaskins. 10. *Paralyfi minor angustifolia flore subnuda.* Red Birds eyen. 11. *Paralyfi hirsuta flore plana vulgaris.* Double Paiglet. 12. *Paralyfi fuscata.* The feulish Cowslip or blacke an Apes on horse backe. 13. *Paralyfi flore viridi roseo calamistrata.* The double greene stacheted Cowslip.

the one cannot be knowne from the other vntill it come to flower, and then it beareth vpon every stalke a double green flower, of a little deeper green colour then the flower of the former single kinde consisting but of two rowes of short leaues most vsually, and both of an equal height aboue the huske, abiding a pretty time in flower, especially if it stand in any shadowed place, or where the Sun may come but a while vnto it,

*5. Primula veris Heskets flore multiplici separatione diviso.*  
Master Heskets double Primrose.

Master Heskets double Primrose is very like vnto the small double Primrose, both in leafe, roote, and heighth of growing, the stalke not rising much higher then it, but bearing flowers in a farre different manner; for this beareth not only single flowers vpon severall stalkes, but somtimes two or three single flowers vpon one stalk, and also at the same time a bigger stalke, and somewhat higher, hauing one greene huske at the toppe thereof, sometimes broken on the one side, and sometimes whole, in the middle whereof standeth sometimes diuers single flowers, thrust together, every flower to be seene in his proper forme, and sometimes there appeare with some whole flowers others that are but parts of flowers, as if the flowers were broken in peeces, and thrust into one huske, the leaues of the flowers (being of a white or pale Primrose colour, but a little deeper) seldom rising aboue the hight of the very huske it selfe; and sometimes, as I haue obserued in this plant, it will haue vpon the same stalke, that beareth such flowers as I haue here described vnto you, a small flower or two, making the stalke seeme branched into many flowers, whereby you may perceiue, that it will vary into many formes, not abiding constant in any yeare, as all the other sorts doe.

*6. Primula borealis flore pleno vulgaris.* The ordinary double Primrose.

The leaues of this Primrose are very large, and like vnto the single kind, but somewhat larger, because it groweth in gardens: the flowers doe stand euery one severally vpon slender long foote stalkes, as the single kinde doth, in greenish huskes of a pale yellow colour, like vnto the field Primrose, but very thicke and double, and of the same sweete sent with them.

*7. Primula veris flore duplo.* The small double Primrose.

This Primrose is both in leafe, roote, and flower, altogether like vnto the last double Primrose, but that it is smaller in all things; for the flower riseth not aboue two or three fingers high, and but twice double, that is, with two rowes of leaues, yet of the very lame Primrose colour that the former is of.

*8. Paralysis vulgaris pratensis flore flavo simplici odorato.*  
The Common field Cowslip.

The common field Cowslip I might well forbear to set downe, being so plentifull in the fields: but because many take delight in it, and plant it in their gardens, I will giue you the description of it here. It hath diuers green leaues, very like vnto the wilde Primrose, but shorter, rounder, stiffer, rougher, more crumpled about the edges, and of a fadder greene colour, euery one standing vpon his stalke, which is an inch or two long: among the leaues rise vp diuers round stalkes, a foote or more high, bearing at the toppe many faire yellow single flowers, with spots of a deeper yellow, at the botome of each leafe, smelling very sweete. The rootes are like to the other Primroses, hauing many fibres annexed to the great roote.

*9. Paralysis altera odorata flore pallido polyanthus.* The Primrose Cowslip.

The leaves of this Cowslip are larger then the ordinary field Cowslip, and of a darke yellowish greene colour: the flowers are many standing together, vpon the toppes of the stalkes, to the number of thirty sometimes vpon one stalke, as I haue counted them in mine owne Garden, and sometimes more, euery one hauing a longer foot

foote stalkethen the former, and of as pale a yellowish colour almost as the field Primrose, with yellow spots at the botome of the leaues, as the ordinary hath, and of as sweet a sent.

*10. Paralysis flore viridante simplici.* The single greene Cowslip.

There is little difference in leafe or roote of this from the first Cowslip, the chiefest varietie in this kinde is this, that the leaues are somewhat greener, and the flowers being in all respects like in forme vnto the first kinde, but somewhat larger, are of the same colour with the greene huskes, or rather a little yellower, and of a very small sent; in all other things I finde no diuersitie, but that it standeth much longer in flower before it fadeth, especially if it stand out of the Sunne.

*11. Paralysis flore & calice criso.* Curl'd Cowslips or Gallegaskins.

There is another kinde, whose flowers are folded or crumpled at the edges, and the huskes of the flowers bigger than any of the former, more swelling out in the middle, as it were ribbes, and crumpled on the sides of the huskes, which doe somewhat resemble mens hose that they did weare, and tooke the name of Gallegaskins from thence.

*12. Paralysis flore geminato odorato.*  
Double Cowslips one within another, or Hose in Hose.

The only difference of this kinde from the ordinary field Cowslip is, that it beareth one single flower out of another, which is as a greeke huske, of the like sent that the first hath, or somewhat weaker.

*13. Paralysis flore flavo simplici inodoro absque calicibus.* Single Oxe lippe.

This kinde of Cowslip hath leaues much like the ordinary kinde, but somewhat smaller: the flowers are yellow like the Cowslip, but smaller, standing many vpon a stalke, but bare or naked, that is, without any huske to containe them, hauing but little or no sent at all, nor differing in any thing else from the ordinary Cowslip.

*14. Paralysis flore geminato inodora.* Double Oxelips Hose in Hose.

As the former double Cowslip had his flowers one within another, in the very like manner hath this kinde of Cowslip or Oxelippe, sauing that this hath no huske to containe them, no more then the former single Oxelippe hath, standing bare or naked, of the very same bignesse each of them, and of the same deepe yellow colour with it, hauing as small a sent as the former likewife.

We haue another of this kinde, whose leaues are somewhat larger, and so are the flowers also, but of a paler yellow colour.

*15. Paralysis inodora calicibus diffectis.* Oxelips with iagged huskes.

This kinde differeth not from the first Oxelip in the smalnesse of the greene leaues, but in the flower, which standing many together on a reasonable high stalke, and being very small and yellow, scarce opening themselues or layde abroade as it, hath a greene huske vnder each flower, but diuided into sixe severall small long peeces.

*16. Paralysis flore fastuo.* The Frantick, or Foolish Cowslip:  
Or Iacke an apes on horse backe.

We haue in our gardens another kinde, not much differing in leaues from the former Cowslip, and is called Fantastike or Foolish, because it beareth at the toppe of the stalke a bush or tuft of small long greene leaues, with some yellow leaues, as it were peeces of flowers broken, and standing among the greene leaues. And sometimes

some stalkes among those greene leaues at the toppe (which are a little larger then when it hath but broken peeces of flowers) doe carry whole flowers in huskes like the single kinde.

17. *Paralyss minor flore rubro.* Red Birds eyes.

This little Cowslippe (which will hardly endure in our gardens, for all the care and industrie we can vse to keepe it) hath all the Winter long, and vntill the Spring begin to come on, his leaues so closed together, that it seemeth a small white head of leaues, which afterwards opening it selfe, spreadeth round vpon the ground, and hath small long and narrow leaues, snipt about the edges, of a pale greene colour on the vpper-side, & very white or mealy vnderneath, among these leaues rise vp one or two stalks, small & hoary, halfe a foot high, bearing at the top a bush or tuft of much smaller flowers, standing vpon short foot stalkes, somewhat like vnto Cowslips, but more like vnto the Beares eares, of a fine reddish purple colour, in some deeper, in others paler, with a yellowish circle in the bottomes of the flowers, like vnto many of the Beares eares, of a faint or small sent: the seede is smaller than in any of the former kindes, and so are the rootes likewise, being small, white and threddy.

18. *Paralyss minor flore albo.* White Birds eyes.

This kinde differeth very little or nothing from the former, sauing that it seemeth a little larger both in leafe and flower, and that the flowers hereof are wholly white, without any great appearance of any circle in the bottome of them, vnaesse it be well obserued, or at least being nothing so conspicuous, as in the former.

*Flore geminato.* These two kindes haue sometimes, but very seldom, from among the middle of the flowers on the stalke, sent ou another small stalke, bearing flowers theron likewise.

19. *Paralyss bortensis flore pleno.* Double Paigles or Cowslips.

The double Paigle or Cowslip hath smaller and darker greene leaues then the single kinde hath, and longer stalkes also whereon the leaues doe stand: it beareth diuers flowers vpon a stalke, but not so many as the single kinde, euery one whereof is of a deeper and fairer yellow colour then any of the former, standing not much aboue the brimmes of the huskes that hold them, consisting of two or three rowes of leaues set round together, which maketh it shew very thicke and double, of a prettie small sent, but not heady.

20. *Paralyss flore viridante pleno.* Double greene Cowslips.

This double greene Cowslip is so like vnto the single greene kinde formerly expressed, that vntill they be neare flowring, they can hardly be distinguished: but when it is in flower, it hath large double flowers, of the same yellowish greene colour with the single, and more laid openthen the former double Paigle.

21. *Paralyss flore viridante fusc calamistrato.*

The greene Rose Cowslip, or double greene feathered Cowslip.

There is small difference in the leaues of this double kinde from the last, but that they are not of so darke a greene: the chiefest difference consisteth in the flowers, which are many, standing together at the toppes of the stalkes, but farre differing from all other of these kindes: for euery flower standing vpon his owne stalke, is composed of many very small and narrow leaues, without any huske to containe them, but spreading open like a little Rose, of a pale yellowish greene colour, and without any sent at all, abiding in flower, especially if it stand in a shadowie place out of the sunne, aboue two moneths, almost in as perfect beautey, as in the first weeke.

The Place.

All these kindes as they haue been found wilde, growing in diuers places in

in England, so they haue been transplanted into Gardens, to be there nourished for the delight of their louers, where they all abide, and grow fairer then in their naturall places, except the small Birds eyes, which will (as I said) hardly abide any culture, but growth plentifuly in all the North Countries, in their squally or wet grounds.

The Time.

These doe all flower in the Spring of the yeare, some earlier and some later, and some in the midst of Winter, as they are defended from the colds and frosts, and the mildnesse of the time will permit: yet the Cowslips doe awayes flower later then the Primroses, and both the single and double greene Cowslips latest, as I said in their descriptions, and abide much after all the rest.

The Names.

All these plants are called most vsually in Latine, *Primula veris*, *Primula pratenses*, and *Primula siluarum*, because they shew by their flowring the new Spring to bee comming on, they being as it were the first Embassadours thereof. They haue also diuers other names, as *Herba Paralyss*, *Arthritica*, *Herba Sancti Petri*, *Claues Sancti Petri*, *Verbasculum odoratum*, *Lunaria arthritica*, *Pblomis*, *Alisma siluarum*, and *Alismatis alteram genus*, as Fabius Columna calleth them. The Birds eyes are called of Lobel in Latine, *Paralytica Alpina*, *Sanicula angustifolia*, making a greater and a lesser. Others call them *Sanicula angustifolia*, but generally they are called *Primula veris minor*. I haue (as you see) placed them with the Cowslips, putting a difference betweene Primroses and Cowslips. And some haue distinguished them, by calling the Cowslips, *Primula veris Elatior*, that is, the Taller Primrose, and the other *Humilis*, Lowe or Dwarfe Primroses. In English they haue in like manner diuers names, according to severall Countries, as Primroses, Cowslips, Oxelips, Palsieworts, and Petty Mulleins. The first kindes, which are lower then the rest, are generally called by the name of Primroses (as I thinke) throughout England. The other are diuersly named; for in some Countries they call them Paigles, or Palsieworts, or Petty Mulleins, which are called Cowslips in others. Those are vsually called Oxelips, whose flowers are naked, or bare without huskes to containe them, being not so sweete as the Cowslip, yet haue they some little sent, although the Latine name doth make them to haue none. The Frantick, Fantastike, or Foolish Cowslip, in some places is called by Country people, Iacke an Apes on horse-backe, which is an vsuall name with them, giuen to many other plants, as Daifies, Marigolds, &c. if they be strange or fantastical, differing in the forme from the ordinary kinde of the single ones. The smallest are vsually called through all the North Country, Birds eyen, because of the small yellow circle in the bottome of the flowers, resembling the eye of a bird.

The Vertues.

Primroses and Cowslips are in a manner wholly vsed in Cephalicall diseases, either among other herbes or flowers, or of themselves alone, to ease paines in the head, and is accounted next vnto Betony, the best for that purpose. Experience likewise hath shewed, that they are profitable both for the Palsie, and paines of the ioynts, ieven as the Beares eares are, which hath caused the names of *Arthritica*, *Paralyss*, and *Paralyties*, to bee giuen them. The iuice of the flowers is commended to cleanse the spots or marks of the face, whereof some Gentlewomen haue found good experience.

## C H A P. XXXVI.

*Pulmonaria*. Lungwort, or Cowslips of Ierusalem.

**A**Lthough these plants are generally more vsed as Pot-herbes for the Kitchen, then as flowers for delight, yet because they are both called Cowslips, and are of like forme, but of much lesse beauty, I haue ioyned them next vnto them, in a distinct Chapter by themselues, and so may passe at this time.

1. *Pulmonaria maculosa*. Common spotted Cowslips of Ierusalem.

The Cowslip of Ierusalem hath many rough, large, and round leaues, but pointed at the ends, standing vpon long foot stalkes, spotted with many round white spots on the vpper sides of the sad greene or browne leaues, and of a grayer greene vnderneath: among the leaues spring vp diuers browne stalkes, a foote high, bearing many flowers at the toppe, very neare resembling the flowers of Cowslips, being of purple or reddish colour while they are buds, and of a darke bleuish colour when they are blowne, standing in brownish greene huskes, and sometimes it hath beeene found with white flowers: when the flowers are past, there come vp small round heads, containing blacke seed: the roote is composed of many long and thicke blacke strings.

2. *Pulmonaria altera non maculosa*. Vnspotted Cowslips of Ierusalem.

The leaues of this other kinde are not much vnlke the former, being rough as they are, but smaller, of a fairer greene colour aboue, and of a whiter greene vnderneath, without any spots at all vpon the leaues: the flowers also are like the former, and of the same colour, but a little more branched vpon the stalkes then the former: the rootes also are blacke like vnto them.

3. *Pulmonaria angustifolia*. Narrow leaved Cowslips of Ierusalem.

The leaues hereof are somewhat longer, but not so broad, and spotted with whitish spots also as the former: the stalk hereof is set with the like long hairy leaues, but smaller, being a foote high or better, bearing at the toppe many flowers, standing in huskes like the first, being somewhat reddish in the bud, and of a darke purplish blew colour when they are blowne open: the seede is like the former, all of them doe well resemble Buglosse and Comfrey in most parts, except the roote, which is not like them, but stringie, like vnto Cowslips, yet blacke.

The Place.

The Cowslips of Ierusalem grow naturally in the Woods of Germany, in diuers places, and the first kinde in England also, found out by John Goodier, a great searcher and louer of plants, dwelling at Maple-durham in Hampshire.

The Time.

They flower for the most part very early, that is, in the beginning of Aprill.

The Names.

They are generally called in Latine, *Pulmonaria*, and *maculosa*, or *non maculosa*, is added for distinction sake. Of some it is called *Sympitium maculosum*, that is, spotted Comfrey. In English it is diuerly called, as spotted Cowslips of Ierusalem, Sage of Ierusalem, Sage of Bethlehem, Lungwort, and

and spotted Comfrey, and it might bee as fitly called spotted Buglosse, whereunto it is as like as vnto Comfrey, as I said before.

The Vertues.

It is much commended of some, to bee singular good for vlcered lungs, that are full of rotten matter. As also for them that spit blood, being boyled and drunke. It is of greatest vse for the pot, being generally held to be good, both for the lungs and the heart.

## C H A P. XXXVII.

1. *Buglossum & Borage*. Buglosse and Borage.

**A**Lthough Borage and Buglosse might as fitly haue bee placed, I confesse, in the Kitchen Garden, in regard they are wholly in a manner spent for Physickall properties, or for the Pot, yet because anciently they haue been enterained into Gardens of pleasure, their flowers hauing been in some respect, in that they haue alwaies been enterposed among the flowers of wemens needle-worke, I am more willing to give them place here, then thrust them into obscurity, and take such of their tribe with them also as may fit for this place, either for beauty or rarity.

The Garden Buglosse and Borage are so well knowne vnto all, that I shall (I doubt) but spend time in wasto to describe them, yet not vsing to passe ouer any thing I name and appropriate to this Garden so sleightly, they are thus to bee knowne: Buglosse hath many long, narrow, hairy, or rough sad greene leaues, among which rise vp two or three very high stalks, branched at the top, whereon stand many blew flowers, consisting of five small round pointed leaues, with a small pointell in the middle, which are very smooth, shining, and of a reddish purple while they are buds, and not blowne open, which being fallen, there groweth in the greene huske, wherein the flower stood, three or four roundish blacke seedes, having that thread or pointell standing still in the middle of them: the roote is blacke without, and whitish within, long, thicke, and full of slimie iuice (as the leaues are also) and perisheth not euery yeaer, as the roote of Borage doth.

2. *Borage*. Borage.

Borage hath broader, shorter, greener, and rougher leaues then Buglosse, the stalkes hereof are not so high, but branched into many parts, whereon stand larger flowers, and more pointed at the end then Buglosse, and of a paler blew colour for the most part (yet sometimes the flowers are reddish, and sometimes pure white) each of the flowers consisting of five leaues, standing in a round hairy whitish huske, diuided into five parts, and haue a small vmbone of fve blackish threads in the middle, standing out pointed at the end, and broad at the bottom: the seed is like the other: the root is thicker and shorter then the roote of Buglosse, somewhat blackish without also, and whitish within, and perisheth after seedetime, but riseth of it owne seede fallen, and springeth in the beginning of the yeaer.

3. *Borrago semper virens*. Euerliuing Borage.

Euerliuing Borage hath many broad greene leaues, and somewhat rough, more resembling Comfrey then Borage, yet not so large as either: the stalkes are not so high as Borage, and haue many small blew flowers on them, very like to the flowers of Buglosse for the forme, and Borage for the colour: the rootes are blacke, thicker then either of them, somewhat more spreading, and not perishing, hauing greene leaues all the Winter long, and therupon tooke his name.

4. *Anchusa*.

## 4. Anchusa. Sea Buglosse or Alkanet.

The Sea Buglosse or Alkanet hath many long, rough, narrow, and darke greene leaues, spread vpon the ground (yet some that growe by the Sea side are rather hoarie and whitish) among these leaues riseth vp a stalke, spread at the toppe into many branches, whereon stand the flowers in tufts, like vnto the Garden Buglosse, or rather Comfrey, but lesser; in some plants of a reddish blew colour, and in others more red or purplish, and in others of a yellowish colour: after which come the seedes, very like vnto Buglosse, but somewhat longer and paler: the roote of most of them being transplanted, are somewhat blackish on the outside, vntill the later end of Summer, and then become more red: for those that grow wilde, will be then so red, that they will give a very deepe red colour to those that handle them, which being dried keepe that red colour, which is vsed to many purposes; the roote within being white, and having no red colour at all.

## 5. Limonium Rauwolfij. Marsh Buglosse.

This Limonium (which I referre here to the kindes of Buglosse, as presuming it is the fittest place where to insert it) hath many long, narrow, and somewhat rough leaues lying vpon the ground, waued or cut in on both sides, like an Indenture, somewhat like the leaues of Ceterach or Miltwast, among which rise vp two or three stalkes, somewhat rough also, and with thin skinnes like wings, indented on both sides thereof also, like the leaues, hauing three small, long, rough, and three square leaues at every ioynt where it brancheth forth; at the toppe whereof stand many flowers vpon their foote stalkes, in such a manner, as is not seene in any other plant, that I know: for although that some of the small winged foot stalkes are shorter, and some longer, standing as it were flatwise, or all on one side, and not round like an vmbell, yet are they even at the toppe, and not one higher than another; each of which small foote stalkes doe bear foure or fve greenish heads or huskes, ioyned together, out of each of which doe arise other pale or bleaké blew stiffe huskes, as if they were flowers, made as it were of parchment, which hold their colour after they are dry a long time; and out of these huskes likewise, doe come (at feuerall times one after another, and not all at onetime or together) white flowers, consisting of fve small round leaues, with some white threds in the middle: after these flowers are past, there come in their places small long seede, inclosed in many huskes, many of those heads being idle, not yeelding any good seede, but chaffe, especially in our Countrey, for the want of sufficient heate of the Sunne, as I take it: the roote is small, long, and blackish on the outside, and perisheth at the first approach of Winter.

## The Place.

Borage and Buglosse grow onely in Gardens with vs, and so doth the *Semper virens*, his originall being vnknowne vnto vs. Alkanet or Sea Buglosse groweth neare the Sea, in many places of France, and Spaine, and some of the kindes also in England. But the Limonium or Marsh Buglosse groweth in Cales, and Malacca in Spaine, and is found also in Syria, as Rauwolfius relateth: and in other places also no doubt; for it hath beeene sent vs out of Italie, many years before eyther Guillaume Boel found it in Cales, or Clusius in Malacca.

## The Time.

Borage and Buglosse doe flower in Iune, and Iuly, and sometimes sooner, and so doth the euer-living or never dying Borage, but not as Gerard saith, flowing Winter and Summer, whereupon it should take his name, but leaues flowing in Autumne, and abideth greene with his leaues all the Winter,

1. *Pulmonaria latifolia maculata*. Cowslips of Jerusalem. 2. *Pulmonaria angustifolia*. Narrow-leaved Cowslips of Jerusalem. 3. *Borago*, Borage. 4. *Borage semper virens*. Everliving Borage. 5. *Anchusa*. Sea Buglosse. 6. *Limonium Rauwolfij*. Marsh Buglosse.

ter, flowring the next Spring following. The other flower not vntill July, and so continue, especially the Marshe Buglosse vntill September bee well spent, and then giueth seede, if early frosts ouertake it not; for it seldome comemeth to be ripe.

#### The Names.

Our ordinary Borage by the consent of all the best moderne Writers, is the true *Buglossum* of Dioscorides, and that our Buglosse was vnkowne to the ancients. The *Borago semper virens*, Lobel calleth *Buglossum semper vires*, that is, Euer-living, or greene Buglosse: but it more resembleth Borage then Buglosse; yet because Buglosse abideth greene, to auoyde that there should not be two *Buglossa semper virens*, I had rather call it Borage, then Buglosse. Anchusa hath diuers names, as Dioscorides setteth downe, And some doe call it *Eucus herba*, from the Greeke word, because the roote giuing so deepe a colour, was vsed to dye or paint the skinne. Others call it *Buglossum Hispanicum*, in English Alkanet, and of some Orchanet, after the French. Limonium was found by Leonhartus Rauwolfius, neere vnto Ioppa, which he setteth downe in the second Chapter of the third booke of his trauayles, and from him first knowne to these parts: I haue, as you see, referred it to the kindes of Buglosse, for that the flowers haue some resemblance vnto them, although I know that *Limonium genninum* is referred to the Beetes. Let it therefore here finde a place of residence, vntill you or I can finde a fitter; and call it as you thinke best, eyther Limonium as Rauwolfius doth, or Marshe Buglosse as I doe, or if you can adde a more proper name, I shall not be offended.

#### The Vertues.

Borage and Buglosse are held to bee both temperate herbes, beeing vsed both in the pot and in drinke that are cordiall, especially the flowers, which of Gentlewomen are candid for compifts. The Alkanet is drying, and held to be good for wounds, and if a peece of the roote be put into a little oyle of Peter or Petroleums, it giueth as deepe a colour to the oyle, as the Hypericon doth or can to his oyle, and accounted to be singular good for a cut or greene wound.

The Limonium hath no vfe that wee know, more then for a Garden; yet as Rauwolfius saith, the Syrians vfe the leaues as fallats at the Table.

### C H A P. XXXVIII.

#### *Lychnis. Campions.*

Here bee diuers sorts of Campions, as well tame as wilde, and although some of them that I shall here entreate of, may peraduenture be found wilde in our owne Countrey, yet in regard of their beautifull flowers, they are to bee respected, and nourfed vp with the rest, to furnish a garden of pleasure; as for the wilde kindes, I will leaue them for another discourse.

##### 1. *Lychnis Coronaria rubra simplex.* The single red Rose Campion.

The single red Rose Campion hath diuers thicke, hoary, or woolly long greene leaues, abiding greene all the winter, and in the end of the spring or beginning of summer, shoothe forth two or three hard round woolly stalkes, with some ioynts thereon, and at euery ioynt two such like hoary greene leaues as those below, but smaller, diuersly branched at the toppe, hauing one flower vpon each severall long foot stalk, consisting

consisting of fife leaues, somewhat broade and round pointed, of a perfect red crimfon colour, standing out of a hard long round huske, ridged or crested in foure or fife places; after the flowers are fallen there come vp round hard heads, wherein is contained small blackish seed: the roote is small, long and wooddy, with many fibres annexed vnto it, and shooteth forth anew oftentimes, yet perisheth often also.

##### 2. *Lychnis Coronaria alba simplex.* The white Rose Campion.

The white Rose Campion is in all things like the red, but in the colour of the flower, which in this is of a pure white colour.

##### 3. *Lychnis Coronaria albescens sive incarnata maculata & non maculata.*

The blush Rose Campion spotted and not spotted.

Like vnto the former also are these other sorts, hauing no other difference to distinguish them, but the flowers, which are of a pale or bleake whitish blush colour, especially about the brims, as if a very little red were mixed with a great deale of white, the middle of the flower being more white; the one being spotted all ouer the flower, with small spots and streakes, the other not hauing any spot at all.

##### 4. *Lychnis Coronaria rubra multiplex.* The double red Rose Campion.

The double red Rose Campion is in all respects like vnto the single red kinde, but that this beareth double flowers, consisting of two or three rowes of leaues at the most, which are not so large as the single, and the whole plant is more tender, that is, more apt to perish, then any of the single kindes.

##### 5. *Lychnis Chalcedonica flore simplici miniatu.* Single Nonesuch, or Flower of Bristol, or Constantinople.

This Campion of Constantinople hath many broad and long greene leaues, among which rise vp sundry stiffe round hairy ioynted stalkes three foot high, with two leaues every ioynt: the flowers stand at the toppes of them, very many together, in a large tuft or vmbell, consisting of fife small long leaues, broade pointed, and notched-in in the middle, of a bright red orange colour, which being past, there come in their places small hard whitish heads or seede vessels, containing blacke seede, like vnto the seede of sweet Williams, and hauing but a small sent; the roote is very stringie, fastening it selfe very strongly in the ground, whereby it is much encreased.

Of the single kinde there is also two or three other sorts, differing chiefly in the colour of the flowers. The one is pure white. Another is of a blush colour wholly, without variation. And a third is very variable, for at the first it is of a pale red, and after a while groweth paler, vntill in the end it become almost fully white; and all these diversities of the flowers are sometimes to bee seene on one stalke at one and the same time.

##### 6. *Lychnis Chalcedonica flore miniatu pleno.* Double Flower of Bristol, or Nonesuch.

This glorious flower being as rare as it is beautifull, is for rootes beeing stringie, for leaues and stalkes being hairy and high, and for the flowers growing in tufts, altogether like the first single kinde: but herein consisteth the chiefeſt difference, that this beareth a larger vmbell or tuft of flowers at the toppe of the stalke, euery flower consisting of three or foure rowes of leaues, of a deeper orange colour then it, which addeth the more grace vnto it, but passeth away without bearing seede, as most other double flowers doe, yet recompenceth that defect with encrease from the roote.

##### 7. *Lychnis plumaria silvestris simplex & multiplex.* The feathered wilde Campion single and double.

The leaues of this wilde Campion are somewhat like the ordinary white wilde Campion

Campion, but not so large, or rather resembling the leaues of sweete Williams, but that they grow not so close, nor so many together: the stalkes haue smaller leaues at the ioynts then those belowe, and branched at the toppes, with many pale, but bright red flowers, iagged or cut in on the edges, like the feathered Pinke, whereof some haue taken it to be a kinde, and some for a kinde of wilde William, but yet is but a wilde Campion, as may be obserued, both by his huske that beareth the flowers, and by the grayish roundish seede, being not of the Family of Pinkes and Gillowers, but (as I said) of the Campions: the roote is full of strings or fibres.

*Stere plante.*  
The double kinde is very like vnto the single kinde, but that it is lower and smaller, and the flowers very double.

8. *Lycchnis silvestris flore pleno rubro.* Red Batchelours buttons.

The double wilde Campion (which of our Countrey Gentlewomen is called Batchelours buttons) is very like both in rootes, leaues, stalkes, and flowers vnto the ordinary wilde red Campion, but somewhat lesser, his flowers are not iagged, but smooth, and very thicke and double, so that most commonly it breaketh his short huske, wherein the flower standeth on the one side, feldome hauing a whole huske, and are of a reddish colour.

9. *Lycchnis silvestris flore albo pleno.* White Batchelours buttons.

As the leaues of the former double Campion was like vnto the single kinde that had red flowers, so this hath his leaues like vnto the single white kinde, differing in no other thing from it, but in the doublenesse of the flowers, which by reason of the multiplicity of leaues in them thrusting forth together, breaketh his huskes wherein the flowers doe stand, as the other doth, and hath scarce one flower in many that is whole.

10. *Ocymoides arborea semper vires.* Strange Baffil Campion.

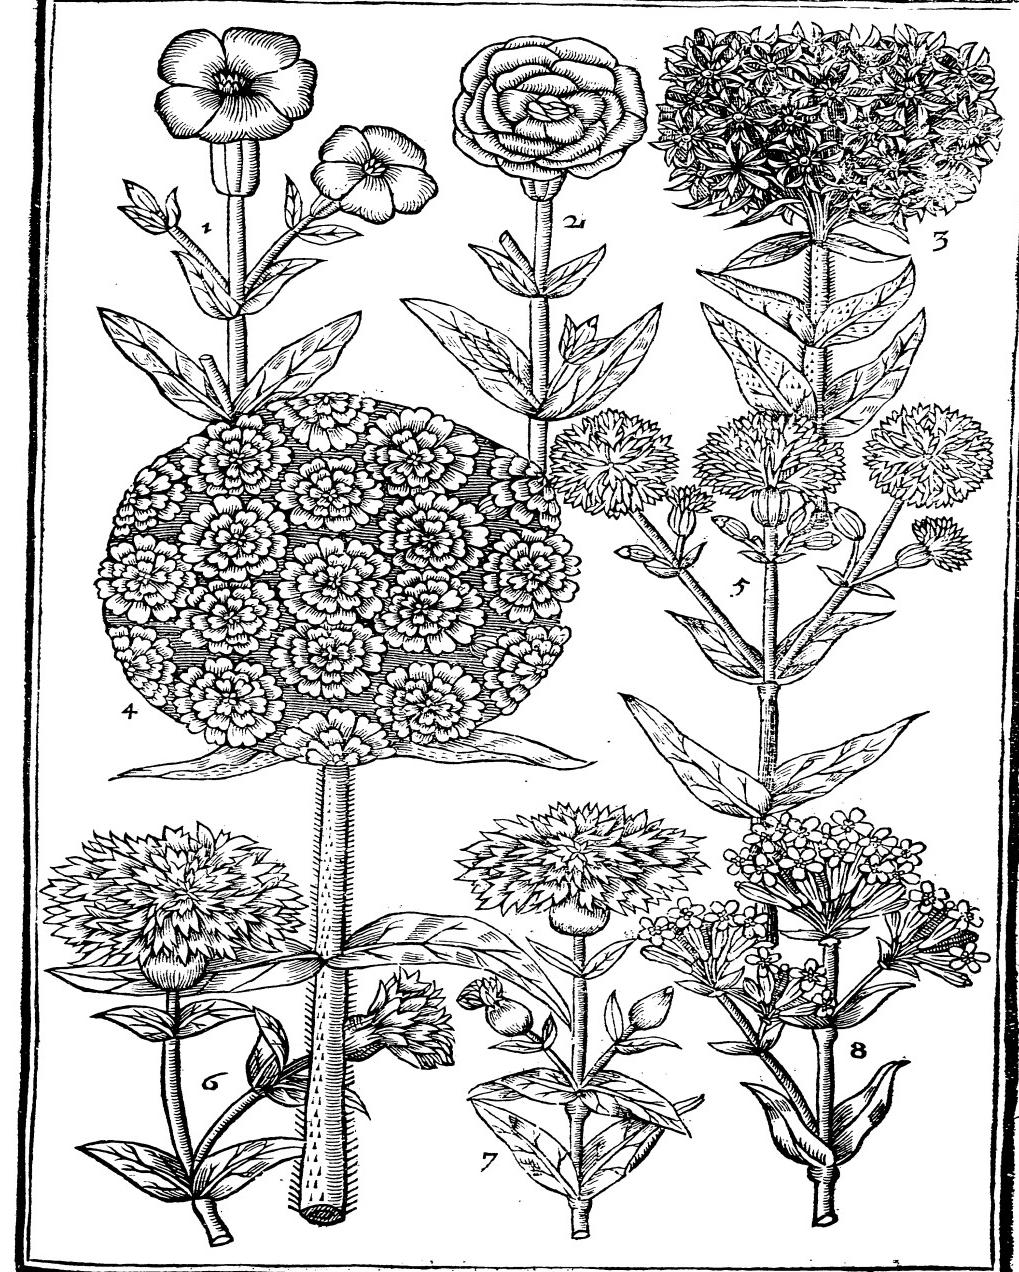

This Strange Campion (for thereunto it must bee referred) shooteth forth many round, whitish, wooddy, but brittle stalkes, whereon stand diuers long, and somewhat thicke leaues, set by couples, narrow at the bottome, and broader toward the point, of a very faire greene and shining colour, so that there is more beauty in the greene leaues, which doe so alwaies abide, then in the flowers, which are of a pale red or blushe colour, consisting of fve small long broad pointed leaues, notched in the middle, which doe not lye close, but loofly as it were hanging ouer the huskes: after the flowers are past, there come heads that containe blackish seede: the roote is small, hard, white, and threadie.

11. *Muscipula Lobeli fine Ben rubrum Monspeliensem.* Lobels Catch Flie.

I must needs insert this small plant, to finish this part of the Campions, whereunto it belongeth, being a pretty toy to furnish and decke out a Garden. It springeth vp (if it haue beeone once sowne and suffered to shed) in the later end of the yeare most commonly, or else in the Spring with fve or six small leaues, very like vnto the leaues of Pinkes, and of the same grayish colour, but a little broader and shorter, and when it beginneth to shooe vp for flower, it beareth smaller leaues on the clammy or viscous stalkes (fit to hold any small thing that lighteth on it) being broad at the bottome compassing them, and standing two at a ioynt one against another: the topes of the stalkes are diuersly branched into severall parts, every branch hauing diuers small red flowers, not notched, but smooth, standing out of small, long, round, stript huskes, which after the flowers are past, containe small grayish seede: the roote is small, and perisheth after it hath giuen seede; but riseth (as is before said) of its owne seede, if it be suffered to shed.

The Place.

The Rose Campions, Flowers of Bristow, or None such, the Baffil Cam-  
pion,

1. *Lycchnis Coronaria simplex.* Single Rose Campion. 2. *Lycchnis Coronaria rubra multiplex.* The double red Rose Campion. 3. *Lycchnis Chaledonica simplex.* Single None such, or flower of Bristow. 4. *Lycchnis Chaledonica flore pleno* Double None such, or flower of Bristow. 5. *Lycchnis plumeria multiplex.* Pleasant in sight. 6. *Lycchnis Gusafri flore pleno rubro.* Red Batchelours Buttons. 7. *Lycchnis silvestris flore pleno albo.* White Batchelours Buttons. 8. *Muscipula Lobeli fine Ben rubrum Monspeliensem.* Lobels Catch Flie.

## The Garden of pleasant Flowers.

pion, and the Catch Flie, haue been sent vs from beyond the Seas, and are only nurſed vp in Gardens with vs; the other Campions that are double, haue been naturally ſo found double wilde (for no art or industry of man, that euer I could be affiſed of to be true, be it by neuer ſo many repetitions of transplantations, and planetiſtall obſeruations (as I haue ſaid in the beginning of this worke) could bring any flower, ſingle by nature, to become double, notwithstanding many affirmations to that purpoſe, but whatioeuer hath been found wilde to be double, nature her ſelue, and not art hath ſo produced it) and being brought into Gardens, are there encreaſed by ſlip-ping, and parting the roote, because they giue no ſeede.

### The Time.

All of them doe flower in the Summer, yet none before May.

### The Names.

The firſt kindes are called *Lychnides ſatine*, and *coronarie*, in English generally Rose Campions. The next is called *Lychnis Chalcedonica*, and *Byzantina*; in English, of ſome Nonesuch, and of others Flower of Bristow, and after the Latine, Flower of Constantinople, becauſe it is thought the ſeede was firſt brought from thence; but from whence the double of this kinde came, we cannot tell. The names of the others of this kinde, both ſingle and double, are ſet downe with their deſcriptions. The feathered Campions are called *Armoraria pratinis*, and *Flos Cuculi*, and of Cluſius and others thought to be *Odontitis Plini*. Some call them in English Crow-flowers, and Cuckowe-flowers; and ſome call the double hereof, The faire Maide of France. The Baſſil Campions were ſent ouer among many other ſeedes out of Italy, by the name of *Ocimoides arborea ſemper vires*. *Arborea*, becauſe the ſtalke is more wooddy and durable then other Campions: And *ſemper vires*, becauſe the leaues abide greene Winter and Summer. Cluſius calleth it *Lychnis ſemper vires*, becauſe it is certainly a Champion. The laſt is diuerſly called of Authors; Lobel calleth it *Muscipula*: Others *Armoraria altera*: Dodonaeus *Armerius flos quartus*. Cluſius *Lychnis ſilueſtris altera*, in his Spanish obſeruations, and *prima* in his History of plants, and ſaith, the learned of Salmantica in Spaine called it, *Berubrum*, as Lobel ſaith, they of Mompelier doe alſo: and by that name I received it firſt out of Italy. It hath the name of Catch Flie, of *Muscipula* the Latine word, becauſe the ſtalkes in the hot Summer dayes haue a certaine viscous or clammy humour vpon them, whereby it eaſily holdeth (as I ſaid before) whatſoever ſmall thing, as Flies, &c. liȝteth vpon it.

### The Vertues.

We know none in theſe dayes, that putteth any of theſe to any Phyſicall uſe, although ſome haue in former times.

### C H A P. XXXIX.

#### *Keiri ſue Leucoium luteum*. Wall-flowers, or Wall Gilloflowers.

There are two ſorts of Wall-flowers, the one ſingle, the other double, and of each of them there is likewile ſome diſferences, as ſhall be ſhewed in their deſcriptions.

1. *Keiri*

## The Garden of pleasant Flowers.

#### 1. *Keiri ſue Leucoium luteum ſimplex vulgare*. Common ſingle Wall-flowers.

The common ſingle Wall-flower which groweth wilde abroad, and yet is brought into Gardens, hath ſundry ſmall, narrow, long, and darke greene leaues, ſet without order vpon ſmall round whitish wooddy ſtalkes, which beare at the tops diuers ſingle yellow flowers one aboue another, every one hauiing four leaues a pece, and of a very ſweete ſent: after which come long pods, containing reddiſh ſeede: the roote is white, hard and thready.

#### 2. *Keiri ſue Leucoium luteum ſimplex maius*. The great ſingle Wall-flower.

There is another ſort of ſingle Wall-flower, whose leaues as well as flowers are much larger then the former: the leaues being of a darker and ſhining greene colour, and the flowers of a very deepe gold yellow colour, and viually broader then a twen-ty ſhilling pece of gold can couer: the ſpike or toppe of flowers alſo much longer, and abiding longer in flower, and much ſweeter likewile in ſent: the pods for ſeede are thicker and shorter, with a ſmall point at the end: this is flower to encrease into branches, as alſo to be encreaſed by the branches, and more tender to be preſerued; for the hard frosts doe cauſe it to periſh, if it be not defended from them.

#### 3. *Keiri ſimplex flore albo*. White Wall-flower.

This Wall-flower hath his leaues as greene as the great kinde, but nothing ſo large: the flowers ſtand at the toppe, but not in ſo long a ſpike, and coniſteth of four leaues, of a very white colour, not much larger then the common kinde, and of a faint or weaker ſent: the pods are nothing ſo great as the former great one: this is more eaſie to be propagated and encreaſed alio, but yet will require ſome care in defending it from the colds of the Winter.

#### 4. *Keiri ſue Leucoium luteum vulgare flore pleno*. Common double Wall-flowers.

This ordinary double Wall-flower is in leaues and ſtalke very like unto the firſt ſingle kinde, but that the leaues hereof are not of ſo deepe a greene colour: the flowers ſtand at the top of the ſtalkes one aboue another, as it were a long ſpike, which flower by degrees, the lauor firſt, and ſo vpwards, by which it is a long time in flowering, and is very double, of a gold yellow colour, and very ſweete.

#### 5. *Keiri ſue Leucoium luteum alteram flore pleno*. Pale double Wall-flowers.

We haue another ſort of this kinde of double Wall-flower, whose double flowers ſtand not ſpike-fashion as the former, but more open ſpread, and doe all of them blowe open at one time almoſt, and not by degrees as the other doth, and is of a paler yellow colour, not differing in any thing elle, except that the greene leaues hereof are of a little paler greene then it.

#### 6. *Keiri ſue Leucoium luteum maius flore pleno ferrugineo*.

##### Double red Wall-flowers.

We haue also another ſort of double Wall-flower, whose leaues are as greene, and almoſt as large as the great ſingle yellow kinde, or full as bigge as the leaues of the white Wall-flower: the flowers hereof are not much larger then the ordinary, but are of a darker yellow colour then the great ſingle kinde, and of a more browniſh or red colour on the vnderſide of the leaues, and is as it were ſtriped.

#### 7. *Keiri ſue Leucoium maximum luteum flore pleno*.

##### The greatest double yellow Wall-flower.

This great double Wall-flower is as yet a stranger in England, and therefore what I

here write is more vpon relation (which yet I beleue to be most true) then vpon sight and speculation. The leaues of this Wall-flower are as greene and as large, if not larger then the great single kinde: the flowers also are of the same deepe gold yellow colour with it, but much larger then any of the former double kindes, and of as sweet a sent as any, which addeth delight vnto beauty.

## The Place.

The first single kind is often found growing vpon old wals of Churches, and other houses in many places of England, and also among rubbish and stones. The single white and great yellow, as well as all the other double kindes, are nourised vp in Gardens onely with vs.

## The Time.

All the single kindes doe flower many times in the end of Autumnne, and if the Winter be milde all the Winter long, but especially in the moneths of February, March, and Aprill, and vntill the heate of the Spring doe spend them: but the other double kindes doe not continue flowring in that manner the yeare throughout, although very early sometimes, and very late also in some places.

## The Names.

They are called by diuers names, as *Viola lutea*, *Leucoium luteum*, and *Keiri*, or *Cheiri*, by which name it is chiefly knowne in our Apothecaries shops; because there is an oyle made thereof called *Cheirnum*: In English they are vsually calld in these parts, Wall-flowers: Others doe call them Bee-flowers; others Wall-Gilloflowers, Winter-Gilloflowers, and yellow Stocke-Gilloflowers; but we haue a kinde of Stocke-Gilloflower that more fitly deserueth that name, as shall be shewed in the Chapter following.

## The Vertues.

The sweetnesse of the flowers causeth them to be generally vsed in Nose-gayes, and to decke vp houses; but physically they are vsed in diuers maners: As a Conserue made of the flowers, is vsed for a remedy both for the Appoplexie and Palsie. The distilled water helpeþ well in the like manner. The oyle made of the flowers is heating and resoluing, good to ease paines of strained and pained sinewes.

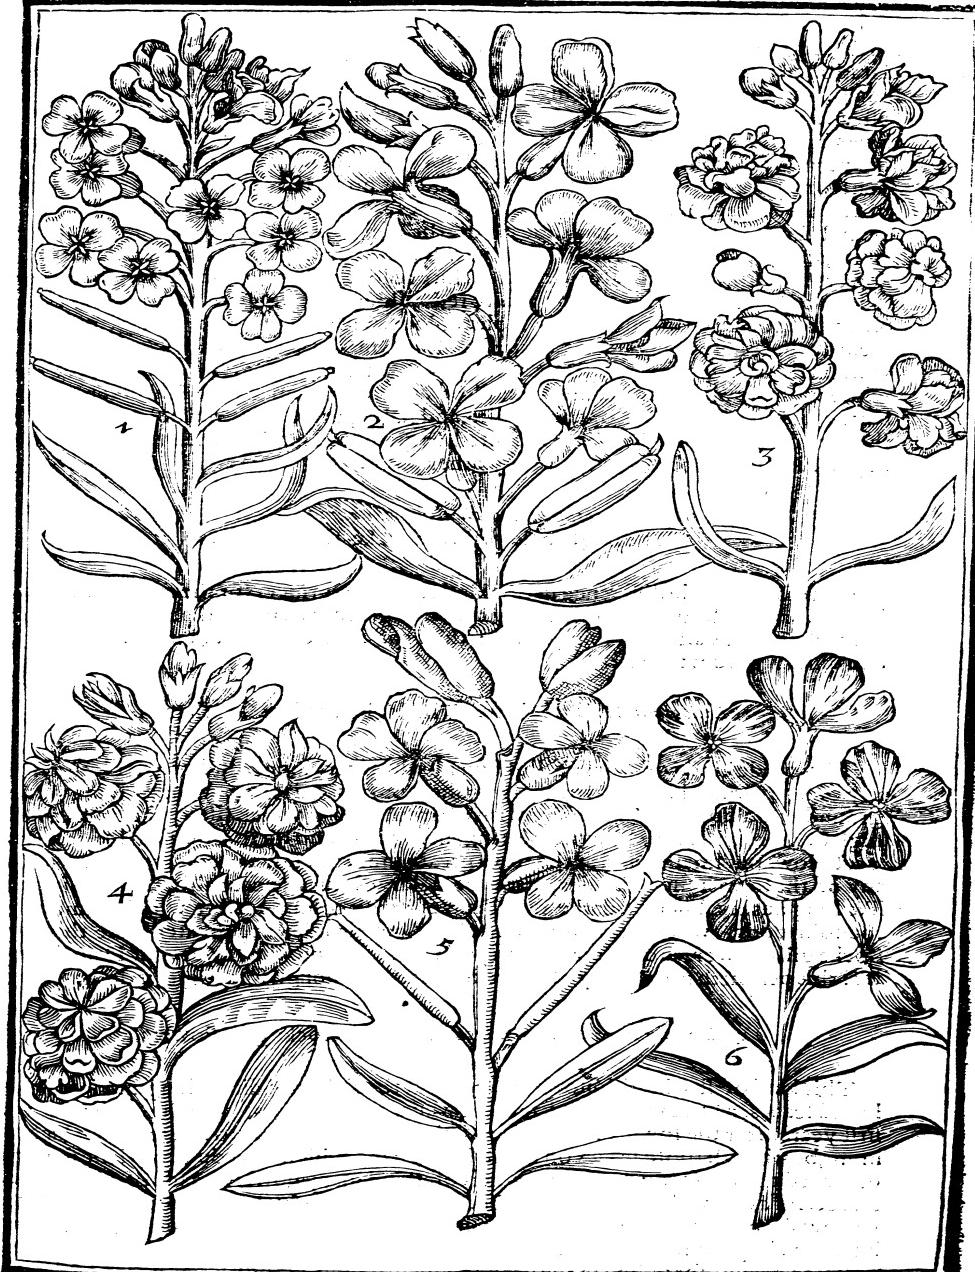

## CHAP. XL.

*Leucoium*. Stocke-Gilloflower.

**T**here are very many sorts of Stocke-Gilloflowers both single and double, some of the fields and mountaines; others of the Sea marshes and medowes, and some nourised vp in Gardens, and there preferued by feede or slippe, as each kinde is aptest to bee ordered. But because some of these are fitter for a generall History then for this our Garden of Pleasure, both for that diuers haue no good sent, others little or no beauty, and to be entreated of onely for the variety, I shall spare so many of them as are not fit for this worke, and onely set downe the rest.

1. *Leucoium simplex sativum diversorum colorum.*  
Garden Stocke-Gilloflowers single of diuers colours.

These single Stocke-Gilloflowers, although they differ in the colour of their flowers,

1. Keiri sive *Leucoium luteum vulgare*. Common Wall-flowers. 2. Keiri sive *Leucoium luteum minus simplex*. The great single Wall-flower. 3. Keiri sive *Leucoium luteum flore pleno vulgare*. Ordinary double Wall-flowers. 4. Keiri minus flore pleno ferrugineo. The great double red Wall-flower. 5. *Leucoium sativum simplex*. Single Stocke-Gilloflowers. 6. *Leucoium sativum simplex flore striato*. Single striped Stocke-Gilloflowers.

ers, yet are in leafe and manner of growing, one so like vnto another, that vntill they come to flower, the one cannot be well knowne that beareth red flowers, from another that beareth purple ; and therfore one description of the plant shall serue, with a declaration of the sundry colours of the flowers. It riseth vp with round whitish woody stalkes, two, three, or foure foot high, whereon are set many long, and not very broad, soft, and whitish or grayish greene leaues, somewhat round pointed, and parted into diuers branches, at the topes whereof grow many flowers, one aboue another, smelling very sweet, consisting of foure small, long, and round pointed leaues, standing in small long huskes, which turne into long and flat pods, sometimes halfe a foote long, wherein is contained flat, round, reddish seedes, with grayish ringes or circles about them, lying flat all along the middle rib of the pod on both sides : the roote is long, white, and woody, spreading diuers wayes. There is great variety in the colours of the flowers : for some are wholly of a pure white colour, others of a most excellent crimson red colour, others againe of a faire red colour, but not so bright or liuely as the other, some also of a purplish or violet colour, without any spot, marke, or line in them at all. There are againe of all these colours, mixed very variably, as white mixed with small or great spottes, strakes or lines of pure or bright red, or darke red, and white with purple spots and lines ; and of eyther of them whose flowers are almost halfe white, and halfe red, or halfe white, and halfe purple. The red of both sorts, and the purple also, in the like manner spotted, striped, and marked with white, differing neyther in forme, nor substance, in any other point.

2. *Leucoium sativum albido luteum simplex.*  
The single pale yellow Stocke-Gilloflower.

There is very little difference in this kind from the former, for the manner of growing, or forme of leaues or flower. Only this hath greener leaues, and pale yellow almost white flowers, in all other things alike : this is of no great regard, but only for rarity, and diuersity from the rest.

3. *Leucoium Melancholicum.* The Melancholick Gentleman.

This wilde kinde of stocke gilloflower hath larger, longer and greener leaues then any of the former kindes, vnuenly gaffed or sinuated on both edges lying on the ground, and a little rough or hairy withall: from among which rise vp the stalkes, a yard high or more, and hairy likewise, bearing theron here and there some such like leaues as are below, but smaller, and at the top a great number of flowers, as large or larger then any of the former single kindes, made of 4. large leaues a peece also, standing in such like long huskes, but of a darke or sullen yellowish colour : after which come long roundish pods, wherein lye somewhat long but rounder and greater seede then any stocke gilloflower, and nearer both in pod and seede vnto the *Hesperis* or Dames Violets : this perisheth not vsually after seede bearing, although sometimes it doth.

4. *Leucoium marinum Syriacum.* Leuant stocke gilloflowers.

This kind of stocke gilloflower riseth vp at the first with diuers long and somewhat broad leaues, a little vnuenly dented or waued on the edges, which so continue the first yeare after the sowing : the stalke riseth vp the next yeare to bee two foot high or more, bearing all those leaues on it that it first had, which then do grow lesse sinuated or waued then before : at the top whereof stand many flowers, made of foure leaues a peece, of a delayed purple colour, but of a small sent which turne into very long and narrow flat pods, wherein are contained flat seed like the ordinary stocke gilloflowers, but much larger and of a darke or blackish browne colour : the root is white, and growtheth deepe, spreading in the ground, but growing woody when it is in seede, and perisheth afterwards.

5. *Leuco-*

5. *Leucoij alterum genus, flore tenui multiplici quam simplici ex seminio oriundum.*  
Another sort of Stocke gilloflowers bearing as well double as singel flowers from seede.

This kinde of Stocke gilloflower differeth neyther in forme of leaues, stalkes, nor flowers from the former, but that it oftentimes groweth much larger and taller ; so that whosoeuer shall see both these growing together, shall scarce discerne the difference, only it beareth flowers, eyther white, red or purple, wholly or entire, that is, of one colour, without mixture of other colour in them (for so much as euer I haue obserued, or could vnderstand by others) which are eyther singel, like vnto the former, or very thicke and double, like vnto the next that followeth ; but larger, and growing with more store of flowers on the long stalke. But this you must vnderstand withall, that those plants that beare double flowers, doe beare no seede at all, and is very seldom increased by slipping or cutting, as the next kinde of double is : but the onely way to haue double flowers any yeare, (for this kinde dyeth every winter, for the most part, after it hath borne flowers, and seldom is preserued) is to saue the seedes of those plants of this kinde that bear singel flowers, for from that seede will rise, some that will beare singel, and some double flowers, which cannot bee distinguished one from another, I meane which will be singel and which double, vntill you see them in flower, or budde at the least. And this is the onely way to preserue this kinde : but of the seed of the former kinde was neuer known any double flowers to arise, and therefore you must be carefull to marke this kinde from the former.

6. *Leucoium flore pleno dinervorum colorum.*  
Double Stocke Gillowflowers of diuers' colours.

This other kinde of Stocke gilloflower that beareth onely double flowers, groweth not so great, nor spreadeth his branches so farre, nor are his leaues so large, but is in all things smaller, and lower, and yet is woody, or shrubby, like the former, bearing his flowers in the like manner, many vpon a long stalke, one aboue another, and very double, but not so large as the former double, although it grow in fertile soyle, which are eyther white, or red, or purple wholly, without any mixture, or else mixed with spots and stripes, as the single flowers of the first kinde, but more variably, and not in all places alike, neuer bearing seede, but must be increased, only by the cutting of the young sproutes or branches, taken in a fit season : this kinde perisheth not, as the former double kinde doth, so as it bee defended in the winter from the extreme frosts, but especially from the snow falling, or at the least remaining vpon it.

7. *Leucoium sativum luteum flore pleno.*  
The double yellow Stocke Gilloflower.

This double yellow Stocke gilloflower is a stranger in Englan, as faras I can learne, neyther haue I any further familiaritie with him, then by relation from Germany, where it is affirmed to grow only in some of their gardens, that are curious louers of these delights, bearing long leaues somewhat hoary or white, (and not greene like vnto the Wallflower, whereto elfe it might be thought to be referred) like vnto the Stock gilloflowers, as the stalkes and branches also are, and bearing faire double flowers, of a faire, but pale yellow colour. The whole plant is tender, as the double Stock gilloflowers are, and must be carefully preserued in the winter from the coldes, or rather more then the last double, lest it perish.

The Place.

The single kindes, especially some of them, grow in Italie, and some in Grecce, Candy, and the Isles adiacent, as may be gathered out of the veries in Plutarches Booke *De Amore fraterno*:

*Inter Echinopodas velut, asperam & inter Ononis,  
Inter dam cresent molia Leucosia.*

Which sheweth, that the soft or gentle stocke gilloflowers doe sometimes grow among rough or prickly Furze and Cammocke. The other sorts are only to be found in gardens.

#### The Time.

They flower in a manner all the yeare throughout in some places, especially some of the singele kindes, if they stand warme, and defended from the windes and cold : the double kindes flower sometymes in Aprill, and more plentifully in May, and Iune ; but the double of feed, flowreth vsually late, and keepeth flowring vnto the winter, that the frostes and colde mistes doe pull it downe.

#### The Names.

It is called *Leucoium*, & *Viola alba* : but the name *Leucoium* (which is in English the white Violet) is referred to diuers plants ; we call it in English generally, Stocke gilloflower, (or as others doe, Stocke gillouer) to put a difference betweene them, and the Gilloflowers and Carnations, which are quite of another kindred, as shall be shewne in place conuenient,

#### The Vertues.

These haue no great vse in Physick that I know : only some haue vsed the leaues of the singele white flowered kinde with salt, to be laid to the wretches of them that haue agues, but with what good successe I cannot say, if it happen well I thiake in one (as many such things else will) it will fayle in a number.

#### CHAP. XLI.

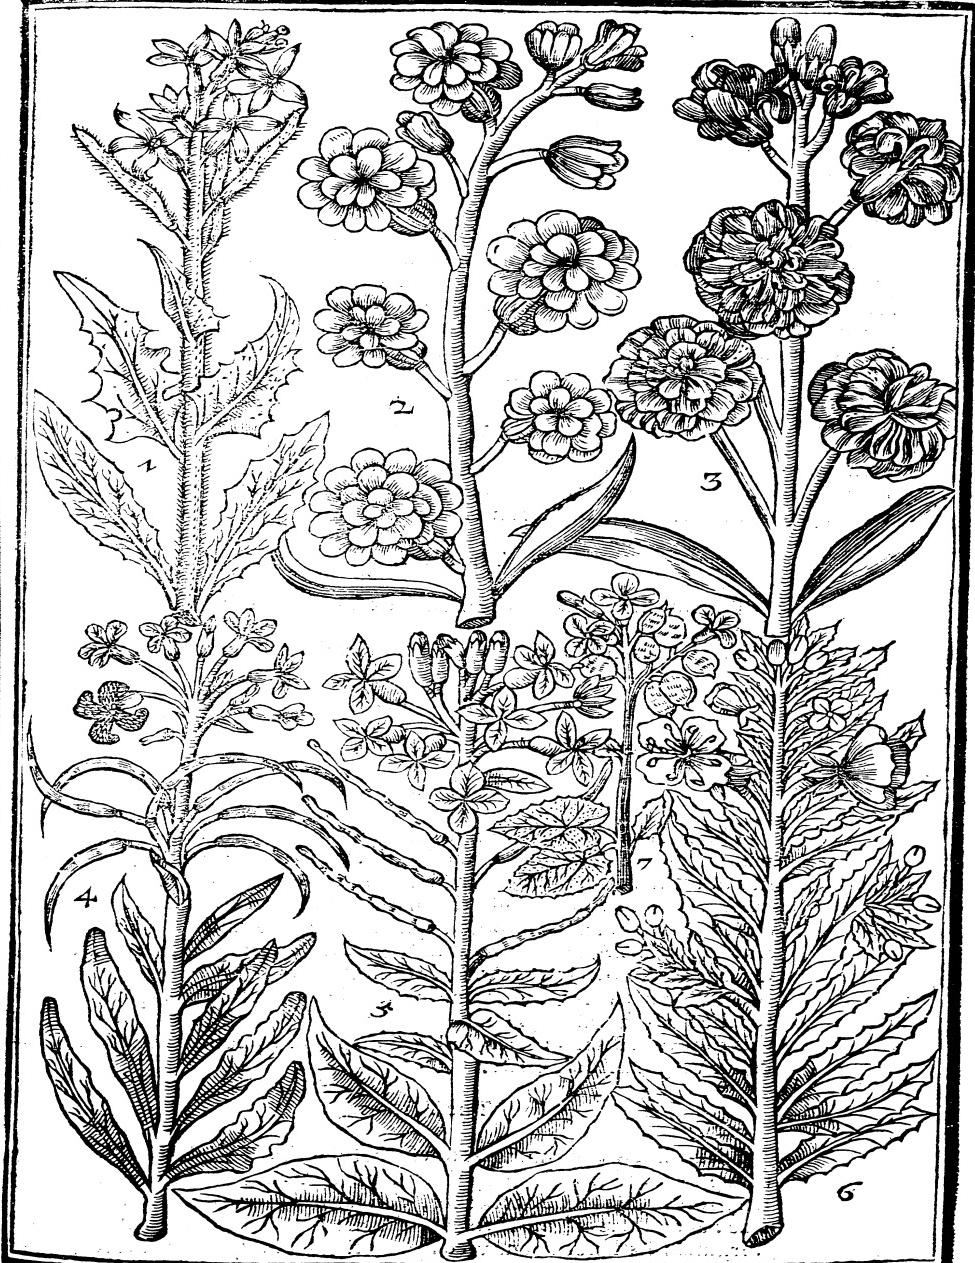

##### 1. *Hesperis*, sive *Viola Matronalis*. Dames Violets, or Queenes Gilloflowers.

**T**He ordinary Dames Violets, or Queenes Gilloflowers, hath his leaues broader, greener, and sharper pointed, then the Stocke gilloflowers, and a little endented about the edges : the stalkes grow two foot high, bearing many greene leaues vpon them, smaller then those at the bottome, and branched at the toppe, bearing ma ny flowers, in fashion much like the flowers of stocke gilloflowers, consisting of four leaues in like manner, but not so large, of a faint purplish colour in some, and in others white, and of a pretty sweet sent, especially towards night, but in the day time little or none at all : after the flowers are past, there doe come small long and round pods, wherein is contained, in two rowes, small and long blacke seede : the roote is wholly composed of stringes or fibres, which abide many yeares, and springeth fresh stalkes every yeare, the leaues abiding all the Winter.

##### 2. *Hesperis Pannonica*. Dames Violets of Hungary.

The leaues of this Violet are very like the former, but smoother and thicker, and not at all indented, or cut in on the edges : the flowers are like the former, but of a full pale colour, turning themselves, and seldom lying plaine open, haing many purple veines, and streakes running through the leaues of the flowers, of little or no sent in the day time, but of a very sweete sent in the euening and morning ; the seedes are alike also, but a little browner.

3 *Lysimachia*

1. *Leucoium Melancholicum*. Sullen Stocke-Gilloflowers. 2. *Leucoium sativum flore pleno*. Double Stocke-Gilloflowers. 3. *Leucoium auron flore pleno vario*. Party coloured Stocke-Gilloflowers. 4. *Leucoium maximum Syriacum*. Leuant Stocke-Gilloflowers. 5. *Hesperis vulgaris*. Dames Violets or Winter Gilloflowers. 6. *Lysimachia latifolia Virginiana*. The tree Primrose of Virginia. 7. *Viola Lukaris sive Bolbitach*. The white Satin flower.

## The Garden of pleasant Flowers.

3. *Lysimachia Latea filiformis Virgiana*. The tree Primrose of Virginia.

Vnto what tribe or kindred I might referre this plant, I haue stood long in suspence, in regard I make no mention of any other *Lysimachia* in this work: lefft therfore it shoulde lose all place, let me ranke it here next vnto the Dames Violets, although I confess it hath little affinity with them. The first yeare of the sowing the seede it abideth without any stalke or flowers lying vpon the ground, with diuers long and narrow pale greene leaues, spread oftentimes round almost like a Rose, the largest leaues being outermost, and very small in the middle: about May the nextyeare the stalke riseth, which will be in Summer of the height of a man, and of a strong bigge size almost to a mans thumbe, round from the bottome to the middle, where it groweth crested vp to the toppe, into as many parts as there are branches of flowers, every one hauing a small leafe at the foote thereof: the flowers stand in order one aboue another, round about the tops of the stalks, every one vpon a short foot-stalke, consisting of foure pale yellow leaues, smelling somewhat like vnto a Primrose, as the colour is also (which hath caused the name) and standing in a greene huske, which parteth it selfe at the toppe into fourre parts or leaues, and turne themselves downwards, lying close to the stalke: the flower hath some chives in the middle, which being past, there come in their places long and cornered pods, sharpe pointed at the vpper end, and round belowe, opening at the toppe when it is ripe into fve parts, wherein is contained small brownish seed: the roote is somewhat great at the head, and wooddy, and branched forth diversly, which perisheth after it hath borne seede.

### The Place.

The two first grow for the most part on Hils and in Woods, but with vs in Gardens onely.

The last, as may be well vnderstood by the title, came out of Virginia.

### The Time.

They flower in May, June, and July.

### The Names.

The name of *Hesperis* is imposed by most Herbarists vpon the two first plants, although it is not certainly knowne to be the same that Theophrastus doth make mention of, in his sixth Booke and twenty ffe Chapter *de cauis plantarum*: but because this hath the like effects to smell best in the euening, it is (as I said) imposed vpon it. It is also called *Viola Marina Maritimalis*, *Hyemalis*, *Damascena* and *Muscarella*: In English, Dames Violets, Queens Gilloflowers, and Winter Gilloflowers.

The last hath his Latine name in the title as is best agreeing with it, and for the English, although it be too foolish I confess, yet it may passe for this time till a fitter be giuen, vnlesse you please to follow the Latine, and call it Virginia Loose-strife.

### The Vertues.

I neuer knew any among vs to vse these kindes of Violets in Physicke, al though by reason of the sharpe biting taste, Dodonaeus accouergeth the ordinary sort to be a kinde of Roker, and saith it prouoketh sweating, and vringing: and others affirme it to cut, digest, and cleanse tough flegme. The Virginian hath not beeene vsed by any that I know, either inwardly or outwardly.

## The Garden of pleasant Flowers.

### CHAP. XLII.

*Viola Lunaris sive Bolbonach*. The Satten flower.

**V**Nto the kindes of Stocke-Gilloflowers I thinke fitteſt to adioyne these kindes of Satten-flowers, whereof there are two sorts, one freuent enough in all our Countrie, the other is not ſo common.

1. *Viola Lunaris vulgaris*. The common white Satten flower.

The firſt of theſe Satten flowers, which is the moft common, hath his leaues broad belowe, and pointed at the end, ſnipt about the edges, and of a darke greene colour: the stalkes are round and hard, two foot high, or higher, diuided into many branchies, ſet with the like leaues, but ſmaller: the tops of the branchies are beset with many purpliſh flowers, like vnto Dames Violets, or Stocke-Gilloflowers, but larger, beeing of little ſent: after the flowers are paſt, there come in their places round flat thin cods, of a darke colour on the outside, but hauing a thinn middle ſkinne, that is white and cleare ſhining, like vnto very pure white Satten it ſelfe, whereon lyethe flat and round browniſh ſeede, ſomewhat thickē and great: the rootes periſh when they haue giuen their ſeede, and are ſomewhat round, long, and thickē, reſemblin the rootes of *Lilium non bulbiferum*, or Day Lilly, which are eaten (as diuers other rootes are) for Sallets, both in our owne Country, and in many places beſide.

2. *Viola Lunaris altera seu peregrina*. Long living Satten flower.

This ſecond kinde hath broader and longer leaues, then the firſt, the stalkes alſo are greener and higher, branching into flowers, of a pale purple colour, almoft white, conſiſting of fourre leaues in like manner, and ſmelling prett ſweete, bearing ſuch like pods, but longer and ſlenderer then they: the rootes are composed of many long ſtrings, which dye not as the firſt, but abide, and ſhoot out new stalkes every yeare.

### The Place.

The firſt is (as is ſaid) frequent enough in Gardens, and is found wilde in ſome places of our owne Country, as Maſter Gerard reporteth, whereof I neuer could be certaiſtly assured, but I haue had it often ſent mee among other ſeedes from Italy, and other places. The other is not ſo common in Gardens, but found about Watford, as he ſaith alſo.

### The Time.

They flower in Aprill or May, and ſometimes more early.

### The Names.

It hath diuers names, as well in English as in Latine; for it is called moft vually *Bolbonach*, and *Viola Lunaris*: Of ſome *Viola latifolia*, and of others *Viola Peregrina*, and *Lunaria Greca*, *Lunaria maior*, and *Lunaria odorata*, and is thought to be *Tbla pi Cratene*: In English, White Satten, or Satten flower: Of ſome it is called Honesty, and Penny-flower.

### The Vertues.

Some doe vſe to eate the young rootes hereof, before they runne vp to flower, as Rampions are eaten with Vinegar and Oyle, but wee know no Phyſicall vſe they haue.

## CHAP. XLIII.

*Linum silaestre & Linaria*. Wilde Flaxe and Tode Flaxe.

**A**lthough neither the manured Line or Flaxe is a plant fit for our Garden, nor many of the wilde sorts, yet there are some, whose pleasant and delightfull aspect doth entertaine the beholders eyes with good content, and those I will set downe here for varietie, and adioyne vnto them some of the *Linarias*, or Tode Flaxe, for the neare affinity with them.

1. *Linum silaestre flore albo*. Wilde Flaxe with a white flower.

This kinde of wilde Flaxe riseth vp with diuers slender branches, a foote high or better, full of leaues, standing without order, being broader and longer then the manured Flaxe: the tops of the branches haue diuers faire white flowers on them, composed of fve large leaues a peece, with many purple lines or strikes in them: the seede vessell as well as the seede, is like vnto the heads and seede of the manured Flaxe: the rootes are white strings, and abide diuers yeares, springing fresh branches and leaues every yeare, but not vntill the Spring of the yeare.

2. *Linum silaestre latcum*. Wilde Flaxe with a yellow flower.

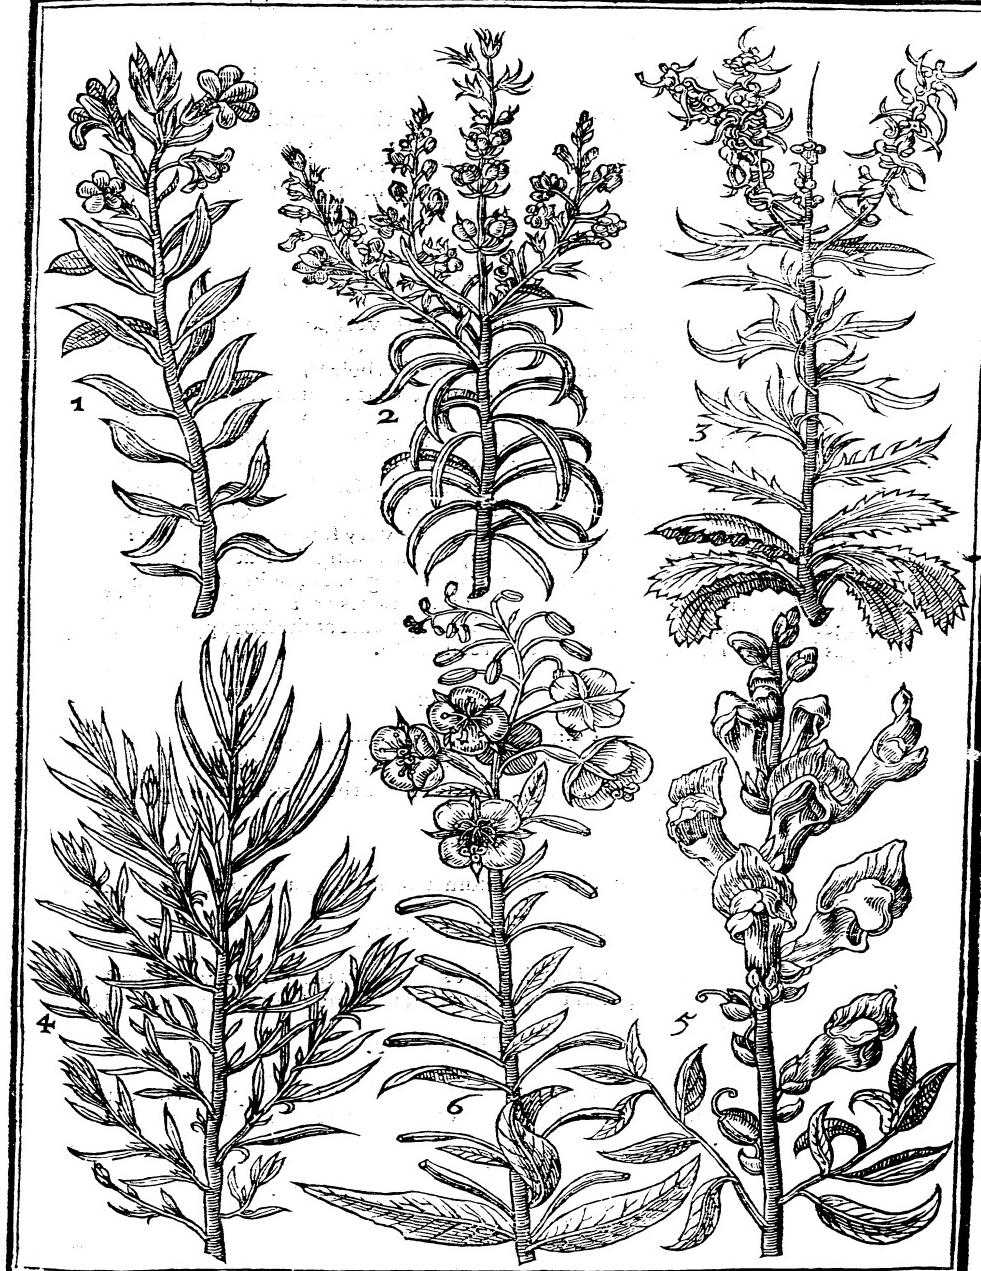

This wilde Flaxe doth so well resemble a kinde of St. Johns wort, that it will soone deceiue one that doth not aduisedly regard it: For it hath many reddish stalkes, and small leaues on them, broader then the former wilde Flaxe, but not so long, which are well stord with yellow flowers, as large as the former, made of fve leaues a peece, which being past, there come small flattish heads, containing blackish seede, but not shining like the former: the rootes hereof dye not every yeare, as many other of the wilde kindes doe, but abide and shooe out every yeare.

3. *Linaria purpurea*. Purple Tode Flaxe.

This purple Tode Flaxe hath diuers thicke, small, long, and somewhat narrowish leaues, snipt about the edges, of a whitish greene colour, from among which rise vp diuers stalkes, replenished at the tops with many small flowers, standing together one aboue another spike-fashion, which are small and somewhat sweete, while they are fresh, fashioned somewhat like the common Tode flaxe that groweth wilde abroad almost euery where, but much smaller, with a gaping mouth, but without any crooked spurre behind, like vnto them, sometimes of a sad purple neare vnto a Violet, and sometimes of a paler blew colour, haning a yellow spot in the middle or gaping place: after the flowers are past, there come small, hard, round heads, wherein are contained small, flat, and grayish seede: the roote is small, and perisheth for the most part every yeare, and will spring againe of it owne sowing, if it be suffered to shed it selfe, yet some hard Winters haue killed the seede it shold seeme, in that sometimes it faileth to spring againe, and therefore had neede to be sowne anew in the Spring.

4. *Linaria purpurea odorata*. Sweete purple Tode Flaxe.

The lower leaues of this purple Tode Flaxe are nothing like any of the rest, but are long and broad, entended about the edges, somewhat resembling the leaues of the greater wilde white Daifie: the stalk is set at the botome with such like leaues, but a little more diuided and cut in, and still smaller and smaller vpward, so that the vp-permost leaues are very like the common Tode Flaxe, the toppe whereof is branched, hauing diuers small flowers growing along vpon them, in fashion and colour almost like the last described Tode Flaxe, but not altogether so deepe a purple: the heads and seedes are very like the former, but that the seede of this is reddish: the flowers in

1. *Linum silaestre flore albo*. Wilde Flaxe with a white flower. 2. *Linaria purpurea flore cerasia*. Purple Tode Flaxe. 3. *Linaria purpurea odorata*. Sweete purple Tode Flaxe. 4. *Scoparia flore Belvidere Italorum*. Broome Tode Flaxe. 5. *Antirrhinum majus*. The greater Snapdragon. 6. *Chamenerion flore delphini*. The willow flower.

in their naturall hot Countries haue a fine sent, but in these colder, little or none at all: the rootes are small and threadie, and perish after they haue flowered and seeded.

5. *Linaria Valentia*. Tode Flaxe of Valentia.

This Spanish Tode Flaxe hath three or fourre thicker and bigger stalkes then the former, bearing small broad leaues, like vnto the small Century, two or three together at a ioynt, round about the lower end of the stalkes, but without any order vpwards, at the topes whereof stand many flowers, in fashyon like vnto the common kinde, and almost as large, of a faire yellow colour, but the gaping mouth is downie, and the spurre behinde of a purplish colour.

6. *Scoparia sive Belvidere Italorum*. Broome Tode Flaxe.

Although this plant haue no beautifull flowers, yet because the greene plant full of leaues is so delightfull to behold, being in Italy and other places planted not only in their Gardens, but set likewise in pots to furnish their Windowes, and euen with vs also hath growne to be so dainty a greene bush, that I haue thought it worthy to be among the delights of my Garden; the description whereof is as followeth: This pleasant Broome Flaxe riseth vp most vsually with one straight vpright square stalke, three foote and a halfe high or better in our Gardens, branching it selfe out diuers waies, bearing thereon many long narrow leaues, like the Garden Line or Flaxe, very thicke set together, like vnto a bush, or rather like vnto a faire greene Cyppresse tree, growing broad belowe, and spire-fashion vpwards, of a very faire greene colour: at the seuerall ioynts of the branches, towards the tops, and among the leaues, there come forth small reddish flowers, not easilly seene nor much regarded, being of no beauty, which turne into small round blackish gray seede: the rootes are a number of blackish strings set together, and the whole plant perisheth every yeare at the first approach of any cold ayre, as if it never had beeene so faire a greene bush.

**The Place.**

These kindes of wilde Flaxe doe growe naturally in diuers places, some in Germany, some in Spaine, and some in Italy. Those that delight in the beauty of natures variety, doe preserue them, to furnish vp the number of pleasant aspects.

**The Time.**

They all flower in the Summer moneths, and soone after perfect their seede.

**The Names.**

Their names are sufficiently expressed in their titles, yet I must give you to vnderstand, that the last is called of some *Linaria magna*, and of others *Oryza*.

**The Vertues.**

The wilde Flaxe hath no medecinable vertue appropriate vnto it that is knowne. The Tode Flaxe is accounted to be good, to cause one to make water.

**C H A P. XLIV.**

*Antirrhinum*. Snapdragon.

There is some diuersity in the Snapdragons, some being of a larger, and others of a lesser stature and bignesse; and of the larger, some of one, and some of another colour, but because the small kinde are of no beautie, I shall at this time only entreate of the greater sorts.

1. *Antirrhinum album*. White Snapdragon.

The leaues of these Snapdragons (for I doe vnder one description comprehend the rest) are broader, longer, and greener then the leaues of the Garden Flaxe, or of the wilde Flaxe set confusedly vpon the tender greene branches, which are spread on all sides, from the very bottome, bearing at the topes many flowers, somewhat resembling the former Tode Flaxe, but much larger, and without any heele or spurre, of a faire white colour, with a yellow spot in the mouth or gaping place: after the flowers are past, there come vp in their places hard round seede vessels, fashioned somewhat like vnto a Calues head, the snout being cut off, wherein is contained small blacke seede: the rootes are many white strings, which perish in most places after they haue giuen seede, notwithstanding any care or paines taken with them to preserue them alive, and yet they will abide in some places where they are defended in the Winter.

2. *Antirrhinum purpureum sive roseum*. Purple Snapdragon.

The purple Snapdragon is in stalkes, leaues, and flowers altogether like the former, and as large and great in cuery part, or greater; the only difference is, that this beareth pale Stammell or Rose coloured flowers, with a yellow spot in the mouth, and sometimes of a paler colour, almost blush.

3. *Antirrhinum variegatum*. Variable Snapdragon.

This variable kinde is somewhat lesse, and tenderer then the last described, haing also a reddish or blush coloured flower, lesser then the former, but much bigger then the middle kinde of Snapdragon (which is not set downe in this worke) the yellow spot in the mouth of it hath some white about it, and extending to both sides of the spot: the heads and seede are like the former: the rootes are smaller, but neuer will abide after they haue giuen flowers and seede.

4. *Antirrhinum luteum*. Yellow Snapdragon.

There is likewise another of these kindes, that beareth leaues as large as any of the former, & very faire yellow flowers, as large likewise as they, not differing in any thing else from the first; let not any therefore imagine this to be a *Linaria* or Tode Flaxe: for all parts are answerable vnto the Snapdragons.

**The Place.**

All these are nourished with vs in our Gardens, although in Spaine and Italy they are found growing wilde.

**The Time.**

They flower for the most part the second yeare after the sowing, from Aprill vntill July, and the seede is quickly ripe after.

## The Garden of pleasant Flowers.

### The Names.

The name *Antirrhinum* is vsually giuen to this plant, although it fully agreeth not eyther with the description of Dioscorides, or Theophrastus: It hath also diuers other names in Latine, as *Orantum*, *Canis cerebrum* or *Leonis*, *Leo herba*, &c. In English Calues inout, from the forme of the seede vesseles, and Snapdragon, or Lyons mouth, from the forme of the flowers.

### The Vertues.

They are seldome or neuer vsed in Phyfick by any in our dayes.

### CHAP. XLV.

#### *Chamenerium flore delphini*. The Willowe flower.

**T**HIS plant riseth vp with many strong, woddy, round, brownish great stalkes, three or fourte foote high, beset here and there without order, with one broad and long whitish greene leafe at a ioynt, somewhat like vnto a *Lysimachia*, or Willow herbe, as also vnto a Peach leafe, but larger and longer: at the toppe of the bratches stand many flowers one aboue another, of a pale reddish purple colour, consisting of fve leaves, spread open with an heele or spurre behinde them, with many yellow threads in the middle, much larger then any flower of the Larkes spurres, and smelling somewhat sweete withall; it beareth a shew of long pods with seede, but I could neuer obserue the seede: the rootes are like the rootes of *Lysimachia*, or the ordinary yellow Loose-strife, or Willowe herbe, but greater: running and spreading vnder ground, and shooting vp in many places, whereby it filleth a ground that it likes quickly: the stalkes dye downe euery yere, and spring againe in many places farre asunder.

### The Place.

Wee haue not knowne where this Willowe flower groweth naturally, but we haue it standing in an out corner of our Gardens, to fill vp the number of delightfull flowers.

### The Time.

It flowreth not vntill May, and abideth a long while flowring.

### The Names.

It may seeme to diuers, that this is that plant that Dodonæus called *Pseu-dolysimachiam purpuream minus*, and Lobel seemeth by the name of *Dolphi-nium buccinum* to aime at this plant, but withall calleth it *Chamenerium Gessert*, and giueth the same figure that Dodonæus hath for his *pseudolysimachium*: But that is one kinde of plant (which hath smaller and shorter stalkes, and very narrow long leaues, whose flowers stand vpon long slender cods, full of downe, with reddish seede, like vnto the *Lysimachia siliquea silvestris*, and rootes that abide many yeaeres, but creepe not) and this is another, much greater, whose true figure is not extant in any Author that I know. It is vsually called *Chamenerium flore delphini*; but the name of *Dolphinium buccinum* in my minde may not so conueniently be applied vnto it. It is called in English, The Willowe flower, for the likenesse of the leaues, and the beauty and respect of the flowers.

The

## The Garden of pleasant flowers.

### The Vertues.

There is no vse hereof in Phyfick that euer I could learne, but is onely cherisched among other sorts of flowers, that serue to decke and set forth a Garden of varieties.

### CHAP. XLVI.

#### *Agathaea*. Colombines.

**T**HERE are many sorts of Colombines, as well differing in forme as colour of the flowers, and of them both single and double carefully nourished vp in our Gardens, for the delight both of their forme and colours.

#### 1. *Aquilegia vulgaris flore simpli*. Single Colombines.

Because the whole difference of these Colombines standeth in the varieties of the forme, and colour of the flowers, and little in the leaves, I shall not neede to make arie repetitions of the description of them, seeing one onely shall suffice for each peculiar kinde. The Colombine hath diuers large spread leaues, standing on long stalkes: every one diuided in seuerall partitions, and roundly entended about the edges, in colour somewhat like the leaues of *Celosia*, that is, of a darke blewish greene colour: the stalkes rise vp sometimes two or three foote high, diuided vsually into many branches, bearing one long diuided leafe at the lowest ioynt above which the flowers growe, every one standing on a long stike, consisting of fve hollow leaues, crooked or horned at the ends, turning backward, the open flower shewing almost like vnto a Cinquefoile, but more hollow: after the flowers are past, there arise small long cods, four or fve together, wherein are contained blacke shining seede: the rootes are thicke and round, for a little space within the ground, and then diuided into branches, ending in many small fibres, abiding many yeaeres, and shooting a fresh every Spring from the round heads, that abide all the Winter. The variety of the colours of these flowers are very much, for some are wholly white, some of a blew or violet colour, others of a blushe or flesh colour, or deepe or pale red, or of a dead purple, or dead murrey colour, as nature listeth to shew it selfe.

#### 2. *Aquilegia vulgaris flore pleno*. Double Colombines.

The double Colombines differ not in leafe or manner of growing from the single, so that vntill they come to flower, they cannot bee discerned one from another, the onely difference is, it beareth very thicke and double flowerets, that is, many horned or crooked hollow leaues set together, and are not so large as the leaues of the single flowers. The variety of colours in this double kinde is as plentiful, or rather more then in the single; for of these there is partly coloured, blew and white, and spotted very variably, which are not in the single kinde, and also a very deepe red, very thicke and double, but a smaller flower, and lesse plentiful in bearing then many of the other double sorts. These double kindes doe giue as good seede as the single kindes doe, which is not obserued in many other plants.

#### 3. *Aquilegia innervis corniculus*. Double inwerted Colombines.

These Colombines are not to be diffinguisched eyther in roote, leaues, or seed from the former, the flowers onely make the difference, which are as double as the former, but that the heeles or horns of these are turned inward, and stand out in the middle of the flowers together: there is not that plentiful variety of colours in this kinde, as there is in the former: for I never saw aboue three or fourte severall colours in this kinde,

kinde, that is, white, purplish, reddish, and a dun or darke ouerworne purplish colour. These double flowers doe likewise turne into pods, bearing seede, continuing his kind, and not varying into the former.

#### 4. *Aquilegia Rosea*. Rose Colombeines.

The leaues and other parts of this kinde of Colombeine, differ little or nothing from the former, the difference consisteth likewise in the flowers, which although they stand in the same manner severall vpon their small stalkes, somewhat more sparingly then the former doe, yet they haue no heele or hornes, eyther inward or outward, or very seldome, but stand sometimes but with eight or tenne smooth small plaine leaues, set in order one by one in a compasse, in a double rowe, and sometimes with four or fift rowes of them, every one directly before the other, like vnto a small thick double Rose layd open, or a spread Marigold: yet sometimes it happeneth, that some of these flowers will haue two or three of the first rowes of leaues without any heele, and the rest that are inward with each of them a piece of a small horne at them, as the former haue: the colours of these flowers are almost as variable, and as variably mixed as the former double kindes. This likewise giueth seede, preseruing his owne kinde for the most part.

#### 5. *Aquilegia degener*. Degenerate Colombeines.

This kinde of Colombeine might seeme to some, to bee but a casuall degeneration, and no true naturall kinde, happening by some cause of transplanting, or otherwise by the art of man: but I haue not so found it, in that it keepeith, and holdeth his own proper forme, which is like vnto the double Rose Colombeine, but that the outermost row of leaues are larger then any of the rest inwardes, and is of a greenish, or else of a purplish greene colour, and is not altogether so apt to giue good seed like the former.

#### The Place.

The single kindes haue beene often found in some of the wooddy mountaines of Germany, as Clusius saith, but the double kindes are chiefly cherisched in gardens.

#### The Time.

They flower not vntill May, and abide not for the most part when June is past, and in the meane time perfecth their seede.

#### The Names.

Coftæus doth call this plant *Pothos* of Theophrastus, which Gaia translateth *Desiderium*. Dalechampius vpon Athenæus, calleth it *Diosanthos*, or *touis flos* of Theophrastus, who in his sixth Booke and seuenth Chapter reckoneth them both, that is, *Diosanthos* and *Pothos*, to be Summer flowers, but severally Dodonæus *Lobberba*, and Gesner *Lecatoforsium*. Fabius Columna in his Phytobasanos, vnto whom Clusius giueth the greatest approbation, referreth it to the *Ioprum* of Dioscorides. All later Writers doe generally call it, eyther *Aquileia*, *Aquilina*, or *Aquilegia*; and we in English, generally (I thinke) through the whole Countrey, Colombeines. Some doe call the *Aquilegia rosea*, *Aquilegia stellata*, The starre Colombeine; because the leaues of the flowers doe stand so directly one by another, besides the doublenesse, that they somewhat represent eyther a Rose or a Starre, and thereupon they giue it the name eyther of a Starre or Rose.

#### The Vertues.

Some in Spaine, as Camerarius saith, vse to eate a peece of the roote here-

1. *Aquilegia simplex*. The single Colombeine. 2. *Aquilegia Rosea multiplo.* The double Colombeine. 3. *Aquilegia versicolor*. The party colored Colombeine. 4. *Aquilegia inversa cornuta*. The double inverted Colombeine. 5. *Aquilegia Rosea sine Stellata*. The Rose or the Starre Colombeine. 6. *Thlaspi album*. White Spanish tufts.

of fasting, many dayes together, to helpe them that are troubled with the stone in the kidneyes. Others vse the decoction, of both herbe and roote in wine, with a little Ambagrise, against those kinds of swoonings, which the Greeks call *ἀσύνταξις*. The seede is vsed for the iaudise, and other obstructions of the liuer. Clusius writheth from the experiance of Franciscus Rapard, a chiefe Physician of Bruges in Flanders, that the seede beaten and drunke is effectuall to women in trauell of childe, to procure a speedy deliuerie, and aduiseth a second draught thereof should betaken if the first succeede not sufficiently.

## C H A P. X L V I I .

*Thalictrum Hispanicum*. Spanish Tufts, or Tufted Colombines.

**F**rom among the diuersities of this plant, I haue selected out two sorts for this my garden, as hauing more beautie then all the rest; leauing the other to be entreated of, where all in generall may be included. I haue in this place inserted them, for the likenesse of the leaues only, being in no other part correspondent, and in a Chapter by themselues, as it is most fit.

*Thalictrum Hispanicum album*. White Spanish tufted Colombines.

These plants haue both one forme, in roote, leafe and flower, and therefore neede but one description. The leaues are both for colour and forme so like vnto Colombines leaues (although lesser and darker, yet more spread, and on larger stalkes) that they may easily deceuse one, that doth not mark them aduisedly; for the leaues are much more diuided, and in smaller parts, and not so round at the ends: the stalkes are round, strong, and three foote high at the least, branching out into two or three parts, with leaues at the severall ioynts of them, at the topes whereof stand many flowers, which are nothing but a number of threds, made like vnto a small round tuft, breaking out of a white skinne, or leafe, which incloseth them, and being vnblowne, shew like vnto little buttons: the colour of these threds or tufts in this are whitish with yellow tips on them, and somewhat purplish at the bottome, hauing a strong but no good sent, and abiding in their beautie (especially if they grow in the shade, and not too hot in the sun) a great while, and then fall away, like shert downe or threds: the seed vessels are three square, containing small, long, and round seede; the rootes are many long yellow stringes, which endure and encrease much.

*Thalictrum Montanum purpureum*. Purple tufted Colombines.

This purple tufted Colombine differeth onely from the former, in that it is not so high nor so large, and that the colour of the flower or tuft is of a blewifh purple colour with yellow tips, and is much more rare then the other.

The Place.

These grow both in Spaine and Italie.

The Time.

They flower in the end of May, or in June, and sometime later.

The Names.

Some doe call them *Thalictrum*, and some *Thalictrum*. Others *Ruta pain-*  
*tria*, and *Ruta pratensis*, and some *Rhabarbarum Monachorum*, or *Pseudo-*  
*rhabarbarum*,

*rhabarbarum*, by reason that the rootes being yellow, haue an opening qualite, and drying as Rubarbe. In English what other fit Names to giue these then I haue expressed in the titles, I know not.

## The Vertues.

The are a little hot and drying withall, good for old Ulcers, as Dioscorides saith, to bring them to cicatrising: in Italy they are vsed against the Plague, and in Saxonye against the iaudise, as Camerarius saith.

## C H A P. X L V I I I .

*Radix cana*. Hollow roote.

**T**He likenesse of the leaues likewise of this plant with Colombines, hath caused mee to insert it next the other, and although some of this kinde bee of small respect, being accounted but foolish, yet let it fill vp a waste corner, that so no place be vnfurnished.

1. *Radix Cava maior flore albo*. The white Hollow roote.

The leaues of this hollow roote breake not out of the ground, vntill the end of March, or seldome before, and are both for proportion and colour somewhat like vnto the leaues of Colombines, diuided into fife parts, indented about the edges, standing on small long foottestalkes of a whitish greene colour, among which rise vp the stalkes, without any leaues from the bottome to the middle, where the flowers shoothe forth one aboue another, with every one a small short leafe at the foote thereof, which are long and hollow, with a spurre behinde it, somewhat like vnto the flowers of Larckes spurres, but hauing their bellies somewhat bigger, and the mouth not so open, being all of a pure white colour: after the flowers are past, arise small long and round cods, wherein are contained round blackish seede: the roote is round and great, of a yellowish browne colour on the outside, and more yellow within, and hollow vnderneath, so that it seemeth but a shell: yet being broken, every part will grow: it abideth greene aboue ground but a small time.

2. *Radix Cava maior flore carneo*. Blush coloured Hollow roote.

The blush Hollow roote is in all things like vnto the former, but onely that the flowers hereof are of a delayed red or purple colour, which we call blush: and sometimes of a very deepe red or purple colour; but very rare to meeete with.

3. *Radix Cana minor, seu Capnos fabacea radice*. Small hollow roote.

This small kinde hath his leaues of a blewifh greene colour, yet greener and smaller then the former, growing more thicke together: the flowers are like in proportion vnto the former in all respects, but lesser, hauing purplish backes, and white bellies: standing closer and thicker together vpon the short stalkes: the roote is folid or firme, round and a little long withall, two being vsually ioyned together, yellowish both within and without: but I haue seen the dry roots that came from beyond Sea hither, that haue beeene as small as hasell nuts, and somewhat flat with the roundnesse, differing from those that growe with vs, whether the nature thereof is to alter by manuring, I know not.

The Place.

The greater kindes Clusius reporteth he found in many places of Hungarie,

tie, and the other parts neere thereunto : the lesser in the lower Germany, or Low Countries, as we call them.

#### The Time.

These are most truely to bee reckoned Vernal plants, for that they rise not out of the ground vntill the Spring bee come in, and are gone likewise before it be past, remaining vnder ground all the rest of the yeare, yet the lesser abideth longer aboue ground then the greater.

#### The Names.

Concerning the former of these, there is a controuersie among diuers, whether it shold be *Thegium* of Theophrastus, or *Eriphium* of Galen, but here is no fit place to traueer those opinions. Some would haue it to bee *Corydalis*, and some referre it to Plinie his *Capnos Cheledonia*, for the likenesse it hath both with Fumererie and Celandine. It is generally called of all moderne Writers, *Radix Cana*, and we in English thereafter, Hollow roote. The lesser for the firmenesse of his round roote, is vsually called, *Capnos fimbriata radice*, and the Dutch men thereafter, *Boontens Hollworstell*: we of the likenesse with the former, doe call it the lesse Hollow roote.

#### The Vertues.

Some by the bitterness doe coniecture (for little prooфе hath beeне had thereof, but in outward cases) that it clenseth, purgeth, and dryeth withall.

### C H A P. X L I X.

#### *Delphinium*. Larkes heeleſ.

**O**F Larkes heeleſ there are two principall kindes, the wilde kinde, and the tame or garden; the wilde kinde is of two sorts, one which is with vs noured vp chiefly in gardens, and is the greatest; the other which is smaller and lower, often found in our plowed landes, and elsewhere: of the former of these wilde sorts, there are double as well as ſingle: and of the tame or more vpright, double alſo and ſingle: and of each of diuers colours, as ſhall be ſet downe.

#### 1. *Delphinium maius sine vulgare*. The ordinary Larkes heeleſ.

The common Larkes heele spreadeth with many branches much more ground then the other, rather leaning or bending downe to the ground, then ſtanding vpright, whereon are ſet many ſmall long greene leaues, finely cut, almoſt like Fennell leaues: the branches end in a long ſpike of hollow flowers, with a long ſpurre behind them, very like vnto the flowers of the Hollow roote laſt deſcribed, and are of diuers feuerall colours, as of a bleuiſh purple colour, or white, or aſh colour or red, paſler or deeper, as alſo party coloured of two colours in a flower: after the flowers are paſt, (which in this kinde abide longer then in the other) there come long round cods, containing very blacke ſeede: the root is hard after it groweth vp to ſeede, ſpreading both abroad and deepe, and perifheth every yeare, vſually raiſing it ſelfe from it own ſowing, as well as from the ſeede ſowne in the ſpring time.

#### 2. *Delphinium vulgare flore pleno*. Double common Larkes heeleſ.

Of this vulgar kinde there is ſome diſference in the flower, although in nothing elſe: the flowers ſtand many vpon a ſtalke like the former, but every one of them are as if

Varietas.

three or four small flowers were ioyned together, with every one his ſpurre behinde, the greatest flower being outermoſt, and as it were containing the reſt, which are of a pale red, or deepe bluſh colour: Another of this kinde will beare his flowers with three or four rows of leaues in the middle, making a double flower with one ſpurre behinde onely: and of this kinde there is both with purple, blew, bluſh, and white flowers, and party coloured alſo, theſe doe all beare ſeed like the ſingle, wherby it is encreaſed every yeare.

#### 3. *Delphinium eructe*. Wilde Larkes ſpurres.

This wilde Larkes ſpurre hath ſmaller and ſhorter leaues, ſmaller and lower branches, and more thinly or ſparſedly growing vpon them, then any of the former: the flowers likewiſe are neyther ſo large as any of the former, nor ſo many growing together, the cods likewiſe haue ſmaller ſeede, and is harder to grow in gardens then any of the former, the moſt vſuall colour hereof is a pale reddiſh or bluſh colour, yet ſometimes they are found both white and blew, and ſometimes mixt of blew and bluſh, variably diſpoſed, as nature can when ſhe liſteth; but are muſt more rare.

#### 4. *Delphinium elatius flore ſimpliſi diuersorum colorum*. Single vpright bearing Larkes heeleſ of many colours.

The diſference betweene this and the laſt is, that the leaues of this are not fully ſo greene, nor ſo large, the ſtalkes grow vpright, to the height of a man, and ſometimes higher, hauing ſome branches thereon, but fewer then the former, and ſtanding likewiſe vpright, and not leaning downe as the former: the topes of the ſtalkes are better ſtored with flowers then the other, being ſometimes two foote long and above, of the ſame faſhion, but not altogether ſo large, but of moſt diuers and ſeveral colours, as white, pale, bluſh, redde deeper or paler, aſhcoloured, purple or violet, and of an ouerworne bleuiſh purple, or iron colour: for of all theſe we haue ſimple, without any mixture or ſpot: but we haue other ſorts, among the ſimple colours, that riſe from the ſame ſeede, and will haue flowers that wil be halfe white, and halfe bluſh or purple, or one leaſe white, and another bluſh or purple, or elſe variably mixed and ſpotted: the ſeede and ſeede veſſels are like the former but larger and harder.

#### 5. *Delphinium elatius flore pleno diuersorum colorum*. Double vpright Larkes heeleſ of many colours.

These double Larkes heeleſ cannot bee knowne from the ſingle of the ſame kinde, vntill they come towards flowring, for there appeare many flowers vpon the ſtalkes, in the ſame manner, and of as many colours almoſt as of the ſingle, except the party coloured, which ſtand like little double Roſes, layd or ſpread broade open, as the Roſe Colombine without any heeleſ behinde them, very delightfull to behold, conſiſting of many ſmall leaues growing together, and after they are fallen there come vp in their places three or four ſmall cods ſet together, wherein is contained here and there (for all are not full of ſeede, as the ſingle kindes) blacke ſeede, like vnto all the reſt, but ſmaller, which being ſownen will bring plants that will beare both ſingle and double flowers againe, and it often happeneth, that it variably altereth in colours from it owne ſowing: for none of them hold conſtantly his owne colour, (ſo farre as euer I could obſerue) but fall into others as nature pleafeth.

#### 6. *Delphinium Hispánicum parnum*. Spanish wilde Larkes ſpurres.

This ſmall Larkes ſpurre of Spaine, hath diuers long and broad leaues next the ground, cut in on both ſides, ſomewhat like vnto the leaſe of a Scabious, or rather that kinde of Stoēbe, which Lobel calleth *Crapina*, for it doth ſomewhat nearely reſemble the ſame, but that this is ſmooth on the edges, and not indented beſides the cuts, as the *Crapina* is, being of a whitish greene colour, and ſomewhat ſmooth and ſoft in handling: among the leaues rifeth vp a whitish greene ſtalke, hauing many ſmaller leaues

leaves vpon it that grow belowe, but not diuided, branching out into many small stalkes, bearing flowers like vnto the wilde Larkes heele, but smaller, and of a blanke colour, which being past, there come vp two or three small pods ioyned together, wherein is blacke seede, smaller and rounder then any of the former: the roote is small and thready, quickly perishing with the first cold that ouertaketh the plant.

The Place.

The greatest or first wilde kinde growe among corne in many countries beyond the Seas, and where corne hath beene sowne, and for his beauty brought and nourished in our Gardens: the lesser wilde kinde in some fields of our owne Country. The Spanish kinde likewise in the like places, which I had among many seedes that Guillaume Boel brought mee out of Spaine. The first double and single haue been common for many yeares in all countries of this Land, but the tall or vpright single kindes haue been entertained but of late yeares. The double kindes are more rare.

The Time.

These flower in the Summer onely, but the Spanish wilde kinde flowreth very late, so that oftentimes in our Country, the Winter taketh it before it can giue ripe seede: the double kindes, as well the vpright as the ordinary or wilde, are very chiose and dainty many times, not yeelding good seede.

The Names.

They are called diuersly by diuers Writers, as *Consolida regalis*, *Calcaria flos*, *Flos regius*, *Buccinum Romanorum*, and of Matthiolus, *Cuminum silaeſtre alterum* *Dioscoridis*: but the most vsuall name with vs is *Delphinium*: but whether it be the true *Delphinium* of *Dioscorides*, or the Poets Hyacinth, or the flower of Ajax, another place is fitter to discusse then this. Wee call them in English Larkes heele, Larkes spurres, Larkes toes or clawes, and Monkeshoods. The last or Spanish kinde came to mee vnder the name of *Delphinium latifolium trigonum*, so stiled eyther from the diuision of the leaues, or from the pods, which come vsually three together. Bauhinus vpon Matthiolus calleth it, *Consolida regalis peregrina parvo flore*.

The Vertues.

There is no vse of any of these in Physicke in these dayes that I know, but are wholly spent for their flowers sake.

CHAP. L.

*Balsamina fuscina*. The Female Balsam Apple.

I Haue set this plant in this place, for some likenesse of the flower, rather then for any other comparison, even as I must also with the next that followeth. This plant riseth vp with a thicke round reddish stalke, with great and bunched ioynnts, being tender and full of iuice, much like to the stalke of Purlane, but much greater, which brancheth it selfe forth from the very ground, into many stalkes, bearing thereon manie long greene leaues, snipt about the edges, very like vnto the Almond or Peach tree leaues; among which from the middle of the stalkes vpwards round about them, come forth vpon severall small short foot-stalkes many faire purplish flowers, of two or three colours in them, fashioned somewhat like the former Larkes heele, or Monks hoods, but that they are larger open at the mouth, and the spurres behinde crooke or bend downewards: after the flowers are past, there come in their places round rough heads,

1. Radix Canna major flore albo. The white flowered Hollow roots. 2. Capnis fabaceæ radice. The small Hollow roots. 3. Delphinium flor. simplici. Single Larkes spurs. 4. Delphinium vulgare flor. media duplo. Larkes spurs double in the middle. 5. Delphinium vulgaris flor. plena. Common Larkes spurs double. 6. Delphinium elatius flor. plena. Double vpright Larkes spurs. 7. Delphinium Hispanicum parvum. Small Spanish Larkes spurs. 8. Balsamina fuscina. The Female Balsam apple. 9. Nasturtium Indicum. Indian Crestes, or yellow Larkes spurs.

heads, pointed at the end, greene at the first, and a little yellower when they bee ripe, containing within them small round blackish seede, which will foone skippe out of the heads, if they be but a little hardly pressed betweene the fingers: the rootes spread themselves vnder ground very much from the toppe, with a number of small fibres annexed thereunto: this is a very tender plant, dying euery yeare, and must bee sowne carefully in a pot of earth, and tended and watered in the heate of Summer, and all little enough to bring it to perfection.

**The Place.**

Wee haue alwaies had the seede of this plant sent vs out of Italy, not knowing his originall place.

**The Time.**

It flowreth from the middle of July, to the end of August: the seed doth seldome ripen with vs, especially if the Summer be backward, so that wee are oftentimes to seeke for new and good seede from our friends againe.

**The Names.**

Some vse to call it *Charantia farnina*, *Balsamina farnina*, *Balsanella*, and *Anguillara*, *Herba Sancte Catharine*. We haue no other English name to call it by, then the Female Balsame Apple, or *Balsamina*.

**The Vertues.**

Some by reason of the name, would attribute the property of Balme vnto this plant, but it is not sufficietly knowne to haue any such; yet I am well perswaded, there may bee some extraordinary quality in so beautifull a plant, which yet lyeth hid from vs.

**C H A P. L I.**

*Nasturtium Indicum*. Indian Cresses, or yellow Larkes heeleſ.

**T**He likenesse (as I said before) of this flower likewise, hauing spurres or heeleſ maketh me ioyne it with the rest, which is of so great beauty and sweetnesſ withall, that my Garden of delight cannot bee vnſurſhied of it. This faire plant ſpreadeth it ſelſe into very many long trayling branches, enterlaced one within another very confuſedly (yet doth it not windē it ſelſe with any claspers about either pole or any other thing, but if you will haue it abide cloſe thereunto, you muſt tye it, or else it will lyē vpon the ground) four or five foot in length at the leaſt, whereby it taketh vp a great deale of ground: the leaues are ſmooth, greene, and as round as the Penniwort that groweth on the ground, without any cut or inciſure therein at all in any part, the ſtalkeſ whereof ſtand in the middle of each leafe, and ſtand at euerie ioynt of the ſtalke, where they are a little reddiſh, and knobbed or bunched out: the flowers are of an excellent gold yellow colour, and grow all along these ſtalkeſ, almost at every ioynt with the leaues, vpon pretty long foote-ſtalkeſ, which are composed of fiue leaues, not hollow or gaping, but ſtanding open each leafe a part by it ſelſe, two of them, that be larger and longer then the other, ſtand aboue, and the other two that are leſſer belowe, which are a little jagged or bearded on both ſides, and the fiſt loweſt: in the middle of each of the three lower leaues (yet ſometimes it is but in two of them) there is a little long ſpot or ſtreake, of an excellent crimson colour, with a long heele or ſpurrie behinde hanging downe: the whole flower hath a fine ſmall ſent, very pleaſing, which being placed in the middle of ſome Carnations or Gillo-flowers

flowers (for they are in flower at the ſame time) make a delicate Tuſſimuffie, as they call it, or Noſegay, both for ſight and ſent: After the flower is paſt, come the ſeede, which are rough or vneuen, round, greeniſh yellow heads, ſometimes but one, and ſometimes two or three ſtanding together vpon one ſtalke, bare or naked of themſelues, without any huſke, containing a white pulpy kernell: the rootes are ſmall, and ſpreading vader ground, which periſh with the firſt froſts, and muſt be ſowne a new euery yeare; yet there needeth no bed of horſe-dung for the matter: the naturall ground will be ſufficient, ſo as you defend it a little from thoſe froſts, that may ſpoile it when it is newly ſprung vp, or being yet tender.

**The Place.**

This goodly plant was firſt found in the West Indies, and from thence ſent into Spaine vnto Monardus and others, from whence all other parts haue received it. It is now very familiar in moſt Gardens of any curioſity, where it yearly giueth ripe ſeed, except the yeare be very unkindly.

**The Time.**

It flowreth ſometimes in Iune, but uſually in July (if it be well defended and in any good ground) and ſo continueth flowring, vntill the cold froſts and miſtes in the middle or end of October, doe checke the luxuriouſ nature thereof, and in the meane time the ſeede is ripe, which will quickly fall downe on the ground, where for the moſt part the beſt is gathered.

**The Names.**

Some doe reckon this plant among the *Clematides* or *Convolvuli*, the Clamberers or Bindweedes, but (as I ſaid) it hath no claspers, neither doth it windē it ſelſe: but by reaſon of the number of his branches, that run one within another, it may ſeeme to climbe vp by a pole or ſtieke, which yet doth but onely cloſe it, as hauing ſomething wheron to leane or reſt his branches. Monardus and others call it *Flos fangineus*, of the red ſpots in the flowers, as also *Mastherzo de las Indias*, which is *Nasturtium Indicum*, by which name it is now generally knowne and called, and wee thereaſter in English, India Crefles, yet it may bee called from the forme of the flowers onely, Yellow Larkes heeleſ.

**The Vertues.**

The Spaniards and others vſe the leaues hereof in ſtead of ordinary Crefles, becauſe the taste is ſomewhaſt ſharpe agreeing thereunto, but other Phyſicall properties I haue heard of none attributed to it.

**C H A P. L I I.**

*Viola*. Violets.

**T**he Garden Violets (for the Wilde I leauē to their owne place) are ſo well knowne vnto all, that either keepe a Garden, or hath but once come into it, that I ſhall (I thinke) but loſe labour and time to deſcribe that which is ſo common. Yet because it is not onely a choiſe flower of delight, notwithstanding the popularity, and that I let not paſſe any thing without his particular deſcription, I muſt alſo doe ſo by this. And hereunto I muſt adde that kinde of Violet, which, althoſh it want that ſmell of the other, goeth beyond it in variety of dainty colours, caſtled *Violatricolor & flammata*, or Harts eases.

1. *Viola simplex Martia.* Single March Violets.

The single Garden Violet hath many round greene leaues, finely snipt or dented about the edges, standing vpon severall small stalkes, set at diuers places of the many creeping branches, which as they runne, doe here and there take roote in the ground, bearing thereon many flowers severally at the ioynts of the leaues, which consist of fve small leaues, with a short round tayle or spurre behinde, of a perfect blew purple colour, and of a very sweete sent, it bringeth forth round seede vessels, standing likewise vpon their severall small stalkes, wherein is contained round white seede: but these heads rise not from where the flowers grew, as in all other plants that I know, but apart by themselves, and being sowne, will produce others like vnto it selfe, whereby there may be made a more speedy encrease to plant a Garden(as I haue done) or any other place, then by slipping, as is the vsuall manner: the rootes spread both deepe and wide, taking strong hold in the ground.

Of this kinde there is another that beareth white flowers, not differing in smell or any thing else from the former.

Flore albo.

Flore oblate.

And also another, that beareth flowers of a dead or sad reddish colour, in all other things alike, sauing that this hath not altogether so good a sent as the other.

2. *Viola Martia flore multiplici.* Double March Violets.

There is no difference betweene this Violet and the former, in any other thing then in the doublenesse of the flowers, which haue so many leaues set and thrust together, that they are like vnto hard buttons. There is of this double kinde both white and purple, as in the single; but the white sort is seldom so thicke and double as the purple: but of the red colour to be double I neuer heard.

3. *Viola flammæa fine tricolor.* Harts easies or Pansies.

The Harts ease hath his leaues longer, and more endented or cut in on the edges then the Violet hath, and somewhat round withall: the stalkes are vpright, yet weake, and ready to fall downe, and lye vpon the ground, set here and there with the like leaues, from whence come forth the flowers, of little or no sent at all, made like vnto a Violet, yet more open, and with larger leaues; but so variably mixed with blew or purple, white and yellow, that it is hard to set downe all the varieties: For some flowers will be more white, and but some spots of purple or blew in the two upper leaues, and the lower leaues with some stripes of yellow in the middle: others will haue more purple in them then any other colour, both in the upper and lower leaues, the side leaues blew, and the middle yellow, and others white and blew with yellow stripes, as nature listeth to distribute their colours: the seede is small, whitish, and round, contained in small round heads: the roote perishest euery yeare, and raiseth it selfe vp plentifull by it owne sowing, if it be suffered.

4. *Viola tricolor flore duplici.* Double Harts ease.

We haue in our Gardens another sort, that beareth flowers with more leaues then the former, making it seeme to be twice double, and that onely in Autumne; for the first flowers are single that come in Summer: This is of that sort that beareth purple flowers: And it is to be obserued, that the seed of this kinde will not all bring double flowers, but only some, if the ground be fit and liking, so that if you haue once had of this double kinde, you shall seldom misse to haue double flowers againe euery yeare of it owne growing or sowing.

5. *Viola flammæa lata maxima.* The great yellow Pansie.

There is one other kinde of Harts ease, that decketh vp our Gardens not to be forgotten, whose leaues and flowers are like the former, but more plentiful in stalkes and branches, and better abideth our Winters: the flowers are larger then any of the former,

former, of a faire pale yellow colour, with some yellower stripes now and then about the middle; for it is sometimes without any stripes, and also of a little deeper yellow colour: this is to bee encreased by slips, which will soone comprehend in a moist or moistened ground, for that I neuer could obserue that it bore seede.

## The Place.

These plants were first wilde, and by manuring brought to be both fairer in colour, and peraduenture of a better sent then when they grew wilde.

## The Time.

The Violets flower in March, and sometimes earlier, and if the yeare be temperate and milde, in Autumne againe. The double Violets, as they are later before they flower then the single, so they hold their flowers longer. The Harts ease flowreth feldome vntill May; but then some will abide to flower vntill the end of Autumne almost, especially if the frosts be not early.

## The Names.

The Violet is called *Viola nigra*, *purpurea*, and *Martia*: In English, Violets, March Violets, and purple Violets. The Harts ease is called *Viola flammæa*, *Viola tricolor*, *Viola multicolor*, and of some, *Iacea*, *Flos trinitatis*, and *Herba clauellata*: In English, Harts ease, and Pansies, of the French name *Pensées*. Some giue it foolish names, as *Loue in idlenesse*, *Cull mee to you*, and *Three faces in a hood*. The great yellow Harts ease is so called, because it is like in forme, and is the greatest of all other, although it haue not that diuersity of colours in it that the other haue.

## The Vertues.

The properties of Violets are sufficienly knowne to all, to coole and moisten: I shall forbear to recite the many vertues that may be set downe, and onely let you know, that they haue in them an opening or purging quality, being taken either fresh and greene, or dried, and made into powder, especially the flowers; the dryed leaues will doe the like, but in greater quantity. Costaeus in his booke of the nature of all plants saith, that the distilled water of Harts ease, is commended in the French disease, to be profitable, being taken for nine dayes or more, and sweating vpon it, which how true it is, I know not, and wish some better experiance were made of it, before we put any great confidence in that assertion.

## C H A P. L III.

*Epimedium. Barrenwort.*

**T**HIS pretty plant riseth vp out of the ground with vpright, hard, round, small stalkes, a foote and a halfe high, or not two foote high at the highest, diuided into three branches for the most part, each branch whereof is againe diuided for the most part into three other branches, and each of them beare three leaues (seldom either more or lesse) set together, yet each vpon his owne stalle, each leafe being broad, round, and pointed at the end, somewhat hard or dry in feeling, hayrie, or as it were prickly about the edges, but very tenderly, without harme, of a light greene colour on the vpper side, and a little whiter vnderneath: from the middle of the stemme or stalle of leaues doth likewise come forth another long stalle, not much higher then those with the leaues on them, diuided into other branches, each whereof

whereof hath likewise three floures, each vpon his owne foote stalke, consisting of eight small leaues a peice, yet seeming to be but of foure leaus spread or layd open flat, for that the foure uppermost, wh<sup>e</sup>re are a little broader and red, that they shew as if they were yellow floures with red edges, haing yellow thredes tipt with greene, standing in the middle of the flowers: the vnderside of the lower leaues are of a pale yellowish red, striped with white lines: after the flowers are past, there come small long pods, wherin are contained flat reddish seede: the rootes are small, reddish and hard, spreading, branching and enterlacing them selues very much, and is fit to be placed on some shadie side of a garden: the whole plant is rather of a strong then any good sent, yet is cherisched for the pleasant varietie of the flowers.

#### The Place.

Cæsalpinus saith it groweth on the mountaines of Liguria, that is nigh vnto Ligerne, in the Florentine Dominion. Cametarius saith, nigh vnto Vicenzo in Italie. Bauhiaus on the Euganian hills, nigh vnto Padoa, and in Romania in shadowie wet grounds.

#### The Time.

It flowreth from June vntill the end of July, and to the middle of August, if it stand, as I said it is fittest, in a shadowie place.

#### The Names.

It is of most Writers accepted for the true *Epimedium* of Dioscorides, though he saith it is without flower or seede, being therein eyther mistaken, or mis-informed, as he was also in *Diclamus* of Candy, and diuers other plants. From the triple triplicite of the standing of the stalkes and leaues, and quadriplicite of the flowers, it might receiue another name in English then is already imposed vpon it: but lest I might be thought to be singular or full of noueltie, let it passe with the name Barrenwort, as it is in the title.

#### The Vertues.

It is thought of diuers to agree in the propertie of causing barrenesse, as the ancients doe record of *Epimedium*.

### CHAP. LIII.

#### *Papaver sativum*. Garden Poppies.

Of Poppies there are a great many sorts, both wilde and tame, but because our Garden doth entertaine none, but those of beautie and respect, I wil onely giue you here a few double ones, and leauue the rest to a general suruey.

##### 1. *Papaver multiplex album*. Double white Poppies.

The double white Poppy hath diuers broade, and long whitish greene leaues, giuing milke (as all the rest of the plant aboue ground doth, wheresoever it is broken) very much rent or torne in on the sides, and notched or indented besides, compassing at the bottome of them a hard round brittle whitish greene stalke, branched towards the toppe, bearing one faire large great flower on the head of every branch, which before it breaketh out, is contained within a thin skinne, and being blowne open is very thick of leaues, and double, somewhat iagged at the ends, and of a white colour; in the middle

1. *Viola Martia simplex*. Single March Violets. 2. *Viola Martia multiplex*. Double March Violets. 3. *Viola stellata*. Ordinary garden Barrenwort. 4. *Viola flammula*. Great-yellow Pansies. 5. *Viola rivularis*. Day's Flawers or Marsh-violets. 6. *Epimedium*. 7. *Papaver sativum*. flore pleno. Double garden Poppies. 8. *Papaver sativum*. flore pleno. laciniata. Double feathered Poppies. 9. *Nigella hispanica*. flore ampla. Spanish Nigella or Fen-leaf Flower. 10. *Nigella multiplex*. cornuta. Double blow. Nigella of Fen-flower. 11. *Nigella duplo*. Double white Nigella. 12. *Tropaeolum*. flore pleno. Double white Peleitory.

middle whereof standeth a round head or bowle, with a striped crowne on the heade of it, very like a starre, compassed about with some threds, wherein when it is ripe, is contained small, round, white seede, disposed into seuerall cels : the roote is hard, woody, and long, perishing every yeare, and must bee new sowne every Spring, if they doe not spring of their own sowing, which if it doe, the flowers are seldom faine and double as they that are sowne in the Spring : the whole plant is of a strong heady smell.

2. *Papaver multiplex rubescens*. Double red or blush Poppies.

This other kind of double Poppy differeth not in any other thing from the former, but only in the colour of the flowers, which are of a bright red, tending to a blush colour, parted, paned or striped in many places with white, and exceedingly more iagged than the former, almost like a feather at the ends, the bottomes of all the leaues being white : the seede hereof is white as the former, which is not so in any other Poppy, that beareth not a full white flower.

3. *Papaver multiplex nigrum sive purpureum*.  
Double purple or murry Poppies.

This kinde varyeth both in flowers and seede, although neyther in leaues or any other thing from the first : the flowers are thicke and double, and somewhat iagged at the ends, in some more, in some lesse, eyther red or blush, or purplish red, more or lesse, or of a sad murrey or tawney, with browne, or blacke, or tawny bottomes : the seede is eyther of a grayish blew colour, or in others more blackish.

4. *Papaver Rhæs flore multiplici*. The double red field Poppy.

This double Poppy is like the wilde or field Poppy, which is well knowne to all to haue longer, narrower, and more iagged greene leaues then the former, the stalkes more hairy, and the flower of a deepe yellowish red colour, knowne to all. Now this differeth in nothing from it, but in the doublenesse of the flower, which is very thicke and double, but not so large as the former. This riseth of seede in the like manner as they doe, and so to bee preferred.

The Place.

From what place they haue beeene first gathered naturally I cannot assure you, but we haue had them often and long time in our gardens, being sent from Italie and other places. The double wilde kinde came from Constantinople, which whether it groweth neere vnto it or further off, we can not tell as yet.

The Time.

They flower in the beginning or middle of Iune at the furthest, the seede is ripe within a small while after.

The Names.

The generall knowne name to all, is *Papaver*, Poppy : the seuerall distinctions are according to their colours. Yet our English Gentlewomen in some places, call it by aby-name, Ione siluer pinne : *sabandinar*, Faire without and fowle within.

The Vertues.

It is not vnyknowne, I suppose to any, that Poppy procureth sleepe, for which cause it is wholly and onely vsed, as I thinke : but the water of the wilde

wilde Poppies, besides that it is of great vse in Pleuresies, and Rheumatick, or thinne Distillations, is found by daily experiance, to bee a soueraigne remedy against surfeits ; yet some doe attribute this propertie to the water of the wilde Poppies.

C H A P. L V.

*Nigella*. The Fenell flower, or Nigella.

A mong the many sorts of Nigella, both wilde and tame, both singel and double, I will onely set downe three sorts, to be nourled vp in this garden, referring the rest to a Phyficke garden, or a generall Historie, which may comprehend all.

1. *Nigella Hispanica flore simplici*. The great Spanish Nigella.

Spanish Nigella riseth vp with diuers greene leaues, so finely cut, and into so many parts, that they are finer then Fenell, and diuided somewhat like the leaues of Larkes heele, among which rise vp stalkes, with many such like leaues vpon them, branched into three or fourre parts, att the toppe of each whereof standeth one faire large flower, like vnto other singel Nigella's, consisting of five or six leaues sometimes, of a bleake blew, or of a purplish blew colour, with a greene head in the middle, compassed about with seuen or eight small bleawis greene flowers, or peeces of flowers rather, made like gaping hoodes, with evry of them a yellowish line thwart or crosse the middle of them, with somethreds also standing by them : after the flower is past the head groweth greater, haing sixe, seuen or eight hornes as it were at the toppe, greater and longer, and standing closter together then any other Nigella, spreading very like a starre, or the crowne of the Poppy head, but larger and longer, each whereof being folded together, openeth a little when the head is ripe, which is greater aboue, and smaller below, and not so round as the others are, containing within them small yellowish greene seede, or not so blacke as the other sorts : the rootes are small and yellow, perishing evry yeare as the others likewise doe.

2. *Nigella Damascena flore multiplici*.  
Double blew Nigella, or The Fenell flower.

The double Nigella is in leaues, stalkes and rootes, very like vnto the former Nigella, so that the one can very hardly bee discerned from the other before this riseth vp to flower, except it be that the leaues hereof are not fully so large as they : the flower consisteth of three or fourre rowes of leaues, layde one vpon another, of a pale blew colour, with a greene round head compassed with diuers short threds in the middle, and haing five or sixe such small greene Fenell-like leaues vnder the flower, to beare it vp (as it were) below, which adde a greater grace to the flowers, which at the first sheweth sometimes white, but changeth quickly after : the horned heads hereof are like vnto the heads of the other wilde kinde, which are somewhat rounder and greater, haing within them blacke vneuen seedes, but without any scent.

3. *Nigella Catrina flore albo multiplici*. Double white Nigella.

This double white Nigella hath such like leaues as the last hath, but somewhat larger, of a yellower greene colour, and not so finely cut and iagged : the flowers are somewhat lesse, and lesser double then the former, and in colour white, haing no greene leaues vnder the flower, as the former hath, the head whereof in the middle is very like the head of the last double kinde, but not so great, wherein is contained black seede for the most part, and sweete like the Romane Nigella, which only is sweet besides this : yet sometimes it is not so blacke, but rather a little more white or yellowish : the roote is yellow, and perisheth as the others every yeare.

*The Garden of pleasant Flowers.***The Place.**

All these, and the rest be found wilde in diuers Countreyes, as France, Spaine, Italie, &c. but wee onely cherish them in our Gardens for our delight.

**The Time.**

They flower in the end of Iune, and in July, or thereabouts.

**The Names.**

They are called *Melanthium*, *Gith*, and *Nigella*, and of some *Flos Dina Catherine*. We may either call them *Nigella* according to the Latine name, or the Fenell flower, as some doe, because the double blew Nigella hath small Fenell-like leaues bearing vp the flower, as I shewed before in the description.

**The Vertues.**

These Nigella's are nothing so hot in qualitie as the single Romane kind is, as may well be knowne by the smell of the seede thereof, and therefore are not fit to be vsed in the steed of it, as many ignorant persons vse to doe: for the single Romane seede is vsed to helpe paines, and cold distillations in the head, and to dry vp the rheume. Pena saith, that the pressed oyly of the seede as well taken inwardly as vsed outwardly is an excellent remedy for the hardnesse and swelling of the spleene.

**C H A P . L V I .***Piarmica siluestris flore pleno.* Double wilde Pelletory.

**T**He double wilde Pelletoric hath straight and slender stalkes, beset with long and narrow leaues, snipt round about the edges, in all points like vnto the single wilde kinde, that groweth common with vs almost euery where: on the toppes of the stalkes stand foure or five, or more white flowers, one aboue another, with a greene leafe at the bottome of the footestalke of every one of them, beeing small, thicke, and very double, with a little yellowishnesse in the middle of every flower, like both for forme and colour vnto the flower of the double Featherfew, but smaller: the rootes are many long strings, running here and there in the ground: this hath no smell at all, but is delightsome only for the double white flowers.

**The Place.**

It is only cherished in some few Gardens, for it is very rare.

**The Time.**

It flowreth in the end of Iune or thereabouts.

**The Names.**

It is called of most *Piarmica*, or *Sternutamentaria*, of his qualitie to provoke neesing; and of some *Pyrethrum*, of the hot biting taste. We vsually call it Double wilde Pelletoric, and some Sneewort, but *Elleborus albus* is vsually so called, and I would not two things should be called by one name, for the mistaking and mis-using of them.

The

*The Garden of pleasant Flowers.***The Vertues.**

The properties hereof, no doubt, may well bee referred to the singe kinde, beeing of the same qualitie, yet as I take it, a little more milde and temperate.

**C H A P . L V I I .***Parthenium flore pleno.* Double Featherfew.

**F**eatherfew that beareth double flowers is so like vnto the single kinde, that the one cannot be discerned from the other, vntill it come to flower, bearing broad, pale or flesh greene leaues, much cut ia on the fides: the stalkes haue such like leaues on them as grow below, from the toppes whereof come forth many double white flowers, like vnto the flowers of the former wilde Pelletory, but larger, and like also vnto the flowers of the double Camomill: the sent whereof is as strong as of the single.

**The Place.**

We haue this kinde only in Gardens, and as it is thought by others, is peculiar only to our owne Countrey.

**The Time.**

It flowreth in the end of May, and in Iune and July.

**The Names.**

It is called diuersly by diuers: Some thinke it to be *Parthenium* of Dioscorides, but not of Galen, for his *Parthenium* is a sweet herbe, and is thought to bee *Amaracus*, that is Marierome: others call it *Mairicaria*; and some *Amarella*. Gaza translateth it *Muraleum*, Theophrast. lib. 7. cap. 7. It is generally in these parts of our Country called Double Feaverfew, or Featherfew.

**The Vertues.**

It is answerable to all the properties of the single kinde which is vsed for womens diseases, to procure their monthly courses chiefly. It is held to bee a speciall remedy to helpe those that haue taken *Opium* too liberally. In Italy some vse to eate the single kinde among other greene herbes, as Camerarius saith, but especially fryed with egges, and so it wholly loseth his strong and bitter taste.

**C H A P . L V I I I .***Chamomelum.* Camomill.

**O**ur ordinary Camomill is well knowne to all, to haue many smal trayling branches, set with very fine smal leaues, bushing and spreading thicke ouer the ground, taking roote still as it spreadeth: the toppes of the branches haue white flowers, with yellow thrummes in the middle, very like vnto the Featherfew, before described, but somewhat greater, not so hard, but more soft and gentle in handling, and the whole herbe to be of a very sweet sent.

B.B

r.Cha-

1. *Chamomelum nudum*. Naked Camomill.

We have another sort of Camomill in some Gardens, but very rare, like vnto the former, but that it is whiter, finer, and smaller, and raiseth it selfe vp a little higher, and beareth naked flowers; that is, without that border of white leaues that is in the former, and consisteth onely of a yellow round thummie head, smelling almost as sweete as the former.

2. *Chamomelum flore pleno*. Double flowered Camomill.

The double Camomill groweth with his leaues vpon the ground, as the other single kinde doth, but of a little fresher greene colour, and larger withall: the stalkes with the flowers on them, doe raise themselues vp a little higher then the ordinary, and bearing one or two flowers vpon a stalk, which are composed of many white leaues set together in diuers rowes, which make a fine double flower, with a little yellow spot in the middle for the most part of euery one, and are much larger then any single kinde, smelling better, and more pleasing then the ordinary: this doth creepe vpon the ground as the other, but is more tender to be kept in the Winter. Yet if you sauue the flowers hereof (and so will the double Featherfew also) when they haue stood long, and ready to fade, and keepe them dry vntill the Spring, and then breaking them or pulling them to peeces, sowe them, there will spring vp from them Camomill, and also Featherfew, that will againe beare double flowers.

## The Place.

Our ordinary Camomill groweth wilde in many places of our Country, and as well neare London as in other places. The others are onely found in our Gardens, where they are cherished. Bauhinus saith, that the double flowered Camomill is found wilde about Orléance in France.

## The Time.

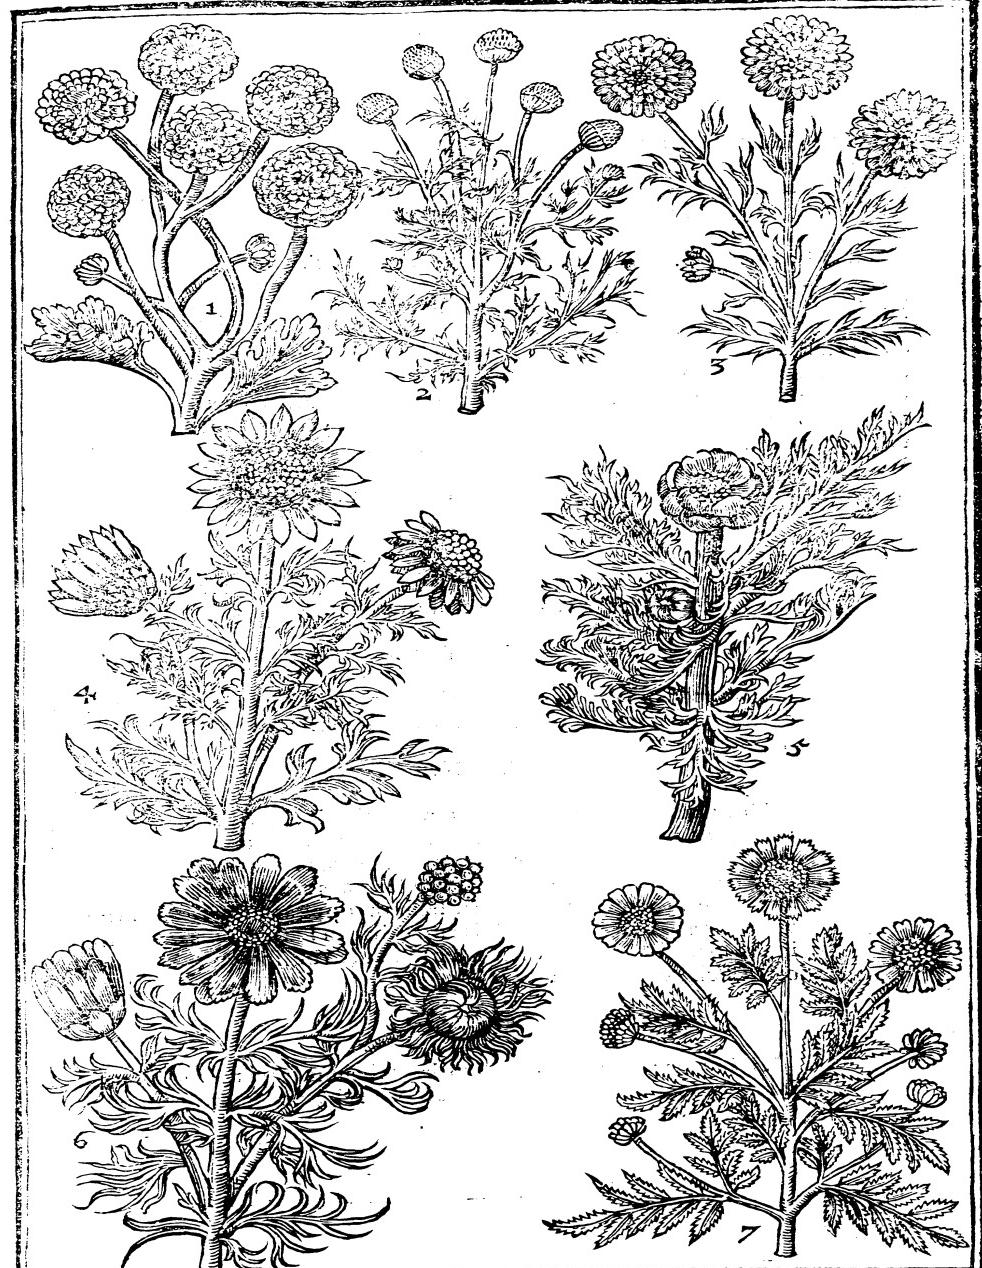

The double kinde is vsually in flower in June, before the ordinary kinde, and most commonly past before it flowreth, which is not vntill July or August. The naked Camomill flowreth betweene them both, or later.

## The Names.

Camomill is called *Anthemis*, *Leucanthemis*, and *Leucanthemum*, of the whitenesse of the flowers; and *Chamomelum* of the corrupted Italian name *Camomilla*. Some call the naked Camomill, *Chrysanthemum odoratum*. The double Camomill is called by some *Chamomelum Romanum flore multiplici*.

## The Vertues.

Camomill is put to diuers and fundry usses, both for pleasure and profit, both for inward and outward diseases, both for the sicke and the sound, in bathings to comfort and strengthen the sound, and to ease paines in the diseased, as also in many other formes applied outwardly. The flowers boyled in Posset drinke prouoketh sweat, and helþereth to expell colds, aches, and other griefes. A Syrupe made of the iuice of the double Camomill, with the flowers and white wine, as Bauhinus saith, is vsed by some against the Iaundise and Dropsic, caused by the euill disposition of the splene.

1. *Parthenium flore pleno*. Double Featherfew. 2. *Chamomelum nudum*. Naked Camomill. 3. *Chamomelum flore pleno*. Double Camomill. 4. *Pyrethrum officinarum*. Pelletory of Spaine. 5. *Flos Adonis*. flower rubro & flower luteo. Adonis flower both red & yellow. 6. *Hippocratea aegyptiacus sive Euphorbium*. The great Ox eye or the great yellow Anemone. 7. *Buphthalmum vulgare*. The common yellow Ox eye.

## C H A P. L I X.

*Pyretrum officinarum*. Pelletory of Spaine.

**I**MUST NEEDES ADIOYNE VNTO THE CAMOMILS THIS FINE AND TENDER PLANT, FOR SOME NEARE RESEMBLANCE IT hath with them in face, though not in quality. It is a small and lowe plant, bearing many fine greene leaues vpon his slender branches, which leane or lye down vpon the ground, diuided into many parts, yet somewhat larger and broader then Camomill, the stalkes whereof are bigger, and more iuicie then it: the flowers that stand at the topes of the stalkes are single, but much larger then any Camomill flower, hauing a pale or border of many leaues, white on the vpperside, and reddish vnderneath, set about the yellow middle thrumme; but not standing so close together ioyning at the bottome, as the Camomill flowers doe, but more seuered one from another: it beareth small whitish seede, which is hardly found and discerned from the chaffe: the roote is long, and growing downe right, of the bignesse of a mans finger or thumb in our Countrey, but not halfe so great where it groweth naturally, with some fibres and branches from the sides thereof, of a very hot, sharpe, and biting taste, drawing much water into the mouth, after it hath been chewed a while: the plant with vs is very tender, and will hardly or not at all endure the hardnesse and extremities of our Winters, vnlesse it be very carefully preserued.

## The Place.

It groweth in Spaine wilde in many places, and in other hot Countries, where it may feele no frosts to cause it perish.

## The Time.

It flowreth so late with vs, that it is not vntill August, that oftentimes we cannot gather ripe seedes from it, before it perish.

## The Names.

The name *Pyretrum* (taken from πυρ, that is, ignis, fire) is giuen to this plant, because of the heate thereof, and that the roote is somewhat like in shew, but specially in property vnto the true *Pyretrum* of Dioscorides, which is an umbelliferous plant, whoserootes are greater, and more feruent a great deale, and haue a hayrie bush or toppe as *Mennis*, and many other umbelliferous plants haue. It is also called in Latine, *Salinaria*, of the effect in drawing much moisture into the mouth, to be spit out. We doe vsually call it Pelletory of Spaine.

## The Vertues.

It is in a manner wholly spent to draw rheume from the teeth, by chewing it in the mouth, thereby to ease the tooth-ach, and likewise from the head, in the paines thereof.

## C H A P.

## C H A P. L X.

*Flos Adonis flore rubro*. Red Adonis flower.

**A**DONIS flower may well be accounted a kinde of Camomill, although it hath some especiall differences, hauing many long branches of leaues lying vpon the ground, and some rising vp with the stalk, so finely cut and iagged, that they much resemble the leaues of Mayweed, or of the former *Nigella*: at the top of the stalkes, which rise a foote high or better, stand small red flowers, consisting of six or eight round leaues, hauing a greene head in the middle, set about with many blackish threads, without any smell at all: after the flowers are past, there grow vp heads with many roundish white seedes at the topes of them, set close together, very like vnto the heads of seede of the great Oxe eye, set downe in the next Chapter, but smaller: the rootes are small and thready, perishing every yeare, but rising of his owne seede againe, many times before Winter, which will abide vntill the next yeare.

Yellow Adonis flower is like vnto the red, but that the flower is somewhat larger,<sup>Flore luteo:</sup> and of a faire yellow colour.

## The Place.

The first groweth wilde in the corn fields in many places of our own country, as well as in others, and is brought into Gardens for the beauties sake of the flower. The yellow is a stranger, but nourished in our Gardens with other rarities.

## The Time.

They flower in May or June, as the yeare fallereth out to be early or late: the seed is soone ripe after, and will quickly fall away, if it be not gathered.

## The Names.

Some haue taken the red kinde to be a kinde of Anemone, other to be *Eranthemum* of Dioscorides: the most vsuall name now with vs is *Flos Adonis*, and *Flos Adonis*: In English, where it groweth wilde, they call it red Maythes, as they call the Mayweede, white Maythes; and some of our English Gentlewomen call it Rosarubic: we vsually call it Adonis flower.

## The Vertues.

It hath been certainly tryed by experiance, that the seed of red Adonis flower drunke in wine, is good to ease the paines of the Collicke and Stone.

## C H A P. L XI.

*Buphtalmum*. Oxe eye.

**V**NDER the name *Buphtalmum*, or Oxe eye, are comprehended two or three severall plants, each differing from other, both in face and property, yet because they all beare one generall name, I thinke fittest to comprise them all in one Chapter, and first of that which in leafe & seed commeth nearest to the Adonis flower.

1. *Buphtalmum maius sive Helleborus niger ferulaceus*.  
Great Oxe eye, or the yellow Anemone.

This great Oxe eye is a beautifull plant, hauing many branches of greene leaues  
leaning

leaning or lying vpon the ground for the most part, yet some standing upright, which are as haies, but shorter then Fenell; some of them ending in a small tuft of green leaues, and some haning at the toppes of them one large flower apeece, somewhat reddish or brownish on the outside, while they are in bud, and a while after, and being open, shew themselues to consist of twelve or fourteene long leaues, of a faire shining yellow colour, set in order round about a greene head, with yellow thrums in the middle, laying themselues open in the sunne, or a faire day, but else remaining close: after the flower is past, the head growing greater, sheweth it selfe compact of many round whitish seede, very like unto the head of seede of the Adonis flower last described, but much greater: the rootes are many long blackish fibres or strings, set together at the head, very like unto the rootes of the lesser blacke Hellebor or Bearefoote, but somewhat harder, stiffer, or more brittle, and seeming without moisture in them, which abide and encrease euery yeaer.

2. *Eupbthalmum minus*, seu *Anthemis flore luteo*. Small Oxeye.

This plant might seeme to be referred to the Camomils, but that it is not sweete, or to the Corne Marigolds, but that the stalkes and leaues are not edible : it is therefore put vnder the Oxe eyes, and so we will describe it ; hauing many weake branches lying vpon the ground, beset with winged leaues, very finely cut and jagged, somewhat like vnto Mayweede, but a little larger : the flowers are like vnto the Corne Marigold, and larger then any Camomill, being wholly yellow, as well the pale or border of leaues, as the middle thrummes : the rootes are somewhat tough and long.

### *Buphtalmum vulgare*. Common Oxeye.

This Ox eye riseth vp with hard round stalkes, a foote and a halfe high, haing many winged leaues vpon them, made of diuers long and something broad leaues, snipt about the edges, set together somewhat like vnto Tansie, but smaller, and not so much winged : the flowers stand at the toppes of the stalkes, of a full yellow colour, both the outer leaues and the middle thrum, and not altogether so large as the last : the rootes of this kinde perish euery yare, and require a new sowing againe.

The Place

The first growth in diuers places of Austria, Bohemia, and those parts, it hath bene likewise brought out of Spaine. The second in Prouence, a country in France. The last in diuers places, as well of Austria as Morauia, and about Mentz and Norimberg, as Clusius setteth downe. We haue them in our Gardens, but the first is of the greatest respect and beauty.

The Time.

The first flowreth betimes, oftentimes in March, or at the furthest in April; the feede is ripe in May, and must be quickly gathered, lest it bee lost. The other two flower not vntill June.

## The Names.

The first is called *Buphthalmum* of Dodonæus, *Pseudohelleborus* of Matthiolus, *Helleborus niger ferulaceus* Theophrasti by Lobel, of some others *Elleborus niger verus*, vsing it for the true blacke Ellebor, but it is much differing, as well in face as properties. Of others *Sesamoides minus*. Some haue thought it to be a yellow Anemone, that haue looked on it without further iudgement, and by that name is most vsually knowne to most of our English Gentlewomen that know it. But it may most fitly be called a *Buphthalmum*, as Dodonæus doth, and *Hispanicum* or *Austriacum*, for distinctions sake. We doe most vsually call it *Helleborus niger ferulaceus*, as Lobel doth: Bauhinis calleth

calleth it *Helleborus niger tenuisolius Buphtalmi flore*. The second is called *Buphtalmum Narbonense*: In English, The French, or lesser Oxe eye, as the first is called, The great Oxe eye. The last, The common Oxe eye.

### The Vertues.

The first hath been vsed in diuers places for the true blacke Ellebor, but now is sufficiently knowne to haue been an error; but what Physicall pro-  
perty it hath, other then Matthiolus hath exprest, to be vsed as Setter-  
wort for cattell, when they rowell them, to put or draw the rootes hereof  
through the hole they make in the dewe lappe, or other places, for their  
coughes or other diseases, I know not, or haue heard or read of any. The  
others likewise haue little or no vse in Physicke now a dayes that I know.

C H A P. L X I I .

### *Chrysanthemum*. Corne Marigold.

**A**Lthough the sorts of Corne Marigolds, which are many, are fitter for another then this worke, and for a Catholicke Garden of Simples, then this of Pleasure and Delight for faire Flowers; yet give me leaue to bring in a couple: the one for a corner or by-place, the other for your choiseſt, or vnder a defenced wall, in regard of his stateliness.

**i. *Chrysanthemum Creticum*. Corne Marigold of Candy.**

This faire Corne Marigold hath for the most part one vpright stalk, two foote high, whereon are set many winged leaues, at euery ioynt one, diuided and cut into divers parts, and they againe parted into feuerall peeces or leaues: the flowers growe at the topes of the stalkes, rising out of a scaly head, composed of ten or twelue large leaues, of a faire, but pale yelow colour, and more pale almost white at the bottome of the leaues, round about the yellow thrumme in the middle, being both larger and sweeter then any of the other Corne Marigolds: the seede is whitish and chassie: the roote perisheth every yeare.

2. *Chrysanthemum Peruvianum*, sive *Elos Solis*.  
The golden flower of Peru, or the Flower of the Sunne.

This goodly and stately plant, wherewith every one is now adayes familiar, being of many sorts, both higher and lower (with one stalke, without branches, or with many branches, with a blacke, or with a white feede, yet differing not in forme of leaues or flowers one from another, but in the greatnesse or smalnesse) riseth vp at the first like vnto a Pompion with two leaues, and after two, or foure more leaues are come forth, it riseth vp into a great stalke, bearing the leaues on it at seuerall distan- ces on all sides thereof, one aboue another vnto the very toppe, being sometimes, and in some places, seuen, eight, or ten foote high, which leaues standing out from the stemme or stalke vpon their seuerall great ribbed foote-stalkes, are very large, broad belowe, and pointed at the end, round, hard, rough, of a sad greene colour, and bending downewards: at the toppe of the stalke standeth one great, large, and broad flower, bowing downe the head vnto the Sunne, and breaking forth from a great head, made of scaly greene leaues, like vnto a great single Marigold, having a border of manie long yellow leaues, set about a great round yellow thrumme, as it were in the middle, which are very like vnto short heads of flowers, vnder euery one whereof there is a feede, larger then any feede of the Thistles, yet somewhat like, and lesser, and rounder then any Gourd feede, set in so close and curious a manner, that when the feede is taken out, the head with the hollow places or cels thereof, seemeth very like vnto an hony combe; which feede is in some plants very blacke, in the hotter countries, or very white.

white, and great, or large, but with vs is neither so large, blacke, or white; but sometimes blackish or grayish. Some sort riseth not vp halfe the height that others doe, and some againe beare but one stemme or stalke, with a flower at the toppe therof; and others two or three, or more small branches, with every one his flower at the end; and some so full of branches from the very ground almost, that I have accounted threescore branches round about the middle stalke of one plant, the lowest neare two yards long; others aboue them a yard and a halfe, or a yard long, with every one his flower thereon; but all smaller then those that beare but one or two flowers, and lesser also for the most part then the flower on the middle stalke it selfe. The whole plant, and every part thereof aboue ground hath a strong resinous sent of Turpentine, and the heads and middle parts of the flowers doe oftentimes (and sometimes the ioynts of the stalke where the leaues stand) sweat out a most fine thin & cleare Roffin or Turpentine, but in small quantity, and as it were in drops, in the heate and dry time of the year, so like both in colour, smell, and taste vnto cleare Venice Turpentine, that it cannot be knowne from it: the roote is strongly fastened in the ground by some greater roots branching out, and a number of small strings, which growe not deepe, but keepe vnder the vpper crust of the earth, and desircth much moisture, yet dyeth every yeare with the first frosts, and must be new sowne in the beginning of the Spring.

#### The Place.

Their places are set downe in their titles, the one to come out of Candy, the other out of Peru, a Prouince in the West Indies.

#### The Time.

The first flowreth in Iune, the other later, as not vntill August, and sometimes so late, that the early frosts taking it, neuer suffer it to come to ripeness.

#### The Names.

The first hath his name in his title. The second, besides the names set downe, is called of some *Planta maxima*, *Flos maximus*, *Sol Indianus*, but the most vsuall with vs is, *Flos Solis*: In English, The Sunne Flower, or Flower of the Sunne.

#### The Vertues.

There is no vse of either in Physicke with vs, but that sometimes the heads of the Sunne Flower are dressed, and eaten as Hartichokes are, and are accounted of some to be good meate, but they are too strong for my taste.

### CHAP. LXIII.

#### *Calendula*. Marigolds.

Some haue reckoned vp many sorts of Marigolds, I had rather make but two, the single and the double; for doubtlesse, those that be most double, rise from the best seede, which are the middlemost of the great double, and some will be lesse double, whose seede is greater then the rest, according to the ground where it groweth; as also those that be of a paler colour, doe come of the seed of the yellerow sort.

#### 1. *Calendula maxima*. The great Garden Marigold.

The Garden Marigold hath round greene stalkes, branching out from the ground into many parts, whereon are set long flat greene leaues, broader and rounder at the point

1. *Chrysanthemum Creticum*. Candy Marigold. 2. *Flos Solis*. The Flower of the Sunne. 3. *Calendula*. Marigolds. 4. *Aticus* (purple Marigold). 5. *Flosella major*. Golden Mouse-earc. 6. *Scorzonera Hispanica*. Spanish Viper's-bug. 7. *Tragopogon*. Goats-beard, or go to bed at noon.

point then any where else, and smaller also at the setting to of the stalke, where it compasseth it about: the flowers are sometimes very thicke and double (breaking out of a scaly clammy greene head) composed of many rowes of leaues, set so close together of is somewhat broader at the point, and nicked into two or three corners, of an excellent faire deepe gold yellow colour in some, and paler in others, and of a pretty strong and resinous sweete sent: after the flowers are past, there succeede heads of crooked seede, turning inward, the outermost biggest, and the innermost least: the roote is white, and spreadeth in the ground, and in some places will abide after the feeding, but for the most part perisheth, and riseth againe of his owne feede. Sometimes this Marigold doth degenerate, and beareth many small flowers vpon short stalkes, compasing the middle flower: but this happeneth but seldome, and therefore accounted but *lusus naturæ*, a play of nature, which she worketh in diuers other plants besides.

2. *Calendula simplex*. The single Marigold.

There is no difference betweene this and the former, but that the flowers are single, consisting of one rowe of leaues, of the same colour; eyther paler or deeper yellow, standing about a great browne thrumme in the middle: the seed likewise is alike, but for the most part greater then in the double kindes.

The Place.

Our Gardens are the chiefe places for the double flowers to grow in, for we know not of any other naturall place: but the single kinde hath beene found wilde in Spaine, from whence I received seede, gathered by Guillaume Boel, in his time a very curious, and cunning searcher of simples.

The Time.

They flower all the Summer long, and sometimes even in winter, if it be milde, and chiefly at the beginning of those monethes, as it is thought.

The Names.

They are called *Caltha* of diuers, and taken to be that *Caltha*, wherof both Virgil and Columella haue written. Others doe call them *Calendula*, of the Kalendes, that is the first day of the monthes, wherein they are thought chiefly to flower; and thereupon the Italians call them, *Fiori di ogni mese*, that is, The Flowers of every moneth: We cal them in English generally, eyther Golds, or Marigolds.

The Vertues.

The herbe and flowers are of great vse with vs among other pot-herbes; and the flowers eyther greene or dried, are often vsed in possets, broths, and drinke, as a comforter of the heart and spirits, and to expell any malignant or pestilential quality, gathered neere thereunto. The Syrupe and Conserue made of the fresh flowers, are vsed for the same purposes to good effect.

CHAP. LXIII.

*Aster. Starre-wort.*

Dioscorides and other of the ancient Writers, haue set forth but one kinde of Starre-wort, which they call *Aster Atticus*, of the place no doubt, where the greatest plentie was found, which was the Countrey of Athens: the later Writers haue found out many other plants which they referre to this kinde, calling them by the same name. It is not my purpose to entreate of them all, neyther doth this garden fitly agree with them: I shall therefore select out one or two from the rest, and giue you the knowledge of them, leauing the rest to their proper place.

1. *Aster Atticus flore luteo*. Yellow Starre-wort.

This Starre-wort riseth vp with two or three rough hairy stalkes, a foote and a halfe high, with long, rough or hairie, brownish, darke greene leaues on them, diuided into two or three branches: at the toppe of every one whereof standeth a flat scaly head, compassed vnderneath with fve or sixe long, browne, rough greene leaues, standing like a Starre, the flower it selfe standing in the middle thereof, made as a border of narrow, long, pale yellow leaues, set with a brownish yellow thrume: the roote dyeth evry yeare, hauing giuen his flower.

2. *Aster Atticus Italorum flore purpureo*. Purple Italian Starre-wort.

This Italian Starre-wort hath many wooddy, round brittle stalkes, rising from the roote, somewhat higher then the former, sometimes standing vpright, and otherwhiles leaning downwards, whereon are set many somewhat hard, and rough long leaues, round pointed, without order vp to the toppe, where it is diuided into seuerall branches, whereon stand the flowers, made like vnto a single Marigold, with a border of bleuish purple leaues, set about a browne middle thrume, the heads sustaining the flowers, are composed of diuers scaly greene leaues, as is to be seene in the Knapweedes or Matfelons, which after the flowers are past yelde a certayne downe, wherein lye small blacke and flat seedes, somewhat like vnto Lettice seede, which are carried away with the winde: the roote is composed of many white strings, which perisheth not as the former, but abideth, and springeth afresh evry yeare.

The Place.

The first is found in Spaine, as Clusius, and in France, as Lobel say. The other hath beene found in many places in Germany, and Austria: in Italie also, and other places; we haue it plentifully in our Gardens.

The Time.

The first flowreth in Summer. And the other not vntill August or September.

The Names.

The first is called *Aster Atticus flore luteo*, *Buboniam*, & *Inginalia*, and of many is taken to be the true *Aster Atticus* of Dioscorides: yet Matthiolus thinketh not so, for diuers good reasons, which hee setteth downe in the Chapter of *Aster Atticus*, as any man may understand, if they will but reade the place, which is too long to bee inserted here. The other is thought by Matthiolus, to bee the truer *Aster Atticus*, (vnto whom I haue also consent) and constantly also affirmed to be the *Amellus Virgili*, as may be seene in the same place: but it is vsually called at this day, *Aster Italorum flore caraleo* or *purpureo*,

## The Garden of pleasant Flowers.

*purpures.* Their English names are sufficiently expressed in their titles, yet some call the last, The purple Marigold, because it is so like unto one in form.

### The Vertues.

They are held, if they bee the right, to bee good for the biting of a mad dogge, the greene herbe being beaten with old hogs grease, and applyed; as also for swolne throats: It is likewise vsed for botches that happen in the groine, as the name doth imp̄t.

### C H A P. L X V.

#### *Pilosella maior.* Golden Mouse-eare.

**S**ome resemblance that the flowers of this plant hath with the former Golds, maketh me to insert it in this place, although I know it agreeth not in any other part, yet for the pleasant aspect thereof, it must bee in this my garden, whose description is as followeth: It hath many broade greene leaues spread vpon the ground, spotted with pale spots, yet more conspicuous at sometimes then at other; somewhat hairy both on the vpper and vnderfide, in the middle of these leaues rise vp one, two or more blackish hairy stalkes, two foote high at the least, bare or naked vp to the top, where it beareth an umbell, or short tuft of flowers, set close together vpon short stalkes, of the forme or fashion of the Hawkewedes, or common Mouse-eare, but somewhat smaller, of a deep gold yellow, or orange tawney colour, with some yellow threds in the middle, of little or no sent at all: after the flowers are past, the heads carry small, short, blacke seede, with a light downie matter on them, ready to bee carried away with the winde, as many other plants are, when they be ripe: the rootes spread vnder ground, and shooe vp in diuers other places, whereby it much encreaseth, especially if it be set in any moist or shadowie place.

### The Place.

It groweth in the shadowie woods of France, by Lions, and Mompelier, as Lobell testifieth: we keepe it in our gardens, and rather in a shadowie then sunnie place.

### The Time.

It flowreth in Somer, and sometimes againe in September.

### The Names.

It is called by Lobell, *Palmonaria Gallorum Hieratij facie*: and the Herbārists of France take it to be the true *Palmonaria* of Tragus. Others call it *Hieratum flore aureo*. Pelleterius *Hieratum Indicum*. Some *Pilosella*, or *Anniculus maris maior flore aureo*. And some *Chondrilla flore aureo*. Dalechampus would haue it to bee *Corynephantes*, but farre vnfitly. The fittest English name we can giue it, is Golden Mouse-eare, which may endure vntill a fitter bee imposed on it: for the name of Grim the Collier, whereby it is called of many, is both idle and foolish.

### The Vertues.

The French according to the name vsē it for the defects of the lynges, but with what good successse I know not.

### C H A P.

## The Garden of pleasant Flowers.

### C H A P. L X VI.

#### *Scorsonera.* Vipers grasse.

**A**lthough there be foure or five sorts of *Scorsonera*, yet I shall here desire you to be content with the knowledge only of a couple.

#### 1. *Scorsonera Hispanica maior.* The greater Spanish Vipers grasse.

This Spanish Vipers grasse hath diuers long, and somewhat broad leaues, hard and crumpled on the edges, and sometimes vncuenly cut in or indented also, of a blewhish greene colour: among which riseth vp one stalk, and no more for the most part, two foote high or therabouts, leuing here and there some narrower long leaues thereon then those below: the toppe of the stalk brancheth it selfe forth into other parts, every one bearing a long scaly head, from out of the toppe whereof riseth a faire large double flower, of a pale yellow colour, much like vnto the flower of yellow Goates beard, but a little lesser, which being past, the seede succeedeth, being long, whitish and rough, inclosed with much downe, and among them many other long smooth seedes, which are limber and idle, and are carryed away at the will of the winde: the roote is long, thicke and round, brittle and blacke, with a certaine roughnesse on the outside: but very white within, yelding a milkie liquor being broken, as every other part of the plant doth besides, yet the roote more then any other part, and abideth many yeares without perishing.

#### 2. *Scorsonera Pannonica purpurea.* Purple flowred Vipers grasse.

This purple flowred Vipers grasse hath long and narrow leaues, of the same blewhish greene colour with the former: the stalk riseth vp a foote and a halfe high, with a few such like leaues, but shorter thereon, breaking at the toppe into two or three parts, bearing on each of them one flower, fashioned like the former, and standing in the like scaly knoppe or head, but of a blewhish purple colour, not fully so large, of the sweetest sent of any of this kinde, comming neare vnto the smell of a delicate perfume.

### The Place.

The first is of Spaine. The other of Hungarie and Austrich: which now furnish our gardens.

### The Time.

They flower in the beginning of May: the seede is soone ripe after, and then perishing downe to the roote for that yeare, springeth afresh before Winter againe.

### The Names.

They are called after the Spanish name *Scorsonera*, which is in Latine *Verperaria*, of some *Viperina*, and *Serpentina*: Wee call them in English Vipers grasse, or *Scorsonera*.

### The Vertues.

Manardus as I thinke first wrote hereof, and saith that it hath been found to cure them that are bitten of a Viper, or other such like venomous Creature. The rootes hereof being preferred with sugar, as I haue done ofte, doe eate almost as delicate as the Eringus roote, and no doubt is good to comfort and strengthen the heart, and vitall spirits. Some that haue vsed the preferred roote haue found it effectuall to expelling windē out of the stomake, and to helpe swoonings and faintnesse of the heart.

### C E

### C H A P.

## C H A P. L X V I I .

*Tragopogon.* Goates beard.

**I**MUST in this place set downe but two sorts of Goates beards; the one blew or ash-colour, the other red or purple, and leue the other kindes: some to bee spoken of in the Kitchin Garden, and others in a Physicall Garden.

1. *Tragopogon flore ceruleo.* Blew Goates beard.

All the Goates beards haue long, narrow, and somewhat hollow whitish greene leaues, with a white line downe the middle of every one on the vpperfide: the stalke riseth vp greater and stronger then the Vipers grasse, bearing at the toppe a great long head or huske, composed of nine or ten long narrow leaues, the sharpe points or ends whereof rise vp aboue the flower in the middle, which is thicke and double, somewhat broad and large spread, of a blewifh ash-colour, with some whitish threads among them, shutting or closing it selfe within the greene huske euery day, that it abideth blowing, vntill about noone, and opening not it selfe againe vntill the next morning: the head or huske, after the flower is past, and the seede neare ripe, openeth it selfe; the long leaues thereof, which closed not before now, falling downe round about the stalke, and shewing the seede, standing at the first close together, and the dounre at the toppe of them: but after they haue stood a while, it spreadeth it selfe round, and is ready to be carried away with the winde, if it be not gathered: the seede it selfe is long, round, and rough, like the seede of the Vipers grasse, but greater and blacker: the roote is long, and not very great, but perisheth as soone as it hath borne seede, and springeth of the fallen seede, that yeare remaining greene all Winter, and flowring the next yeare following: the whole yeeldeth milke as the former, but somewhat more bitter and binding.

2. *Tragopogon purpureum.* Purple Goates beard.

There is little difference in this kind from the former, but that it is a little larger, both in the leafe, and head that beareth the seede: the flowers also are a little larger, and spread more, of a darke reddish purple colour, with some yellow dust as it were cast vpon it, especially about the ends: the roote perisheth in the like manner as the other.

## The Place.

Both these haue been sent vs from the parts beyond the Seas, I haue had them from Italy, where no doubt they grow naturally wilde, as the yellow doth with vs: they are kept in our Gardens for their pleasant flowers.

## The Time.

They flower in May and Iune: the seede is ripe in July.

## The Names.

Their generall name is after the Greeke word *Tragopogon*, which is in Latine, *Barbabilis*: In English, Goates beard; the head of seede when it is ready to bee carried away with the winde, causing that name for the refection: and because the flower doth every day close it selfe at noone (as I said before) and opeaeth not againe vntill the next Sunne, some haue fiftly called it, Goe to bed at noone.

## The Vertues.

The rootes of these kindes are a little more bitter and more binding also then

then the yellow kinde expressed in the Kitchin Garden; and therefore fitter for medicinre then for meate, but yet is vsed as the yellow kinde is, which is more fit for meate then medicinre. The distilled water is good to wash old sores and wounds.

## C H A P. L X V I I I .

*Flos Africanus.* The French Marigold.

**O**F the French or African Marigolds there are three kindes as principall, and of each of them both with singele and double flowers: of these, some diuersity is obserued in the colour of the flowers, as well as in the forme or largesse, so that as you may here see, I haue expressed eight differences, and Fabius Columna nine or ten, in regard hee maketh a diuersity of the paler and deeper yellow colour: and although the lesser kinde, because of its euill sent, is held dangerous, yet for the beauty of the flower it findeth roome in Gardens.

1. *Flos Africanus major sine maximus multiplex.*  
The great double French Marigold.

This goodly double flower, which is the grace and glory of a Garden in the time of his beauty, riseth vp with a straight and hard round greene stalke, haying some crests or edges all along the stalke, beset with long winged leaues, every one whereof is like unto the leafe of an Ash, being composed of many long and narrow leaues, snipt about the edges, standing by couples one against another, with an odde one at the end, of a darke or full greene colour: the stalke riseth to be three or four foote high, and diuideth it selfe from the middle thereof into many branches, set with such like leaues to the topes of them, every one bearing one great double flower, of a gold yellow colour aboue, and paler vnderneath, yet some are of a pale yellow, and some betweene both, and all these rising from one and the same seede: the flower, before it be blowne open, hath all the leaues hollow; but when it is full blowne open, it spreadeth it selfe larger then any Prouince Rose, or equall vnto it at the least, if it be in good earth, and riseth out of a long greene huske, striped or furrowed, wherein after the flower is past, (which standeth in his full beauty a moaeth, and oftentimes more, and being gathered, may be preserued in his full beauty for two moneths after, if it be set in water) standeth the seede, set thicke and close together vpright, which is blacke, somewhat flat and long: the roote is full of small strings, whereby it strongly comprehengeth in the ground: the flower of this, as well as the singele, is of the very smell of new waxe, or of an honiecombe, and not of that poisonfull sent of the smaller kindes.

2. *Flos Africanus major simplex.* The great single French Marigold.

This single Marigold is in all things so like vnto the former, that it is hard to discerne it from the double, but by the flowers, only the stalke will be browner then the double; and to my best obseruation, hath and doth euery yeare rise from the seede of the double flower: so that when they are in flower, you may see the difference (or not much before, when they are in bud) this single flower euer appearing with thrums in the middle, and the leaues, which are the border or pale standing about them, shewing hollow or fistulous, which after lay themselues flat and open (and the double flower appearing with all his leaues folded close together, without any thrum at all) and are of a deeper or paler colour, as in the double.

3. *Flos Africanus fistuloso flore simplex & multiplex.*  
Single and double French Marigolds with hollow leaved flowers.

As the former two greatest sortes haue risen from the seede of one and the same (I  
Cc 2  
meane

meane the pod of double flowers) so doe these also, not differing from it in any thing, but that they are lower, and haue smaller greene leaues, and that the flower alio being smaller, hath every leafe abiding hollow, likevnto an hollow pipe, broad open at the mouth, and is of as deepe a yellow colour for the most part as the deepest of the former, yet sometimes pale also.

4. *Flos Africanus minor multiplex*. The lesser double French Marigold.

The lesser double French Marigold hath his leaues in all things like vnto the former, but somewhat lesser, which are set vpon round browne stalkes, not so stiffe or vp-right, but bowing and bending diuers wayes, and sometimes leaning or lying vpon the ground: the stalkes are branched out diuersly, whereon are set very faire double flowers like the former, and in the like greene huskes, but smaller, and in some the outermost leaues will be larger then any of the rest, and of a deeper Orange colour, almost crimson, the innermost being of a deepe gold yellow colour, tending to crimson: the whole flower is smaller, and of a stronger and more vnplesant fauour, so that but for the beautifull colour, and doublenesse of the flower, pleasant to the eye, and not to any other sence, this kinde would finde roome in few Gardens: the rootes and seedes are like the former, but lesser.

5. *Flos Africanus minor simplex*. The small single French Marigold.

This single kinde doth follow after the last in all manner of proportion, both of stalkes, leaues, seedes, and rootes: the flowers onely of this are single, hauing five or six broad leaues, of a deepe yellow crimson colour, with deepe yellow thrummes in the middle, and of as strong a stinking sent, or more then the last.

The Place.

They growe naturally in Africa, and especially in the parts about Tunis, and where old Carthage stood, from whence long agoe they were brought into Europe, where they are onely kept in Gardens, being sowne for the most part every year, vnaesse in some milde Winters. The last single and double kindes (as being more hardy) haue sometimes endured: but that kinde with hollow leaved flowers, as Fabius Columna setteth it downe, is accounted to come from Mexico in America.

The Time.

They flower not vntill the end of Summer, especially the greater kindes: but the lesser, if they abide all the Winter, doe flower more early.

The Names.

They haue been diversly named by diuers men: Some calling them *Cryptophyllum Indicum*, that is, Indian Gilloflowers, and *Tanacetum Peruvianum*, *Tanac* of Peru, as if it grew in Peru, a Province of America; and *Flos Indicum*, as a flower of the Indies; but it hath not beeene knowne to haue beeene brought from thence. Others would haue it to be *Othonna* of Plinie, and others, some to be *Lycopersicum* of Galen. It is called, and that more truly, *Flos Tunensis*, *Flos Africanus*, and *Calcha Africana*, that is, the flower of Tunis, the flower of Africa, the Marigold of Africa, and peraduenture *Pedna Peuana*. We in English most vsually call them, French Marigolds, with their severall distinctions of greater or smaller, double or single. To that with hollow leaved flowers, Fabius Columna giueth the name of *Flos flore*, and I so continue it.

The

1. *Flos Africanus major multiplex*. The greatest double French Marigold. 2. *Flos Africanus major multiplex*. The greater double French Marigold. 3. *Flos Africanus major simplex*. The greatest single French Marigold. 4. *Flos Africanus multiplex flosculus*. The double hollow French Marigold. 5. *Flos Africanus simplex flosculus*. The single hollow French Marigold. 6. *Flos Africanus minor multiplex*. The smaller double French Marigold. 7. *Flos Africanus minor multiplex alter*. Another sort of the flos double French Marigold. 8. *Flos Africanus minor simplex*. The lesser single French Marigold.

## The Vertues.

We know no vse they haue in Physicke, but are cherished in Gardens for their beautifull flowers sake.

## CHAP. LXIX.

*Caryophyllus hortensis*. Carnations and Gilloflowers.

**T**O auoide confusion, I must diuide Gilloflowers from Pinkes, and intreate of them in severall Chapters. Of those that are called Carnations or Gilloflowers, as of the greater kinde, in this Chapter; and of Pinkes, as well double as single, in the next. But the number of them is so great, that to give severall descriptions to them all were endlessse, at the least needlesse: I will therefore set downe onely the descriptions of three (for vnto these three may be referred all the other sorts) for their fashion and manner of growing, and giue you the severall names (as they are vnlauily called with vs) of the rest, with their variety and mixture of colours in the flowers, wherein consisteth a chiefe difference. I account those that are called Carnations to be the greatest, both for leafe and flower, and Gilloflowers for the most part to bee lesser in both; and therefore will giue you each description apart, and the Orenge tawnie or yellow Gilloflower likewise by it selfe, as differing very notably from all the rest.

1. *Caryophyllus maximus Harricensis sive Anglicus*.  
The great Harwich or old English Carnation.

I take this goodly great old English Carnation, as a president for the description of all the rest of the greatest sorts, which for his beauty and stateliness is worthy of a prime place, hauing beeene alwayes very hardly preserued in the Winter; and therefore not so frequent as the other Carnations or Gilloflowers. It riseth vp with a great thicke round stalke, diuided into severall branches, somewhat thickly set with ioynts; and at every ioynt two long greene rather then whitish leaues, somewhat broader then Gilloflower leaues, turning or winding two or three times round (in some other sorts of Carnations they are plaine, but bending the points downewards, and in some also of a darke reddish greene colour, and in others not so darke, but rather of a whitish greene colour:) the flowers stand at the topes of the stalkes in long, great, and round greene huskes, which are diuided into five points, out of which rise many long and broad pointed leaues, deeply iagged at the ends, set in order round and comely, making a gallant great double flower, of a deepe Carnation colour, almost red, spotted with many blush spots and strakes, some greater and some lesser, of an excellent soote sweete sent, neither too quicke as many others of these kinds are, nor yet too dull, and with two whitish crooked threads like hornes in the middle: this kinde neuely beareth many flowers; but as it is slow in growing, so in bearing, not to be often handled, which sheweth a kinde of statelinesse, fit to preferue the opinion of magnifice: the roote is branched into diuers great, long, wooddy rootes, with many small fibres annexed vnto them.

2. *Caryophyllus hortensis flore pleno rubro*. The red or Cloue Gilloflower.

The red Cloue Gilloflower, which I take as a president for the second sort, which are Gilloflowers, grow like vnto the Carnations, but not so thicke set with ioynts and leaues: the stalkes are more, the leaues are narrower and whiter for the most part, and in some doe as well a little turne: the flowers are smaller, yet very thicke and double in most, and the greene huskes wherein they stand are smaller likewise then the former: the ends of the leaues in this flower, as in all the rest, are dented or iagged, yet in some more then in others; some also hauing two small white threads, crooked at the ends like hornes, in the middle of the flower, when as diuers other haue none. These kindes,

1. *Caryophyllus maximus rubra varia*. The great old Carnation or gray Fluo. 2. *Caryophyllus maioribus & albo varia*. The white Carnation. 3. *Caryophyllus rubra*. The Camberline or the Peole flower. 4. *Caryophyllus Carty frisiae*. The faire made of Kent. 5. *Caryophyllus Sabaudicus carnea*. The blauish Savadge. 6. *Caryophyllus X cruentissimus*. The Gredeline Carnation. 7. *Caryophyllus dittae Griseae*. The Gruncel or Prince. 8. *Caryophyllus album major*. The great white Gilloflower. 9. *Elegans Heronia Bradshawi*. Malter Bradshaws dainty Lady.

kindes, and especially this that hath a deepe red crimson coloured flower, doe endure the cold of our winters, and with lesse care is preserued : these sorts as well as the former doe very seldomie giue any seede, as far as I could euer obserue or learne.

3. *Caryophyllus Silesiacus flore pleno miniatu.*  
The yellow or Orenge tawny Gilloflower.

This Gilloflower hath his stalkes next vnto the ground, thicker set, and with smaller or narrower leaues then the former for the most part : the flowers are like vnto the Cloue Gilloflowers, and about the same bignesse and doublenesse most vsually, yet in some much greater then in others ; but of a pale yellowish Carnation colour, tending to an Orenge, with two small white threds, crooked at the ends in the middle, yet some haue none, of a weaker sent then the Cloue Gilloflower : this kinde is more apt to beare seede then any other, which is small, black, flat, and long, and being sowne, yeelde wonderfull varieties both of single and double flowers : some being of a lighter or deeper colour then the mother plants : some with stripes in most of the leaues : Others are striped or spotted, like a speckled Carnation or Gilloflower, in diuers sorts, both single and double : Some againe are wholly of the same colour, like the mother plant, and are eyther more or lesse double then it, or else are single with one row of leaues, like vnto a Pinck ; and some of these likewise eyther wholly of a crimson red, deeper or lighter, or variably spotted, double or single as a Pinck, or blush eyther single or double, and but very seldomie white : yet all of them in their greene leaues little or nothing varying or differing.

*Caryophyllus maximus.*

CARNATIONS.

*Caryophyllus maximus dictus*  
*Halo rubro-varius.*

*Caryophyllus maximus dictus*  
*Halo ruber non varius.*

*Caryophyllus maximus dictus*  
*Halo carnilio-purpureus.*

*Caryophyllus maximus dictus*  
*Grinello sive Princeps.*

*Caryophyllus maximus Incar-*  
*natus albus.*

*Caryophyllus maximus Incar-*  
*natus Gallicus.*

*Caryophyllus maximus Incar-*  
*natus grandis.*

The gray *Halo* hath as large leaues as the former old Carnation, and as deepeley iagged on the edges : it hath a great high stalk, whereon stand the flowers, of a deepe red colour, striped and speckled very close together with a darkish white colour :

The red *Halo* is also a faire great flower, of a stamell colour, deepeley iagged as the former, and groweth very comely without any spot at all in it, so that it seemeth to bee but a stamell Gilloflower, saue that it is much greater.

The blew *Halo* is a goodly faire flower, being of a faire purplish murrey colour, curiously marbled with white, but so smal-ly to be discerned, that it seemeth only purple, it hath so much the Maistrie in it ; it resemblmeth the Brassill, but that it is much bigger.

The *Grinello* or Prince is a faire flower also, as large as any Chrystall or larger, being of a faire crimson colour, equally for the most part striped with white, or rather more white then red, thorough euery leafe from the bottome, and standeth comely.

The white Carnation or Delicate, is a goodly delightfull fair flower in his pride and perfection, that is, when it is both marbled and flaked, or striped and speckled with white vpon an incarnate crimson colour, beeing a very comely flower, but abideth not constant, changing oftentimes to haue no flakes or stakses of white, but marbled or speckled wholly.

The French Carnation is very like vnto the white Carnation, but that it hath more specks, and fewer stripes or flakes of white in the red, which hath the maistrie of the white.

The ground Carnation (if it be not the same with the ground or great old Carnation first set downe, as the alteration but of one letter giueth the coniecture) is a thicke flower, but spreadeth

*Caryophyllus maximus Gran-*  
*Pere dictus.*

*Caryophyllus maximus Camber-*  
*sue dictus.*

not his leaues abroade as others doe, hauing the middle standing higher then the outer leaues, and turning vp their brimmes or edges ; it is a sad flower, with few stripes or spots in it : it is verie subiect to breake the pod, that the flower seldomie commeth faire and right ; the greene leaues are as great as the *Halo* or Lombard red.

The Chrystall or Chrystalline (for they are both one, howsover some would make them differ) is a very delicate flower when it is well marked, but it is inconstant in the markes, being sometimes more striped with white and crimson red, and sometimes lesse or little or nothing at all, and changing also sometimes to be wholly red, or wholly blush.

The red Chrystall, which is the red hereof changed, is the most orient flower of all other red Gilloflowers, because it is both the greatest, as comming from the Chrystall, as also that the red hereof is a most excellent crimson.

The Fragrant is a faire flower, and thought to come from the Chrystall, being as large, but of a blush red colour, spotted with small speckes, no bigger then pinnes points, but not so thicke as in the Pageant.

The stript Sauadge is for forme and bignesse equall with the Chrystall or White Carnation, but as inconstant as eyther of them, changing into red or blush ; so that few branches with flowers containe their true mixtures, which are a whitish blush, fairely striped with a crimson red colour, thicke and short, with some spots also among.

The blush Sauadge is the same with the former, the same root of the stript Sauadge, as I said before, yeelding one side or part whose flowers will be eyther wholly blush, or hauing some small spots, or sometimes few or none in them.

The red Sauadge is as the blush, when the colour of the flower is wholly red without any stripes or spots in them, and so abideth long ; yet it is somerimes seene, that the same side, or part, or roote being separate from the first or mother plant, will giue striped and well marked flowers againe.

The Oxford Carnation is very like vnto the French Carnation, both for forme, largenesse and colour : but that this is of a fadder red colour, so finely marbled with white thereon, that the red hauing the maistrie, sheweth a very sad flower, not hauing any flakes or stripes at all in it.

The Kings Carnation or ordinary Bristow, is a reasonable great flower, deepeley iagged, of a sad red, very smally striped and speckled with white : some of the leaues of the flower on the one side will turne vp their brimmes or edges : the greene leafe is very large.

The greatest *Granado* is a very faire large flower, bigger then the Chrystall, and almost as bigge as the blew *Halo* : it is almost equally diuided and stript with purple and white, but the purple is fadder then in the ordinary *Granado* Gilloflower, else it might bee said it were the same, but greater. Diuers haue taken this flower to bee the *Gran Pere*, but you shall haue the difference shewed you in the next easing flower.

The *Gran Pere* is a fair great flower, and comely for the forme, but of no great beautie for colour, because although it be stript red and white like the *Queanes* Gilloflower, yet the red is so sad that it taketh away all the delight to the flower.

The *Camber* is a great flower and a faire, beeing a redder flower, well marked or stript with white, somewhat like vnto a Sauadge

Sauadge, say some, but that the red is not crimson as the Sauadge; others say the Daintie, but not so comely: the leaues of the flowers are many, and thrust together, without any due forme of spreading.

*Caryophyllum Maximus Longardicus ruber.*

The great Lombard red is a great sad red flower, so double and thick of leaues, that it most vsually breaketh the pod, and selome sheweth one flower among twenty perfect: the blades or greene leaues are as large as the *Halo*.

*Caryophyllum majores.*

*Caryophyllum major Westminsterianum.*

*Caryophyllum major Brisbanensis purpurea.*

*Caryophyllum major Brisbanensis carnis.*

*Caryophyllum major Darbornensis ruber.*

*Caryophyllum major Regiensis.*

*Caryophyllum major elegans.*

*Caryophyllum major Brassifolia.*

*Caryophyllum major Granatensis.*

## GILLO FLOWERS.

The lustie Gallant or Westminster (some make them to be one flower, and others to bee two, one bigger then the other) at the first blowing open of the flower sheweth to be of a reasonable size and comeliness, but after it hath stood blownen some time it sheweth smaller and thinner: it is of a bright red colour, much striped and speckled with white.

The Brislowe hath greene leaues, so large, that it would seeme to bring a greater flower then it doth, yet the flower is of a reasonable size, and very like vnto the ordinary *Granado* Gillo-flower, striped and flaked in the same manner, but that the white of this is purer then that, and the purple is more light, and tending to a blew: this doth not abide constant, but changeth into purple or blush.

The Brislowe blush is very like the last both in leafe and flower, the colour only sheweth the difference, which selome varyeth to be spotted, or change colour.

The red Douer is a reasonable great Gilloflower and constant, being of a faire red thicke powdered with white spots, and seemeth somewhat like vnto the ground Carnation.

The light or white Douer is for forme and all other things more comely then the former, the colour of the flower is blush, thicke spotted with very small spots, that it seemeth all gray, and is very delightfull.

The faire maid of Kent, or Ruffling Robin is a very beautiful flower, and as large as the white Carnation almost: the flower is white, thicke powdered with purple, wherein the white hath the maistrie by much, which maketh it the more pleasant.

The Queens Gilloflower is a reasonable faire Gilloflower althought very common, striped red and white, some great and some small with long stripes.

The Daintie is a comely fine flower, although it be not great, and for the smallnesse and thinnesse of the flower being red so finely marked, striped and speckled, that for the liueliness of the colours it is much desired, beeing inferiour to very few Gillo-flowers.

The Brassill Gilloflower is but of a meane size, being of a sad purple colour, thicke powdered and speckled with white, the purple herein hath the maistrie, which maketh it shew the fadder, it is vnconstant, varying much and often to bee all purple: the greene leaues lye matting on the ground.

The *Granado* Gilloflower is purple and white, flaked and striped very much: this is also much subiect to change purple. There is a greater and a lesser of this kinde, besides the greatest that is formerly described.

The

*Caryophyllum Turcicum.*

*Caryophyllum Cambrensis Poole.*

*Caryophyllum Pegma dilatior.*

*Caryophyllum Pegma saturation.*

*Caryophyllum Hercina dictus digam Magistris Erasbaw.*

*Caryophyllum albus optimus maior Londonensis et alias.*

*Caryophyllum major rubens & minor.*

*Caryophyllum purpureum maior & minor.*

*Caryophyllum Persico violaceum.*

*Caryophyllum purpuroceruleum.*

*Caryophyllum carnosum.*

*Caryophyllum Silesiacum maximum Wittie.*

The Turkie Gilloflower is but a small flower, but of great delight, by reason of the well marking of the flower, being most vsually equally striped with red and white.

The Poole flower, growing naturally vpon the rockes neare Cogshot Castle in the Isle of Wight, is a small flower, but very pleasant to the eye, by reason of the comely proportion thereof; it is of a bright pale red, thicke speckled, and very small with white, that it seemeth to bee but one colour, the leaues of the flower are but smally iagged about: it is constant.

The light or pale Pageant is a flower of a middle size, very pleasant to behold, and is both constant and comely, and but that it is so common, would be of much more respect then it is: the flower is of a pale bright purple, thicke powdered, and very euinely with white, which hath the mastery, and maketh it the more gracefull.

The sad Pageant is the same with the former in forme and bignesse, the difference in colour is, that the purple hath the maistrie, which maketh it so sad, that it doth resemble the Brassill for colour, but is not so bigge by hafte.

Master Bradshawe his dainty Lady may bee well reckoned among these sorts of Gilloflowers, and compare for neatenesse with most of them: the flower is very neat, though small, with a fine small iagge, and of a fine white colour on the vaderseite of all the leaues, as also all the whole iagge for a pretty compasse, and the bottome or middle part of the flower on the vpperseite also: but each leafe is of a fine bright pale red colour on the vpperseite, from the edge to the middle, which mixture is of wonderfull great delight.

The best white Gilloflower groweth vpright, and very double; the blades grove vpright alto, and crawle not on the ground.

The London white is greater and whiter then the other ordinary white, being wholly of one colour.

The stamell Gilloflower is well knowne to all, not to differ from the ordinary red or cloue Gilloflower, but only in being of a brighter or light red colour: there is both a greater and a lesser of this kinde.

The purple Gilloflower a greater and a lesse: the stalkes is so slender, and the leaues vpon them so many and thicke, that they lye and traile on the ground: the greatest is almost as bigge as a Chrystall, but not so double: the lesse hath a smaller flower.

The Gredekine Gilloflower is a very neat and handsome flower, of the bignesse of the Cloue red Gilloflower, of a fine pale reddish purple or peach colour, enclining to a blew or violet, which is that colour is vsually called a gredekine colour: it hath no affinity with eyther Purple, *Granado*, or Pageant.

The blew Gilloflower is neither very double nor great, yet round and handsome, with a deepe iagge at the edge, and is of an exceeding deepe purple colour, tending to a tawnie: this differeth from all other sorts, in that the leafe is as greene as grasse, and the stalkes many times red or purple: by the greene leaues it may be knowne in the Winter, aswell as in the Summer.

The blushe Gilloflower differeth not from the red or stamell, but only in the colour of the flower, which is blushe.

John Wittie his great tawny Gilloflower is for forme of growing, in leafe and flower altogether like vnto the ordinary tawny, the flower onely, because it is the fairest and greatest that any other

## The Garden of pleasant Flowers.

ther hath scoured vp, maketh the difference, as also that it is of a faire deepe scarlet colour.

There are also diuers other Tawnies, either lighter or sadder, either leſſe or more double, that they cannot be numbered, and all rising (as I ſaid before) from ſowing the ſeade of ſome of them : besides the diuerſities of other colours both ſingle and mixed, every yeare and place yielding ſome variety was not ſeen with them before : I ſhall neede but onely to giue you the names of ſome of them we haue abiding with vs, I meane ſuchas haue received names, and leauē the rest to every ones particular denominated.

Of Bluſties there are many ſorts, as the deepe bluſh, the pale bluſh, the Infanta bluſh, a bluſh enclining to a red, a great bluſh, the faireſt and moſt double of all the other bluſties, and many others both ſingle and double.

Of Reds likewiſe there are ſome varieties, but not ſo many as of the other colours ; for they are moſt dead or deepe reds, and few of a bright red or ſtamell colour ; and they are ſingle like Pinkes, either ſtriped or ſpeckled, or moſt double ſtriped and ſpeckled variably, or elſe

There are neither purple nor white that riſe from this ſeade that I haue obſerued, except one white in one place.

The ſtriped Tawny are either greater or leſſer, deeper or lighter flowers twenty ſorts and aboue, and all ſtriped with ſmaller or larger ſtripes, or equally diuided, of a deeper or lighter colour : and ſome alſo for the very ſhape or forme will bee moſt neate, cloſe, and round ; others moſt loſe, vnequall, and ſparſed.

The marbled Tawny hath not ſo many varieties as the ſtriped, but is of as great beautey and delight as it, or more : the flowers are greater or ſmaller, deeper or lighter coloured one then another, and the veines or markes moſt conſpicuous, or moſt frequent in ſome then in others : but the moſt beauteiful that euer I did ſee was with Maſter Ralph Trugge, which I muſt needs therefore call

Maſter Tuggies Princeſſe, which is the greateſt and faireſt of all theſe ſorts of variable tawnies, or ſeed flowers, being as large fully as the Prince or Chrystall, or ſomething greater, ſtanding comely and round, not loſe or ſhakea, or breaking the pod as ſome other ſorts will ; the marking of the flower is in this manner : It iſ of a ſtamell colour, ſtriped and marbled with white ſtripes and veines quite through euery leafe, which are as deeply iagged as the Hulo : ſometimes it hath more red then white, and ſometimes more white then red, and ſometimes ſo equally marked, that you cannot diſcerne which hath the maſtery, yet which of theſe hath the predominance, ſtill the flower is very beauteiful, and exceeding delightsome.

The Flaked Tawny is another diuerſity of theſe variable or mixt coloured flowers, being of a pale reddiſh colour, flaked with white, not alwaies downeright, but often thwart the leaues, ſome more or leſſe then others, the marking of them is much like vnto the Chrystall : theſe alſo as well as others will be greater or ſmaller, and of greater or leſſe beauty then others.

The Feathered Tawny is more rare to meeke with then many of the other, for moſt viſually it is a faire large flower and double, equalling the Lumbard red in his perfeccion : the colour hereof is viſually a ſcarlet, little deeper or paler, moſt curiouſly feathered red and ſreamed with white through the whole leafe.

The Speckled Tawny is of diuers ſorts, ſome bigger, ſome leſſe,

lesse, some more, and some lesse spotted then others: Vnusually it is a deepe scarlet, speckled or spotted with white, hauing also some stripes among the leaues.

*Caryophyllum roseum rotundus*  
Magister Tuggie.

Master Tuggie his Rose Gilloflower is of the kindred of these Tawnies, being raised from the seede of some of them, and onely possessed by him that is the most industrious pr eseruer of all natures beauties, being a different sort from all other, in that it hath round leaues, without any iagge at all on the edges, of a fine stamell full colour, without any spot or strake therin, very like vnto a small Rose, or rather much like vnto the red Rose Campion, both for forme, colour, and roundnesse, but larger for size.

#### The Place.

All these are nourished with vs in Gardens, none of their naturall places being knowne, except one before recited, and the yellow which is *Silcia*; many of them being hardly preferued and encreased.

#### The Time.

They flower not vntill the heate of the yeare, which is in July (vnlesse it be an extraordinary occasion) and continue florring, vntill the colds of the Autumnne checke them, or vntill they haue wholly ouer spent themselves, and are vnsightly encreased by the slips.

#### The Names.

Most of our later Writers doe call them by one generall name, *Caryophyllum sativum*, and *flos Caryophyllum*, adding therunto *maximus*, when wee incane Carnations, and *major* when we would expresse Gilloflowers, which name is taken from Cloves, in that the sent of the ordinary red Gilloflower especially doth resemble them. Diuers other severall names haue beene formerly given them, as *Vetonica*, or *Betonica altera*, or *Vetonica altissima*, and *coronaria*. *Herbe Tanica*, *Viola Damascena*, *Ocellus Damascenus*, and *Barbaricum*. Of some *Centabrigia Plini*. Some thinke they were vnowne to the Ancients, and some would haue them to be *Iphium* of Theophrastus, wherof he maketh mention in his fifth and seventeenth Chapters of his fifth booke, among Garland and Summer flowers; others to be his *Dios antros*, or *Iou flos*, mentioned in the former, and in other places. We call them in English (as I said before) the greatest kindes, Carnations, and the others Gilloflowers (quaf July flowers) as they are severally expressed.

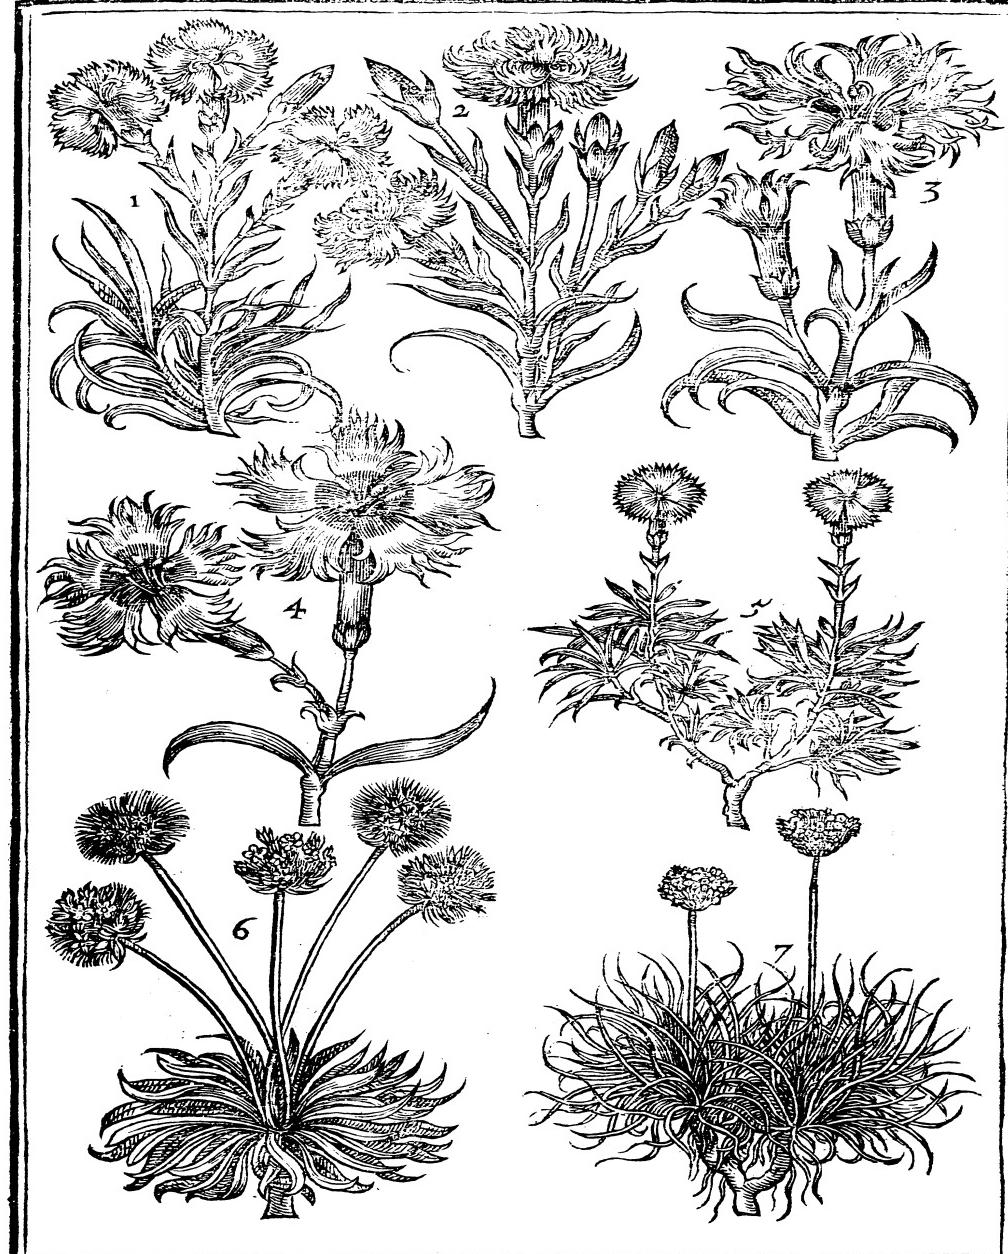

#### The Vertues.

The red or Cloue Gilloflower is most vsed in Physicke in our Apothecaries shops, none of the other being accepted of or vsed (and yet I doubt not, but all of them might serue, and to good purpose, although not to giue so gallant a tincture to a Syrupe as the ordinary red will doe) and is accounted to be very Cordiall.

#### CHAP. LXX.

##### *Caryophyllum siluestris*. Pinkes.

Here remaine diuers sorts of wilde or small Gilloflowers (which wee vnsightly call Pinkes) to be entreated of, some bearing single, and some double flowers, some smooth, almost without any deepe dents on the edges, and some iagged, or as it were feathered. Some growing vpright like unto Gilloflowers, others creeping

1. *Caryophyllum siluestris simplex*. The vnsightly Eagle Pink. 2. *Caryophyllum multiplex siluestris*. Double Pinkes. 3. *Caryophyllum siluestris plumaris*. Feathered or iagged Pinkes. 4. *Caryophyllum Stellatum*. Starre Pinkes. 5. *Caryophyllum retens*. Matted Pinkes. 6. *Caryophyllum mediterraneum*. The great Thistle or Sea Gilloflower. 7. *Caryophyllum merinus*. The ordinary Thistle or Sea Cushion.

ping or spreading vnder the toppe or crust of the ground, some of one colour, some of another, and many of diuers colours : As I haue formerly done with the Gilloflowers, so must I doe with these that are entertained in our Gardens, onely give you the descriptions of some three or foure of them, according to their variety, and the names of the rest, with their distinctions.

1. *Caryophyllus minor silvestris multiplex & simplex.*  
Double and single Pinkes.

The singele and double Pinkes are for forme and manner of growing, in all parts like vnto the Gilloflowers before described, sauing onely that their leaues are smaller and shorter, in some more or lesse then in others, and so are the flowers also : the singele kindes consisting of fve leaues vsually (seldome fix) round pointed, and a little snipt for the most part about the edges, with some threads in the middle, either crooked or straight : the double kindes being lesser, and lesse double then the Gilloflowers, hauing their leaues a little snipt or endented about the edges, and of diuers feuerall colours, as shall hereafter be set downe, and of as fragrant a sent, especially some of them as they : the rootes are long and spreading, somewhat hard and woody.

2. *Caryophyllus plumarius.* Feathered or iagged Pinkes.

The iagged Pinkes haue such like stalkes and leaues as the former haue, but somewhat shorter and smaller, or grasse-like, and of a whitish or grayish greene colour likewise : the flowers stand in the like manner at the toppes of the stalkes, in long, round, slender, greene huskes, consisting of fve leaues, very much cut in on the edges, and iagged almost like a feather, of a light red, or bright purple colour, with two white threads standing in the middle, crooked like a horne at the end, and are of a very good sent. Some of these haue not those two crooked threads or hornes in the middle, but haue in their stead many small threads, not crooked at all : the seedes of them all are like vnto the seedes of Gilloflowers, or the other Pinkes, that is, small, blacke, long, and flat : the rootes are small and woody likewise.

3. *Caryophyllus plumarius albus orbe rubro fine Scellatus.* Starre Pinkes.

Of this kinde there is another sort, bearing flowers almost as deeply cut or iagged as the former, of a faire white colour, hauing a ring or circle of red about the bottome or lower part of the leaues, and are as sweete as the former : this being sowne of seede doth not giue the starre of so bright a red colour, but becommeth more dunne.

4. *Caryophyllus plumarius Austriacus sive Superba Austria.*  
The feathered Pinke of Austria.

This kinde of Pinke hath his first or lower leaues, somewhat broader and greener then any of the former Pinkes, being both for breadth and greennesse more like vnto the Sweete Iohns, which shall bee described in the next Chapter : the leaues on the stalkes are smaller, standing by couples at evry ioynt, at the toppes whereof stand such like iagged flowers as the last described, and as large, but more deeply cut in or iagged round about, some of them of a purplish colour, but the most ordinary with vs are pure white, and of a most fragrant sent, comforting the spirits and senses a farre off: the seedes and rootes are like vnto the former. Some haue mistaken a kinde of wilde Campion, growing in our Woods, and by the paths sides in Hornsies Parke, and other places, to be this feathered Pinke : but the flowers declare the difference sufficiently.

5. *Caryophyllus minor repens simplex & multiplex.*  
Single and double matted Pinkes.

The matted Pinke is the smallest, both for leafe and flower of all other Pinkes that are nourished in Gardens, hauing many short and small grasse greene leaues vpon the stalkes,

stalkes, which as they grow and lye vpon the ground (and not standing so upright as the former) doth take roote againe, whereby it quickly spreadeth, and couereth a great deale of ground in a little space : the flowers are small and round, a little snipt about the edges, whereof some are white, and some red, and some are white spotted with red, and some red ported with white, all of them being singele flowers. But there is another of this kinde, not differing in leafe, but in flower : for that the first flowers are but once double, or of two rows of leaues, of a fine reddish colour, spotted with siluer spots : but those that follow, are so thicke and double, that they often-times doe breake the pod or huske ; being not altogether of so deepe a red colour, but more pale.

6. *Caryophyllus Mediterraneus sive Marinus maior.*  
Great Sea Gilloflower or Great Thrift.

Vnto these kindes of Pinkes I must needs adde, not only our ordinary Thrift (which is more frequent in gardens, to empale or border a knot, because it abideth greene Winter and Summer, and that by cutting, it may grow thick, and be kept in what form one list, rather then for any beautie of the flowers) but another greater kinde, which is of as great beautie and delight almost as any of the former Pinkes, as well for that the leaues are like vnto Gilloflowers, being longer and larger then any Pinkes, and of a whitish greene colour like vnto them, not growing long or by couples vpon the stalkes as Pinkes and Gilloflowers do, but tufting close vpon the ground, like vnto the common Thrift: as also that the stalkes, rising from among the leaues (being sometimes two foote high (as I haue obserued in my garden) are yet so slender and weake, that they are scarce able to beare the heads of flowers, naked or bare, both of leaues and ioynts, sauing only in one place, where at the ioynt each stalke hath two small and very short leaues, not rising vpwards as in all other Gilloflowers, Pinkes, and other herbes, but growing downwards) and doe beare each of them a tuft or vmbell of small purplish, or blush coloured flowers, at the toppes of them standing somewhat like vnto sweete Williams, but more roundly together, each flower consisting of fve small, round, stiffe or hardish leaues, as if they were made of paper, the bottome or middle being hollow, not blowing all at once as the ordinary Thrift, but for the most part one after another, not shewing vsually above foure or fve flowers open at one time (so farre as I could obserue in the plants that I kept) so that it was long before the whole tuft of flowers were past ; but yet the hoter and dryer the time was, the sooner it would be gone : the seede I haue not perfectly obserued, but as I remember, it was somewhat like vnto the seede of Scabious ; I am sure nothing like vnto Gilloflowers or Pinkes : the roote is somewhat great, long and hard, and not so much spreading in the ground as Gilloflowers or Pinkes.

*Caryophyllus Marinus.* Thrift, or Sea Cushion.

Our common Thrift is well knowne vnto all, to haue many short and hard greene leaues, smaller then many of the grases, growing thicke together, and spreading vpon the ground : the stalkes are naked of leaues a spanne high, bearing a small tuft of light purple, or blush coloured flowers, standing round and close thrusting together.

Double Pinkes.

**T**He double white Pinke is onely with more leaues in it then the singele, which maketh the difference.

The double red Pinke is in the same manner double, differing from the singele of the same colour.

The double purple Pinke differeth not

Single Pinkes.

**T**He single white ordinary Pinke hath a single white flower of fve leaues, finely iagged about the edges.

The single red Pinke is like the white, but that the leaues are not so much iagged, and the flower is of a pale purplish red colour.  
Dd 3

from the single purple for colour, but only in the doublenesse of the flower.

The *Granado* Pinke differeth not from the Gilloflower of the same name, but in the smalnesse both of leaues and flower.

The double Matted Pinke is before described.

The double blush Pinke is almost as great as the ordinary blush Gilloflower, and some haue taken it for one, but the greene leaues are almost as small as Pinks, and therefore I referre it to them.

Iagged on the edges, with a faire red circle at the lower end of the leaues on the inside.

The white featherd Pinke of Austria is described before. The purple featherd Pinke of Austria is so likewise. The single matted Pinke is before described. The speckled Pinke is a small flower hauing small spotsof red here and there dispersed ouer the white flower.

Those single flowers being like vnto Pinkes that rise from the sowing of the orange tawney, I bring not into this *clasis*, hauing already spoken of them in the precedent Chapter.

#### The Place.

These are all like as the former, nourished in Gardens with vs, although many of them are found wilde in many places of Austria, Hungarie, and Germany, on the mountaines, and in many other places, as Clusius recordeth. The ordinary Thrift groweth in the salt Marshes at Chatham by Rochester, and in many other places in England : but the great kinde was gathered in Spaine, by Guillaume Boel that painfull searcher of simples, and the seede thereof imparted to me, from whence I had diuers plants, but one yeare after another they all perished.

#### The Time.

Many of these Pinkes both single and double, doe flower before any Gilloflower, and so continue vntill August, and some, most of the Summer and Autunane.

#### The Names.

The seuerall titles that are giuen to these Pinkes, may suffice for their particular names : and for their generall they haue beeene expressed in the former Chapter, beeing of the same kindred, but that they are smaller, and more frequently found wilde. The two sorts of Thrift are called *Caryophylle Marinus*. The greater, *Maior & Mediterraneus*; In English, The greater or Leuant Thrift, or Sea Gilloflower. The lesser *Minimus*, and is accounted of some to be a grasse, and therefore called *Gramen Marinum & Polyant hemum*; In English, Thrift, Sea grasse, and our Ladies Cushion, or Sea Cushion.

#### The Vertues.

It is thought by diuers, that their vertues are answerable to the Gilloflowers, yet as they are of little yse with vs, so I thinke of as small effect.

#### C H A P. L X X I.

##### *Armerius*. Sweet Johns, and sweet Williams.

These kinde of flowers as they come neerest vnto Pinkes and Gilloflowers, though manifestly differing, so it is fittest to place them next vnto them in a peculiar Chapter.

##### 1. *Armerius angustifolius rubens simplex*. Single red sweete Johns.

The sweete John hath his leaues broader, shorrter and greener then any of the former Gilloflowers, but narrower then sweete Williams, set by couples, at the ioynts of the stalkes, which are shorrter then most of the former, and not aboue a foote and a halfe high, at the tops whereof stand many small flowers, like vnto small Pinkes, but standing closer together, and in shorrter huskes, made of fine leaues, smaller then most of them, and more deepeley iagged then the Williams, of a red colour in the middle, and white at the edges, but of a small or soft sent, and not all florwing at once, but by degrees : the seede is blacke, somewhat like vnto the seede of Pinkes, the roote is dispersed diuersly, with many small fibres annexed vnto it.

##### 2. *Armerius angustifolius albus simplex*. Single white sweete Johns.

This white John differeth not in any thing from the former, but onely that the leafe doth never change brownish, and that the flower is of a faire white colour, without any mixture.

##### 3. *Armerius angustifolius duplex*. Double sweete Johns.

There is of both those former kinde, some whose flowers are once double, that is, consisting of two or three rowes of leaues, and the edges not so deepeley iagged ; not differing in any thing else.

##### 4. *Armerius latifolius simplex flore rubro*. Single red sweete Williams.

The sweet Williams doe all of them spread into many very long trayling branches, with leaues lying on the ground, in the very like manner that the sweete Johns doe : the chiefe differences betweene them are, that these haue broader, and darker greene leaues, somewhat brownish, especially towards the points, and that the flowers stand thicker and closer, and more in number together, in the head or tuft, hauing many small pointed leaues among them, but harmlesse, as all men knowe, the colour of the flower is of a deep red, without any mixture or spot at all.

##### 5. *Armerius latifolius flore rubro multiplici*. Double red sweete Williams.

The double kinde differeth not from the single kinde of the same colour, but only in the doublenesse of the flowers, which are with two rowes of leaues in every flower.

##### 6. *Armerius latifolius variegatus fine vericolor*. Speckled sweete Williams, or London pride.

These spotted Williams are very like the first red Williams, in the forme or maner of growing, hauing leaues as broade, and browne sometimes as they, the flowers stand as thicke or thicker, clusting together, but of very variable colours : for some flowers will be of a fine delayed red, with few markes or spots vpon them, and others will

## The Garden of pleasant Flowers.

wili bee full peckled or sprinkled with white or siluer spots, circelwise about the middle of the flowers, and some will haue many specks or spots vpon them dispersed: all these flowers are not blowne at one time, but some are flowring, when others are decaying, so that abiding long in their pride, they become of the more respect: The seede is blacke, as all the rest, and not to be distinguished one from another: the roots are some long, and some small and threddy, running vnder the vpper crust of the earth.

### 7. *Armerius latifolius flore rubro saturo holosericis.* Sweet Williams of a deepe red or murrey colour.

The leaues of this kinde seeme to be a little larger, and the ioints a little redder then the former, but in the flower consisteth the chiefest difference, which is of a deepe red, or murrey purple colour, like vnto velvet of that colour, without any spots, but smooth, and as it were soft in handling, hauing an eye or circle in the middle, at the bottome of the leaues.

### 8. *Armerius latifolius simplex flore albo.* Single white sweete Williams.

The white kinde differeth not in forme, but in colour from the former, the leaues are not browne at all, but of a fresh greene colour, and the flowers are wholly white, or else they are all one.

### The Place.

These for the most part grow wilde in Italic, and other places: we haue them in our Gardens, where they are cherished for their beautifull varietie.

### The Time.

They all generally doe flower before the Gilloflowers or Pinkes, or with the first of them: their seede is ripe in Iune and Iuly, and doe all well abide the extremitie of our coldest winters.

### The Names.

They all generally are called *Armerius*, or *Armeria*, as some doe write, and distinguished as they are in their titles: Yet some haue called them *Vettonica agrestis*, and others *Herba Tunica, Scarlatea, & Caryophyllus filicifolia*: Wee doe in English in most places, call the first or narrower leaved kindes, Sweet Johns, and all the rest Sweete Williams; yet in some places they call the broader leaved kindes that are not spotted, *Tolmeiners*, and *London tufts*: but the speckled kinde is termed by our English Gentlewomen, for the most part, *London pride*.

### The Vertues.

We haue not knowne any of these vsed in Phyfiche.

## CHAP. LXXII.

### *Bell. Daisie.*

Here be diuers sorts of Daisies, both great and small, both single and double, both wilde growing abroade in the fieldes, and elsewhere, and manured growing only in Gardens: of all which I intend not to entreate, but of those that are of most beautie and respect, and leauue the rest to their proper place.

### 1. *Bellis*

## The Garden of pleasant Flowers.

1. *Armeria angustifoliae simplex*. Single sweete Williams. 2. *Armeria angustifoliae multiplex*. Double sweete Williams. 3. *Armeria latifoliae simplex*. Single forming White. 4. *Armeria latifoliae versicolor*. Spotted Sweete Williams or pride of London. 5. *Armeria latifoliae multiplex*. Double Sweete Williams. 6. *Bellis bartschiana major*. Double Garden Daisies. 7. *Bellis minor hortensis*. Double Daisies. 8. *Bellis minor hortensis praecisa*. Double fruitfull Daisies or Jacke an Apes on horsebacke. 9. *Bellis carduoides Globularia*. Double blaw Daisies or blaw Globeflower. 10. *Bellis latens monspeliensis*. Double yellow Daisies or yellow Globeflower.

*1. Bellis major flore albo pleno.* The great double white Daisie.

The great Daisie with the double white flower, is in all things so like vnto the great single kinde, that groweth by the high wayes, and in diuers medowes and fields, that there is no difference but in the flower, which is double. It hath many long, and somewhat broad leaues lying vpon the ground, deeply cut in on both sides, somewhat like vnto an oaken leaf; but those that are on the stalkes are shorter, narrower, and not so deeply cut in, but onely notched on the edges: the flowers at the toppe are (as I said) white and double, consisting of diuers rows of leaues, being greater in compass than any of the double Daisies that follow, but nothing so double of leaues.

*2. Bellis minor flore rubro simplici.* Single red Daisies.

This single Daisie (like as all the rest of the small Daisies) hath many smooth, greene, round pointed leaues lying on the ground, a little snipt about the edges; from among which rise many slender round foote-stalkes, rather then stalkes or stems, about an hand breadth high at the most, and oftentimes not halfe so high, bearing one flower a peice, consisting of many small leaues, as a pale or border set about a middle thrumme: the leaues of this kinde are almost wholly red, whereas in the wilde they are white or whitish, enclining to red on the edges, the middle being yellow in both sorts: the rootes are many small white threads or strings.

*3. Bellis minor hortensis flore pleno varioram colorum.*  
Double Garden Daisies of diuers colours.

The leaues of all the double Daisies are in forme like vnto the single ones, but that they are smaller, and little or nothing snipt or notched about the edges: the small stalkes likewise are smaller and lower, but bearing as double flowers as any that growe on the ground, being composed of many small leaues, thicke thrust together, of diuers colours; for some are wholly of a pure white, others haue a little red, either dispersed vpon the white leaues, or on the edges, and sometimes on the backes of the leaues: some againe seeme to be of a whitish red, or more red then white, when as indeede they are white leaues dispersed among the red; others of a deepe or darke red colour, and some are speckled or striped with white and red through the whole flower: and some the leaues will bee red on the vpperfide, and white vnderneath; and some also (but those are very rare) are of a greenish colour.

*4. Bellis minor hortensis prolifera.* Double double Daisies or childing Daisies.

There is no difference either in leafe or roote in this kinde from the former double Daisies: the chiefest variety consisteth in this, that it beareth many small double flowers, standing vpon very short stalkes round about the middle flower, which is vphysually as great and double as any of the other double kindes, and is either wholly of a deepe red colour, or speckled white and red as in some of the former kindes, or else greenish, all the small flowers about it being of the same colour with the middlemost.

*5. Bellis carnnea sive Globularia.* Blew Daisies.

The likenesse and affinity that this plant hath with the former, both in the forme of leafe and flower, as also in the name, hath caused me to insert it, and another rare plant of the same kinde, in this place, although they be very rare to be met with in our English Gardens. This beareth many narrower, shorter, and blacker greene leaues then the former, lying round aboue vpon the ground; among which rise vp slender, but stiffe and hard stalks, halfe a foot high or more, set here and there with small leaues, and at the top a small round head, composed of many small blew leaues, somewhat like vnto the head of a Scabious: It hath bin found likewise with a white head of flowers: the roote is hard and stringie: the whole plant is of a bitter taste.

*6. Globularia**6. Globularia lutea montana.* Yellow Daisies.

This mountaine yellow Daisie or Globe-flower hath many thicke, smooth, round pointed leaues, spread vpon the ground like the former; among which spring diuers small round rufhie stalkes, a foote high, bearing about the middle of them two small leaues at the ioynts, and at the toppes round heads of flowers thrust thicket together, standing in purplish huskes, every of which flowers do blow or spread into fve leaues, starre-fashion, and of a faire yellow colour, smelling like vnto broome flowers, with many small threads in the middle compassing a flat pointell, horned or bended two wayes: after the flowers are past rise vp the seede vessels, which are round, swelling out in the middle, and diuided into foure parts, at the toppes, containing within them round, flat, blacke seede, with a small cut or notch in them: the roote is a finger long, round and hard, with a thicke barke, and a woddy pith in the middle, of a sharpe dryng taste and strong sent: the leaues are also sharpe, but bitter.

## The Place.

The small Daisies are all planted, and found onely in Gardens, and will require to be replanted often, lest they degenerate into single flowers, or at least into lesse double. The blew Daisie is naturall of Mompelier in France, and on the mountaines in many places of Italy, as also the yellow kinde in the Kingdome of Naples.

## The Time.

The Daisies flower betimes in the Spring, and last vntill May, but the last two flower not vntill August or September.

## The Names.

They are vsually called in Latine *Bellides*, and in English Daisies. Some call them *Herba Margarita*, and *Primula veris*, as it is likely after the Italian names, of *Marguerite*, and *Fior di prima vera gentile*. The French call them *Pasquettes*, and *Marguerites*, and the Fruittfull sort, or thosethat beare small flowers about the middle one, *Margueritons*: our English women call them Iacke an Apes on horse-backe, as they doe Marigolds before recited, or childing Daisies: but the Physitians and Apothecaries doe in generall call them, especially the singlie or Field kindes, *Consolidae minor*. The blew Daisie is called *Bellus carnlea*, and *Globularia*, of some *Scabiosa pumilana* genus. The Italians call it *Botanaria*, because the heads are found like buttons. The yellow, *Globularia montana*, is onely described by Fabius Columna, in his last part of *Phytobafanos*, and by him referred vnto the former *Globularia*, althoughe it differ in some notable points from it.

## The Vertues.

The properties of Daisies are certainly to bind, and the roote especially being dryed, they are vsed in medicines to that purpose. They are also of speciall account among those herbes, that are vsed for wounds in the head.

## CHAP. LXXXIII.

*Scabiosa. Scabious.*

**T**He sorts of Scabious being many, yeeld nor flowers of beauty or respect, fit to bee cherished in this our Garden of delight; and therefore I leauie them to the Fields and Woods, there to abide. I haue onely two or three strangers to bring to your acquaintance, which are worthy this place.

1. *Scabiosa flore albo*. White flowred Scabious.

This white Scabious hath many long leaues, very much iagged or gaſht in on both ſides, of a meane bignesse, being neither ſo large as many of the field, nor ſo ſmall as any of the ſmall kindes: the ſtakles riſe about a foote and a halfe high, or ſomewhat higher, at the tops wherof grow round heads, thicke ſet with flowers, like in all points vnto the field Scabious, but of a milke white colour.

2. *Scabiosa rubra Austriae*. Red Scabious of Austria.

This red Scabious hath many leaues lying vpon the ground, very like vnto Devils bit, but not ſo large, being ſhorter and iñipt, not gaſhed about the edges, of a light greene colour; yet (there is another of a darker greene colour, whose flower is of a deeper red) the ſtakles haue diuers ſuch leaues on them, ſet by couples at the ioynts as grow belowe, and at the tops ſmall heads of flowers, each coniſting of ſiue leaues, the biggest flowers ſtanding round about in the outer compaffe, as is vſually almost in all the kinds of Scabious, of a fine light purple or red colour: after the flowers are paſt, come the ſeede, which is ſomewhat long and round, ſet with certaine haieres at the head thereof, like vnto a Starre: the roote is composed of a number of ſlender strings, fastened at the head.

3. *Scabiosa rubra Indiae*. Red flowred Indian Scabious.

This (reputed Indian) Scabious hath many large faire greene leaues lying on the ground, iagged or cut in on both ſides to the middle ribbe, euerie peece whereof is narrower then that at the end, which is the broadest: among theſe leaues riſe vp ſun-dry ſlender and weake ſtakles, yet ſtanding vpright for the moft part, ſet with ſmaller and more iagged leaues at certayne diſtances, two or three at euerie ioynt, branching forth at the toppe into other ſmaller branches, bearing euerie one head of flowers, like in forme vnto other Scabiouses, but of an excellent deepe red crimson colour (and ſometimes more pale or delayed) of no ſent at all: after which doe come ſmall roundiſh ſeede, like vnto the field Scabious: the roote is long and round, compaffed with a great many ſmall strings, and periſheth vſually as ſoon as it hath borne out his flowers and ſeede: otherwise if it doe not flower the firſt yeaſe of the ſowing, if it be carefully defended from the extremitie of Wiſter, it will flower the ſooner the next yeaſe, as I my ſelfe haue often found by expeſience.

## The Place.

The firſt is ſometimes found wilde in our owne Countrey, but it is very geaſon, and hath been ſent among other rare ſeedes from Italy.

The ſecond was firſt found and written of by Cluſius, in Pannonia and Austria, where it is very plentifull.

The third hath been ſent both from Spaine & Italy, and is verily thought to grow naturally in both thoſe parts.

The

1. *Scabiosa flore albo*. White flowred Scabious. 2. *Scabiosa rubra Austriae*. Red Scabious of Austria. 3. *Scabiosa rubra Indiae*. Red flowred Indian Scabious. 4. *Cyanus vulgaris minor*. Corn-flower of divers colours. 5. *Cyanus Batticus*, Spanish Corn-flower. 6. *Cyanus floridus Turicensis*. The braue Sultans flower. 7. *Cariolum sativum*. Spanish Saſſion.

## The Time.

The first and second flower earlier then the last, for that it flowreth not vntill September or October, (vnlesse it be not apt to beare the first yeare as I before said) so that many times (if none be more forward) it perisheth without bearing ripe seede, whereby we are oftentimes to seeke new seede from our friends in other parts.

## The Names.

They haue all one generall name of Scabious, distinguisched eyther by their flower, or place of growing, as in their titles: yet the last is called of diuers *Scabiosae exoticæ*, because they thinke the name *Indica*, is not truly imposed vpon it.

## The Vertues.

Whether these kindes haue any of the vertues of the other wilde kindes, I know none haue made any experiance, and therefore I can say no more of them.

## C H A P. L X X I I I I.

*Cyanus*. Corne flower, or blewe Bottles.

**V**Nder the name of *Cyanus* are comprehended, not onely those plants which from the excellent blewe colour of their flower (furnishing or rather pestering the Corne fieldes) haue peculiarly obtained that name, and which doth much vary also, in the colour of the flowers, as shall be shewed; but some other plants also for their neere resemblance, but with feweall distinctions. The *Cyanus maior*, *Ptarmica austriaca*, *Ptarmica Imperati*, and many others which may be adioyned vnto them, do more fitly belong to the Garden of Simples, whereunto I leau them, and will here only entreate of those that may most please the delight of our Gentle Florists, in that I labour and striaue, to furnish this our garden, with the chiefeſt choyſe of natures beauties and delights.

1. *Cyanus vulgaris diuerſorum colorum*. Corne flower of diuers colours.

All these ſorts of Corne flowers are for the moft part alike, both in leaues and flowers one vnto another for the forme: the difference betwenee them confiſteth in the varying colour of the flowers: For the leaues are long, and of a whitish greene colour, deeply cut in on the edges in ſome places, ſomewhat like vnto the leaues of a Scabious: the stalkes are two foote high or better, beſet with ſuch like leaues but ſmaller, and little or nothing ſlit on the edges: the toppeſ are branched, bearing many ſmall greene ſcaly heads, out of which riſe flowers, conſiſting of five or ſix, or more long and hollow leaues, ſmall at the bottome, and opening wider and greater at the brims, notched or cut in on the edges, and ſtanding round about many ſmall thredes in the middle: the colours of the flowers are diuers, and very variable; for ſome are wholly blewe, or white, or bluſh, or of a ſad, or light purple, or of a light or dead red, or of an ouerworne purple colour, or elſe mixed of theſe colours, as ſome, the edges white, and the reſt blewe or purple, or the edges blewe or purple, and the reſt of the flower white, or ſtriped, ſpotteſ, or halfeſ, the one part of one colour, and the other of another, the thredes likewiſe in the middle varying in many of them; for ſome will haue the middle thrum of a deeper purple then the outer leaues, and ſome haue white or bluſh leaues, the middle thrum being reddiſh, deeper or paler: After the flowers are paſt, there come ſmall, hard, white and ſhining ſeede in theſe heads, wrapped

ped or ſet among a deale of flockie matter, as is moft uſuall, in all plants that haue ſcaly heads: the rootes are long and hard, periſhing euery yeare when it hath giuen ſeede.

2. *Cyanus floridus Turcicus*. The Sultans flower.

As a kinde of theſe Corne flowers, I muſt needs adioyne another ſtranger, of much beaute, and but lately obtained from Constantinople, where, becauſe (as it is ſaid) the great Turke, as we call him, ſaw it abroade, liked it, and worte it himſelfe; all his vaffals haue had it in great regard, and haue been obtained from them, by ſome that haue ſent it into theſe parts. The leaues whereof are greener, and not onely gafched, but finely ſnipt on the edges: the stalkes are three foote high, garniſhed with the like leaues as are below, and branched as the former, bearing large ſcaly heads, and ſuch like flowers but larger, hauing eight or nine of theſe hollow gaping leaues in every flower, ſtanding about the middle thredes (if it be planted in good and fertile ground and be well watered, for it ſoone starueth and periſheth with drought) the circling leaues are of a ſad delayed purple or bluſh colour, very beautefull to beholde; the ſeede of this is ſmaller and blacker, and not enclosed in ſo much dounie ſubſtance, as the former (yet in our Countrey the ſeede is not ſo blacke, as it came vnto vs, but more gray) the roote periſheth likewiſe every yeare.

3. *Cyanus Beticus sapinus*. The Spanish Corne-flower.

This Spaniſh kinde hath many ſquare low bending or creeping stalkes, not ſtanding ſtright as the former, but branching out more diuerſly; ſo that one plant will take vp a great deale of ground: the leaues are broader then any of the reſt, ſofter alſo, of a pale or whitish greene colour, and not much gafched on the edges: the flowers ſtand in bigger heads, with four or five leaues vnder every head, and are of a light pale purple or bluſh colour; after which come ſeede, but not ſo plentifull, yet wrapped in a great deale of flockie matter, more then any: the roote growtheth downe deepe into the ground, but periſheth every yeare as they doe.

## The Place.

The firſt or former kindes, grow many times in the Corne fields of our own Countrey, as well as of others, eſpecially that ſort with a blewe flower: but the other ſorts or colours are not ſo frequent, but are nouriſhed in gardeſ, where they will vary wonderfully.

The ſecond as is before ſet downe, growtheth in Turkie: and the laſt in Spaine, found out and first ſent to vs by that induſtrious ſearcher of ſimples, Guillaume Boel before remembred.

## The Time.

The firſt doe flower in the end of June, and in July, and ſomtimes ſooner. The other two later, and not vntill August moft commonly, and the ſeede is ſoone ripe after.

## The Names.

The firſt is generally called *Cyanus*, and ſome following the Ditch name, call it *Flos frumenti*. The olde Writers gaue it the name of *Bapti ſecuba*, which is almoft worne out. We doe call them in English, Blewe Bottles, and in ſome places, Corne flowers, after the Ditch names. The ſecond hath beeſen ſent by the name of *Ambreboi*, which whether it be a Turkie or Arabian name, I know not. I haue called it from the place, from whence we had it, *Turcicus*, and for his beauty, *Floridas*. The Turkes themſelues as I underſtand, doe call it The Sultans flower, and I haue done ſo likewiſe, that it may bee diſtinguiſhed from all the other kindes, or elſe you may call it,

## The Garden of pleasant Flowers.

The Turkey blush Corne flower, which you please. The i. t. was sent by the name of *Iacea Batica*, but I had rather to referre it to the *Cyanus*, or Corne flowers, because the flowers are like vnto the Corne flowers, and not vnto the Iaceas or Knapweedes.

### The Vertues.

These had no vse in Physicke in Galen and Dioscorides time, in that (as it is thought) they haue made no mention of them: We in these dayes doe chiefly vse the first kindes (as also the greater sort) as a cooling Cordiall, and commended by some to be a remedy, not onely against the plague and pestilentiall diseases, but against the poison of Scorpions and Spiders.

## CHAP. LXXV.

### *Iacea Marina Batica*. Spanish Sea Knapweede.

There are a great many sorts of Knapweedes, yet none of them all fit for this our Garden, but this only stranger, which I haue beeene bold to thrust in here, for that it hath such like gaping or open flowers, as the former Corne flowers haue, but notably differing, and therefore deserueth a peculiar Chapter, as partaking both with *Cyanus* and *Iacea*. It hath many long and narrow leaues vneuenly dented or waued on both edges (and not notched, gashed or indented, as many other herbes are) being thicke, fleshie and brittle, a little hairy, and of an ouerworne darke greene colour, among which rise lowe weake stalkes, with such like leaues as grow at the bottom, but smaller, bearing but here and there a flower, of a bright reddish purple colour, like in forme vnto the Corne flowers, but much larger, with many thredes or thrumes in the middle of the same colour, standing vp higher then any of the former: this flower riseth out of a large scaly head, all set ouer with small sharpe (but harmefesse) white prickles: the seedes are blackish, like vnto the Knapweedes, and larger then any of the former Corne flowers: the roote is great and thicke, growing deepe into the ground, fleshie and full of a flimie or clammy iuice, and easie to bee broken, blackish on the outside, and whitish within, enduring many yeares, like as the other Knapweedes, or Matfelons doe, growing in time to be very thicke and great.

### The Place.

It growtheth naturally by the Sea fide in Spaine, from whence I received the seedes of Guillaume Boel, and did abide well in my garden a long time, but is now perished.

### The Time.

It flowreth in the beginning of July, or thereabouts, and continueth not long in flower: but the head abideth a great while, and is of some beauty after the flower is past; yet seldom giueth good seed with vs.

### The Names.

It hath no other name then is set down in the title, being altogether a Novelist, and not now to be seene with any sauing my selfe.

### The Vertues.

We haue not yet known any vse hereof in Physick.

## CHAP.

## The Garden of pleasant Flowers.

### CHAP. LXXVI.

### *Cnicus* sive *Carthamus sativus*. Bastard or Spanish Saffron.

Here are two or three sorts of *Cnicus* or bastard Saffrons which I passe ouer, as not fit for this Garden, and onely set downe this kinde, whose flowers are of a fairer and more liuely colour in our Country, then any hath come ouer from Spaine, where they manure it for the profit they make thereof, seruing for the dying of Silke especially, and transporting great quantities to diuers Countries. It hath large broad leaues, without any prickes at all vpon them in our Country, growing vpon the stalk, which is strong, hard, and round, with shorter leaues thereon vpto the toppe, where they are a little sharpe pointed, and prickly about the edges sometimes, which stalk riseth three or fourfe foote high, and brancheth it selfe toward the toppe, bearing at the end of euery branch one great open scaly head, out of which thrusth out many gold yellow threads, of a most orient shining colour, which being gathered in a dry time, and kept dry, will abide in the same delicate colour that it bare when it was fresh, for a very long time after: when the flowers are past, the seede when it is come to maturity, which is very seldom with vs, is white and hard, somewhat long, round, and a little cornered: the roote is long, great, and wooddy, and perisheth quickly with the first frosts.

### The Place.

It growtheth in Spaine, and other hot Countries, but not wilde, for that it is accounted of the old Writers, Theophrastus and Dioscorides, to be a manured plant.

### The Time.

It flowreth with vs not vntill August, or September sometimes, so that it hardly giueth ripe seede (as I said) neither is it of that force to purge, which growtheth in these colder Countries, as that which commeth from Spaine, and other places.

### The Names.

The name *Cnicus* is derived from the Greekes, and *Carthamus* from the Arabians, yet still *sativus* is added vnto it, to shew it is no wilde, but a manured plant, and iowne euery where that wee know. Of some it is called *Crocus hortensis*, and *Saracenicus*, from the Italians which so call it. We call it in English Bastard Saffron, Spanish Saffron, and Catalonia Saffron.

### The Vertues.

The flowers are vsed in colouring meates, where it growtheth beyond Sea, and also for the dying of Silkes: the kernels of the seede are onely vsed in Physicke with vs, and serueth well to purge melancholike humours.

## CHAP. LXXVII.

### *Carduus*. Thistles.

You may somewhat maruaile, to see mee curios to plant Thistles in my Garden, when as you might well say, they are rather plagues then pleasures, and more trouble to weed them out, then to cherish them vp, if I made therein no distinction or choise; but when you haue viewed them well which I bring in, I will then

then abide your censure, if they be not worthy of some place, although it be but a corner of the Garden, where something must needs be to fill vp roome. Some of them are smooth, and without prickes at all, some at the heids onely, and some all ouer; but yet not without some especiall note or marke worthy of respect: Out of this discourse I leue the Artichoke, with all his kindes, and referre them for our Kitchin Garden, because (as all know) they are for the pleasure of the taste, and not of the smell or sight.

1. *Acanthus sativus*. Garden Beares breech.

The leaues of this kinde of smooth thistle (as it is accounted) are almost as large as the leaues of the Artichoke, but not so sharp pointed, very deeply cut in and gashed on both edges, of a sad green & shining colour on the vpper side, and of a yellowish green vnderneath, with a great thicke rib in the middle, which spread themselves about the root, taking vp a great deale of ground. After this plant hath stood long in one place, and well defended from the iniury of the cold, it sendeth forth from among the leaues one or more great and strong stalkes, three or foure foote high, without any branch at all, bearing from the middle to the top many flowers one aboue another, spike-fashion round about the stalke, with smalier but not diuided greene leaues at every flower, which is white, and fashioned somewhat like vnto a gaping mouth; after which come broad, flat, thicke, round, brownish yellow seede (as I haue well obserued by them haue beene sent me out of Spaine, and which haue sprung vp, and doe grow with me; for in our Countrey I could neuer obserue any seede to haue grown ripe) the rootes are composed of many great and thicke long strings, which spread farre in and vnder the ground, somewhat darkish on the outside, and whitish within, full of a clammy moisture (whereby it sheweth to haue much life) and doe endure our Winters, if they be not too much exposed to the sharpe violence thereof, which then it will not endure, as I haue often found by experiance.

2. *Acanthus spinosus*. Wilde or prickly Beares breech.

This prickly Thistle hath diuers long greenish leaues lying on the ground, much narrower then the former, but cut in on both sides, thicke set with many white prickes and thornes on the edges: the stalke riseth not vp so high, bearing diuers such like thornie leaues on them, with such a like head of flowers on it as the former hath: but the seede hereof (as it hath come to vs from Italy and other places, for I neuer saw it beare seed here in this Country) is blacke and round, of the bignesse of a small pease: the roote abideth reasonable well, if it be defended somewhat from the extremity of our Winters, or else it will perish.

3. *Eryngium Pannonicum* sive *Montanum*. Hungary Sea Holly.

The lower leaues of this Thistle that lye on the ground, are somewhat large, round, and broad, hard in handling, and a little snipt about the edges, every one standing vp on a long foote-stalke: but those that growe vpon the stalke, which is stiffe, two or three foote high, haue no foote-stalke, but encompasse it, two being setat every ioynt, the toppe whereof is diuided into diuers branches, bearing small round rough heads, with smaller and more prickly leaues vnder them, and more cut in on the sides then those belowe: out of these heads rise many blew flowers, the foote-stalkes of the flowers, together with the toppes of the branches, are likewise blew and transparent, or shining.

We haue another of this kinde, the whole toppes of the stalkes, with the heads and branches, are more white then blew: the seede contained in these heads are white, flat, and as it were chaffie: the roote is great and whitish, spreading farre into many branches, and somewhat sweete in taste, like the ordinary Sea Holly rootes.

4. *Carduus mollis*. The gentle Thistle.

The leaues of this soft and gentle Thistle that are next vnto the ground, are greene

01

1. *Acanthus sativus*. Garden Beares breech. 2. *Acanthus spinosus*. Wilde Beares breech. 3. *Eryngium Pannonicum* Mountains Sea Holly. 4. *Carduus bursa-pastoris*. The lowe Cardine Thistle. 5. *Carduus sphaerocarpus major*. The greater Globe-Thistle. 6. *Carduus sphaerocarpus minor*. The lesser Globe-Thistle. 7. *Carduus eriophyllum*. The Friers crowne. 8. *Fraxinella*. Bastard Dittany.

on the vpperside, and hoary vnderneath, broad at the bottome, somewhat long pointed, and vnequally notched about the edges, with some soft haire prickle, not hurting the handler, every one standing vpon a short foote stalke; those that growe about the middle stalke are like the former, but smaller and narrower, and those next the toppe smallest, where it diuideth it selfe into small branches, bearing long and scaly heads, out of which breake many reddish purple threads: the seede is whitish and hard, almost as great as the seede of the greater Century: the roote is blackish, spreading vnder the ground, with many small fibres fastened vnto it, and abideth a great while.

*5. Carlina humilis.* The lowe Carline Thistle.

This lowe Thistle hath many iagged leaues, of a whitish greene colour, armed with small sharp white prickle round about the edges, lying round about the rootypon the ground, in the middle whereof riseth vp a large head, without any stalke vnder it, compassed about wth many small and long prickly leaues, from among which the flower sheweth it selfe, composed of many thin, long, whitish, hard shining leaues, standing about the middle, which is flat and yellow, made of many thrums or threads like small flowers, wherein lye small long seede, of a whitish or siluer colour: the roote is somewhat aromaticall, blackish on the outside, small and long, growing downwards into the ground. There is another of this kinde that beareth a higher stalke, and a redder flower, but there is a manifest difference betwenee them.

*6. Carduus Sphaerocephalus sine Globosus maior.* The greater Globe Thistle.

The greatest of these beautifull Thistles, hath at the first many large and long leaues lying on the ground, very much cut in and diuided in many places, even to the middle ribbe, set with small sharpe (but not very strong) thornes or prickle at every corner of the edges, greene on the vpperside, and whitish vnderneath: from the middle of these leaues riseth vp a round stiffe stalke, three foote and a halfe high, or more, set without order with such like leaues, bearing at the toppe of euery branch a round hard great head, consisting of a number of sharpe bearded huskes, compact or set close together, of a blewish greene colour, out of euery one of which huskes start small whitish blew flowers, with white threads in the middle of them, and rising aboue them, so that the heads when they are in full flower, make a fine shew, much delighting the spectators: after the flowers are past, the seede encreaseth in every one, or the most part of the bearded huskes, which doe still hold their round forme, vntill that being ripe it openeth it selfe, and the huskes easilly fall away one from another, containing within them a long whitish kernell: the roote is great and long, blackish on the outside, and dyeth every yeare when it hath borne seede.

*7. Carduus Globosus minor.* The lesser Globe Thistle.

The lesser kinde hath long narrow leaues, whiter then the former, but cut in and gashed on the edges very much with some small pricks on them; the stalke is not halfe so long, nor the heads halfe so great, but as round, and with as blew flowers as the greater: this seldome giueth ripe seede, but recompenseth that fault, in that the roote perisheth not as the former, but abideth many yeares.

*8. Carduus Erioccephalus sine Tomentosus.* The Friers Crowne.

This woolly Thistle hath many large and long leaues lying on the ground, cut in on both sides into many diuisions, which are likewise somewhat vnequally cut in or diuided againe, hauing sharpe white prickle at every corner of the diuisions, of a dead or sad greene colour on the vpperside, and somewhat woolly withall, and grayish vnderneath: the stalke is strong and tall, fourre or five foote high at the least, branching out into diuers parts, euery where beset with such like leaues as growe below; at the toppe of euery branch there breaketh out a great whitish round prickly head, flattish at the toppe, so thicke set with wooll, that the prickle seeme but small spots or haire, and

and doth so well resemble the bald crowne of a Friar, not onely before it be in flower, but especially after it hath done flowring, that thereupon it deseruedly received the name of the Friers Crowne Thistle: out of these heads riseth forth a purple thrumme, such as is to be seene in many other wilde Thistles, which when they are ripe, are full of a flockie or woolly substance, which breake at the toppe shedding it, and the seede which is blackish, flat, and smooth: the roote is great and thicke, enduring for some yeares, yet sometimes perishing, if it be too much exposed to the violence of the frosts in Winter.

The Place.

The first groweth naturally in Spaine, Italy, and France, and in many other hot Countries, and growe onely in Gardens in these colder climates, and there cherisched for the beautifull aspect both of the greene plants, and of the stalkes when they are in flower. The Carline Thistle is found both in Germany and Italy in many places, and as it is reported, in some places of the West parts in England. The others are found some in France, some in Hungary, and on the Alpes, and the last in Spaine.

The Time.

They doe all flower in the Summer moneths, some a little earlier or later then others.

The Names.

The first is called *Acanthus sativus* (because the other that is prickly, is called *silvestris* or *spinosa*) and *Branca urinaria*; In English, Branck vrine, and Beares breech. The third is called *Eringium montanum*, *Alpinum*, and *Pannonicum latifolium*: In English, Mountaine or Hungary Sea Holly. The fourth is called *Carduus mollis*, The gentle Thistle, because it hath no harmfull prickle, although it seeme at the first shew to be a Thistle. The fifth is called of diuers *Chameleo albus*, and *Carlina*, as if they were both but one plant; but Fabius Columna hath in my judgement very learnedly desciuded that controvercie, making *Carlina* to be *Ixine* of Theophrastus, and *Chameleo* another differing Thistle, which Gaza translathet *Vernalago*. We call it in English, The Carline Thistle. The other haue their names in their titles, as much as is conuenient for this discourse.

The Vertues.

The first hath alwaies been vsed Physically, as a mollifying herbe among others of the like slimie matter in Gisters, to open the body; yet Lcb. I seemeth to make no difference in the vse of them both (that is, the prickly as well as the smooth.) The Carline Thistle is thought to bee good against poysons and infection. The rest are not vsed by any that I know.

C H A P. L X X V I I I .

*Fraxinella.* Bastard Dittany.

**H**aving finished those pleasing Thistles, I come to other plants of more gentle handling, and first bring to your consideration this bastard Dittany, whereof there are found out two especiall kindes, the one with a reddish, the other with a whitish flower, and each of these hath his diuersity, as shall be presently declared.

*1. Fraxinella flore rubente.* Bastard Dittany with a reddish flower.

This goodly plant riseth vp with diuers round, hard, brownish stalkes, neare two foote

foote high, the lower parts whereof are furnished with many winged leaues, somewhat like vnto Liquerice, or a small young Ashe tree, consisting of seuen, nine, or eleven leaues set together, which are somewhat large and long, hard and rough in handling, of a darkish greene colour, and of an vnpleasant strong resinous sent: the vpper parts of the stalkes are furnished with many flowers, growing spike fashion, at certaine distances one aboue another, consisting of fve long leaues a peece, whereof foure that stand on the two sides, are somewhat bending vpwards, and the fift hanging downe, but turning vp the end of the leafe a little againe, of a faint or pale red colour, striped through every leafe with a deeper red colour, and hauing in the middle a tassell of fve or six long purplish threds, that bowe downe with the lower leafe, and turne vp also the ends againe, with a little frise or thrume at the ends of every one: after the flowers are past, arise hard, stiffe, rough, clammy huskes, horned or pointed at the end, foure or fve standing together, somewhat like the seede vessels of the Wolfes-banes, or Columbines, but greater, thicker and harder, wherein is contained round shining blacke seede, greater than any Colombe seede by much, and smaller than Peony seede: the roote is white, laige, and spreading many wayes vnder ground, if it stand long: the whole plant, as well roots as leaues and flowers, are of a strong sent, not so pleasing for the smell, as the flowers are beautifull to the sight.

2. *Fraxinella flore rubro.* Bastard Dittaine with a red flower.

This differeth not from the former eyther in roote, leafe or flower for the forme, but that the stalkes and leaues are of a darker greene colour, and that the flowers are of a deeper red colour, (and growing in a little longer spike) wherein the difference chiefly consisteth, which is sufficient to distinguish them.

3. *Fraxinella flore albo.* Bastard Dittanie with a white flower.

The white flowred *Fraxinella* hath his leaues and stalkes of a fresher greene colour then any of the former; and the flowers are of a pure white colour, in forme differing nothing at all from the other.

4. *Fraxinella flore albo ceruleo.*  
Bastard Dittanie with an ash coloured flower.

The colour of the flower of this *Fraxinella* onely putteth the difference betweene this, and the last recited with a white flower: for this beareth a very pale, or whitish blew flower, tending to an ash colour.

The Place.

All these kindes are found growing naturally, in many places both of Germany, and Italie: and that with the white flower, about Franckford, which being sent me, perished by the way by long and euill carriage.

The Time.

They flower in June and July, and the seede is ripe in August.

The Names.

The name *Fraxinella* is most generally imposed on those plants, because of the resemblance of them vnto young Ashes, in their winged leaues. Yet some doe call them *Dictamus albus*, or *Dictamnus albus*, and *Diptamas albus*, as a difference from the *Dictamnus Creticus*, which is a farre differing plant. Some would haue it to be *Tragium* of Dioscorides, but beside otherthings wherein this differeth from *Tragium*, this yeeldeth no milkie iuice, as Dioscorides saith *Tragiam* doth: We in English doe eyther call it *Fraxinella*, or after the other corrupted name of *Dictamus*, Bastard Dittanie.

The

The Vertues.

It is held to be profitable against the stingings of Serpents, against contagious and pestilent diseases, to bring downe the feminine courtes, for the paines of the belly and the stone, and in Epilepticall diseases, and other cold paines of the braines: the roote is the most effectuall for all these, yet the seede is sometimes vsed.

C H A P. L X X I X.

*Legumina. Pulse.*

I F I should describe vnto you all the kindes of Pulse, I should vnfold a little world of varieties therein, more knowne and found out in these dayes, then at any time before, but that must bee a part of a greater worke, which will abide a longer time before it see the light. I shall only select those that are fit for this garden, and set them downe for your consideration. All sorts of Pulse may be reduced vnder two generall heads, that is, of Beanes and Pease, of each whereof there is both tame and wilde: Of Beanes, besides the tame or vsuall garden Beane, and the French or Kidney Beane, (whereof I meane to entreate in my Kitchen garden, as pertinent thereto) there is the Lupine or flat Beane, whereof I meane to entreate here, and the blacke Beane and others which must bee reserved for the Physicke Garden. And of the kindes of Pease some are fit for this Garden, (whereto I will adioyne two or three other plants as nearest of affinitie, the flowers of some, and the fruit of others being delightfull to many, and therefore fit for this garden) some for the Kitchin, the rest for the Physicke garden. And first of Lupines or flat Beanes, accepted as delightfull to many, and therefore fit for this garden.

1. *Lupinus sativus albus.* The white garden Lupine.

The garden Lupine riseth vp with a great round stalk, hollow and somewhat woolly, with diuers branches, wheron grow vpon long footestalkes many broade leaues, diuided into seuen or nine parts, or smaller leaues, equally standing round about, as it were in a circle, of a whitish greene colour on the vpper side, and more woolly vnderneath: the flowers stand many together at severall ioynts, bothe of the greater stalk, and the branches, like vneo beanies, and of a white colour in some places, and in others of a very bleake blew tending to white: after the flowers are past, there come in their places, long, broade, and flat rough cods, wherein are contained round and flat seede, yellowish on the inside, and couered with a tough white skin, and very bitter in taste: the rootes are not very great, but full of small fibres, whereby it fasteneth it selfe strongly in the ground, yet perisheth every yeare, as all the rest of these kindes doe.

2. *Lupinus ceruleus maximus.* The greater blew Lupine.

The Stemme or stalk of this Lupine is greater then the last before recited, as also the leaues more soft and woolly, and the flowers are of a most perfect blew colour, with some white spots in the middle: the long rough greenish cods are very great and large, wherein are contained hard, flat and round seede, not so white on the outside as the former, but somewhat yellower, greater also, and more rough or hard in handling.

3. *Lupinus ceruleus minor.* The lesser blew Lupine.

This kinde of wilde Lupine differeth not in the forme of leafe or flower from the former, but only that it is much smaller, the leaues are greener, and haue fewer diuisions in them: the flower is of as deepe a blew colour as the last; the cods likewise are small and long, containing small round seede, not so flat as the former, but more discoloured

*Lupinus*. discoloured or spotted on the outside, then the greater kinde is. There is a lesser kind then this, not differing in any thing from this, but that it is lesser.

#### 4. *Lupinus flore lateo*. The yellow Lupine.

The yellow Lupine growtheth not vsually so high, but with larger leaues then the small blew Lupine; the flowers grow in two or three rundles or tufts, round about the stalke and the branches at the ioynts, of a delicate fine yellow colour, like in fashio vnto the other kindes, being larger then the last, but nothing so large as the greater kindes, and of a fine small lent: the seede is round, and not flat, but much about the forme and bignesse of the small blew, or somewhat bigger, of a whitish colour on the outside, spotted with many spots.

#### The Place.

The first growtheth in many places of Greece, and the Easterne Countries beyond it, where it hath beeene anciently cherished for their foode, being often watered to take away the bitternesse. It groweth also in these Western parts, but still where it is planted. The great blew Lupine is thought to come from beyond the parts of Persia, in Caramania. The lesser blew is found very plentifully wilde, in many places both of Spaine and Italy. The last hath beeene brought vs likewise out of Spaine, whereas it is thought it groweth naturally. They all grow now in the gardens of those, that are curious louers of these delights.

#### The Time.

They flower in Summer, and their seede is ripe quickly after.

#### The Names.

They are generally called *Lupini*. Plantus in his time saith, they were vsed in Comedies in stead of money, when in any Scene thereof there was any shew of payment, and therefore he calleth them *Aurum Comicum*. And Horace hath this Verse,

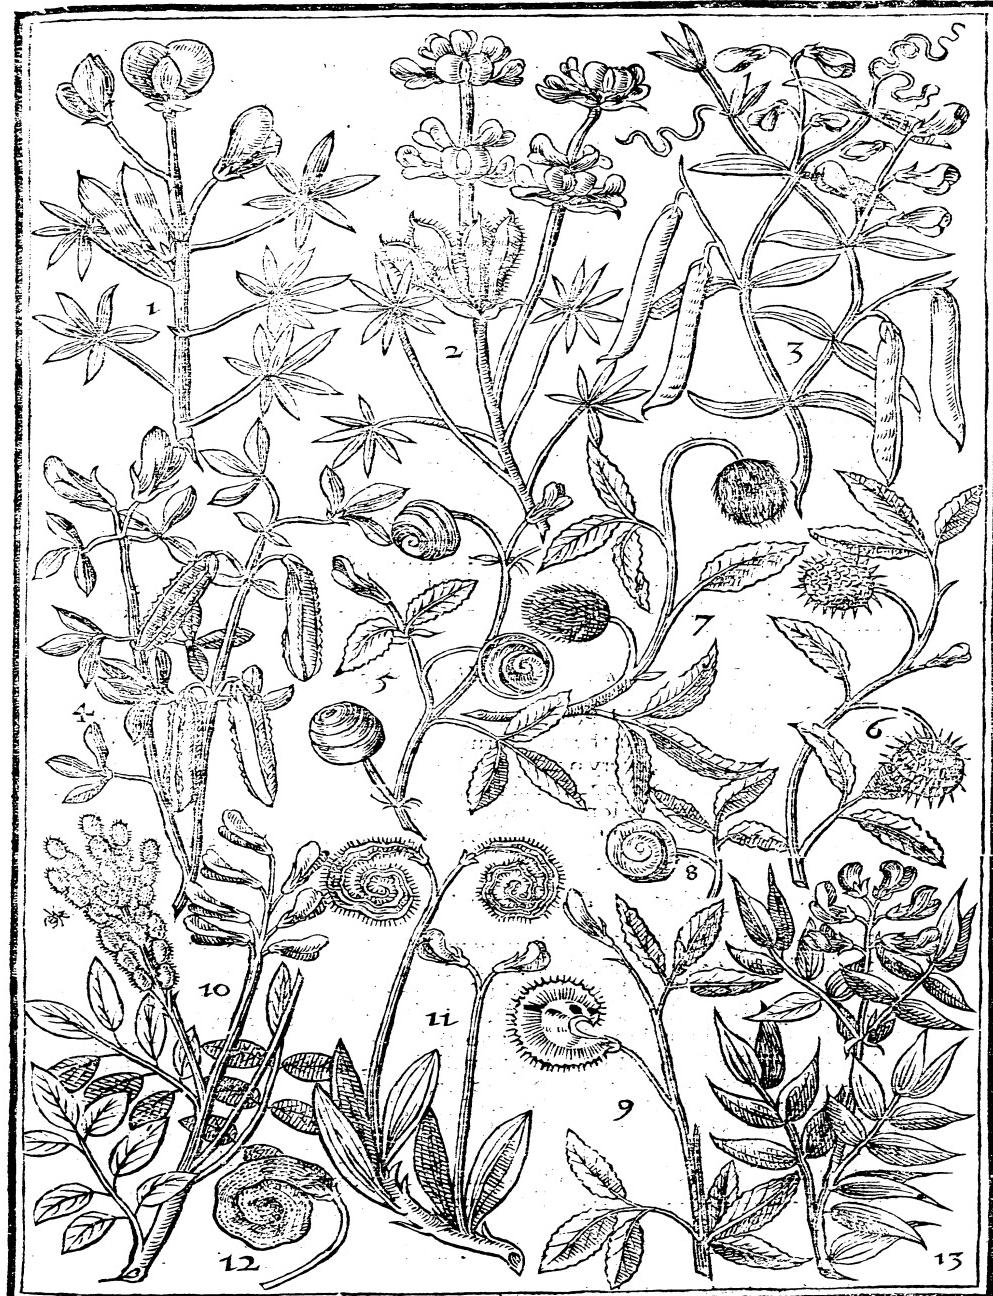

*Nec tamen ignorant, quid destinet era Lupinis,*

to shew that counterfeit money (such as counters are with vs, or as these Lupines were vsed in those times) was easily knowne from true and currant coine. In English wee vsually call them after the Latine name, Lupines; and some after the Dutch name, Figge-beanes, because they are flat and round as a Figge that is pressed; and some Flat-beanes for the same reason. Some haue called the yellow Lupine, Spanish Violets: but other foolish names haue beeene giuen it, as Virginia Roses, and the like, by knauish Gardiners and others, to deceiue men, and make them beleue they were the finders out, or great preseruers of rarities, of no other purpose, but to cheate men of their money: as you would therefore auoyde knaues and deceiuers, beware of these manner of people, wherof the skirts of our towne are too pitifully pestered.

#### The Vertues.

The first or ordinary Lupine doth scour and cleanse the skin from spots, morphew, blew markes, and other discolorings thereof, beeing vsed either in a decoction or pouther. Wee feldome vsit in inward medicines, not that it is dangerous, but of neglect, for formerly it hath beeene much vsed for the wormes, &c.

#### I. *Lathyrus*

1. *Lupinus major*. The great Lupine. 2. *Lupinus latifolius*. The yellow Lupine. 3. *Lathyrus latifolius seu Pisum perenne*. Pease everlasting. 4. *Pisum quadratum*. The crimson bladdom or square Pease. 5. *Medica sativa*. Snailes or Barbitary Buttons. 6. *Medica spinosa*. Prickly Snails. 7. *Medica spinosa altera*. Another sort of prickly Snails. 8. *Medica foliolata*. Broadbuttons or Snails. 9. *Medica Lutea*. Half Moons. 10. *Herba cyparissia*. Theridion Satin flower, or French Honeysuckle. 11. *Seepioides minus*. The lesser Caterpiller. 12. *Seepioides minus*. The greater Caterpiller. 13. *Orobus Venetus*. Blew upright Pease everlasting.

1. *Lathyrus latifolius, sive Pisum perenne*. Pease euerlasting.

This kinde of wilde Pease that abideth long, and groweth euery yeare greater then other, springeth vp with many broade trayling branches, winged as it were on both the sides, diuersly diuided into other smaller branches, at the severall ioynts whereof stand two hard, not broad, but somewhat long greene leaues, and diuers twining claspers, in sundry places with the leaues, from betweene the branches and the leaues, at the ioynts towards the topes, come forth diuers purplish pease like blossomes, standing on a long stemme or stalke, very beautifull to behold, and of a pretty sent or smell: after which come small, long, thin, flat, hard skind pods, containing small round blackish seede: the roote is great and thicke, growing downe deepe into the ground, of the thicknesse sometimes of a mans arme, blackish on the outside, and whitish within, with some branches and a few fibres annexed thereunto.

2. *Orobus Venetus*. Blew vpright euerlasting Pease.

This pretty kinde of Pease blossome beareth diuers slender, but vpright greene branches somewhat cornered, two foote high or therabouts, hauing at severall distances on both sides of them certayne winged leaues, set together vpon long footestalkes one against another, consisting of fix or eight leaues, somewhat broade and pointed, and without any odde one at the end: at the ioynts toward the topes, between the leaues and the stalkes, come forth many flowers set together at the end of a pretty long footestalke, of the fashion of the former Pease blossome, but somewhat smaller, and of a purplish violet colour: after which come slender and long pointed pods rounder then they, wherein is contained small round grayish pease: the roote is blacke, hard or woody, abiding after seede bearing as the former doth, and shooting afresh euery year.

3. *Lathyrus annuus siliquis orobi*. Partie coloured Cichelings.

This small Pulse or wild Pease, hath two or three long slender winged branches, with smaller leaues theron then the former, and without any claspers at all on them: the flowers stand singe, every one by it selfe, or two at the most together, the middle leaues whereof that close together are white, and the vpper leaues of a reddish purple colour: after which come long round flattish pods, bunched out in the severall places where the seedes lye, like vnto the pods of *Orobus* or the bitter Vetch, but greater: the roote is small and dyeth euery yeare.

4. *Pisum quadratum*. The crimson blossomed or square codded Pease.

This pretty kinde of Pulse might very well for the forme of the leaues, be referred to the kindes of *Lotus* or *Trefoiles*: but because I haue none of that kindred to entreat of in this Worke, I haue thought fittest to place it here before the *Medica's*, because both pods and seedes are like also. It hath three or four small weake stalkes, diuided into many branches, hauing two stalkes of leaues at euery ioynt, and three small soft leaues standing on a very small stalke, comming from the ioynts: the flowers stand for the most part two together, of a perfect red or crimson colour, like in forme almost vnto a Pease blossome, after which come long thicke and round pods, with two skinnes or filmes, running all along the cod at the backe or vpperside, and two other such like filmes, all along the belly or vnder side, which make it seeme four square, wherein there lye round discoloured Pease, somewhat smaller and harder then ordinary Pease: the roote is small and perisheth euery yeare.

5. *Medica Cobcleata vulgaris*. Snailes or Barbary buttons.

The plant that beareth these pretty toyes for Gentlewomen, is somewhat like vnto a Threeleafed grasse or Trefoile, hauing many long trayling branches lying vpon the ground, wherein at diuers places are three small greene leaues, set together at the end of a little footestalke, each of them a little snipt about the edges: at severall distances,

from the middle of these branches to the ends of them, come forth the flowers, two for the most part standing together vpon a little footstalke, which are of a pale yellow colour, very small, and of the forme of a Pease blossome: after which come smooth heads, which are turned or writhen round, almost like a Snaile, hard and greene at the first, somewhat like a greene button (from the forms of both which came their names) but afterwards growing whiter, more soft and open, wherein lyeth yellowish round and flat seede, somewhat like vnto the Kidney beane: the roote is small and stringie, dying downe euery yeare, and must be new sowne in the spring, if you desire to haue it.

6. *Medica spinosa maior*. Prickly or thorny Snailes, or Buttons.

This kinde of *Medica* is in all things very like vnto the former, both in the long trayling branches, & three leaues alwaies growing together, but a little greater pale yellow flowers, and crooked or winding heads: but herein chiefly consisteth the difference, that this kinde hath his heads or buttons harder, a little greater, more closed together, and set with short and somewhat hard prickles, all the head ouer, which being pulled open, haue those prickles standing on each side of the filme or skinne, whereof the head consisteth, somewhat like vnto a fish bone, and in this kinde goeth all one way, in which are contained such like seedes for the forme, as are in the former, but great and blacke, and shining withall.

7. *Medica spinosa altera*. Small thorney Buttons, or Snailes.

This other kinde is also like vnto the last described in all other things, except in the heads or buttons, which are a little smaller, but set with longer and softer prickles vpon the filmes, and may easilly bee discerned to goe both forwards and backwards, one enterlacing within another, wherein are contained such like flat and blacke shining seede, made after the fashion of a kidney, as are in the former, but somewhat smaller: the roote perisheth in like manner euery yeare.

8. *Medica lata*. Broade Buttons.

This kinde differeth not from the first in leafe or flower, the fruite onely hereof is broade and flat, and not so much twined as it.

9. *Medica Lunata*. Halfe Moones.

This is also a kinde of these Medicke fodders, hauing a trefoyle leafe and yellow flowers like the former sorts, but both somewhat larger, the chiefeſt difference consisteth in the head or fruite, which is broade and flat, and not twined like the rest, but abideth halfe closed, resembling a halfe Moone (and thereupon hath assumed both the Latine and English name) wherein is contained flat seede, kidney fashion like the former.

10. *Hedysarum clypearium*. The red Sattin flower.

This red flowred Fitchling, hath many stalkes of winged faire greene leaues, that is, of many set on both sides a middle ribbe, whereof that at the end is the greatest of the rest: from the ioynts where the leaues stand, come forth pretty long small stalkes, bearing on them very many flowers, vp to the toppe one aboue another, of an excellent shining red or crimson colour, very like vnto Sattin of that colour, and sometimes of a white colour, (as Master William Coys, a Gentleman of good respect in Essex, a great and ancient louer and cherisher of these delights, and of all other rare plants, in his life time assured me, he had growing in his garden at Stubbers by North Okenden) which are somewhat large, and more closed together, almost flat and not open, as in most of the other sorts: after the flowers are past, there come rough, flat, round huskes, somewhat like vnto the old fashioned round bucklers without pikes, three or four standing one vpon or aboue another, wherein are contained small

small brownish seede : the roote perisheth the same yeaere it beareth seede, for often times it flowreth not the first yeaere it is sowne.

11. *Scorpioides maius & minus.*  
Great and small Caterpillars.

Vnder one description I comprehend both these sorts of Scorpions grasse, or Caterpillars, or Wormes, as they are called by many, whereof the greater hath been known but of late yeares ; and ioyn them to these pulses, not hauing a fitter place where to insert them. It is but a small low plant, with branches lying vpon the ground, and somewhat long, broad, and hard leaues theron, among which come forth small stalkes, bearing at the end for the most part, two small pale yellowish flowers, like vnto Tares or Vetches, but smaller, which turne into writhed or crooked tough cods, in the greater sort they are much thicker, rounder and whiter, and lesser wound or turned together then in the smaller, which are slenderer, more winding, yet not closing like vnto the Snailes, and blacker more like vnto a Caterpiller then the other, wherein are contained brownish yellow seede, much like vnto a *Medica* : the rootes of both are small and fibrous, perishing every yeaere.

The Place.

These are found seuerally in diuers and seuerall places, but wee sow and plant them vsually to furnish our gardens.

The Time.

They doe all flower about the moneths of June and July, and their seede is ripe soone after : but the second is earliher then the rest.

The Names.

The first is called *Clymenum* of Matthiolus, and *Lathyrus* of Lobel and others : but *Lathyrus* in Greecke is *Catapatis* in Latine, which is our Spurge, farre differing from this Pulse ; and therefore *Lathyrus* is more proper to distinguishe them asunder, that two plants so farre vnlike shoulde not bee called by one name : this is also called *Lathyrus latifolius*, because there is another called *angustifolius*, that differeth from it also : It is most vsually called with vs, *Pisum perenne*, and in English Pease blossom, or Pease eueralasting. The second is called by Clusius, *Orobis venetus*, because it was sent him from Venice, with another of the same kinde that bore white flowers ; yet differeth but little or nothing from that kinde he found in Hungary, that I thinke the seuerall places of their growing only cause them to beare leuall names, and to be the same in deede. Although I yeeld vnto Clusius the Latine name which doth not sufficiently content mee ; yet I haue thought good to giue it a differing English name, according as it is in the title. The third, because I first receiued it among other seeds from Spaine, I haue giuen it the name, as it is entituled. The fourth is called of some *Sandalia Cretica*, & *Lotus siliqueflos florae rubella*, *Lotus tetragonalobus*, *Pisum rubrum*, & *Pisum quadratum* : We vsually call it in English, Crimson Pease, or square Pease. The *Medica Cockleata* is called of *Dodonaeus Trifolium Cockleatum*, but not iudged to be the true *Medica*. Wee call it in English, Medick fodder, Snailes Clauer, or as it is in the title, and so the rest of the *Medica*'s accordingly. The *Hedysarum cyprium* or *Securidaca* is called of *Dodonaeus Onobrychis altera*, and we in English for the likenesse, The red Satin flower, although some foolishly call it, the red or French Honyfuckle. The last is called by Lobel, *Scorpioides bupleurifolia*, I haue called it *minus*, because the greatest sort which came to me out of Spaine was not knowne unto him: in English they are generally called Caterpillars.

The

The Vertues.

The *Medica*'s are generally thought to feede cattell fat much more then the Medow Trefoile, or Clauer grasse, and therefore I haue known diuers Gentlemen that haue plowed vp some of their pasture grounds, and sowne them with the seedes of some *Medica*'s to make the experiance. All the other sorts are pleasures to delight the curious, and not any way profitable in Physicke that I know.

CHAP. LXXX.

*Paonia*. Peonic.

Here are two principall kindes of Peonic, that is to say, the Male and the Female. Of the male kinde, I haue onely known one sort, but of the Female a great many ; which are thus to be distinguishe. The Male his leafe is whole, without any particular diuision, notch or dent on the edge, & his rootes long & round, diuided into many branches, somewhat like to the rootes of Gentian or Elecampane, and not tuberos at all. The Female of all sorts hath the leaues diuided or cut in on the edges, more or lesse, and hath alwaies tuberos rootes, that is, like clogs or Asphodill rootes, with many great thick round peeces hanging, or growing at the end of smaller strings, and all ioyned to the toppe of the maine roote.

1. *Paonia mascula*. The Male Peonic.

The Male Peonic riseth vp with many brownish stalkes, whereon doe grow winged leaues, that is, many faire greene, and sometimes reddish leaues, one set against another vpon a stalke, without any particular diuision in the leafe at all : the flowers stand at the topes of the stalkes, consisting of five or six broade leaues, of a faire purplish red colour, with many yellow threds in the middle, standing about the head, which after riseth to be the seede vessels, diuided into two, three or four rough crooked pods like hornes, which when they are ful ripe, open and turn themselves down one edge to another backward, shewing within them diuers round black shining seede, which are the true seede, being full and good, and hauing also many red or crimson graines, which are lanke and idle, intermixed among the blacke, as if they were good seede, whereby it maketh a very pretty shew : the roots are great, thick and long, spreading in the ground, and running downe reasonable deepe.

2. *Paonia feminina vulgaris flore simplici*.  
The ordinary single Female Peonic.

This ordinary Female Peonic hath many stalkes, with more store of leaues on them then the Male kinde hath, the leaues also are not so large, but diuided or nicked diuersly on the edges, some with great and deepe, and others with smaller cuts or diuisions, and of a darke or dead greene colour : the flowers are of a strong heady sent, most vsually smaller then the male, and of a more purple tending to a murrey colour, with yellow thrumes about the head in the middle, as the male kinde hath : the heads or hornes with seede are like also but smaller, the seede also is blacke, but lesse shining : the rootes consist, as I said, of many thicke and short tuberos clogs, fastened at the ends of long strings, and all from the head of the roote, which is thicke and short, and tuberos also, of the same or the like sent with the male.

3. *Paonia feminina vulgaris flore pleno rubro*.  
The double red Peonic.

This double Peonic as well as the former single, is so frequent in euerie Garden of note, through evry Countrey, that it is almost labour in vaine to

to describe it : but yet because I vse not to passe ouer any plant so lightly , I will set down the description briefly, in regard it is so common. It is very like vnto the former single female Peony, both in stalkes and leaues, but that it groweth somewhat higher, and the leaues are of a fresher greene colour : the flowers at the tops of the stalkes are very large, thicke, and double (no flower that I know to faire, great, and double ; but not abiding blowne aboue eight or ten dairys) of a more reddish purple colour then the former female kinde, and of a sweeter sent : after these flowers are past, sometimes come good seed, which being sowne, bring forth some single flowers, and some double : the rootes are tuberous, like vnto the former female.

*4. Paeonia femina flore carneo simplici.* The single blush Peony.

The single blush Peony hath his stalkes higher, and his leaues of a paler or whiter greene colour then the double blush, and more white vnderneath (so that it is very probable it is of another kinde, and not risen from the seede of the double blush, as some might think) with many veines, that are somewhat discoloured from the colour of the leafe running through them : the flowers are very large and single, consisting of fve leaues for the most part, of a pale flesh or blush colour, with an eye of yellow dispersed or mixed therewith, haing many whitish threads, tipt with yellow pendent about the middle head : the rootes are like the other female Peonies.

*5. Paeonia femina flore pleno albicante.* The double blush Peony.

The double blush Peony hath not his stalkes so high as the double red, but somewhat lower and stiffer, bearing such like winged leaues, cut in or divided here and there in the edges, as all these female kindes are, but not so large as the last : the flowers are smaller, and lesse double by a good deale then the former double red, of a faint shining crimson colour at the first opening, but decaying or waxing paler every day : so that after it hath stood long (for this flower sheddeth not his leaues in a great while) it will change somewhat whitish; and therefore diuers haue ignorantly called it, the double white Peony : the seedes, which sometimes it beareth, and rootes, are like vnto the former female kindes, but somewhat longer, and of a brighter colour on the outside.

*6. Paeonia femina Byzantina.* The single red Peony of Constantinople.

This red Peony of Constantinople is very like in all things vnto the double red Peonic, but that the flowers hereof are single, and as large as the last, and that is larger then either the single female, or the male kinde, consisting of eight leaues, of a deeper red colour then either the single or double Peonies, and not purplish at all, but rather of the colour of an ordinary red Tulipa, standing close and round together : the roots of this kinde haue longer clogs, and not so short as of the ordinary female kinde, and of a paler colour on the outside.

**The Place.**

All these Peonies haue beene sent or brought from diuers parts beyond the Seas ; they are endenized in our Gardens, where wee cherish them for the beauty and delight of their goodly flowers, as well as for their Physicall vertues.

**The Time.**

They all flower in May , but some (as I said) abide a small time, and others many weekes.

**The Names.**

The name *Paeonia* is of all the later Writers generally giuen to these plants, although they haue had diuers other names giuen by the elder Writers, as *Rose fatuina*, *Ideus daedylus*, *Aglaophotis*, and others, whereof to let downe

1. *Paeonia masculina*. The male Peony & the seed. 2. *Paeonia femina Byzantina*. The female red Peony of Constantinople. 3. *Paeonia femina flore pleno vulgaris*. The ordinary double Peony. 4. *Paeonia flore pleno albicante*. The double white Peony. 5. *Helleborus niger vernus*. The early white Hellebore with a dark red flower. 6. *Helleborus niger vernus*. The Christmas flower. 7. *Cetonia aurata*. Our Ladies Slipper.

downe the causes, reas ons, and erro rs, were to ipend more time then I intend for this worke. Wee call them in English, Peonic, and di tinguish them according to their titles.

**The Vertues.**

The male Peony roote is farre aboue all the rest a most singular approued remedy for all Epilepticall diseases, in English, The falling sicknesse (and more especially the greene roote then the dry) if the disease be not too inueterate, to be boyled and drunke, as also to hang about the neckes of the younger sort that are troubled herewith, as I haue found it sufficiently experim ented on many by diuers. The seede likewise is of especiall vse for women, for the rising of the mother. The seede of the female kinde, as well as the rootes, are most vsually sold, and may in want of the other be (and so are generally) vsed.

**C H A P . L X X X I .***Helleborus niger. Beares foote.*

**T**here are three sorts of blacke Hellebor or Beares foote, one that is the true and right kinde, whose flowers haue the most beautifull aspect, and the time of his flou ring most rare, that is, in the deepe of Winter about Christmas, when no other can bee seene vpon the ground: and two other that are wilde or bastard kindes, brought into many Gardens for their Physicall properties; but I will only ioyne one of them with the true kinde in this worke, and leau e the other for another.

**1. *Helleborus niger verus.* The true blacke Hellebor, or Christmas flower.**

The true blacke Hellebor (or Beare foote as some would call it, but that name doth more fitly agree with the other two bastard kindes) hath many faire greene leau es rising from the roote, each of them standing on a thicke round fleshy stiffe green stalk, about an hand breadth high from the ground, diuided into seuen, eight, or nine parts or leau es, and each of them nicked or dented, from the middle of the leafe to the pointward on both sides, abiding all the Winter, at which time the flowers rise vp on such short thick stalkes as the leau es stand on, euery one by it selfe, without any leafe thereon for the most part, or very seldom hauing one small short leafe not much vnder the flower, and very little higher then the leau es themselves, consisting of five broad white leau es, like vnto a great white single Rose (which sometimes change to be either leſſe or more purple about the edges, as the weather or time of continuance doth effect) with many pale yellow thrumms in the middle, standing about a greene head, which after growth to haue diuers cods set together, pointed at the ends like horns, somewhat like the seede vessels of the *Aconitum hyemale*, but greater & thicker, wherein is contained long, round, and blackish seede, like the seede of the bastard kindes: the rootes are a number of brownish strings running downe deepe into the ground, and fastened to a thicke head, of the bignesse of a finger at the toppe manie times, and smaller still downewards.

**2. *Helleborus minor.* The lesser bastard blacke Hellebor, or Beare foote.**

The smaller Beare foote is in most things like unto the former true blacke Hellebor; for it beareth also many leau es vpon short stalkes, diuided into many leau es also, but each of them are long and narrow, of a blacker greene colour, stript or dented on both edges, which feele somewhat hard or sharpe like prickes, and perish every yeare, but rise againe the next Spring: the flowers hercelf stand on higher stalkes, with some leau es on them also, although but very few, and are of a pale greene colour, like in forme

forme vnto the flowers of the former, but smaller, haing also many greenish yellow threads or thrums in the middle, and such like heads or seede vessels, and blackish seede: the rootes are stringie and blackish like the former.

**The Place.**

The first groweth onely in the Gardens of those that are curious, and delight in all sorts of beautifull flowers in our Countrey, but wilde in many places of Germany, Italy, Greece, &c.

The other groweth wilde in many places of England, as well as the other greater sort, which is not here described; for besides diuers places within eight or ten miles from London, I haue seen it in the Woods of Northamptonshire, and in other places.

**The Time.**

The first of these plants doth flower in the end of December, and beginning of January most vsually, and the other a moneth or two after, and sometime more.

**The Names.**

The first is called *Helleborus*, or *Helleborus niger verus*, and is the same that both Theophrastus and Dioscorides haue written of, and which was called *Melampodion*, of Melampus the Goateheard, that purged and cured the mad or melancholike daughters of Prætus with the rootes thereof. Dodonaëus calleth it *Veratrum nigrum primum*, and the other *secundum*: Wee call it in English, The true blacke Hellebor, or the Christmas flower, because (as I said) it is most commonly in flower at or before Christmas. The second is a bastard or wilde kinde thereof, it so nearely resembleth the true, and is called of most of the later Writers, *Pseudohelleborus niger minor*, or *Helleboraster minor*, for a distinction betweene it and the greater, which is not here described: and is called in English, The smaller or lesser Beare foote, and most vsed in Phyficke, because it is more plentiful, yet is more churlish and strong in operation then the true or former kinde.

**The Vertues.**

The rootes of both these kindes are safe medecines, being rightly prepared, to be vsed for all Melancholike diseases, whatsoeuer others may feare or write, and may be without danger applied, so as care and skill, and not temerary rashnesse doe order and dispose of them.

The powder of the dried leau es, especially of the bastard kinde, is a sure remedy to kill the wormes in children, moderately taken.

**C H A P . L X X X I I .***Helleborus albus. White Ellebor or Neesewort.*

**T**here are two sorts of great white Ellebors or Neeseworts, whereas there was but one kinde knowne to the Ancients; the other being found out of later dayes: And although neither of both these haue any beauty in their flowers, yet because their leau es, being faire and large, haue a goodly prospect, I haue inser ted them in this place, that this Garden should not be vnfurnished of them, and you not vnacquainted with them.

**1. *Helleborus***

1. *Elleborus albus vulgaris*. White Ellebor or Neesing roote.

The first great white Ellebor riseth at the first out of the ground, with a whitish greene great round head, which growing vp, openeth it selfe into many goodly faire large greene leaues, plaited or ribbed with eminent ribbes all along the leaues, compassing one another at the bottome, in the middle whereof riseth vp a stalke three foot high or better, with diuers such like leaues thereon, but smaller to the middle thereof, from whence to the toppe it is diuided into many branches, hauing many small yellowish, or whitish greene starre-like flowers all along vpon them, which after turne into small, long, three square whitish seede, standing naked, without any huske to containe them, although some haue written otherwise: the roote is thicke and reasonable great at the head, hauing a number of great white strings running downe deepe into the ground, whereby it is strongly fastened.

2. *Elleborus albus precox fine atrorubente flore*.  
The early white Ellebor with reddish flowers.

This other Ellebor is very like the former, but that it springeth vp a moneth at the least before it, and that the leaues are not fully so thicke or so much plaited, but as large or larger, and doe sooner perish and fall away from the plant: the stalke hereof is as high as the former, bearing such like starry flowers, but of a darke or blackish red colour: the seede is like the other: the roote hath no such head as the other (so farre as I haue obserued, both by mine own and others plants) but hath many long white strings fastened to the top, which is as it were a long bulbous scaly head, out of which spring the leaues.

## The Place.

The first groweth in many places of Germany, as also in some parts of Russia, in that abundance, by the relation of that worthy, curious, and diligent searcher and preseruer of all natures rarities and varieties, my very good friend, Iohn Tradescante, often heretofore remembred, that, as hee laid, a good ship might be loaden with the rootes hereof, which hee saw in an Island there.

The other likewise groweth in the vpland wooddy grounds of Germany, and other the parts thereabouts.

## The Time.

The first springeth vp in the end or middle of March, and flowreth in June. The second springeth in February, but flowreth not vntill June.

## The Names.

The first is called *Elleborus albus*, or *Helleborus albus*, the letter *H*, as all Schollers know, being but *aspirationis nota*: and *Veratrum album flore viridante*, of some *Sanguis Herculis*. The other is called *Elleborus albus precox*, and *flore atrorubente*, or *atropurpurante*. We call the first in English, White Ellebor, Neesewort, or Neesing roote, because the powder of the roote is vsed to procure neesing; and I call it the greater, in regard of those in the next Chapter. The other hath his name according to the Latine title, most proper for it.

## The Vertues.

The force of purging is farre greater in the roote of this Ellebor, then in the former, and therefore is not carelesly to bee vsed, without extreame danger; yet in contumacious and stubborn diseases it may bee vsed with good

good caution and aduise. There is a Syrupe or Oxymel made hereof in the Apothecaries shops, which as it is dangerous for gentle and tender bodies, so it may be very effectuall in stronger constitutions. Pausanias in *Phocis*, recordeth a notable stratagem that Solon vsed in besieging the Citie of Cirrheus, viz. That hauing cut off the riuier Plistus from running into the Citie, he caused a great many of these rootes to be put into a quantity thereof, which after they had steeped long enough therein, and was sufficiently infected therewith, he let passe into the Citie againe: whereof when they had greedily drunke, they grew so weake and feeble by the superpurgation thereof, that they were forced to leave their wals vnmaned, and not guarded, whereby the Amphyctions their enemies became masters of their Citie. The like stratagems are set downe by diuers other Authors, performed by the helpe of other herbes.

## C H A P. LXXXIII.

*Elleborine*. Small or wilde white Ellebor.

**T**He likenesse of the leaues of these plants, rather then any other faculty with the former white Ellebor, hath caused them to be called *Elleborine*, as if they were smaller white Ellebors. And I for the same cause haue ioyned them next, whereof there are found many sorts: One which is the greater kinde, is of greatest beauty; the other which are lesser differ not much one from another, more then in the colour of the flowers, whereof I will onely take three, being of the most beautie, and leaue the rest to another worke.

1. *Helleborine vel Elleborine maior, sive Calceolaria Maris*.  
Our Ladies Slipper.

This most beautifull plant of all these kindes, riseth vp with diuers stalkes, a foote and a halfe high at the most, bearing on each side of them broad greene leaues, somewhat like in forme vnto the leaues of the white Ellebor, but smaller and not so ribbed, compassing the stalke at the lower end; at the tops of the stalkes come forth one, or two, or three flowers at the most, one aboue another, vpon small short foote-stalkes, with a small leafe at the foote of euery stalke: each of these flowers are of a long ouall forme, that is, more long then round, and hollow withall, especially at the upper part, the lower being round and swelling like a belly: at the hollow part there are two small peeces like eares or slippers, that at the first doe couer the hollow part, and after stand apart one from another, all which are of a fine pale yellow colour, in all that I haue seene (yet it is said there are some found, that are more browne or tending to purple) there are likewise foure long, narrow, darke coloured leaues at the setting on of the flower vnto the stalke, wherein as it were the flower at the first standeth: the whole flower is of a pretty small sent: the seede is very small, very like vnto the seede of the *Orchides* or *Satyrions*, and contained in such like long pods, but bigger: the roots are composed of a number of strings enterlacing themselues one within another, lying within the vpper crust of the earth, & not spreading deep, of a darke brownish colour.

2. *Elleborine minor flore albo*.  
The small or wilde white Ellebor with a white flower.

This smaller wilde white Ellebor riseth vp in the like manner vnto the former, and not much lower, bearing such like leaues, but smaller, and of a whiter greene colour, almost of the colour and fashon of the leaues of *Lilly Conually*; the top of the stalke hath many more flowers, but lesser, growing together, spike-fashon, with small short leaues at the stalke of euery flower, which consisteth of fiuē small white leaues, with a small close hood in the middle, without any sent at all: the seede and seede vessels are like

like vnto the former, but smaller : the rootes are many small strings, dispersing themselves in the ground.

3. *Elleborine minor flore purpureo.*

The small or wilde white Ellebor with blush flowers.

The leaues of this kinde are like vnto the last described, but somewhat narrower : the stalkes and flowers are alike, but smaller also, and of a pale purplish or blush colour, which causeth the difference.

*The Place.*

The first growth in very many places of Germany, and in other Countries also. It groweth likewise in Lancashire, neare vpon the border of Yorkshire, in a wood or place called the Helkes, which is three miles from Ingleborough, the highest Hill in England, and not farre from Ingletton, as I am enformed by a courteous Gentlewoman, a great louer of these delights, called Mistris Thomasin Tunstall, who dwelleth at Bull-banke, neare Hornby Castle in those parts, and who hath often sent mee vp the rootes to London, which haue borne faire flowers in my Garden. The second growth in many places of England, and with the same Gentlewoman also before remembred, who sent me one plant of this kinde with the other. The last I haue not yet knowne to growe in England; but no doubt many things doe lye hid, and not obserued, which in time may bee discouered, if our Country Gentlemen and women, and others, in their severall places where they dwell, would be more carefull and diligent, and be aduertised either by themselues, or by others capable and fit to be employed, as occasion and time might serue, to finde out such plants as growe in any the circuits or limits of their habitations, or in their trauels, as their pleasures or affaires leade them. And because ignorance is the chiefe cause of neglect of many rare things, which happen to their view at sometimes, which are not to be seene againe peraduature, or not in many yeares after, I would heartily aduise all men of meanes, to be stirred vp to bend their mindes, and spend a little more time and trauell in these delights of herbes and flowers, then they haue formerly done, which are not onely harmlesse, but pleasurable in their time, and profitable in their vse. And if any would be better enformed, and certified of such things they know not, I would be willing and ready to my best skill to aduertise them, that shall send any thing vp to me where I dwell in London. Thus farre I haue digressed from the matter in hand, and yet not without some good vse I hope, that others may make of it.

*The Time.*

The two first flower earlier then the last, and both the first about one time, that is, in the end of Aprill, or beginning of May. The last in the end of May, or in June.

*The Names.*

The first is called *Elleborine recentiorum maior*, and *Calceolaria Maria*: Of some thought to be *Cosmofandalos*, because it is *Sandaliiforma*. In English we call it our Ladies Slipper, after the Dutch name. The other two lesser haue their names in their titles: I haue thought fit to adde the title of small white Ellebors vnto these, for the forme sake, as is before said.

*The Vertues.*

There is no vse of these in Physicke in our dayes that I know.

C H A P. LXXXI.

*Lilium Conwallum.* Lilly Conually.

The remembrance of the Conwall Lilly, spoken of in the precedent Chapter, hath caused me to insert these plants among the rest, although differing both in face and properties; but lest it shoulde lose all place, let it keepe this. It is of two sorts, differing chiefly in the colour of the flowers, the one being white, and the other reddish, as shall be shewed in their descriptions following.

1. *Lilium Conwallum flore albo.* The white Lilly Conually.

The white Conwall or May Lilly, hath three or four leaues rising together from the roote, one enclosed within another, each whereof when it is open is long and broad, of a grayish shining greene colour, somewhyle resembling the leaues of the former wilde Neesewort, at the side whereof, and sometime from the middle of them, riseth vp a small short naked foote-stalke, an hand breadth high or somewhat more, bearing at the toppe one aboue another many small white flowers, like little hollow bottles with open mouthes, nicked or cut into fve or six notches, turning all downwards one way, or on one side of the stalke, of a very strong sweete sent, and comfortable for the memory and senses, which turne into small red berries, like vnto *Aparagus*, wherein is contained hard white seede: the rootes runne vnder ground, creeping every way, consisting of many small white strings.

2. *Lilium Conwallum flore rubente.* May Lillies with red flowers.

This other May Lilly differeth neither in roote, leafe, nor forme of flower from that before, but onely in the colour of the flower, which is of a fine pale red colour, being in my judgement not altogether so sweete as the former.

*The Place.*

The first groweth abundantly in many places of England. The other is a stranger, and groweth only in the Gardens of those that are curious louers of rarities.

*The Time.*

They both flower in May, and the berries are ripe in August.

*The Names.*

The Latines haue no other name for this plant but *Lilium Conwallum*, although some would haue it to be *Lilium vernum* of Theophrastus, and others *Oenanthae* of the same Author. Gesner thinketh it to be *Callionymus*, Lonicerus to be *Cacalia*, and Fuchsius to be *Ephemera non letale*: but they are all for the most part mistaken. We call it in English Lilly Conually, May Lilly, and of some Liriconfancie.

*The Vertues.*

The flowers of the white kinde are often vsed with those things that help to strengthen the memory, and to procure ease to Applegatike persons. Camerarius setteth downe the manner of making an oyle of the flowers hereof, which he saith is very effectuall to easeth the paines of the Goute, and such like diseases, to be vsed outwardly, which is thus: Hauing filled a glasse with the flowers, and being well stopped, set it for a moneths space in an Ants hill, and after being drayned cleare, set it by to vse.

## CHAP. LXXXV.

*Gentiana.* Gentian or Fell-wort.

Here are diuers sorts of Gentians or Fell-wortes, some greater, others lesser, and some very small; many of them haue very beautifull flowers, but because some are very suddenly past, before one would thinke they were blowne open, and others will abide no culture and manuring, I will onely set forth unto you two of the greater sorts, and three of the lesser kindes, as fittest, and more familiarly furnishing our gardens, leauing the rest to their wilde habitations, and to bee comprehended in a generall Worke.

1. *Gentiana maior flore flavo.* The great Gentian.

The great Gentian riseth vp at the first, with a long, round and pointed head of leaues, closing one another, which after opening themselues, lye vpon the ground, and are faire, long and broad, somewhat plaited or ribbed like vnto the leaues of white Ellebor or Neefeworte, but not so fairely or eminently plaited, neyther so stiffe, but rather resembling the leaues of a great Plantane: from among which riseth vp a stiffe round stalke, three foote high or better, full of ioynts, hauing two such leaues, but narrower and smaller at every ioynt, so compassing about the stalke at the lower end of them, that they will almost hold water that falleth into them: from the middle of the stalke to the toppe, it is garnished with many coronets or rondles of flowers, with two such greene leaues likewise at every ioynt, and wherein the flowers doe stand, which are yellow, layd open like starres, and rising out of small greenish huskes, with some threds in the middle of them, but of no sent at all, yet stately to behold, both for the order, height and proportion of the plant: the seede is browne and flat, contained in round heads, somewhat like vnto the seede of the *Fritillaria*, or checkerd Daffodill, but browner: the rootes are great, thicke and long, yellow, and exceeding bitter.

2. *Gentiana maior folio Asclepiadis.* Swallow-wort Gentian.

This kinde of Gentian hath many stalkes rising from the roote, neere two foote high, whereon grow many faire pale greene leaues, set by couples, with three ribs in every one of them, and doe somewhat resemble the leaues of *Asclepias* or Swallow-wort, that is, broade at the bottome, and sharpe at the point: the flowers grow at the feuerall ioynts of the stalkes, from the middle vpwards, two or three together, which are long and hollow, like vnto a bell flower, ending in fve corners, or pointed leaues, and folded before they are open, as the flowers of the *Bitteweedes* are, of a faire blew colour, sometimes deeper, and sometimes paler: the heads or seede vessels haue two points or hornes at the topes, and containe within them flat grayish seed, like vnto the former, but lesse: the rootes hereof are nothing so great as the former, but are yellow, small and long, of the bignesse of a mans thumb.

3. *Gentiana minor Cruciate.* Croffe-wort Gentian.

This small Gentian hath many branches lying vpon the ground, scarce lifting them selues vpright, and full of ioynts, whereat grow vsually foure leaues, one opposite vnto another, in manner of a Croffe, from whence it tooke his name, in shape vnto *Saponaria* or Sopewort, but shorter, and of a darker greene colour: at the tops of the stalkes stand many flowers, thick thrusting together, and likewise at the next ioynt vnderneath, euery one of them standing in a darke blewish greene huske, and consisting of fve small leaues, the points or ends whereof only appear above the huskes wherein they stand, and are hardly to be seen, but that they are of a fine pale blew colour, and that many grow together: the seed is small and brown, hard, and somewhat like

1. *Lilium Convallaria*. Liriconfancy or Lilly Conusly. 2. *Gentiana minor.* The great Gentian. 3. *Gentiana Haemata.* Small Gentian of the Spring. 4. *Gentiana Crucifera.* Croffe-wort Gentian. 5. *Pneumonanthe seu Gentiana Autumnalis.* Autumnal Gentian. 6. *Saponaria Peregrina.* Double flowered Sopewort. 7. *Plantago Rosea.* Rose Platane.

## The Garden of pleasant Flowers.

like vnto the seed of the Marian Violets, or Coutry bels: the roots are small and whitish, dispersing themselues diuersly in the ground, of as bitter a taste almost as the rest.

### 4. *Gentianella Verna*. Small Gentian of the Spring.

The small Gentian of the Spring hath diuers small hard greene leaues, lying vpon the ground, as it were in heads or tufts, somewhat broade below, and pointed at the end, with iue ribs or veines therein, as conspicuous as in the former Gentians, among which riseth vp a small short stalk, with some smaller leaues thereon, at the toppe whereof standeth one faire, large, hollow flower, made bell fashion, with wide open brimmes, ending in iue corners or diuisions, of the most excellent deepe blue colour that can be seen in any flower, with some white spots in the bottome on the inside: after the flower is past, there appear long and round pods, wherin are contained small blackish seede: the rootes are small, long, pale yellow strings, which shooft forth here and there diuers heads of leaues, and thereby encrease reasonable well, if it finde a fit place, and ground to grow, or else will not be nourised vp, with all the care and diligence can be vsed: the whole plant is bitter, but not so strong as the former.

### 5. *Gentiana Autumnalis sine Pneumonanthe*. Calathian Violet or Autumnne Gentian.

This Gentian that flowreth in Autumne, hath in some places higher stalkes then in others, with many leaues thereon, set by couples as in other Gentians, but long and narrow, yet shewing the three ribbes or veines that are in each of them: the toppes of the stalkes are furnished every one with a flower or two, of an excellent purple colour, ending in iue corners, and standing in long huskes: the rootes are somewhat great at the top, and spreading into many small yellow strings, bitter as the rest are.

### 6. *Saponaria flore duplo*. Double flowred Sopewort.

Vnto these kindes of Gentians, I must needs adde these following plants, for that the former is of some neere resemblance in leafe with some of the former. And because the ordinary Sopewort or Bruisewort with singel flowers is often planted in Gardens, and the flowers serue to decke both the garden and the house; I may vnder the one describe them both: for this with double flowers is farre more rare, and of greater beautie. It hath many long and slender round stalkes, scarce able to sustaine themselues, and stand vpright, being ful of ioynts and ribbed leaues at them, euery one somewhat like a small Gentian or Plantane leafe: at the toppes of the stalkes stand many flowers, consisting of two or three rowes of leaues, of a whitish or pale purple colour, and of a strong sweet sent, somewhat like the smell of Iasmin flowers, standing in long and thicke pale greene huskes, which fall away without giuing any seede, as most other double flowers doe that encrease by the roote, which spreadeth within the ground, and riseth vp in sundry distant places like the singel.

### 7. *Plantago Rosea*. Rose Plantane.

This other plant is in all things like vnto the ordinary Plantane or Ribworte, that growth wilde abroade in many places, whose leaues are very large: but in stead of the long slender spike, or eare that the ordinary hath, this hath eyther a thicke long spike of small greene leaues vpon short stalkes, or else a number of such small leaues layd round-wise like vnto a Rose, and sometimes both these may be seene on one and the same roote, at one and the same time, which abide a great while fresh upon the roote, and sometimes also giueth seede, especially from the more long and slender spikes.

### The Place.

Some of these Gentians grow on the toppes of hills, and some on the sides and foote of them in Germany and other Countreyes: some of them also upon barren heaths in those places, as also in our owne Countrey, especially

## The Garden of pleasant Flowers.

ly the Autumnne Gentian, and as it is reported, the Vernal likewise. The singel or ordinary Sope wort is found wilde in many places with vs, but the double came to vs from beyond the Sea, and is (carke known or heard of in England. The Rose Plantaine hath beene long in England, but whether naturall thereof or no, I am not assured.

### The Time.

They flower for the most part in Iune and July, but the small Gentian of the Sping flowreth somewhat earlier, and that of the Autumne in August and September.

### The Names.

*Gentiana* is the generall name giuen to the Gentians. We call them in English Gentian, Fellworte, Bitterwort, and Baldmoneyn. *Saponaria* taketh his name from the scouring qualitie it hath: Wee call it in English Sopewort, and in some places Bruisewort. Some haue thought it to bee *Stratibium* of Dioſcorides, or at least haue vsed it for the same caufes, but therein they are greatly deceiued, as Matthiolus hath very well obſerved theron, and so is Dodoneus, that thought it to be *Alisma*. The Rose Plantaine is so calld of the double spikes it carrieth.

### The Vertues.

The wonderfull wholsomnesse of Gentian cannot bee easily knowne to vs, by reaſon our daintie taſtes refuse to take therof, for the bitternesſe sake: but otherwise it would vndoubtedly worke admirable cures, both for the liver, ſtomacke and lunges. It is alſo a ſpeciall counterpoiſon againſt any infection, as alſo againſt the violence of a mad dogges tooth: wilde Sopewort is vsed in many places, to ſcoure the countrey womenſ treen, and pewter vefſels, and physically ſome make great boaſt to perorme admirabla cures in Hydropicall diſeaſes, becauſe it is diureticall, and in *Lue Venetria*, when other Mercuriall medicinnes haue failed. The Rose Plantaine no doubt hath the ſame qualities that the ordinary hath.

## C H A P. L X X X VI.

### *Campanula*. Bell-flowers.

**V**Nder the title of Bell-flowers are to bee comprehended in this Chapter, not only those that are ordinarily called *Campanula*, but *Viola Mariana*, and *Trachelium* alſo, whereof the one is called Couentry, the other Canterbury Bells.

### 1. *Campanula Persicifolia alba, vel cernua*. Peach-leaved Bell-flowers white or blewe.

The Peach-leaved Bell-flower hath many tufts, or branches of leaues lying vpon the ground, which are long and narrow, ſomewhat like vnto the leafe of an Almond or Peach tree, being finely nicked about the edges, and of a ſad greene colour, from among which riſe vp diuers stalkes, two foote high or more, ſet with leaues to the middle, and from thence vpwards, with many flowers ſtanding on ſeverall ſmall footestalkes, one above another, with a ſmall leafe at the foote of every one: the flowers ſtand in ſmall greene huskes, being ſmall and round at the bottome, but wider open at the brimme, and ending in iue corners, with a three forked clapper in the middle, ſet about with ſome ſmall threds tipt with yellow, which flowers in ſome plants are pure white

white, and in others of a pale blew or wachet colour, hauing little or no sent at all: the seede is small, and contained in round flat heads, or seede vessells: the roote is very small, white and threddy, creeping vnder the vpper crust of the ground, so that often times the heat and drought of the Summer wil goe near to parch and wither it vterly: it requireth therefore to be planted in some shadowie place.

2. *Campionula major*, sive *Pyramidalis*.  
The great or steeple Bell-flower.

This great Bell-flower hath diuers stalkes, three foote high or better, whereon grow diuers smooth, darke, greene leaues, broade at the bottome, and small at the point, somewhat vncuenly notched about the edges, and standing vpon longer footstalkes below then those aboue: the flowers are blew, and in some white, riot so great or large as the former, but neare of the forme fashion, growing thicker and more plentifullly together, with smaller leaues among them, bushing thicke below, and rising smaluer and thinnuer vp to the toppe, in fashion of a *Pyramis* or speere Steeple: the roote is thicke and whitish, yelding more store of milke being broken (as the leaues and stalkes also doe) then any other of the Bell-flowers, every one whereof doe yelde milke, some more and some lesse.

3. *Viola Mariana flore albido vel purpureo*.  
Country Bels white or purple.

The leaues of Country Bels are of a pale or fresh greene colour, long, and narrow next vnto the bottome, and broader from the middle to the end, and somewhat round pointed, a little hairy all ouer, and snipt about the edges: the stalkes rise vp the yeare after the sowing, being somewhat hairy also, and branching forth from the roote, into diuers parts, whereon stand diuers leaues, smaller then the former, and of a darker greene colour: at the end of every branch stand the flowers, in greene huskes, from whence come large, round, hollow Bels, swelling out in the middle, and rising somewhat aboue it, like the necke of a pot, and then ending in fие corners, which are either of a faire or faint white, or of a pale blew purplish colour, and sometimes of a deeper purple or violet: after the flowers are past, there rise vp great square, or cornered seede vessells, wherein is contained in diuers diuisions, small, hard, shining, browne, flat seeds: the roote is white, and being young as in the first yeares sowing, is tender, and often eaten as other Rampions are; but the next yeare, when it runneth vp to seede, it groweth hard, and perisheth: so that it is to be continued by every other yeares sowing.

4. *Trachelium minus flore albo vel purpureo*.  
Great Canterbury Bels white or purple.

The greater Canterbury Bels, or Throateworte, hath many large rough leaues, somewhat like vnto Nettle leaues, being broad and round at the bottome, and pointed at the end, notched or dented on the edges, and every one standing on a long footstalk: among these leaues rise vp diuers square rough stalkes, diuided at the toppe into diuers branches, whereon grow the like leaues as grow below, but lesser, toward the ends of the branches stand the flowers, mixed with some longer leaues, every one in his severall huske, which are hollow, long and round, like a bell or cup, wide open at the mouth, and cut at the brimme into fие corners, or diuisions, somewhat lesser then the Country Bels, in some of a pure white, and others of a faire deepe purple violet colour, and sometimes paler: after the flowers are past, come smaller and rounder heade then in the former, containing flat seede, but blacker, and not so redde as the last: the roote is hard and white, dispersing it selfe into many branches vnder ground, not perishing every yeare as the former (although it loseth all the leaues in winter) but abiding many yeares, and encreasing into diuers heades or knobs, from whence spring new leaues and branches.

5. *Trache-*

1. *Campionula persicifolia*. Peach-leaved Bell-flower. 2. *Trachelium minus simplex*. Canterbury Bells. \* *Trachelium boreale duplo*. Double Canterbury Bells. 3. *Viola Mariana*. Country Bells. 4. *Trachelium Giganteum*. Giants Throatewort. 5. *Trachelium minus*. The lesser Throatewort. 6. *Trachelium americanum* sive *Cardinalis planta*. The rich crimson Cardinals flower.

5. *Trachelium maius flore duplice albo & ceruleo.*  
Canterbury Bells with double flowers both white and blew.

Of this kinde of Throateworte or Canterbury Bells, there is another sort, not differing in any thing from the former, but in the doublenesse of the flower : For there is of both the kindes, one that beareth double white flowers, and the other blew : Of each whereof I received plants from friends beyond the Sea, which grow well with me.

6. *Trachelium Giganteum flore purpurante.*  
Pale purple Giants Throateworte.

This Bell-flower, although it hath a Gigantine name, yet did I never perceiue it in my Garden, to rise vph gher then the former, the epithite beeing in my perswasion, only giuen for difference sake : the leaues whereof are not so rough, but as large, and dented about the edges, somewhat larger pointed, and of a fresher greene colour : the stalkes beare such like leaues on them, but more thinly or dispersedly set, having a flower at the iesting on of every one of the leaues, from the middle vpwards, and are somewhat like the great Throateworte in forme, but of a pale or bleake reddish purple colour, turning the brims or corners a little backwards, with a forked clapper in the middle, sufficient eminent and yellow : the seede hereof is white, and plentifull in the heads, which will abide all the winter vpon the stalkes, vntill all the seede being shed, the heads remaining seeme like torn rags, or like thin pecces of skin, eaten with wormes : the roote is great, thicke and white, abiding long without perishing.

There is another which differeth not any thing but in the flower, which is white.

7. *Trachelium minus flore albo & purpureo.*  
Small Throateworte or Canterbury Bells both white and purple.

The lesser Throateworte hath smaller leaues, nothing so broade or hard as the former great kinde, but long, and little or nothing dented about the edges : the stalkes are square and brownish, if it beare purple flowers, and greene if it beare white flowers, which in forme are alike, and grow in a bush or tuft, thicke set together, more then any of the former, and smaller also, being not much bigger then the flowers of the field, or garden Rampions : the roote is lasting, and shooteth afresh euery yeare.

8. *Trachelium Americarum flore ruberrimo, sine Planta Cardinalis.*  
The rich crimson Cardinals flower.

This braue plant, from a white roote spreading diuers wayes vnder ground, sendeth forth many greene leaues, spread round about the head thereof, each whereof is somewhat broade and long, and pointed at the end, finely also snipt about the edges : from the middle whereof ariseth vp a round hollow stalke, two foote high at the least, beset with diuers such leaues as grow below, but longer below then aboue, and branching out at the toppe abundantly, every branch bearing diuers greene leaues on them, and one at the foote of euery of them also, the toppes whereof doe end in a great large tuft of flowers, with a small greene leafe at the foote of the stalke of every flower, each foostalke being about an inch long, bearing a round greene huske, diuided into fve long leaues or points turned downwards, and in the midst of every of them a most rich crimson coloured flower, ending in fve long narrow leaues, standing all of them foreright, but three of them falling downe, with a long vmbone set as it were at the backe of them, bigger below, and smaller aboue, and at the toppe a small head, being of a little paler colour then the flower, but of no sent or smell at all, commendable onely for the great bush of so orient red crimson flowers : after the flowers are past, the seede commeth in small heads, closed within those greene husks that held the flowers, which is very like vnto the seede vessels of the *Viola Mariana*, or Couentry Bells, and is small and brownish.

The

The Place.

All these Bell-flowers do grow in our Gardens, where they are cherisched for the beautie of their flowers. The Couentry Bells doe not grow wilde in any of the parts about Couentry, as I am credibly informed by a faithfull Apothecary dwelling there, called Master Brian Ball, but are nourished in Gardens with them, as they are in other places. The last growth neere the riuier of Canada, where the French plantation in America is seated.

The Time.

They flower from May vntill the end of July or August, and in the mean time the seede is ripe : But the Peache-leaved Bell-flowers, for the most part, flower earlier then the other.

The Names.

The first is generally called *Campanula Persicifolia*, in English Peach-leaved Bell-flower. The second is called *Campanula maior*, *Campanula latifrons Pyramidalis*, and *Pyramidalis Lutescens* of Lobel, in English, Great or Steeple Bell-flower. The third is vsually called *Viola Mariana*, and of some *Viola Marina*. Lobel putteth a doubt whether it be not *Medium* of *Dioscorides*, as Matthiolus and others doe thinke ; but in my opinion the thicknesse of the roote, as the text hath it, contradiceth all the rest. We call it generally in English Couentry Bells. Some call it Marian, and some Mercuries Violets. The fourth and fift are called *Trachelium* or *Ceruncaria*, of some *Vularia*, because many haue vsed it to good purpose, for the paines of the *Vulna*, or Throate : Yet there is another plant, called also by some *Vularia*, which is *Hippoglossum*, Horse tongue, or Double tongue. The sixt hath his title to descipher it out sufficiently, as is declared. The seuenth is called *Trachelium minus*, and *Ceruncaria minor*, of some *Saponaria altera* ; in English, Small Throateworte, or Small Canterbury Bells. The last hath his name in the title, as it is called in France, from whence I received plants for my Garden with the Latine name : but I haue giuen it in English.

The Vertues.

The Peach-Bells as well as the others may safely bee vsed in gargles and lotions for the mouth, throat, or other parts, as occasion serueth. The rootes of many of them, while they are young, are often eaten in sallets by diuers beyond the Seas.

CHAP. LXXXVII.

*Campana Cerulea*, sine *Convolvulus Ceruleus*.  
Blew Bell flowers, or blew Bindeweede.

Here are two other kindes of Bell-flowers, much differing from the Tribe or Familiie of the former, because of their climbing or winding qualitie, which I must needs place next them, for the likenesse of the flowers, although otherwise they might haue beeene placed with the other clamberers that follow. Of these there is a greater, and a lesser, and of each likewise some difference, as shall be declared.

1. *Convolvulus ceruleus maior rotundifolius.*

The greater blew Bindweede, or Bell-flower with round leaues.

This goodly plant riseth vp with many long and winding branches, whereby it climberth and windeth vpon any poles, herbes, or trees, that stand neare it within a great compasse, alwaies winding it selfe contrary to the course of the Sunne: on these branches doe growe many faire great round leaues, and pointed at the end, like vnto a Violet leafe in shape, but much greater, of a sad greene colour: at the ioynts of the brancis, where the leaues are set, come forth flowers on pretty long stalkes, two or three together at a place, which are long, and pointed almost like a finger, while they are buds, and not blowne open, and of a pale whitish blew colour, but being blowne open, are great and large blos, with broad open mouths or brims ending in fve corners, and small at the bottome, standing in small greene huskes of fine leaues: these flowers are of a very deepe azure or blew colour, tending to a purple, very glorious to behold, opening for the most part in the euening, abiding so all the night and the next morning, vntill the Sunne begin to growe somewhat hot vpon them, and then doe close, never opening more: the plant carrieth so many flowers, if it stand in a warme place, that it will be replenished plentifully, vntill the cold ayres and euennings stay the luxury thereof: after the flowers are past, the stalkes whereon the flowers did stand, bend downwards, and beare within the huskes three or fourre blacke seedes, of the bignesse of a Tare or thereabouts: the rootes are stringy, and perish every yeare.

2. *Convolvulus trifolius sine hederaceus purpureus.*

The greater purple Bindeweede, or Bell-flower with cornered leaues.

The growing and forme of this Bindeweede or Bell-flower, is all one with the former, the chiefeſt diſſerences conſiſting in the forme of the leafe, which in this is three cornered, like vnto an Iuie leafe with corners; and in the flower, which is of a deeper blew, tending more to a deepe purple Viole, and ſomewhat more reddish in the fine plaies of each flower, as also in the bottomeſ of the flowers.

3. *Convolvulus tenuifolius Americanus.* The red Bell-flower of America.

Although this rare plant (because wee ſeldome haue it, and can as hardly keepe it) be ſcarce knowne in theſe cold Countries, yet I could not but make mention of it, to incite those that haue conuenientie to keepe it, to be furnished of it. It springeth vp at the firſt from the ſeede with two leaues, with two long forked ends, which abide a long time before they periſh, betwene which riſeth vp the ſtakke or ſtemme, branching forth diuers waies, being of a browniſh colour, which windeth it ſelfe as the former great Bell-flower doth, whereon are ſet at ſeverall ioynts diuers winged leaues, that is to ſay, many ſmall narrow and long leaues ſet on both ſides of the middle ribbe, and one at the end: from theſe ioynts arife long stalkes, at the ends wherof ſtand two or three ſmall, long, hollow flowers, muſtred very like vnto the flowers of a Bindeweede, or the flowers of Tabacco, and ending in the like manner in fine points, but not ſo much laide open, being of a bright red colour, plaied as the Bindeweedes or Bell-flowers before they be open; with ſome few threads in the middle, which turne into long pointed cods, wherein is contained long and blacke ſeede, tasting hot like Pepper: the roote is ſmall and stringy, periſhing every yeare, and with vs will ſeldome come to flower, becauſe our cold nights and froſts come to ſoone, before it can haue comfort enough of the Sun to ripen it.

4. *Convolvulus ceruleus minor Hispanicus.*

The Spanish small blew Bindeweede.

This ſmall Bindeweede hath ſmall long leaues, ſomewhat broader then the next that followeth, and not ſo broad as the common ſmall Bindeweede (that groweth every

every where wilde on the bankes of fields abroad) ſet vpon the ſmall trayling branches, which growe aboue two or three foote high: from the middle of theſe branches, and ſo vnto the toppes of them, come forth the flowers at the ioynts with the leaues, folded together at the firſt into fine plaies, which open into ſo many corners, of a moſt excellent faire ſkie coloured blew (ſo pleauant to behold, that often it amazeth the ſpectator) with white bottomes, and yellowiſh in the middle, which turne into ſmall round white heads, wherein are contained ſmall blackiſh cornered ſeede, ſomewhat like the former, but ſmaller: the roote is ſmall and threddy, periſhing as the former every yeare: this neuer windeth it ſelfe about any thing, but leaneth by reaſon of the weakneſſe of the branches, and dyeth every yeare after ſeede time, and not to be ſowne againe vntill the next Spring.

5. *Convolvulus purpureus Spicafolius.* Lauander leafed Bindeweede.

This ſmall purple Bindeweede, where it naturally groweth, is rather a plague then a pleauere, to whatſoever growth with it in the fields; yet the beauty of the flower hath cauſed it to be received into Gardens, bearing longer and ſmaller leaues then the laſt, and ſuch like ſmall Bell-flowers, but of a ſad purple colour: the roote is liuing, as the common kinds are, and ſpringeth againe where it hath been once ſowne, without feare of periſhing.

## The Place.

The firſt two greater kindes haue beeene ſent vs out of Italy, but whether they had them from the Eaſt Indies, or from ſome of the Eaſterne Countries on this ſide, wee know not: but they thriue reasonable well in our Country, if the year be any thing kindly. The next came out of America, as his name teſtifieth. The leſſer blew kinde groweth naturally in many places both of Spaine and Portuſall (from whence I firſt received ſeede from Guillaume Boel, heretofore remembred.) The laſt groweth wilde in the fields, about Dunmowe in Eſſex, and in many other places of our owne Country likewiſe.

## The Time.

The three firſt greater kindes flower not vntill the end of Auguft, or thereabouts, and the ſeede ripeneth in Septembe, if the colds and froſts come not on too ſpeedily: The leſſer kinde flower in June and July.

## The Names.

The firſt is caſted of ſome *Campana Lazura*, as the Italians doe call it, or *Campana cerulea*, of others *Convolvulus ceruleus maior, ſine Indicus, and Flos noctis*. Of ſome *Nil Auicenna*. The ſecond is caſted of *Convolvulus trifolius, or hederaceum*, for the diſtincſion of the leaues. In English we call them eyther Great blew Bell-flowers, or more uſually, Great blew Bindeweedes: That of America is diuerſly caſted by diuers. It is caſted *Quamoclit* of the Indians, and by that name it was ſent to Ioachinus Camerarius out of Italy, where it is ſo caſted ſtill, as Fabius Colonna ſetteth it downe, and as my ſelfe alſo can wiſneſſe it, from thence being ſo ſent vnto mee: but Andreas Caſpalinus calleth it, *Iſminum folio Milleri*, ſuppofing it to be a Iſminiae. Camerarius ſaith, it may not vniſtly be caſted *Convolvulus tenuifolius*, acounting it a kinde of Bindeweede. Colonna entitlēth it *Convolvulus penatus exoticus rarior*, and ſaith it cannot bee referred to any other kinde of plant then to the Bindeweedes. Hee that published the *Cure posteriores* of Cluſius, giueth it the name of *Iſminum Americanum*, which I would doe alſo, if I thought it might belong to that Family, but ſeeing the face and forme of the plant better agreeing with the Bindeweedes or Bell-flowers, I haue

I haue (as you see) inserted it among them, and giuen it that name may bee most fit for it, especially because it is but an annuall plant. The lesser kindes haue their names sufficiently expressed in their titles.

#### The Vertues.

We know of no vse these haue in Physicke with vs, although if the first be *Nil* of Auicen, both he and Serapio say it purgeth strongly.

#### CHAP. LXXXVIII.

##### *Stramonium*. Thorne-Apple.

**V**NTO the Bell-flowers, I must adioyne three other plants, in the three severall Chapters following, for some affinity of the flowers: and first of the Thorne-Apples, whereof there are two especiall kindes, that is; a greater and a lesser, and of each soone diuersity, as shall be set downe.

##### 1. *Stramonium minus album*. The great white flowred Thorne-Apple.

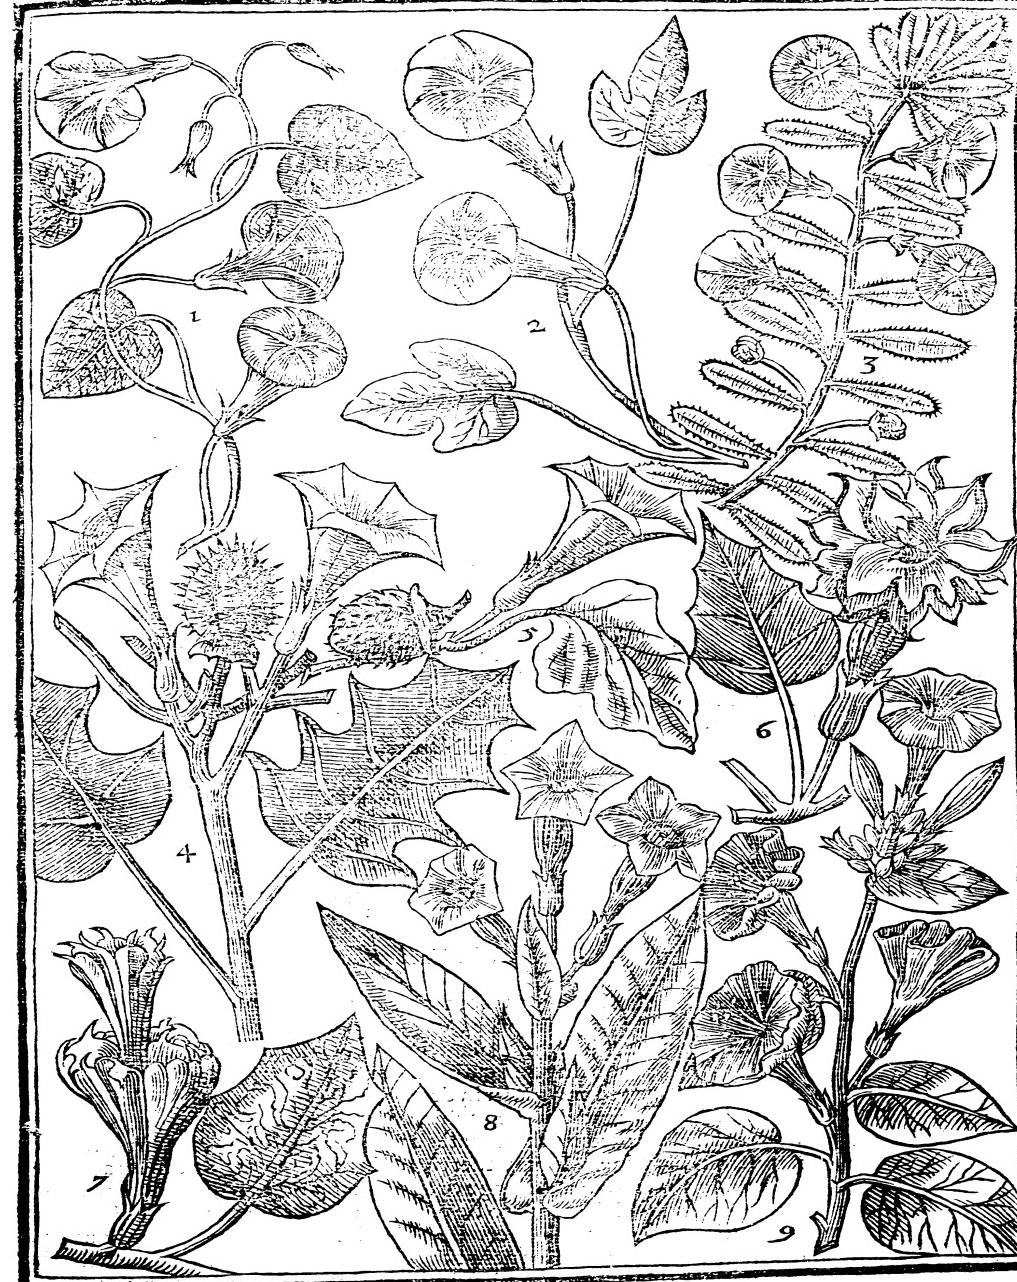

The greater Thorne-Apple hath a great, strong, round greene stalke, as high as any man, if it be planted in good ground, and of the bignesse of a mans wret almost at the bottome, spreading out at the toppe into many branches, wherein stand many very large and broad darke greene leaues, cut in very deeply on the edges, and hauing ma-  
nic points or corners therein: the flowers come forth at the ioynts, betweenetwo  
branches towards the toppe of them, being very large, long, and wide open, ending  
in five points or corners, longer and larger then any other Bell-flowers whatsoeuer:  
after the flowers are past, come the fruit, which are thorny long heads, more prickly  
and greene then the lesser kindes, which being ripe openeth it selfe into three or four  
parts, haung a number of flat blackish seede within them: the roote is abundant in  
fibres, whereby it strongly taketh hold in the ground, but perisheth with the first  
frosts; yet the seede that is shed when the fruit is ripe, commeth vp the next year.

##### 2. *Stramonium minus purpureum*. The great purple flowred Thorne-Apple.

This purple Thorne-Apple is in largenesse of leaues, thicknesse and height of stalke,  
greatnesse and forme of flowers and fruit, every way equall and correspondent vnto  
the former, the chiefe differences be these: the stalke is of a darke purple colour; the  
leaues are of a darker greene, somewhat purplish, and the flowers are of light purple  
or pale Doue colour, enclining to white, and whiter at the bottome.

##### 3. *Stramonium minus seu Nux Metel flore albo*. The smaller Thorne-Apple with a white flower.

The smaller Thorne-Apple riseth vp with one round stalke, of the bignesse of a  
mans finger, and never much aboue two foote high with vs, bearing a few large, broad,  
smooth leaues thereon, without any branches at all, which are vneuenly rent or ~~the~~  
about the edges, with many ribs, and smaller veines running through them, yet less  
by much then the greater kinde: at the ioynts where the leaues stand, come forth  
long and large white flowers, with broad or wide open brims, folded together before  
their opening, as the other former Bell-flowers or Bindeweedes, but hauing their five  
corners more pointed or horned then either they, or the former Thorne-Apples: af-  
ter the flowers are past, succeed small fruit, rounder and harder, set with harder, but  
blunt prickes then the former, wherein is contained brownish yellow flat seede,  
sticking

1. *Convolvulus major cornutus*. The greater bell Bindweed or Bell flower. 2. *Convolvulus trifolatus* (see before last). The great purple Bindweed. 3. *Datura stramonarium Hispanicum*. The Spanish small bell Bindweed. 4. *Stramonium minus* (Thornapple). The great Thorne Apple. 5. *Stramonium minus* (Thornapple). The small Thorne Apple. 6. *Stramonium flore dulcis*. The double-flowered Thorne Apple. 7. *Stramonium flore dulcis*. Double Thorne Apple one way of another. 8. *Tabacum Virginianum*. Broad leaved Tobacco. 9. *Malibius persicus*. The Mercuries of the world.

sticking to the inward pulpe : the roote is not very great, but full of strings, and quickly perisheth with the first frosts.

4. *Stramonium minus flore germinato purpurante.*  
The small double flowered purple Thorne-Apple.

In the flower of this plant, consisteth the chiefeſt diſſeſt from the former, which is as large as the laſt, pointed into more hornes or corners, and beareth two flowers, ſtanding in one huſke, one of them riſing out from the middle of the other, like vnto thofe kindes of Cowſlips and Oxelips, called double, or Hoſe in hoſe, before deſcribed, which are of a pale purpliſh colour on the outside, and almoſt white within : the fruit is round like the laſt, and beareth ſuch like ſeede, ſo that vntill it bee in flower, their diſſeſt can hardly bee diſcerned : this is moſte tender then the laſt, althoſh even it is ſo tender, that it ſeldome beareth ripe ſeede with vs.

*Flore duplice.* Sometimes (for I think it is not another kind) the flower will haue as it were double rowes of leaues, cloſe ſet together, and not coniſting of two, riſing ſo diſtinctly one aboue another.

The Place.

All theſe kindes haue been brought or ſent vs out of Turkie and Egypt; but Garcias, and Christopherus Acoſta, with others, affirme that they grow in the Eaſt Indies. The leſſer kindes are very rare with vs, because they ſeldome come to maturity ; and therefore we are ſtill to ſeekē of new ſeede to ſow. The greater kindes are plentifull enough in our Gardens, and will well abide, and giue ripe fruit.

The Time.

The smaller kindes flower later then the greater, and therefore their fruit are the ſooner ſpoiled with the cold ayres, dewes, and froſts, that come at the latter end of the yeare : but the greater kinds neuer miſſe lightly to ripen.

The Names.

Both the greater and smaller kindes are generally called *Stramonium*, *stramonia*, *Pomum spinosum*, and *Datura*. Bauhinus vpon Matthiolus his Comentaries on Diſcorides, calleth it *Solanum fetidum spinosum*. Some learned men haue referred it to *Nux Metel*, of the Arabian Authors. Wee call them generally in English, Thorne-Apples, and diſtinguiſh them by their titles of greater and leſſer, ſingle and double.

The Vertues.

The Eaſt Indian laſciuous women perorme ſtrange acts with the ſeed (of the smaller kind, as I ſuppoſe, or it may be of either) giuing it their hufbands to drinke. The whole plant, but eſpecially the ſeed, is of a very cold and ſoporiferous quality, procurring ſleep and diſtraction of ſenes. A few of the ſeeds ſteeped and giuen in drinke, will cauſe them that take it to ſeem ſtarke drunke or dead drunke, which ſit will within a few houres weareaway, and they recouer their ſenes againe, as a drunken man rayfed after ſleep from his wine. It may therefore (in my opinion) be of ſafe and good uſe to one, that is to haue a legge or an arme cut off, or to be cut for the ſtone, or ſome other ſuſh like cure to be performed, to take away the ſene of paine for the time of doing it ; otherwiſe I hold it not fit to be uſed without great caution. But the greene leaues of the greater kindes (as also of the leſſer, but that with vs they are not ſo plentifull) are by tryed expeſience, found to be excellent good for any ſcalded or burned part, as alſo to take away any hot inflammatiōns, being made vp into a ſalue or ointment with ſuet, waxe, and roſin, &c. or with *Axungia*, that is, Hogs larde.

C H A P. LXXXIX.

*Tabacco.* Indian Henbane, or Tabacco.

There hath beeſe formerly but three kindeſ of Tabacco knowne vnto vs, two of them called Indian, and the third English Tabacco. In theſe later yeaſes, we haue had in our gardens about London (before the ſuppreſſing of the planting) three or four other ſorts at the leaſt, and all of the Indian kinde, haue ſome eſpeciall diſſeſt, eyther in leafe, or flower, or both : And in regard the flowers of ſome of theſe carry a pretty ſhew, I ſhall only entreat of them, and not of the English kind.

*Tabacco latifolium.* Broade leafed Tabacco.

The great Indian Tabacco hath many very large, long, thiſke, fat and faire greene leaues, ſtanding foreright for the moſt part, and coimpaſſing the ſtakle at the bottome of them, being ſomewhat pointed at the end : the ſtakle is greene and round, ſix or feuen foote high at ſometimes, and in ſome places, in others not paſt three or four foote high, diuided towards the toppe into many branches, with leaues at every ioynt, and at the toppes of the branches many flowers, the bottomes hereof are long and hollow, and the toppes plaide or folded before they are open, but being open, are diuided ſometimes into four, or more vſually into five corners, ſomewhat like vnto other of the Bell-flowers, but lying a littel flatter open, of a light carnation colour. The ſeede is very ſmall and browne, contained in round heads, that are clammy while they are greene, and pointed at the end : the roote is great, whitish, and woody at the head, diſperſing many long branches, and ſmall fibres vnder the ground, whereby it is ſtrongly fastened, but periſheth with our violent froſts in the winter, if it be left abroad in the garden, but if it be hoſed, or ſafely prouided for againſt the froſtes, the rootes will liue, and ſpring afreſh the next year.

There is of this kinde another ſort, whose leaues are as large and long as the former, but thicker, and of a more dead greene colour, hanging downe to the ground-ward, and ſcarce any ſtanding forth-right, as the former, vnilefſe they bee very young : the flowers of this kinde are almoſt whole, without any great ſhew of corners at the brims or edges, in all other things there is no diſſeſt.

There is another, whose large and thiſke flat leaues doe compaſſe the ſtakle at the bottome, and are as it were folded together one ſide vnto another: the flowers are of a deeper bluſh, or carnation colour, and with longer points and corners then in any of the former ; and in theſe two things coniſteth the diſſeſt from the others, and is called Verines Tabacco.

Another hath his leaues not ſo large and long as the first, and theſe haue ſhort footeſtakles, whereon they ſtand, and doe not compaſſe the ſtakle as the other doe : the flower hereof is like the first, but ſmaller, and of a little paler colour.

*Tabacco angustifolium.* Narrow leafed Tabacco.

This kinde of Tabacco hath ſomewhat lower, and ſmaller ſtakles, then any of the former : the leaues hereof are ſmaller and narrower, and not altogether ſo thiſke, but more pointed, and every one ſtanding vpon a footſtakle, an inch and a halfe long at the leaſt : the flowers hereof ſtand thiſke together, vpon the ſmall branches, ſomewhat larger, of a deeper bluſh colour, and more eminent corners then in any of the former : the ſeed and rootes are alike, and periſh in like manner, vnilefſe it be brought into a cellar, or other ſuſh court, to defend it from the extremitie of the Winter.

The Place.

America or the West Indies is the place where all theſe kindeſ doe grow naturally, ſome in one place, and ſome in another, as in Peru, Trinidad, Hispani-

Hispaniola, and almost in every Iland and Countrey of the continent thereof: with vs they are cherished in gardens, as well for the medicinable qualities, as for the beauty of the flowers.

#### The Time.

It flowreth in August, seldome before, and the seede is ripe quickly after. If it once sowe it selfe in a Garden, it will giue next year after young plants: but for the most part they will spring vp late, and therefore they that would haue them more early, haue sownen the seede vpon a bed of dung, and transplanted them afterwards.

#### The Names.

This plant hath gotten many names. The Indians call it in some places *Petum*, in others *Picciat*, and *Perebeccus*, as Ouidius and others doe relate. The Spaniards in the Indies first called it *Tabacco*, of an Iland where plenty of it grew. It hath in Christendome receiuied diuers other names, as *Nicotiana*, of one Nicot a French man, who seeing it in Portugall, sent it to the French Queene, from whom it receiuied the name of *Herba Regia*. Lobel calleth it *Santa herba*, & *Sana Santa Indorum*. Some haue adiudged it to be an *Hoscyamus*, and therefore call it *Peruvianus*. The most vsuall name wherby we call it in English, is Tabacco.

#### The Vertues.

The herbe is, out of question, an excellent helpe and remedy for diuers diseases, if it were rightly ordered and applyed, but the continuall abuse thereof in so many, doth almost abolish all good vs in any. Notwithstanding if men would apply their wits to the finding out of the vertues, I make no doubt but many strange cures would bee performed by it, both inward and outward. For outward application, a Salve made hereof (as is before recited of the Thorne apple leaues) cureth vlcers, and wounds of hard curacion: And for inward helpes, a Syrupe made of the iuice and sugar, or honey, procureth a gentle vomit (but the dried leafe infused in wine much more) and is effectuall in astmatical diseases, if it bee carefully giuen. And likewise cleanseth cankers and fistulaes admirably, as hath beeene found by late experience. The ashes of Tabacco is often vsed, and with good successe, for cuts in the hands, or other places, and for other small greene wounds.

#### C H A P. X C.

#### *Mirabilia Peruviana. The Meruaile of Peru.*

**T**HIS plant yeeldeth in our Gardens fve or sixe severall varieties of beautifull flowers, as pure white, pure yellow, pure red, white and red spotted, and red and yellow spotted. But besides these, I haue had some other sorts, among which was one, of a pale purple or peach colour: all which, comming vnto mee out of Spaine with many other, seedes in an vnkindly yeare (an early winter following a cold summer) perished with mee; yet I plainly might discerne by their leaues, and manner of growing, to be diuers from them that we now haue and keepe. I shall need therefore (because the chiefeſt difference confiſteth almost in the flowers) to giue only one description of the plant, and therein shew the varieties as is before declared.

#### *Admirabilis. The Meruaile of the World.*

The ſtalle of this meruellous plant is great and thick, bigger then any mans thumb, bunched

bunched out or swelling at euery ioynt, in ſome the ſtakles will bee of a faire greene colour, and thoſe will bring white, or white and red flowers: in others they will bee reddish, and more at the ioynts, and thoſe giue red flowers; and in ſome of a darker greene colour, which giue yellow flowers; the ſtakles and ioynts of thoſe that will giue red and yellow flowers ſpotted, are ſomewhat browniſh, but not fo red as thoſe that giue wholly red flowers: vpon these ſtakles that ſpread into many branches, doe grow at the ioynts vpon ſeverall footestakles, faire greene leaues, broad at the ſtakle, and pointed at the end: at the ioynts likewife toward the upper part of the branches, at the foote of the leaues, com forth ſeverall flowers vpon ſhort footestakles, every one being ſmall, long and hollow from the bottome to the brimme, which is broade ſpread open, and round, and conſift but of one leafe without diuision, like vnto a Bell flower, but not cornered at all: which flowers, as I ſaid, are of diuers colours, and diuerſly marked and ſpotted, ſome being wholly white, without any ſpot in them for the moft part, through all the flowers of the plant; ſo likewife ſome being yellow, and ſome wholly red; ſome plants againe being mixed and ſpotted, ſo variably either white and red, or purple, (except here and there ſome may chance to be wholly white, or red or purple among the reſt) or red and yellow through the whole plant, (except as before ſome may chance in this kinde to be eyther wholly red, or wholly yellow) that you ſhall hardly finde two or three flowers in a hundred, that will bee alike ſpotted and marked, without ſome diuerſtie, and ſo likewife every day, as long as they blow, which is vntill the winters, or rather autumnes cold blaſtes do ſtay their willing pronenesſe to flower: And I haue often alſo obſerved, that one ſide of a plant will give fairer varieties then another, which is moft commonly the Eaſterne, as the more temperate and shadowie ſide. All theſe flowers doe open for the moft part, in the euening, or in the night time, and ſo stand blowne open, vntill the next mornings ſun beginne to grow warme vpon them, which then close themſelues together, all the brims of the flowers shrinking into the middle of the long necke, much like vnto the blewe Bindeweede, which in a manner doth ſo close vp at the funnes warme heate: or elſe if the day be temperate and milde, without any ſunne ſhining vpon them, the flowers will not close vp for the moft part of that day, or vntill toward night: after the flowers are paſt, come ſeverall ſeedes, that is, but one at a place as the flowers stood before, of the bignesse (ſometimes) of ſmall peafe, but not fo round, ſtanding within the greene huſkes, wherein the flowers stood before, being a little flat at the toppe, like a crowne or head, and round where it is fastened in the cup, of a blacke colour when it is ripe, but elſe greene all the while it growtheth on the ſtakle, and being ripe is ſoone ſhaken downe with the wind, or any other light ſhaking: the roote is long and round, greater at the head, and ſmaller downwards to the end, like vnto a Reddiſh, ſpreading into two or three, or more branches, blackiſh on the outside and whitish within. These rootes I haue often preſerued by art a winter, two or three (for they will periſh if they be left out in the garden, vnlеſſe it be vnder a house ſide) because many times, the yeare not falling out kindly, the plants giue not ripe ſeede, and ſo we ſhould be to ſeeke both of ſeede to ſow, and of rootes to ſet, if this or the like art to keep them, were not vsed; which is in this manner: Within a while after the firſt froſts haue taken the plants, that the leaues wither and fall, digge vp the rootes whole, and lay them in a dry place for three or fourre daies, that the ſuperfluouſ moſture on the outside, may be ſpent and dryed, which done, wrap them vp ſeverall in two or three browne papers, and lay them by in a boxe, cheſt or tub, in ſome conuenient place of the house all the winter time, where no winde or moist ayre may come vnto them; and thus you ſhall haue theſe rootes to ſpring a fresh the next yeare, if you plant them in the beginning of March, as I haue ſufficiently tryed. But ſome haue tryed to put them vp into a barrell or firkin of ſand, or aſhes, which is alſo good if the ſand and aſhes be thorough dry, but if it bee any thing moist, or if they giue againe in the winter, as it is vſuall, they haue found the moſture of the rootes, or of the ſand, or both, to ptureſe the rootes, that they haue beeene nothing worth, when they haue taken them forth. Take this note alſo for the ſowing of your ſeede, that if you would haue variable flowers, and not all of one colour, you muſt choose out ſuch flowers as be variable while they grow, that you may haue the ſeede of them: for if the flowers bee of one entire colour, you ſhall haue for the moft part from thoſe ſeedes, plants that will bring flowers all of that colour, whether it be white, red or yellow.

## The Place.

These plants grow naturally in the West Indies, where there is a perpetuall summer, or at the least no cold frosty winters, from whence the seede hath been sent into these parts of Europe, and are dispersed into every garden almost of note.

## The Time.

These plants flower from the end of July sometimes, or August, vntill the frosts, and cold ayres of the evenings in October, pull them down, and in the meane time the seed is ripe.

## The Names.

Wee haue not received the seedes of this plant vnder any other name; then *Mirabilis peruviana*, or *Admirabilis planta*. In English wee call them, The merauale of Peru, or the merauale of the world: yet some Authors haue called it *Gelseminum*, or *Jasminum rubrum*, & *Indicum*: and Bauhines *Solanum Mexicatum flore magno*.

## The Vertues.

We haue not knowne any vse hereof in Phisickie.

## CHAP. XCI.

*Malva. Mallowes.*

**O**f the kindred of Mallowes there are a great number, some of the gardens, others wilde, some with single flowers, others with double, some with whole leaues, others with cut or diuided: to entreate of them all is not my purpole, nor the scope of this worke, but onely of such whose flowers, hauing beautie and respect, are fit to furnish this garden, as ornaments therunto. And first of those single kindes, whose flowers come nearest vnto the fashion of the former Bell-flowers, and after to the double ones, which for their brauerie, are entertained every where into every Countrey womans garden.

1. *Malva Hispanica flore carneo ample.*  
The Spanish blush Mallow.

The Spanish Mallow is in forme and manner of growing, very like vnto our common fieldie Mallow, hauing vpright stalkes two or three foote high, spread into diuers branches, and from the bottome to the toppe, beset with round leaues, like vnto our Mallowes, but somewhat smaller, rounder, and lesse diuided, yet larger belowe then aboue: the flowers are plentifully growing vpon the small branches, folding or writhing their leaues one about another before they bee blowne, and being open consist of fve leaues, with a long forked clapper therein, of the same colour with the flower: the chiefeft difference from the common consisteth in this, that the leaues of these flowers are longer, and more wide open at the brimmes (almost like a Bell-flower) and of a faire blush or light carnation colour, closing at night, and opening all the day: after the flowers are past, there come such like round heads, with small blacke seede, like vnto the common kinde, but somewhat smaller: the roote is small and long, and perisheth every yeare.

2. *Alcea vulgaris flore caraco.* Vervaine Mallow with blush flowers.

There is a Mallow that hath long stalkes, and flowers like vnto the common wilde Mal-

1. *Malva Hispanica flore carneo ample.* The Spanish Mallow. 2. *Alcea Veneta.* The Venice Mallow. 3. *Alcea Americana.* Thorne Mallow. 4. *Alcea Egypcia.* The Mallow of Egypt. 5. *Alcea frutescens.* The shrubby Mallow. 6. *Malva horiontalis simplex.* Single Hollyhocks. 7. *Malva rosea multiplex.* Double Hollyhocks.

Mallow, and of the same deepe colour with it, so that you can hardly know it from the ordinary kinde, which is found growing wilde together with it, but onely by the leafe, which is as round and as large as the former, but cut into many fine diuisions, euen to the stalke that vpholdeth it, that it seemeth to consist onely of ragges, or peeces of leaues : Of this kinde I take a plante for this garden; growing in all respects like vnto it, but differing onely in the colour of the flowers, which are of the same blush or light carnation colour, or not much differing from the former Spanish kinde, with some veines therein of a deeper colour: the root hereof liueth, as the root of the common wilde kinde doth.

3. *Alcea peregrina sine vesicaria.*  
Venice Mallow, or Good night at noone.

The Venice Mallow hath long and weake stalkes, most vsually lying or leaning vpon the ground, haing here and there vpon them long leaues and somewhat broad, cut in or gashed very deeply on both edges, that it seemeth as if they were diuers leaves set together, every one standing on a long foote stalk : at the ioynts of these stalkes, where the leaues are set, come forth seuerall flowers, standing vpon long foot stalkes, which are somewhat larger then any of the former flowers, consisting of five leaues, small at the bottome, and wide at the brimmes, of a whitish colour tending to a blush, and sometimes all white, with spots at the bottomes of the leaues on the inside, of a very deepe purple or murrey colour, which addeth a great grace to the flower, and haing also a long pestle or clapper in the middle, as yellow as gold : these flowers are so quickly faded and gone, that you shall hardly see any of them blowne open, vnlesse it bee betimes in the morning before the Sunne doe grow warme vpon them, for as soone as it feeleth the Sunnes warme heate, it closeth vp and neuer openeth againe, so that you shall very seldom see a flower blowne open in the day time, after nine a clocke in the morning : after these flowers are past, there rise vp in their places thinne, round, shining or transparent bladders, pointed at the toppe, and ribbed down all along, wherein are contained small, round, blackish seede : the roote is long and small, and perisheth euery yeare.

4. *Alcea fruticosa pentaphyllea.* Cinquefoyle Mallow.

The stalkes of this Mallow are very long, hard or wooddy, more then of any of the other Malloves : at the lower part whereof, and vp to the middle, stand diuers leaves vpon long foot stalkes, parted or diuided into five parts or leaues, and dented about the edges ; but vpwards from the middle to the toppe, the leaues haue but three diuisions : among these leaues stand large wide open flowers, of the colour of the common Mallow : the seede is smaller then in any other Mallow, but the rootes are great and long, spreading in the ground like vnto the roots of Marsh Malloves, springing vp afresh euery yeare from the roote.

5. *Sabdarifa seu Alcea Americana.* Thorney Mallowe.

This Thorney Mallowe hath greene leaues next vnto the ground, that are almost round, but pointed at the end, and dented very much about the edges; the other leaues that growe vpon the stalke are diuided into three parts, like vnto a trefoile, and some of them into five diuisions, all of them dented about the edges : the stalke is reddish, with some harmelesse prickles in sundry places thereon, and riseth vp three or fourfeet high in a good ground, a fit place, and a kindly yeare, bearing plenty of flowers vpon the stalkes, one at the foote of every leafe, the toppe it selfe ending in a long spike, as it were of buddes and leaues together : the flowers are of a very pale yellow, tending to a white colour, spotted in the bottome of each of the five leaues, with a deepe purple spot, broad at the lower part, and ending in a point about the middle of the leafe, which are quickly fading, and not abiding aboue one day, with a long pestle in the middle diuided at the toppe : after the flower is past, commeth vp a short prickly podde, set within a small greene huske or cup that bore the flower, wherein is contained

ned whitish, or rather brownish yellow seede, flat and somewhat round, like vnto the seedes of Hollyhocke : the roote is stringie, and quickly perisheth ; for it will hardly endure in our cold Country to giue flowers, much lesse seede, vnlesse (as I said before) it happen in a kindly yeare, and be well planted and tended.

6. *Bania seu Alcea Egyptia.* The Mallow of Egypt.

This Mallow is also as tender to nourse vp as the last, haing the lower leaues broad like a Marsh Mallow, and of a fresh greene colour ; but those that growe vpon the stalke, and vp to the toppe, are diuided into five parts or points, but are not cut in to the middle ribbe, like the former Thorney Mallow, yet dented about the edges like vnto them : the flowers growe at the setting to of the leaues, like vnto a Mallow for forme, but of a whitish colour, after which come long five square pointed pods, with hard shels, wherein are contained round blackish gray seede, as bigge as a Vetch or bigger : the roote perisheth quickly with vs, euen with the first frosts.

7. *Althea fratercula flore albo vel purpureo.*  
Shrubbe Mallow with a white or purple flower.

There are diuers sorts of shrubbe Malloves, whereof some that haue their stemmes or stalkes lesse wooddy, dye downe to the ground every yeare, and others that abide alwayes, are more wooddy : Of the former sorts I intend not to speake, referring them to a fitter place ; and of the other, I will onely give you the knowledge of one or two in this place, although I doe acknowledge their fittest place had been to be among the shrubbes ; but because they are Malloves, I pray let them passe with the rest of their kindred, and their descriptions in this manner : These wooddy kindes of shrub Malloves haue somewhat large, long, and diuided leaues, of a whitish greene colour, soft also, and as it were woolly in handling, set dispersedly on the whitish hard or wooddy stalkes : their flowers are large, like vnto a single Rose or Hollyhocke, in the one being white with purple spots in the bottome ; in the other either of a deepe red colour, or else of a paler purple, with a deeper bottome, and with veines running in every leafe : they are somewhat tender, and would not be suffered to be vncouered in the Winter time, or yet abroad in the Garden, but kept in a large pot or tubbe, in the house or in a warne cellar, if you would haue them to thriue.

8. *Malva hortensis rosea simplex & multiplex diversorum colorum.*  
Hollihockes single and double of seuerall colours.

I shall not neede to make many descriptions of Hollihockes, in regard the greatest difference consisteth in the flowers, which are in some single, in some double, in some of one colour, and in others of other colours : for the lowest leaues of Hollihockes are all round, and somewhat large, with many corners, but not cut in or diuided, soft in handling, but those that growe vp higher are much more diuided into many corners : the stalkes sometimes growe like a tree, at the least higher then any man, with diuers such diuided leaues on them, and flowers from the middle to the toppe, where they stand as it were a long spike of leaues and buds for flowers together : the flowers are of diuers colours, both single and double, as pure white, and pale blush, almost like a white, and more blush, fresh and lively, of a Rose colour, Scarlet, and a deeper red like a crimson, and of a darke red like blacke bloud, these are the most especiall colours both of single and double flowers that I haue seene : the single flowers consist of five broad and round leaues, standing round like vnto single Roses, with a middle long stile, and some chives aboue them : the double flowers are like vnto double Roses, very thicke, so that no stile or vmbone is seene in the middle, and the outermost rowe of leaues in the flowers are largest, the innermost being smaller and thicke set together : after the flowers are past, there come vp as well in the double as single, flat round heads, like flat cakes, round about the bottomes whereof growe flat whitish seede : the roote is long and great at the head, white and tough, like the roote of the common Malloves, but greater, and will reasonably well abide the Winter.

**The Place.**

The first groweth wilde in Spaine. The second in our owne Countrey. The third is thought to growe in Italy and Venice; but Lobel denieth it, saying, that it is there onely in Gardens, and is more plentifull in these parts then with them. The fourth Clusius saith he found in many places of Germany. The fifth is supposed to be first brought out of the West Indies, but an Arabicke name being giuen it, maketh me somewhat doubtfull how to beleue it. The sixth groweth in Egypt, where it is of great vse, as Prosper Alpinus hath set downe in his Booke of Egyptian plants. The seventh groweth in some parts both of Spaine and France. The last is not found but in Gardens euery where.

**The Time.**

The first, second, third, fourth, and last, doe flower from Iune vntill the end of Iuly and August. The rest flower very late, many times not vntill September or October.

**The Names.**

The first and second haue their names sufficiently expressed in their titles. The third is diuersly called, as *Malva horaria*, *Alcea vesicaria*, *Alcea Veneta*, *Alcea Peregrina*, and of Matthiolus, *Hypocomm*. The most vsuall English name is Venice Mallow. The fourth is called *Alcea fruticosa pentaphyllea*, and *Cannabinifolio*, or *Pentaphyllifolio*: In English, Cinquefoile Mallow. The fifth hath been sent vnder the name of *Sabdarifa*, and *Sabdariffe*, and (as I said) is thought to be brought from America, and therefore it beareth the name of that Country. The sixth is called in Egypt, *Bamia*, or *Bammia*, and by that name sent with the addition *del Cairo* vnto it: In English, Egyptian Mallow, or Mallow of Egypt. The seventh is called *Althea frutex*, and of some *Althea arborea*: In English, Shrubbe Mallow, because his stemme is woodie, and abideth as shrubbes and trees doe. The eight and last is called *Malva hortensis*, *Malva Rosa*, and of some *Rosa ultramarina*: In English, of some Hockes, and vsually Hollihockes.

**The Vertues.**

All sorts of Mallowes, by reason of their viscous or slimie quality, doe helpe to make the body soluble, being vsed inwardly, and thereby helpe also to easse the paines of the stome and grauel, causing them to be the more easily voided: being outwardly applied, they mollifie hard tumors, and helpe to easse paines in diuers parts of the body; yet those that are of most vse, are most common. The rest are but taken vpon credit.

**C H A P. X C I I.***Amaranthus. Flower-gentle.*

**W**E haue foure or ffe sorts of Flower-gentle to trimme vp this our Garden wthall, which doe differ very notably one from another, as shall be declared in their severall descriptions; some of which are very tender, and must be carefully regarded, and all little enough to cause them beare seede with vs, or else wee shall bee to seekke euery yeare: others are hardy enough, and will hardly be lost out of the Garden.

*1. Amaranthus*

*1. Amaranthus purpureus minor.* The small purple Flower-gentle.

This gallant purple Velvet flower, or Flower-gentle, hath a crested stalk two foote high or more, purplish at the bottome, but greene to the toppe, wherout groweth many small branches, the leaues on the stalkes and branches are somewhat broad at the bottome, and sharpe pointed, of a full greene colour, and often somewhat reddish withall, like in forme vnto the leaues of Blites (wherof this and the rest are accounted species, or sorts) or small Beetes: the flowers are long, spikie, soft, and gentle tufts of haies, many as it were growing together, broad at the bottome, and small vp at the toppe, pyramis or steeple-fashion, of so excellent a shining deepe purple colour, tending to a murrey, that in the most excellent coloured Velvet, cannot be seene a more orient colour, (and I thinke from this respect, the French call it *Passe velours*, that is to say, passing Velvet in colour) without any sinell at all, which being braised giueth the same excellent purple colour on paper, and being gathered in his full strength and beauty, will abide a great time (if it be kept out of the winde and sunne in a dry place) in the same grace and colour: among these tufts lye the seede scattered, which is small, very blacke, and shining: the rootes are a few threddy strings, which quickly perish, as the whole plant doth, at the first approach of Winter weather.

*2. Amaranthus Coccineus.* Scarlet Flower-gentle.

The leaues of this Flower-gentle are longer, and somewhat narrower then the former; the stalk groweth somewhat higher, bearing his long tufts at severall leaues, as also at the toppe of the stalkes, many being set together, but separate one from another, and each bowing or bending downe his head, like vnto a Feather, such as is worn in our Gallants and Gentlewomens heads, of an excellent bloody Scarlet colour: the seede is blacke, like vnto the former: the roote perisheth quicklier, because it is more tender.

*3. Amaranthus tricolor.* Spotted or variable Flower-gentle.

The chiefeft beauty of this plant consisteth in the leaues, and not in the flowers; for they are small tufts growing all along the stalk, which is nothing so high as the former, especially with vs, and at the ioynts with the leaues: the leaues hereof are of the same fashion that the former are, and pointed also; but every leafe is to be seene parted into greene, red, and yellow, very orient and fresh (especially if it come to his full perfection, which is in hot and dry weather) diuided not all alike, but in some leaues, where the red or yellow is, there will be greene, and so varying, that it is very pleasant to behold: the seede hereof is blacke and shining, not to bee knowne from the former.

*4. Amaranthus Carnica spica.* Carnation Flower-gentle.

There is another more rare then all the rest, whose leaues are somewhat longer, and narrower then the first, and like vnto the second kinde: the spikes are short, many set together, like branches full of heads or ears of corne, every one whereof hath some long haies sticking out from them, of a deep blushe, tending to a carnation colour.

*5. Amaranthus purpureus maior panniculus sparsis.*  
Great Floramour, or purple Flower-gentle.

The great Floramour hath one thicke, tall, crested, browne red stalk, ffe or six foot high, from whence spring many great broad leaues, like vnto the former for the forme, but much larger & redder for the most part, especially the lowest, which branched forth into diuers parts, & from between these leaues, & the stalks or branches, as also at the tops of them, stand long, spikie, round, & somewhat flat tufts, of a more reddish purple colour then the first, and diuided also into severall parts, wherin when they are

are full ripe, are to be seen an innumerable company of white seed, standing out among the short thrums, and do then easily fall away with a little touching, every one of them white seed hath as it were an hole halfe bored through therin; the root is a great bush of strings, spreading in the ground, whereby it is strongly fastened, yet perisheth every yeare, after it hath giuen his seede.

*The Place.*

All these plants growe in the Easterne Countries, as Persia, Syria, Arabia, &c. except the greatest, which hath been brought out of the West Indies, where it is much vsed, especially the seede: they are all, except, nourised vp with much care in our Gardens, and yet in a backward or cold yeare they will not thrive, for that they deſire much heate: but the greatest doth alwayes giue ripe seede euery yeare.

*The Time.*

They beare their gallant tufts or spikes for the most part in August, and some not vntill September.

*The Names.*

The name *Amaranthus* is giuen to all these plants, taken from the Greeke word *αμαρανθος*, non marcescens, or non senescent, that is, neuer waxing old, and is often alſo imposed on other plants, who haue the ſame property, that is, that their flowers being gathered in a fit ſeaſon, will retaine their naue colour a long time, as ſhall be ſhewēd in the Chapter following. Diuers do thinke the firſt to be *Pblos*, or *Flamma* of Theophrastus. The third is called *Gelofia*, or *Celofia* of Tragus. Spigelius in his *Iſagoges* faith, it is generally taken to be *Sophonia*, whereof Plinic maketh mention; and Lobel, to bee the Persians *Theombroton* of Plinic. The Italians, from whom I had it (by the meanes of M<sup>r</sup>. Doctor Loha More, as I haue had many other rare ſimplis) call it, *Brite di tre colori*, A three coloured Brite. The fifth, which is the greatest, hath been ſent from the West Indies by the name of *Quinus*, as Clusius reportereth. The name Flower-gentle in English, and *Flovamont*, which is the French, of *Elos amoris*, and *Paffe velours*, as is before ſaid, or Velvet flower, according to the Italian, *Fior veluto*, are equally giuen to all theſe plants, with their ſeverall diſtinctions, as they are exprefſed in their titles.

*The Vertues.*

Diuers ſuppoſe the flowers of theſe plants doe helpe to ſtay the fluxe of bloud in man or woman, becauſe that other things that are red or purple doe perfore the ſame. But Galen diſprooueth that opinion very no-  
tably, in lib. 2. & 4. de ſimpl. medicament. facilitatibus.

**C H A P. X C III.**

*Heliocryſum*, ſine *Amaranthus luteus*.  
Golden Flower-gentle, Goldilocks, or Gold-flower.

**T**he propinquity of property (as I before ſaid) hath cauſed the affinity in name, and ſo in neighbourhood in theſe plants, wherein there are ſome diuerſity, and although they differ from them before in many notable points, yet they all agree with themſelues in the golden, or ſiluer heads or tufts they beare; and therefore I haue

1. *Amaranthus purpureus major*. The great purple Flower-gentle. 2. *Amaranthus purpureus minor*. The leſſer purple Flower-gentle. 3. *Amaranthus tricolor*. Variable Flower-gentle. 4. *Amaranthus Coccineus*. Scarlet Flower-gentle. 5. *Amaranthus carus* (rice). Carnation Flower-gentle. 6. *Chrysanthemum Californiae*. Candy Goldilocks. 7. *Heliocryſum Creticum*. Candy Goldilocks. 8. *Gnaphalium Americanum*. Liſtlong or Liſtcurlating. 9. *Gnaphalium monspeliacum*. Cats foot. 10. *Gnaphalium resinaceum*. The Cotton Ruff.

haue comprised them in one Chapter, and will begin with that which commeth nearest vnto the *Helichrysum* of Dioscorides, or *Aurelia* (as Gaza translateth it) of Theophrastus.

**1. Helichrysum. The Golden flower of life.**

This first Golden tuft riseth vp with many hard, round, white stalkes, a foote and a halfe high, wherone at certayne distancess stand many fine cut leaues, or rather one leafe cut into many small fine parts, almost as small as Fenell, but grayish, like vnto the Cud-weedes or Cotton-weedes (whereof certainly these are speciall kindes) at the topes of the stalkes stand many round flowers, of a pale gold colour, in an vmbell close together, yet every flower vpon his owne stalke, and all of an even height, which will keepe the colour, being gathered, and kept dry for a long time after, and are of a hot and quicke sent: the roote is small and wooddy, spreading vnder the vpper crust of the earth, and liueth long in his owne naturall place, but very hardly endureth the cold of our Winters, vnlesse they be milde, or it be well defended.

**2. Helichrysum Creticum. Candy Goldilocks.**

Candy Goldilocks hath two or three small slender white branches, set here and there very scatteringly, with small, long, and narrow hoary leaues, hauing yellow heads of flowers at the tops made into vmbells or tufts, not so round and even as the former, but longwise one aboue another, the heads being made as it were of scales, loosly, and not so closely set together, as in the next following, which when they are full ripe, doe passe into dounre, and are blowne away with the winde, hauing a small reddish seede at the end; but will abide a long time, as the other in his beauty, being gathered in time, as the rest will doe.

**3. Helichrysum Orientale sive Amaranthus luteus.  
Golden Flower-gentle.**

This most beautifull plant is very like vnto the former Candy Goldilocks last described, but growing vp higher, with many more branches, and more hoary, white, and woolly, hauing also long and narrow white leaues, but somewhat broader, and thicker set on the branches: the tufts of flowers or vmbells likewise doe consist of longer and larger heads, more scaly, and closer compact together, of an excellent pale gold yellow colour, and shining, with some yellow threads or thrummis in the middle: the roote dyeth not every yeare, but liueth long, especially in the South and East Countries, where no colds or frostes are felt; but will require extraordinary care and keeping, and yet scarce sufficient to preferue it in these cold Countries.

**4. Chrysocome sive Stachys Citrina. Golden tufts or Golden Cassidony.**

This Golden flower is somewhat like the former of these two last described, hauing hoary stalkes and leaues, standing confusedly on them, being long, and narrower then any of the former: the tops of the stalkes are diuided into many parts, each bearing a small long yellow head or flower at the toppe, with some yellow thrummis in them, which heads being many, are diffusedly set together, like a loole or sparsed vmbell, keeping their colour long before they wither, and when they are ripe, haue thinne small reddish seede, like Mariorome seede, but smaller; the roote is small and blacke: the whole plant, as well leaues and flowers, as rootes, are of a strong sharpe sent, yet pleasant.

**5. Argyrocome sive Gnaphalium Americanum.  
Lieue long or Life euerlasting.**

This siluer tuft or Indian Cotton weede, hath many white heads of leafes at their first springing out of the ground, couered with a hoary woolliness like cotton, which rising into hard, thicke round stalkes, containe still the same hoariness vpon them, as also vpon the leag and narrow leaues which are set thereon, especially on the vnder side,

side, for the vpper sides are of a darke shining greene colour: the stalkes are diuided at the toppe into many small branches, each whereof haue many scaly tufted heads set together, couered ouer with cotton before their opening, and then disauering one from another, abiding very white on the outside, when they are fully growne, but with a small yellow thrume in the midde of every flower, which in time turne into yellow dounre, apt to be blowne away with evry winde: the roots are long and blacke on the outside, creeping vnder ground very much.

**6. Gnaphalium montanum flore albo & flore purpureo.  
White and purple Catsfoote.**

This small Cudweede or Cottonweede, hath many small white woolly leaues growing from the roote, which is composed of a few small blackish threds, and lying vpon the ground somewhat like vnto the leaues of a small Mouse-eare, but smaller; from among which riseth vp a small stalke of halfe a foote high or thereabouts, beset here and there with some few leaues, at the top whereof commeth forth a tuft of small flowers, set close together, in some of a pure white, in others of a purple or reddish colour, in some of a pale red or blush, and in others of a white and purple mixt together, which for the beauty is much commended and desired, but will hardly abide to be kept in Gardens, so vnwilling they are to leaue their naturall abiding.

**7. Gnaphalium Roseum. The Cotton Rose.**

This little rose Cotton weede hath many such like woolly leaues, growing as the former from the roote vpon small shott branches, not full an hand breadth high, in fasshion somewhat like vnto Dayfie leaues, but lesser, and round pointed: at the toppe of every stalke or branch, standeth one flower, composed of two rowes of small white leaues, layd open like a Starre or a Rose, as it beareth the name, hauing a round head in the middle made of many yellow threds or thrumes, which falling away, there riseth vp a small round head, full of small seedes: the root is small, long and threddy.

**The Place.**

The foure first plants doe grow naturally in many of the hot Countries of Europe, as Spaine, Italie, and Province in France; as also in Candy, Barbary, and other places, and must be carefully kept with vs in the winter time. The Lieue long was brought out of the West Indies, and groweth plentifully in our gardens. The two last doe grow as well in the colder Countries of Germany, as in France and other places.

**The Time.**

They all flower in the end of September, if they will shew out their beauty at all with vs, for sometimes it is so late, that they haue no faire colour at all, especially the foure first sorts.

**The Names.**

Variable and many are the names that severall Writers do call these foure first sorts of plants, as *Helichrysum*, *Heliochrysum*, or *Eliochrysum*. *Eliochrysum*, *Chrysocome*, *Coma aurea*, *Amaranthus luteus*, *Stoechas Citrina*, and *Annelia*, with others, needless here to be recited: it is sufficient for this worke, to giue you knowledge that their names are sufficient as they are expressed in their titles: The fift is called *Gnaphalium* by Carolus Clusius, from the likenesse of the vmbells or tufts of heads, though greater and white: for as I said before, the Cotton weedes are of kindest with the golden tufts: It hath been called by our English Gentlewomen, Lieue long, and Life euerlasting, because of the durabilitie of the flowers in their beautie. The two last are cal-

Ied *Gnaphalium*, according to their titles ; and in English they may passe vander those names are set downe with them.

#### The Vertues.

The foure first are accounted to bee hot and dry, and the three last to bee cold and dry : yet all of them may to some good purpose bee applyed to rheumaticke heads. The former foure are likewise vsed to cause vrine, and in baths to comfort and heate cold parts. They are also layd in ohests and wardrobes, to keepe garments from moths ; and are worne in the heads and armes of Gentiles and others, for their beautifull aspect.

#### CHAP. XC IIII.

##### *Canna Indica.* The Indian flowring Reede.

**T**here are two kindes or sorts of this beautifull plant, the one with a red flower, the other with a yellow, spotted with reddish spots, both which in some kind ly yeares haue borne their braue flowers, but neuer any ripe seede, and doth not abide the extremities of our winters, eyther abroade or vnder couert, vnlesse it meeete with a stoue or hot-house, such as are vsed in Germany, or such other like place: For neyther house nor cellar will preserue it, for want of heate.

##### *Canna Indica flore rubro.* Red flowred Indian Reede.

This beautifull plant riseth vp with faire greene, large, broade leaues, every one ring out of the middle of the other, and are folded together, or writhed like vnto a paper Coffin (as they call it) such as Comfitmakers and Grocers vse, to put in their Comfits and Spices, and being spread open, another riseth from the bottome thereof, folded in the same manner, which are set at the ioynts of the stalke when it is risen vp, like vnto our water Reedes, and growing (if it runne vp for flower) to be thre or fourre foote high, as I haue obserued in mine owne garden : the flowers grow at the toppe of the stalke one aboue another, which before their opening are long, small, round, and pointed at the end, very like vnto the claw of a Crauife or Sea-Crab, and of the same red or crimson colour, but being open, are very like vnto the flower of *Gladiolus* or Coorne-flagge, but of a more orient colour then at the first, and standing in a rough huske, wherein afterwards standeth a thre square head, containing therein round blacke seede, of the bignesse of a pease : the roote is white and tuberos, growing into many knobs, from whence arise such other leaues and stalkes, whereby it encreaseth very much, if it be righly kept and defended.

##### *Canna Indica flore flavo punctato.* Yellow spotted Indian Reede.

This Reede growtheth vp with leaues and flowers, in all points so like vnto the former, that it cannot bee knowne from it, vntill it come to flower, which is of a yellow colour, spotted with reddish spots, without any other difference.

#### The Place.

These plants grow naturally in the West Indies, from whence they were first sent into Spaine, and Portugall, where Clusius saith he saw them planted by the houses sides, flowring in winter, which might be in those warme Countreyes. We preserue them with great care in our gardens, for the beautifull aspect of their flowers.

The

#### The Time.

They flower not with vs vntill the end, or middle of August, at the footest.

#### The Names.

They are called of some *Canna Indica*, and *Arundo Indica*, of others *Canna-corus*, and of some *Flos Cancri*, because the colour of the flowers, as well as the forme of the buds, are so like vnto a Sea-Crabs cle, or claw.

#### The Vertues.

There is not any vse of these in Phyfiche that I know.

#### CHAP. XC V.

##### *Mandragora.* Mandrake.

**T**He Mandrake is distinguisched into two kindes, the male and the female ; the male hath two sorts, the one differing from the other, as shall be shewed; but of the female I know but one : The male is frequent in many gardens, but the female, in that it is more tender and rare, is nourised vp but in a few.

##### *Mandragoras mas.* The male Mandrake.

The male Mandrake thrusteth vp many leaues together out of the ground, which being full growne, are faire, large and greene, lying round about the roote, and are larger and longer then the greatest leaues of any Lettice, whereunto it is likened by Dioscorides and others : from the middle, among these leaues, rise vp many flowers, every one vpon a long slender stalke, standing in a whitish greene huske, consisting of five pretty large round pointed leaues, of a greenish white colour, which turne into small round apples, greene at the first, and of a pale red colour when they are ripe, very smooth and shining on the outside, and of a heady or strong stutting smell, wherein is contained round whitish flat seede : the roote is long and thick, blackish on the outside, and white within, consisting many times but of one long roote, and sometimes diuided into two brancheis a litle below the head, and sometimes into three or more, as nature listeth to bestow vpon it, as my selfe haue often seene, by the transplanting of many, as also by breaking and cutting off of many parts of the rootes, but neuer found harme by so doing, as many idle tales haue beeene set downe in writing, and deliuered also by report, of much danger to happen to such, as shoulde digge them vp or breake them ; neyther haue I euer seene any forme of man-like or woman-like parts, in the rootes of any : but as I said, it hath oftentimes two maine rootes running downe right into the ground, and sometimes three, and sometimes but one, as it likewise often happeneth to Parsneps, Carrots, or the like. But many cunning counterfeit rootes haue bin shaped to such forme, and publickly exposed to the view of all that wold see them, and haue beene tolerated by the chiefe Magistrates of the Cittie, notwithstanding that they haue beeene informed that such practices were iniurid, and vnlufferable ; whether this happened through their ouer carenesse of checkinge, or of the persons, or through an opinion that the information of the truth to seruent vny. I know not, I leane therto the searcher of all artis. : But this you may bee biold to rest vpon, and assure your selues that such forme as haue bin publickly exposed to the view, were neuer so formed by nature, but only by the art and cunning of cheareis and deceivers, and let this be your *Calefaction* against all such vaine, idle and ridiculous toyes of mens inuocations.

II 3

There

There is likewise another sort of these male Mandrakes, which I first saw at Canterbury, with my very louing and kinde friende Iohn Tradescante, in the garden of the Lord Wotton, whose gardiner he was at that time ; the leaues whereof were of a more grayish greene colour, and somewhat folded together, when as the former kind that grew hard by it, was of the same forme that is before described, and ordinary in all others : but whether the apples were differing from the other, I know not, nor did they remember that euer it had borne any.

## *Mandragora famina*. The female Mandrake.

The female Mandrake doth likewise put vp many leaues together, from the head of the roote, but they are nothing so large, and are of a darker greene colour, narrower also and shining, more crumpled, and of a stronger sent: the flowers are many, rising vp in the middle of the leaues, vpon slender stalkes, as in the male kind, but of a blewish purple colour, which turne into small round fruite or apples, and not long like a pearre (as Clusius reporteth that saw them naturally growing in Spaine) greene at the first, and of a pale yellowish colour, when they are full ripe; of a more pleasing, or if you will, of a lesse heady sent then the apples of the male, wherein is contained such like seede, but smaller and blacker: the rootes are like the former, blacke without and white within, and diuided in the same manner as the male is, sometimes with more, and sometimes with fewer parts or branches.

## The Place.

They grow in many places of Italie, as Matthiolus reporteth, but especially on Mount Garganus in Apulia. Clusius saith hee found the female in many wet groundes of Spaine, as also in the borders of those medowes that lye neare vnto riuers and water courses. The male is cherisched in many Gardens, for pleasure as well as for vse: but the female as is said, is both ver  
and farrre more tender.

The Times

The Male flowreth in March, and the fruit is ripe in July. The Female, if it be well preserved, flowreth not vntill August, or September; so that without extraordinary care, we never see the fruite thereof in our gardens.

## The Names.

*Mandrakes* are called *albus*, as the *Femina* is called *niger*, which titles of blacke and white, are referred vnto the colour of the leaues : the female is called also *Tribacis* from the likenesse of Lettice, whereunto they say in forme it doth carry some similitude. Dioscorides saith, that in his time the male was called *Auron*, and both of them *Auriculae*, and *Circeas*. Wee call them in English, The male, and the female Mandrake.

## The Virtues

The leaues haue a cooling and drying qualitie, fit for the oyntment *pa-*  
*piles*, wherina it is put. But the Apples haue a soporiferous propertie, as  
Leuimus Lemnus maketh mention in his Herball to the Bible, of an expe-  
riment of his owne. Besides, as Diacordies first, and then Serapio, Auiuen,  
Paulus Aegineta, and others also do declare, they conduce much to the cool-  
ing and cleansing of an hot *matrix*. And it is probable, that Rachel know-  
ing that they might be profitable for her hot and dry body, was the more  
earnest with Leah for her Simeon Rubens Apples, as it is set downe *Genesys*  
*30: verse 14*. The strong sent of these apples is remembred also, *Cant. 7: 13*,  
although some would diuert the signification of the Hebrew word, *drunim*.

vnto Violets, or some other sweet flowers, in the former place of *Genesis*, and the fruit of *Muse*, or Adams Apples in this place of the *Canticles*. Hamilcar the Carthaginian Captaine is said to haue infected the wine of the Lybians (his enemies against whom he fought) with the apples of Mandrake, whereby they being made exceeding drowfie, he obtained a famous victory ouer them.

CHAP. XCVI.

*Pomum Amoris.* Love Apples.

**A**lthough the beautie of this plant consisteth not in the flower, but fruit, yet giue  
me cause to insert it here, lest otherwise it haue no place : whereof there are  
two especiall sorts, which wee comprehend in one Chapter, and distinguish  
them by *maius* and *minus*, greater and smaller : yet of the greater kinde, we haue nour-  
fed vp in our Garden's two sorts, that differ only in the colour of the fruite, and in no-  
thing else.

*Pomaria Americana* *fructuosa*

**Great Apple of Looe** the ordinary red sort.

This greater kinde of Loue Apples, which hath beeene most frequently cherished with vs, hath diuers long and trayling branches, leaning or spreading vpon the ground, not able to sustaine themselues, whercon doe grow many long winged leaues, that is, many leaues set on both sides, and all along a middle ribbe, some being greater, and others lesse, iagged also and dented about the edges, of a grayish ouer-worne greene colour, somewhat rough or hairy in handling, from among the leaues and the branches come forth long stalkes, with diuers flowers heretoforeon, vpon severall short footstalks, consisting of sixe, and sometimes of eight small long yellow leaues, with a middle pricke or vmbone, which after the flowers are fallen, riseth to be the fruite, which are of the bignesse of a small or meane Pippis, vnaevenly bunched out in diuers places, and scarce any full round without bunches, of a faire pale reddish colour, or somewhat deeper, like vnto an Orenge, full of a slimie iuice and watery pulpe, wherein the seede lyeth, which is white, flat and somewhat rough : the roote shoocteth with many small strings and bigger branches vnderground, but perisheth at the first feeling of our winter weather. The fruite hereof by often sowing it in our Land, is become much smoller then I haue here described it; but was at the first, and so for two or three years after, as bigge as I haue related it, thinke about an handbreadth long, and about a handbreadth wide, and about a handbreadth high, and about a handbreadth thick.

*Pomum Ameris minus fructu lateo: Yellow Amorous Apples*

Of the same kind is this other sort of Amorous Apples, differing in nothing but the colour of the fruite, which is of a pale yellow colour, hauing bunches or lobes in the same manner, and seede also like the former.

#### **Answers for Grade 7 Mathematics**

**The small Apples of Lane** in the very like manner, haue long weak trayling  
branches, beft with such like leaves as the greater kinder hath, but smalles in every  
part : the flowres alio stand many together on a long stalke, and yellow as the bo-  
ther, but much smaller : the fruit are small, round, yellowish red berries, no man  
bigger then great grapes, wherein are contained white flat seede, like the other, but  
smaller : the roote perifhereth in like manner euery yere, and therefore must bee new  
owen euery spring, if you will haue the pleasure of their sight in the garden : yet some  
yares I haue knowne them rise of their owne sowing in my garden.

## The Place.

They growe naturally in the hot Countries of Barbary, and Ethiopia; yet some report them to be first brought from Peru, a Province of the West Indies. Wee onely haue them for curiosity in our Gardens, and for the amorous aspect or beauty of the fruit.

## The Time.

They flower in July and August, and their fruit is ripe in the middle or end of September for the most part.

## The Names.

The first is named diuersly by diuers Authors; for Lobel, Camerarius, and others, call them *Poma amoris*. Dodonaeus *Aurea Mala*. Gesnerus first, and Bauhinus after him, make it to be a kinde of *Solanum Pomiferum*. Auguillart taketh it to be *Lycopersicum* of Galen. Others thinke it to bee *Glaucium* of Dioscorides. The last is called *Mala Ethiopiae parva*, and by that title was first sent vnto vs, as if the former were of the same kinde and country. We call them in English, Apples of Loue, Loue-Apples, Golden Apples, or Amorous Apples, and all as much to one purpose as another, more then for their beautifull aspect.

## The Vertues.

In the hot Countries where they naturally growe, they are much eaten of the people, to coole and quench the heate and thirst of their hot stomackes. The Apples also boyled, or infused inoyle in the sunne, is thought to be good to cure the itch; assuredly it will allay the heate thereof.

## C H A P. X C V I I .

*Digitalis Foxglove.*

Here are three principall sorts of Foxgloues; a greater, a middle or medie sort, and a lesser, and of them, three especiall colours, that is, purple, white, and yellow; the common purple kinde that groweth abroad in the fields, I leave to his wilde habitation; and of the rest as followeth.

*Digitaria maxima ferruginea.* Dun coloured Foxgloues.

The leaues of this Foxglove are long and large, of a grayish great colour, finely cut or dented about the edges, like the teeth of a fine saw; among which commeth vp a strong tall stalk, which when it was full growne, and with ripe seede thereon, I haue measured to be seuen foot high at the least, wherong grew an innumerable company (as I may so say, in respect of the abundance) of flowers, nothing so large as the common purple kinde, that groweth wilde every where in our owne Countrey, and of a kinde of browne or yellowish dunne colour, with a long lippe at every flower; after the same seede, like the common kinde, but in smaller heads: the rootes are stringie like the ordinary, but doe vsually perish, or seldome abide after it hath given seede.

*Digitaria major flore carmine.* Blush coloured Foxgloues.

This kinde of Foxgloues hath reasonable large leaues; yet not altogether so large

1. *Coena indica*, The Indian Reed. 2. *Mandragoras mas*. The male Mandrake. 3. *Pommum amoris minus*. Great Apples of loue. 4. *Digitalis mai rora luteo ampli*. The great yellow Foxglove. 5. *Digitalis media flore luteo rubente*. Orange tawny Foxgloves. 6. *Digitalis maxima ferruginea*. Dun coloured Foxgloues.

as the common field kinde : the flowers are also smaller then the common sorte ; but of a blushe colour.

3. *Digitalis media flore luteo rubente.* Orenge tawnie Foxeglogue.

As this Foxeglogue is none of the greatest, so also is it none of the smalles ; but a sort betweene both , haing leaues in some proportion correspondent to the lesser yellow Foxeglogue , but not so large as the lesser white : the flowers are long and narrow , almoſt as large as the last white, but nothing so large as the first white, of a faire yellowish browne colour, as if the yellow were ouershadowed with a reddish colour, and is that colour wee vsually call an Orenge tawnie colour : the seede is like the former : the rootes perish every yeaſe that they beare seede, which is vsually the ſecond yeaſe of the ſpringing.

4. *Digitalis maior alba.* The greater white Foxeglogue.

This white Foxeglogue is in all things ſo like vnto the purple wilde kinde, that it can hardly be diſtinguished from it, vnlleſſe it be in the fresher greeneſſe and largenesſe of the leaues : the flowers are as great in a manner as the purple, but wholly white, without any ſpot in them : the ſeede and other things agree in all points.

5. *Digitalis alba altera ſeu minor.* The leſſer white Foxeglogue.

We haue in our Gardens another ſort of white Foxeglogue, whose leaues are like vnto the laſt deſcribed, but not altogether ſo long or large, and of a darker greene colour : the ſtalke groweth not ſo high, as not full three foote : the flowers are pure white, viſioned like vnto the former, but not ſo great or large, in all other things alike : the rootes hereof did abide ſometime in our Gardens, but ſince periſhed, and the ſeede alſo, ſince when we neuer could obtaine from any our friends of that kinde againe.

6. *Digitalis maior lutea flore amplio.*  
The great yellow Foxeglogue.

The leaues of this greater yellow Foxeglogue, are in forme ſomewhat like vnto the common purple kinde, but not altogether ſo large : the ſtalke groweth to bee threecor fourfeet high, whereon ſtand many long hollow pendulous flowers, in ſhape like the ordinary purple, but ſomewhat shorter, and more large and open at the brimmes of a faire yellow colour, wherein are long threads, like as in the others : the roote hereof is greater at the head, and more wooddy then any of the reſt, with many ſmaller fibres, ſpreading themſelues in the ground, and abideth almoſt as well as our common purple kinde.

7. *Digitalis minor lutea ſine pallida.*  
The ſmall pale yellow Foxeglogue.

This ſmall pale yellow Foxeglogue hath ſomewhat ſhort, broad, ſmooth and darke greene leaues, ſnipt or dented about the edges very finely : the ſtalke is two foot high, beſet with ſuch like leaues, but leſſer: the flowers are moe in number then in any of the reſt, except the first and greatest, and growe along the upper part of the ſtalke, being long and hollow, like the other, but very ſmall, and of a pale yellow colour almoſt white : the ſeede veſſels are ſmall like the former, wherein are contained ſeede like the reſt, but ſmaller: the rootes are ſtrongy, but durable, and ſeldome periſh with any iniury of the extreameſt froſts.

The Place.

The great white kinde hath been often, and in many places found wilde in our owne Country, among or hard by the common purple kinde. All the reſt are ſtrangers, but cheriſhed in our Gardens.

The

The Time.

They flower in Iune and July, and ſome in Auguft, their ſeede becoming ripe quickly after.

The Names.

Onely the name *Digitalis*, is of all Writers giuen vnto theſe plants ; for it is not knowne to bee remembred of any of the old Authors. Wee call them generally in English, Foxeglogue ; but ſome (as thinking it to bee too fooliſh a name) doe call them Finger-flowers, because they are like vnto the fingers of a gloue, the ends cut off.

The Vertues.

Foxegloues are not vſed in Phyſickē by any iudicious man that I know, yet ſome Italiens of Bononia, as Camerarius ſaith, in his time vſed it as a wound herbe.

C H A P. X C V I I I.

*Verbascom. Mullein.*

**T**Here be diuers kindes of Mullein, as white Mullein, blacke Mullein, wooddy Mullein, base Mullein, Moth Mullein, and Ethiopian Mullein, all which to diſtinguifh or to diſcribe, is neither my purpose, nor the intent of this worke, which is to ſtore a Garden with flowers of delight, and ſequeſter others not worthy of that honour. Thoſe that are fit to bee brought to your conſideration in this place, are firſt, the *Blattarias*, or Moth Mulleins, and then the wooddy Mullein, which oþerwise is called French Sage, and laſtly, the Ethiopian Mullein, whose beauty conſiſteth not in the flower, but in the whole plant ; yet if it pleaſe you not, take it according to his Country for a Moore, an Infidell, a Slaue, and ſo vfe it.

1. *Blattaria lutea odorata.* Sweete yellow Moth Mullein.

The yellow Moth Mullein whose flower is sweete, hath many hard grayiſh greene leaues lying on the ground, ſomewhat long and broad, and pointed at the end : the ſtakles are two or three foot high, with ſome leaues on them, & branching out from the middle vpwards into many long branches, ſtored with many ſmall pale yellow flowers, of a pretty ſweete ſent, ſomewhat stronger then in the other ſorts, which ſeldome giueſt ſeede, but abideth in the roote, liuing many yeaſes, which few or none of the others doe.

2. *Blattaria lutea maior ſine Hispanica.* The great yellow Moth Mullein.

This Spanish kinde hath larger and greener leaues then the former, and rounder and larger then the next that followeth : the ſtalke is higher then in any of the Moth Mulleins, being for the moft part fourfeet or five foote high, whereon toward the toppe growe many goodly yellow flowers, conſiſting of ſue leaues, as all the reſt doe, not fo thickē ſet as the former, but much larger, with ſome ſmall purpliſh threads in the middle : the ends whereof are viſioned ſomewhat like as if a Flic were creeping vp the flower, which turne into round heads, ſometimes two or three or more ſtanding together, but vsually one, wherein lye ſmall dusky ſeede: the roote is not great nor full of threads, and doth periſh moſt vsually hauing giuen ſeede, except the Winter bee very milde.

3. *Blattaria*

*3. Blattaria lutea altera vulgarior.* The ordinary yellow Moth Mullein.

This yellow Moth Mullein (which is the most frequent in our Gardens) hath longer, and narrower leaues then any of the former, and roundly notched or dented on the edges, of a darke greene colour: the stalle is sometimes branched, but most visually single, whereon stand many gold yellow flowers, not fully so large as the Spanish kinde, but with the like purple threads in the middle: the seede is small, and contained in the like round heads, but alwaies every one single by it selfe: the roote perisheth every yare that it beareth seede.

*4. Blattaria flore luteo purpurascente.* Cloth of gold Moth Mullein.

The greatest point of difference betweene this and the last described, consisteth chiefly in the colour of the flower, which in this is of the colour of cloth of gold, that is, the ground yellow, and overshadowed with a bright crimson colour, which is a fine colour of much delight: the threads in the middle are not so purple red as in the former, but much about the colour of the flower: this is not so willing to give seede, and will as hardly abide in the roote, and hath out of question risen from the seede of the former.

*5. Blattaria flore albo.* White Moth Mullein.

The leaues of the white Moth Mullein are somewhat like vnto the yellow, yet not altogether so much roundly notched about the edges, but rather a little dented, with sharper notches: the stalle riseth as high as the yellow, and hath now and then some branches about it: the flowers hereof are pure white, as large and great as the ordinary yellow, or somewhat larger, with the like purple threads in the middle, as are in the yellow: the seede is like the other; the root perisheth in like maner, and will not endure.

*6. Blattaria flore purpureo.* Purple Moth Mullein.

The Purple Moth Mullein hath his leaues lying on the ground, broader and shorter than any of the other, of a more grayish greene colour, and without any denting for the most part about the edges, sharpe pointed also at the end of the leafe; among the leaues riseth vp the stalle, not so high as either the white or the yellow, and many times branched, bearing many flowers thereon, of the same fashion, and no whit smaller, of a faire deepe blewifh colour tending to rednesse, the threads in the middle of the flowers being yellow: the seede vessels hereof are somewhat smaller then any of the former, except the first sweete yellow kinde: the roote hereof is long, thicke, and blackish on the outside, abiding very well from yare to yare, and riseth well also from the sowing of the seede.

*7. Blattaria flore ceraso.* Blew Moth Mullein.

This blew Moth Mullein is in all respects like vnto the former purple kinde, sauing only in the colour of the flower, which is of a blewifh violet colour, and is not much inferior in greatness of the plant, or in the largenesse of the flower, vnto the former purple kinde, and endureth many years in the like manner. And these be all the sorts of this kinde of Moth Mullein, that I haue seene and nourised vp for this my Garden, without interposing any vnknowne, nor seene, or vnworthy.

*8. Verbascum silvestre sive quartum Matthiolii.*  
Woody Mullein or French Sage.

Woody Mullein or French Sage, hath diuers wooddy branches two or three foot high, very hoary or white, whereon at seuerall ioynts stand diuers thicke leaues, white also and hoary, long, somewhat broad, round pointed, and rough, somewhat resembling the leaues of Sage in the forme and roughnesse, but not in the sent, whereof our people

people gaue it the name of Sage, calling it French Sage (when as it is as great a stranger in France as in England, yet they doe with this as with many other things, calling them French, which come from beyond the Seas; as for example, all or most of our bulbous flowers, they call French flowers, &c.) at the topes of the stalkes and branches, at certayne distances, are placed round about them many gaping flowers, like vnto the flowers of Sage, but yellow: after which now and then come seede, somewhat bigger then the Moth Mulleins, and lesse then the next Mullein of Ethiopia: the roote is wooddy at the toppe, with diuers blackish strings growing from it, and endureth as well aboue ground with his leaues, as vnder it with his rootes.

*9. Ethiopis.* Ethiopian Mullein.

This Mullein of Ethiopia hath many great, broad, and large leaues lying on the ground, rent or toone in diuers of them very much on the sides, of so hoary a white greene colour, that it farre passeth any of the white Mulleins, that growe wilde abroad in our owne Country; for they are of a yellowish white hoariness, nothing so pleasant to looke on as this: in the middle of these leaues riseth vp a square strong stalle, fourre or five foote high, set full of such like leaues as growe belowe, but much lesser, and lesser still vp to the toppe, all hoary and woolly, as the rest, and diuided into manie branches, spreading farre, and taking vp a great compasse of ground, more then any one roote of Garden Clary, or other such like plant: at each of the stalkes and branches are set two small leaues, and with them, round about the stalkes, stand many small gaping flowers, of a pale bleake blew colour: the seede is almost as large as Garden Clary seede, and of the same forme and colour: the roote is wooddy, and perisheth as soone as it hath borne seede, which is visually the second yare after the sowing; for the first yare it seldom runneth vpto flower.

*10. Lamium Pannonicum sive Galeopsis Pannonica.*  
Hungary dead Nettle or the Dragon flower.

Let mee thrust this plant into this place, rather then make a peculiar Chapter, because I haue no other of the same stocke or kindred to be ioyned with it, and is a pretty ornament in a Garden. The leaues whereof are very large, round, and great, rough or full of veines, which make it seeme crumpled, dented or deepe notched about the edges, and of a very darke greene colour, and sometimes brownish, or of a darke reddish colour withall, every one standing on a long foote-stalle, very like in forme vnto the great white Arch-Angell leaues, but farre larger and blacker: the stalkes are great and fourre square, hauing leaues and flowers standing round about them at the ioynts like coronets, which flowers are very great, long, and wide gaping open, of a darke red or purple colour, with some whitenesse or spots in the iawes, and some hainenesse also on the sides, which stand in full flower two or three moneths most visually, and sometimes longer, after which come brownish seede: the roote is a great tuft or bush of long whitish strings, and increaseth every yare, not fearing the greatest iniuries of our coldest and extreamest Winters.

The Place.

All these plants are strangers in our Countrey, and onely preserued in Gardens, to furnish them with variety; but (as I said) the cloth of gold Moth Mullein hath been raised from seed in our owne Country.

The Time.

The last flowreth first, before all the rest, beginning in Aprill. The Moth Mulleins in May and June. The French Sage in July.

The Names.

All the sorts of *Blattaria* may bee comprehended vnder the kinades of  
*Kk* *Verbascum*

*Verbascum nigrum*, as any one but meanely exercised in the knowledge of plants, may discerne. And although Plinic faith, that Moths doe most frequently haunt where *Blattaria* either growtheth, or is laid, yet it is not observed sufficiently in our Country so to doe, notwithstanding the name of Moth Mullein is generally giuen them. The last is generally called with vs *Lamium Pannonicum*, but certainly it is the *Galeopsis maxima Pannonica* of Clusius.

## The Vertues.

Other qualities I haue not found hath been allotted vnto the *Blattaria* or Moth Mullein, then those of Plinic, to engender Moths. Wee vsse none of these plants in Physeke in these daies.

## C H A P. X C I X.

*Valeriana*. Valerian.

**T**He many sorts of Valerian (or Set-wall as many doe call them) are fitter for a generall worke, or a generall Physicall Garden of Simples, then this of delightfull flowers. I will therefore select out a few, worthy of the place, and offer them to your considerations.

1. *Valeriana rubra Dodonei*. Red Valerian.

This Valerian hath diuers hard, but brittle whitish greene stalkes, rising from the roote, full of tuberous or swelling ioynts, wherat stand two leaues, on each side one, and now and then some small leaves from betweene them, which are somewhat long and narrow, broadest in the middle, and small at both ends, without either diuision or incisure on the edges, of a pale greene colour : the stalkes are branched at the top into diuers parts, at the ends whereof stand many flowers together, as it were in an vnabell or tuft, somewhat like vnto the flowers of our ordinary Valerian, but with longer neckes, and of a fine red colour, very pleasant to behold, but of no sent of any Valerian : after these flowers haue stood blowne a very great while, they sodainly fall away, and the seede is ripe very quickly after, which is whitish, standing vpon the branches naked, as the Valerians doe, and very like vnto them, with a little white dounre at the end of every one of them, whereby they are soone carried away with the winde : the roote is great, thicke, and white, continuing long, and shooting out new branches every yeare, and smellemeth somewhat like a Valerian.

2. *Nardus Montana tuberosa*. Knobbed Mountaine Valerian.

This kinde of Valerian or Spiknard, if you will so call it, hath his first leaues lying on the ground, without any diuision in them at all, being smooth, and of a dark greene colour, which so abide all the winter ; but those that spring vp after, and when it runneth vp to flower, are cut in on the edges, very like vnto the iagged leaues of the great garden Valerian, and so the elder they grow, the moare cut and iagged they are : the stalk and flowers are very like the stalk with flowers of the garden Valerian, but of a darke or deepe red colour, and more store of them thrust together, by double the number almost : the seede is like the seede of the great Valerian : the root is tuberous, or knobbed in many parts, round about, aboue and below also, with some fibres shooing from them, whereby it is increased, and smelleth very like the roote of the garden Setwall, or not altogether so strong.

3. *Valerians*

1. *Blattaria flore albo*. Moth Mullein with a white flower. 2. *Blattaria flore purpureo*. Moth Mullein with a purple flower. 3. *Verbascum sativum Matthiolii*. French Sage. 4. *Eriopis*. Ethiopian Mullein. 5. *Valeriana rubra Dodonei*. Red Valerian. 6. *Valeriana Graeca*. Greek Valerian. 7. *Lamium Pannonicum*. Hungary dead Nettle. 8. *Cardamine flore plena*. Double Cuckooe flower or Ladies smocks.

3. *Valeriana Graeca*. Greeke Valerian.

The Greek Valerian hath many winged leaues lying vpon the ground, that is, many small leaues set on both sides of a middle ribbe, very like vnto the wilde Valerian, that groweth by the ditch sides, but much smaller and tenderer, among which rise vp one or two round brittle stalkes, two foote high or thereabouts, whereon are set at the ioynts, such like leaues as grow below, but smaller : the topes of the stalkes are diuided into many small branches, thicke set together, full with flowers, consisting of fve small round leaues a peece, layd open like vnto the Cinquefoile flower, with some white threds in the middle, tipt with yellow pendent : the colour of these flowers in some plants, is of a faire bleake blew colour, and in others pure white : And I doe heare of one beyond the Seas (if the report bee true, for I haue not seene such a one) which shalld beare red flowers : after the flowers are past, there come vp in their places small hard huskes or heads, containing small blackish seedes : the roote is composed of a number of small long blackish threds, fastened together at the head, without any sent at all of a Valerian, eyther in roote or leafe ; and why it shalld bee called a Valerian I see no great reason, for it agreeth with none of them, in flower or seede, and but onely with the wilde Valerian in leafe, as I said before : but as it is, we so gue it you, and for the flowers sake is receiued into our gardens, to helpe to fill vp the number of natures rarities and varieties.

## The Place.

All these Valerians are strangers, but endenizond for their beauties sake in our Gardens. The Mountaine Valerian I had of the liberalitie of my louing friend John Tradescante, who in his trauaile, and search of natures varieties, met with it, and imparted thereof vnto me.

## The Time.

They flower in the Summer moneths, and seed quickly after.

## The Names.

The first is generally called of most, *Valeriana rubra Dodonei*, who saith also that some would haue it to be *Beben rubrum*. Some call it *Valerianthon*, others make it a kinde of *Ocimastrum*, and some *Saponaria altera*, with other names, which are to no great purpose to set downe in this place, it beeinge fitter for a generall worke to discusse of names, wherein both reading, knowledge and judgement must bee shewen, to correct errours, and set downe the truth, that one may rest thereon. The others haue their names in their titles sufficient to distinguishe them.

## The Vertues.

The Mountaine Valerian is of all the rest here set downe of most vse in Phisick, the rest hauing little or none that I know, although it be much weaker then the great garden kinde, or the Indian Nardus, in whose steed anciently it was vsed, in oyles, oyntments, &c.

## C H A P. C.

*Cardamine*. Cuckow flowers, or Ladies smockes.

**O**f the common sorts of Cuckow flowers that grow by ditch-sides, or in moist medowes, & wet grounds, it is not my purpose hereto write, but of one or two other, the most specious or faire of all the tribe, that doe best besit this garden.

1. *Cardamine*

1. *Cardamine flore pleno*. Double Cuckow flowers.

The double *Cardamine* hath a few winged leaues, weake and tender, lying on the ground, very like vnto the single medow kinde, from among which riseth vp a round greene stalk, set here and there, with the like leaues that grow below, the top wherof hath a few branches, whereon stand diuers flowers, every one vpon a small footestalk, consisting of many small whitish round leaues, a little dasht ouer with a shew of blush, set round together, which make a double flower : the roote creepeth vnder ground, sending forth small white fibres, and shooteth vp in diuers places.

2. *Cardamine trifolia*. Trefoile Ladies smocks.

This small plant hath diuers hard, darke round greene leaues, somewhat vncuen about the edges, alwayes three set together on a blackish small footstalk, among which rise vp small round blackish stalkes, halfe a foote high, with three small leaues at the ioynts, where they branch forth; at the topes whereof stand many flowers, consisting of four leaues a peece, of a whitish or bluish colour very pale : after which come vp small, thicke and long pods, wherein is contained small round seede : the root is composed of many white threds, from the heads whereof runne out small strings, of a dark purple colour, whereby it increaseth.

## The Place.

The first with the double flower is found in diuers places of our owne Countrey, as neere Micham aboue eight miles from London ; also in Lancashire, from whence I received a plant, which perished, but was found by the industrie of a worthy Gentlewoman, dwelling in those parts heretofore remembred, called Mistresse Thomasin Tunstall, a great louer of these delights. The other was sent me by my especial good friend John Tradescante, who brought it among other dainty plants from beyond the Seas, and imparted thereof a roote to me.

## The Time.

The last most vsually flowreth before the former, yet not much differing, that is, in the end of Aprill or in May.

## The Names.

The first is a double kinde of that plant, that growing wilde abroade, is vsually called *Cardamine altera*, and *Syimbrium alterum* of Dioscorides, and of some *Flos cuculi*, but not fitly ; for that name is more vsually giuen vnto the wilde featherd Campions, both single and double, as is before exprest: yet for want of a fitter name, wee may call it in English, eyther Cuckowe flower, or Ladys smockes, which you will. The second hath beene sent vnder the name of *Sanicula trifolia*, but the most frequent name now receiued, is *Cardamine trifolia*, and in English Trefoile Ladies spockes.

## The Vertues.

The double Ladies smockes are of the same qualite with the single, and is thought to be as effectuall as Watercresses. The propertie of the other I thinke is not much knowne, although some would make it a wound herbe.

## C H A P. C I.

*Thlaspi Creticum.* Candy Tufts.

**O**f the many sorts of *Thlaspi* it is not the scope of this worke to relate, I will select but onely two or three, which for their beautie are fit to bee inserted into this garden.

*Thlaspi Creticum umbellatum flore albo & purpureo.*  
Candy Tufts white and purple.

This small plant riseth seldome aboue a foote and a halfe high, hauing small, narrow, long and whitish greene leaues, notched or dented with three or foure notches on each side, from the middle to the point-wards ; from among which rise vp the stalkes, branched from the bottome almost into diuers small branches, at the topes whereof stand many small flowers, thick thrust together in an umbell or tuft, making them seeme to be small, round, double flowers of many leaues, when as euery flower is single, and standeth part by it selfe, of a faire white colour in some plants, without any spot, and in others with a purplish spot in the centre or middle, as if some of the middle leaues were purple, in others againe the whole flower is purplish all ouer, which make a pretty shew in a garden : the seede is contained in many small and flat seed vessells, which stand together in an umbell, as the flowers did, in which are contained somewhat reddish seede, like vnto some other sorts of *Thlaspi*, called Treakle Mustards : the roote is small and hard, and perisheth every yeare hauing giuen seede.

*Thlaspi Maritimum Beticum.* We haue another sort, whose leaues before it sendeth forth any stalke, are a little toothed, or finely dented about the edges, and brancheth not so much out, but carryeth an umbell of purplish flowers like vnto the former, and paler yellow seede.

## The Place.

These doe grow in Spaine and Candie, not farre from the Sea side.

## The Time.

These *Thlaspi* giue not their flowers vntill the end of Iune, or beginning of July, and the seed is ripe soone after.

## The Names.

The first is named by some, *Draba*, or *Arabis*, as *Dodonaeus*, but *Draba* is another plant differing much from this. Wee call one sort, *Thlaspi Creticum*, and the other *Thlaspi Beticum maritimum*, because the one came from Spaine, and the other from Candy ; we giue it in English, the name of Tufts, because it doth fit the forme of the flowers best, although ordinarily all the *Thlaspi* are Englisched Wilde Mustardes.

## The Vertues.

Candy, or Spanish Tufts, is not so sharpe biting in taste, as some other of the *Thlaspies* are, and therefore is not to be vsed in medicines, where *Thlaspi* should be in the stead thereof.

## C H A P.

## C H A P. C II.

*Clematis.* Clamberers, or Creepers.

**H**Aving shewed you all my store of herbes bearing fine flowers, let mee now bring to your consideration the rest of those plants, be they Shrubs or Trees, that are cherished in our garden, for the beauty of their flowers chiefly, or for some other beautifull respect : and first I will begin with such as creape on the ground, without climing, and then such as clime vp by poles, or other things, that are set or grow neere them, fit to make Bowers, and Arbours, or else arelike them in forme, in name, or some other such qualitie or propertie.

1. *Clematis Daphnooides*, sive *Vinca peruviana simplici minor diuersorum colorum.*  
Single Perwinkle of diuers colours.

The smaller Perwinkle which not onely groweth wilde in many places, but is most vsall in our Gardens, hath diuers creeping branches, trayling or running vpon the ground, shooting out small fibres at the ioynts, as it creepeth, taking thereby hold in the ground, and rooteth in diuers places : at the ioynts of these branches stand two small darke greene shining leaues, somewhat like vnto small Baye leaues, but smaller, and at the ioynts likewise with the leaues, come forth the flowers, one at a ioynt, standing vpon a tender footestalke, being somewhat long and hollow, parted at the brims, sometimes into foure leaues, and sometimes into five, the most ordinary sort is of a pale or bleake blew colour, but some are pure white, and some of a darke reddish purple colour : the root is in the body of it, little bigger then a rush, bushing in the ground, and creeping with his branches farre about, taking roote in many places, whereby it quickly possesseth a great compasse ; and is therefore most vsually planted vnder hedges, or where it may haue roome to runne.

2. *Vinca peruviana flore duplice purpureo.*  
Double purple Perwinkle.

The double Perwinkle is like vnto the former single kinde, in all things except in the flower, which is of that darke reddish purple colour that is in one of the single kindes ; but this hath another row of leaues within the flower, so that the two rows of leaues caufeth it to be called double, but the leaues of these are lesser then the single. I haue heard of one with a double white flower, but I haue not yet seene it.

3. *Clematis Daphnooides sive Peruviana maior.*  
The greater Perwinkle.

This greater Perwinkle is somewhat like the former, but greater, yet his branches creepe not in that manner, but stand more vpright, or lesse creeping at the least : the leaues also hereof stand by couples at the ioynts, but they are broader and larger by the halfe : the flowers are larger, consisting of five leaues that are blew, a little deeper then the former blew : this plant is farre tenderer to keepe then the other, and therefore would stand warme, as well as in a moist shadowie place.

4. *Clematis altera sive vrens flore albo.*  
Burning Clamerer, or Virgins Bower.

This Causticke or burning Climer, hath very long and climbing tender branches, yet somewhat woody below, which winde about those things that stand neere it, covered with a brownish greene bark, from the ioynts whereof shoothe forth many winged leaues, consisting for the most part of five single leaues, that is, two and two together, and one at the end, which are a little cut in or notched on the edges here and there,

there, but every part of them is lesser then the leaues of the next following Climer, without any clasping tendrels to wnde about any thing at all : towards the vpper part of the branches, with the said leaues, come forth long stalks, wheron stand many white flowers clustering together, opening the brims into sixe or eight small leaucs, spreading like a starre, very sweet of smell, or rather of a strong heady sent, which after turne into flatish and blackish seede, plumed at the head, which plume or feather flyeth away wirth the winde after it hath stood long, and leaueth the seede naked or bare : the roote is white and thicke, fleshie and tender, or easie to be broken, as my selfe can well testifie, in that desiring to take a sucker from the roote, I could not handle it so tenderly, but that it broke notwithstanding all my care. Master Gerard in his Herball maketh mention of one of this kinde with double white flowers, which hee saith he recovered from the seede was sent him from Argentine, that is Strasborough, whereof hee setteth forth the figure with double flowers : but I neuer saw any such with him, neither did I euer heare of any of this kinde with double flowers. Clusius indeed saith, that hee receiued from a friend some seede vnder the name of *Clematis flore albo pleno* : but he doubteth whether there bee any such : the plants that sprang with him from that seede, were like vnto the vpright kinde cailed *Flammula Matthiois*, or *Louis cresta*, as he there saith : but assuredly I haue beeene informed from some of my especiall friends beyond Sea, that they haue a double white *Clematis*, and haue promised to send it; but whether it will be of the climbing or vpright sort, I cannot tell vntill I see it : but surely I doe much doubt whether the double will give any good seede.

5. *Clematis alcea sine peregrina flore rubro*. Red Ladies Bower.

This Climer hath many limber and weake climbing branches like the former, couered with a browne thin outer barke, and greene vnderneath : the leaues stand at the ioynts, consisting but of three leaues or parts, whereof some are notched on one side, and some on both, without any clasping tendrels also, but winding with his branches about any thing standeth next vnto it : the flowers in like manner come from the same ioynts with the leaues, but not so many together as the former vpon long footstalks, consisting of four leaues a piece, standing like a crosse, of a darke red colour ; the seede is flat and round, and pointed at the end, three or four or more standing close together vpon one stalk, without any douning vpon them at all, as in the former : the roots are a bundell of brownish yellow strong strings, running down deep into the ground, from a bigge head aboue.

6. *Clematis peregrina flore purpureo simplici*.  
Single purple Ladies Bower.

This Ladies Bower differeth in nothing from the last described, but onely in the colour of the flower, which is of a sad bleuish purple colour ; so that the one is not possible to be known from the other, vntill they be in flower.

7. *Clematis peregrina flore purpureo pleno*.  
Double flowered purple Ladies Bower.

This double *Clematis* hath branches and leaues so neere resembling the singe kinds, that there can be knowne no difference, vnlesse it be, that this groweth more goale and great, and yeeldeth both more store of branches from the ground, and more spreading aboue : the chiefe marke to distinguishe it is the flower, which in this is very thicke and double, consisting of a number of smaller leaues, set close together in order in the middle, the fourre outermost leaues that encompasse them, being much broader and larger then any of the inward, but all of a dull or sad bleuish purple colour, the points or ends of the leaves seeming a little darker then the middle of them : this beareth no seede that euer I could see, heare of, or learne by any of credit, that haue nourised it a great while ; and therefore the tales of false deceitfull gardiners, and others, that diliuere such for truth, to deceiue persons ignorant therof, must not bee credulously entertained.

In the great booke of the Garden of the Bishop of Eystot (which place is neere vnto Norcemberg) in Germany, I reade of a *Clematis* of this former kinde, whose figure is thereto also annexed, with double flowers of an incarnate, or pale purple tending to a blush colour, whereof I haue not heard from any other place.

8. *Flammula Louis erecta*. Vpright Virgins Bower.

This kinde of *Clematis* hath diuers more vpright stalkes then any of the foure last described, sometimes foure or five foote high, or more ; yet leaning or bending a little, so that it had some neede of sustaining, couered with a brownish barke ; from whence come forth on all sides diuers winged leaues, consisting of fve or seuen leaues, set on both sides of a middle ribbe, whereof one is at the end : the tops of the stalkes are diuided into many branches, bearing many white sweet smelling flowers on them, like in fashion vnto the white Virgins Bower ; after which come such like feather topt seede, which remaine and shew themselues, being flat like the other, when the plumes are blowne abroad : the roote spreadeth in the ground from a thicke head, into many long strings, and fasteneth it selfe strongly in the earth ; but all the stalkes dye downe euery year, and spring afresh in the beginning of the next.

9. *Clematis cerulea Pannonica*. The Hungarian Climer.

The stalks of this plant stand vpright, &c are foure square, bearing at every ioynt two leaues, which at the first are closed together, and after they are open, are somewhat like vnto the leaues of *Aesculus*, or Swallow-wort : from the tops of the stalks, and sometimes also from the sides by the leaues commeth forth one flower, bending the head downward, consisting of foure leaues, somewhat long & narrow, standing like a crosse, and turning vp their ends a little againe, of a faire blew or skie colour, with a thicke pale yellow short thrumme, made like a head in the middle : after the flower is past, the head turneth into such a like round feather topt ball, as is to be seene in the Trauelers ioy, or *Viorna* (as it is called) that groweth plentifully in Kent, and in other places by the way sides, and in the hedges, wherein is included such like flat seede. These stalkes (like as the last) dye downe to the ground euery yeare, and rise againe in the Spring following, shooting out new branches, and therby encrasheth in the root.

10. *Maracoc sive Clematis Virginiana*. The Virginia Climer.

Because this braue and too much desired plant doth in some things resemble the former Climers, so that vnto what other family or kindred I might better conioyne it I know not ; let me I pray insert it in the end of their Chapter, with this description. It riseth out of the ground (very late in the yeare, about the beginning of May, if it be a plant hath risen from the seed of our owne sowing, and if it be an old one, such as hath been brought to vs from Virginia, not till the end thereof) with a round stalk, not aboue a yard and a halfe high (in any that I haue seene) but in hotter Countries, as some Authors haue set it downe, much higher, bearing one leafe at every ioynt, which from the ground to the middle thereof hath no claspers, but from thence vpwards hath at the same ioynt with the leafe both a small twining clasper, like vnto a Vine, and a flower also : every leafe is broad at the stalk thereof, and diuided about the middle on both sides, making it somewhat resemble a Figge leafe, ending in three points, whereof the middlemost is longest : the bud of the flower, before it doe open, is very like vnto the head or seede vessell of the ordinary single *Nigella*, haing at the head or top fve small crooked hornes, which when this bud openeth, are the ends or points of fve leaues, that are white on the inside, and lay themselues flat, like vnto an Anemone, and are a little hollow like a scoope at the end, with fve other smaller leaues, and whiter then they lying betweene them, which were hid in the bud before it opened, so that this flower being full blowne open, consisteth of ten white leaues, laide in order round one by another : from the bottome of these leaues on the inside, rise diuers twined threads, which spread and lay themselues all ouer these white leaues, reaching beyond the points of them a little, and are of a reddish peach colour : towards the bottomes

tomes likewise of these white leaues there are two red circles, about the breadth of an Oten strawe, one distant from another (and in some flowers there is but one circle seen) which adde a great grace vnto the flower, for the white leaues shew their colour through the peach coloured threads, and these red circles or rings vpon them being also perspicuous, make a tripartite shew of colours most delightfull: the middle part of this flower is hollow, and yellowish; in the bottome whereof riseth vp an vmbone, or round stile, somewhat bigge, of a whitish greene colour, spotted with reddish spots like the stalkes of Dragons, with fwe round threads or chives, 1potted in the like manner, and tipt at the ends with yellow pendent, standing about the middle part of the said vmbone, and from thence rising higher, endeth in three long crooked hornes most vsually (but sometimes in four, as hath beene obserued in Rome by Dr. Aldine, that set forth some principall things of Cardinall Farnesius his Garden) spotted like the rest, hauing three round greene buttons at their ends: these flowers are of a comfortable sweete sent, very acceptable, which perish without yeelding fruit with vs, because it flowreth so late: but in the naturall place, and in hot Countries, it beareth a small round whitish fruit, with a crowne at the toppe thereof, wherein is contained (while it is fresh, and before it be ouer dried) a sweet liquor, but whea it is dry, the seede within it, which is small, flat, somewhat rough and blacke, will make a ratling noise: the rootes are composed of a number of exceeding long and round yellowish browne strings, spreading farre abroad vnder the ground (I haue seene some rootes that haue beene brought ouer, that were as long as any rootes of *Sarsa parilla*, and a great deale bigger, which to be handsomely laid into the ground, were faine to be coyled like a cable) and shooting vp in severall places a good distance one from another, whereby it may be well encreased.

#### The Place.

The first blew Perwinkle groweth in many Woods and Orchards, by the hedge sides in England, and so doth the white herē and there, but the other single and double purple are in our Gardens onely. The great Perwinkle groweth in Prouence of France, in Spaine, and Italy, and other hot Countries, where also growe all the twining Clamberers, as well single as double: but both the vpright ones doe growe in Hungary and thereabouts. The surpassing delight of all flowers came from Virginia. Wee preserue them all in our Gardens.

#### The Time.

The Perwinkles doe flower in March and Aprill. The Climers not vntill the end of Iune, or in July, and sometimes in August. The Virginian somewhat later in August; yet sometimes I haue knowne the flower to shew it selfe in July.

#### The Names.

The first is out of question the first *Clematis* of Dioscorides, and called of many

GRANADILLVS FRVTEX INDICVS  
CHRISTI PASSIONIS IMAGO.

<sup>1</sup> *Thalpi creticum*. Candy tufts. <sup>2</sup> *Vinca peruviana flore simplici*. Single Perwinkle. <sup>3</sup> *Vincetoxicum hirundinaria flore duplo*. Double Perwinkle. <sup>4</sup> *Flamula Matthioli*. Vpright Virginias Bower. <sup>5</sup> *Clematis peregrina flore simplici*. The Single Ladies Bower. <sup>6</sup> *Clematis peregrina flore purpureo*. Double flowered Ladies Bower. <sup>7</sup> *Maracoc sive Clematis Virginiana*. The Virginian Climber.

many *Clematis Daphnides* (but not that plant that is simply called *Daphnides*, for that is *Laurula*) and is vsually called *Vinca peruviana*: but it is not *Chamedaphne*, for that is another plant, as shall be shewed in his place; some call it *Centunculus*: In English wee call it Perwinkle. The other is *Clematis altera* of Dioscorides, and is called also *Clematis peregrina*, whose distinctions are set downe in their titles: In English, Ladies Bower, or Virgins Bower, because they are fit to growe by Arbours, to couer them. The first vpright Clamberer is called, and that rightly of some, *Clematis erecta*, or *serrata*. Of others, *Flammula frutescens*, and *Flammula Iozis*, or *surrecta*: In English, Vpright Virgins Bower. The next is called by Clusius, *Clematis Pannonica carulea*, who thought it to be *Clematis species*, by the relation of others, at the first, but after entituled it, *Clematis*: In English, the Hungarian Climer. The last may be called in Latine, *Clematis Virginianae*: In English, The Virgin or Virginian Climer; of the Virginians, *Marsacoc*: of the Spaniards in the West Indies *Granadillo*, because the fruit (as is before said) is in some fashion like a small Pomegranate on the outside, yet the seede within is flattish, round, and blackish. Some superstitious Jesu-ite would faine make men beleue, that in the flower of this plant are to be seene all the markes of our Sauours Passion; and therefore call it *Flos Passio*: and to that end haue caused figures to be drawne, and printed, with all the parts proportioned out, as thornes, nailes, speare, whippe, pillar, &c. in it, and all as true as the Sea burns, which you may well perceiue by the true figure, taken to the life of the plant, compared with the figures set forth by the Jesuites, which I haue placed here likewise for every one to see: but these bee their aduantagious lies (which with them are tolerable, or rather pious and meritorious) wherewith they vse to instruct their people; but I dare say, God neuer willed his Priestes to instruct his people with lyes: for they come from the Diuell, the author of them. But you may say I am beside my Text, and I am in doubt you will thinke, I am in this besides my selfe, and so nothing to be beleue herein that I say. For, for the most part, it is an inherent errour in all of that side, to beleue nothing, be it neuer so true, that any of our side shall affirme, that contrarieth the assertions of any of their Fathers, as they call them: but I must referre them to God, and hee knoweth the truth, and will reforme or deform them in his time. In regard whereof I could not but speake (the occasion being thus offered) against such an erroneous opinion (which even Dr. Aldiae at Rome, before remembred, disproued, and contrariet both the said figures and name) and seek to disproue it, as doth (I say not almost, but I am afraid altogether) leade many to adore the very picture of such things, as are but the fictions of superstitious brains: for the flower it selfe is farre differing from their figure, as both Aldine in the aforesaid booke, and Robinus at Paris in his *Theatrum Flora*, doe set forth; the flowers and leaues being drawne to the life, and there exhibited, which I hope may satisfie all men, that will not be perpetually obstinate and contentious.

#### The Vertues.

Costeus saith hee hath often seene, that the leaues of Perwinkle held in the mouth, hath stayed the bleeding at the nose. The French doe vse it to stay the menstruall fluxes. The other are causticke plants, that is, fiery hot, and blistering the skinne; and therefore (as Dioscorides saith) is profitable to take away the scurfe, lepyrye, or such like deformities of the skin. What property that of Virginia hath, is not knowne to any with vs I thinke, more then that the liquor in the greene fruit is pleasant in taste; but assuredly it cannot be without some speciaall properties, if they were knowne.

#### C H A P. C III.

##### *Chamaelea*. Dwarf Spurge Oliue, or Dwarf Baye.

I Haue three sorts of *Chamaelea* to bring to your consideracion, every one differing notably from other; two of them of great beauty in their flowers, as well as in the whole plant: the third abiding with greene leaues, although it haue no beauty in the flower, yet worthy of the place it holds. And vnto these I must adioyne another plant, as comming nearest vnto them in the brauery of the flowers.

##### 1. *Chamaelea Germanica* sive *Mezereon floribus dilutioris coloris & saturationis*. Dwarf Baye, or flowring Spurge Oliue.

We haue two sorts of this Spurge Oliue or Dwafe Baye, differing onely in the colour of the flowers. They both rise vp with a thicke wooddy stemme, fife or six foot high sometimes, or more, and of the thicknesse (if they be very old) of a mans wret at the ground, spreading into many flexible long branches, couered with a tough grayish bark, beset with small long leaues, somewhat like vnto Priuet leaues, but smaller and paler, and in a manner round pointed: the flowers are small, consisting of foure leaues, many growing together sometimes, and breaking out of the branches by themselves: in the one sort of a pale red at the first blowing, and more white afterwards; the other of a deeper red in the blossome, and continuing of a deeper red colour all the time of the flowring, both of them very sweete in smell: after the flowers are past, come the berries, which are greene at the first, and very red afterwards, turning blackish red, if they stand too long vpon the branches: the rootes spread into many tough long branches, couered with a yellowish bark.

##### 2. *Chamaelea Alpina*. Mountaine Spurge Oliue.

This Mountaine Laurell riseth vp with a small wooddy stemme, three or foure foot high, or more, branching forth towards the vpper parts into many slender and tough branches, couered with a rough hoary greene bark, beset at the ends thereof with flatter, fuller, and smaller round pointed leaues then the former, of a grayish greene colour on the vpperside, and hoary vnderneath, which abide on the branches in Winter, and fall not away as the former: the flowers are many set together at the ends of the branches, greater then the former, and consisting of foure leaues a peece, of a light blush colour, standing in small grayish huskes, of little or no sent at all: the fruit followeth, which are small long graines or berries, of an excellent red colour, which afterwards turne blacke: the roote is long, and spreadeth about vnder the vpper part of the earth.

##### 3. *Chamaelea tricoccos*. Widowe Wayle.

This three berried Spurge Oliue hath no great stemme at all, but the whole plant spreadeth from the ground into many flexible tough greene branches, whereon are set diuers narrow, long, darke greene leaues all along the branches, which abide greene all the Winter: the flowers are very small, scarce to be seene, and come forth between the leaues and the stalkes, of a pale yellow colour, made of three leaues; after which come small blackish berries, three vsually set together: the roote spreadeth it selfe in the ground, nor very farre, being hard and wooddy, and often dyeth, if it bee not well defended from the extremity of our sharpe Winters.

##### 4. *Cneorum Matthiolii*. Small Rocke Roses.

I was long in doubt in what place I shoulde dispose of this plant, whether among the Campions, as Bauhinus, or among these, as Clusius doth; but lest my Gorden should want it wholly, let it take vp roome for this time here. This gallant plant hath diuers long,

long, weake, slender, but yet tough branches lying vpon the ground, diuided vsually into other smaller branches, whereon growe many, small, long, and somewhat thicke leaues, somewhat like vnto the leaues of the former *Mezereon*, set without any order to the very tops, from whence doe come forth a tuft of many small flowers together, made or consisting of foure leaues a piece, of a bright red or carnation colour, and very sweete withall, which turne into small round whitish berries, wherein is contained small round seede, couered with a grayish coate or skinne: the roote is long and yellowish, spreading diuers wayes vnder the ground, and abideth many yeares shooting forth new branches.

It hath beeene obserued in some of these plants, to bring forth white flowers, not differing in any thing else.

Flora albo.

*The Place.*

The first sorts growe plentifully in many places of Germany. The second in the mountaines by Sauoye. The third in Prouence and Spaine. The last in diuers parts of Germany, Bohemia, and Austria, and about Franckford.

*The Time.*

The two first sorts are most vsually in flower about Christmas, or in Ianuary, if the weather be not violent, and sometimes not vntill February. The second flowreth not vntill Aprill. The third in May. The berries of them ripen some in Iune and July; some in August and September, as their flowring is earlier or later. The last flowreth as well in the Spring as in Autumn, so apt and plentifull it is in bearing, and the seede at both times doth ripen soone after.

*The Names.*

The first is called of some *Chamelea*, with this addition *Germanica*, that it may differ from the third, which is the true *Chamelea* of Dioscorides, as all the best Authors doe agree, and is also called *Piper montanum* of the Italians. It is generally called *Mezereon*, and is indeede the true *Mezereon* of the Arabians, and so vsed in our Apothecaries shops, wheresoeuer the Arabians *Mezereon* is appointed, although the Arabians are so intricate and vncertaine in the descriptions of their plants, confounding *Chamelea* and *Thymelea* together. Matthiolus maketh it to be *Daphnoides* of Dioscorides; but in my opinion he is therein mistaken: for all our best moderne Writers doe account our *Laurola*, which hath blacke berries, to bee the true *Daphnoides*: the errore of his Countrey might peraduenture drawe him thereunto; but if hee had better considered the text of Dioscorides, that giueth black berries to *Daphnoides*, and red to *Chamedaphne*, he would not so haue written; and truly, I shoulde thinke (as Lobel doth) with better reason, that this *Chamelea* were Dioscorides *Chamedaphne*, then hee to say it were *Daphnoides*: for the description of *Chamedaphne*, may in all parts be very fitly applyed to this *Chamelea*: and Euen these words, *Semen annexum folijs*, wherein may be the greatest doubt in the description, may not vnsitly bee construed, that as is seene in the plant, the berries growe at the foote of the leaues, about the branches: the faculties indeede that Dioscorides giueth to *Chamedaphne*, are (if any repugnancie be) the greatest let or hinderance, that this *Chamelea* shoulde not be it: but I leaue the discussing of these and others of the like nature, to our learned Physitians; for I deale not so much with vertues as with descriptions. The second is called of Lobel *Chamelea Alpina incana*, of Clusius *Chamelea secunda*, and saith hee had it out of Italy. Wee may call it in English, Mountaine Spurge Olieue, as it is in the description, or Mountaine Laurell, which you will. The last hath the name of *Cneorum*, first giuen it by Matthiolus, which since is continued by all others, Bauhinus (as I said) referreth it to the Mountaine Campions, but Clusius

1. *Chamelea Germanica* seu *Mezereon* *Mezereon* or Dwarf Bay. 2. *Chamelea Alpina*. Mountain Spurge Olieue. 3. *Cneorum Matthiolii*. Small Cherry tree. 4. *Laurus Tinus* sive *silvestris*. The wild Bay tree. 5. *Oleander* sive *Lauris Kosca*. The Rose Bay tree. 6. *Laurecerafus*. The Bay

(as I doe) to the kindes of *Chamalea* or *Thymelea*. For want of an English name I haue (as you see, and that is according to the name the Germane women, as Clusius saith, doe call it) entituled it the Small Rocke Rose; which may abide vntill a fitter may be conferred vpon it.

### The Vertues.

All these plants except the last, as well leaues as berries, are violent purgers, and therefore great caution is to bee had in the vse of them. The last hath not beeene applyed for any disease that I know.

## CHAP. CIII.

### *Laurus*. The Bay Tree.

My meaning is not to make any description of our ordinary Bayes in this place (for as all may very well know, they may be for an Orchard or Courtyard, and not for this Garden) but of two or three other kindes, whose beautifull aspect haue caused them to be worthy of a place therein: the one is called *Laurus Tinus*, The wilde Baye: the other *Laurus Rosea* or *Oleander*, The Rose Baye: and a third is *Laurocerasus*, The Cherry Baye; which may haue not onely some respect for his long bush of sweet smelling flowers, but especially for the comely statelinesse of his gallant euer fresh greene leaues; and the rather, because with vs in most places, it doth but fructifere, vse to bee Shrub high, *not arborescere*, Tree high, which is the more fit for this Garden.

#### 1. *Laurus Tinus* sive *filicifolis*. The wilde Bay tree.

This wilde Baye groweth seldom to bee a tree of any height, but abideth for the most part low, shooting forth diuers slender branches, whereon at every ioynt stand two leaues, long, smooth, and of a darke greene colour, somewhat like vnto the leaues of the Female Cornell tree, or between that and Baye leaues: at the topes of the branches stand many small white sweete smelling flowers, thrusting together, as it were in an vmbell or tuft, consisting of five leaues a peece, the edges whereof haue a shew of a wash purple, or light blush in them, which for the most part fall away without bearing any perfect ripe fruit in our Countrey: Yet sometimes it hath small black berries, as if they were good, but are not. In his naturall place it beareth small, round, hard and pointed berries, of a shining blacke colour, for such haue come often to my hands (yet Clusius writheth they are blew); but I could never see any spring that I put into the ground. This that I here describe, seemeth to me to be neither of both those that Clusius saw growing in Spain and Potugall, but that other, that (as he saith) sprang in the low Countreyes of Italian seede.

#### 2. *Laurus Rosea* sive *Oleander*. The Rose Bay.

Of the Rose Bay there are two sorts, one bearing crimson coloured flowers, which is more frequent, and the other white, which is more rare. They are so like in all other things, that they neede but one description for both. The stemme or trunke is many times with vs as bigge at the bottome as a good mans thumbe, but growing vp smaller, it diuideth it selfe into branches, three for the most part comming from one ioynt or place, and those branches againe doe likewise diuide themselues into three other, and so by degrees from three to three, as long as it groweth: the lowest of these are bare of leaues, hauing shed or lost them by the cold of winters, keeping only leaues on the uppermost branches, which are long, and somewhat narrow, like as forme vnto Peach leaues, but thicker, harder, and of a darke greene colour on the vpper side, and yellowish

yellowish greene vnderneath: at the tops of the young branches come forth the flowers, which in the one sort before they are open, are of an excellent bright crimson colour, and being blowen, consist of foure long and narrow leaues, round pointed, somewhat twining themselues, of a paler red colour, almost treading to blush, and in the other are white, the greene leaues also being of a little fresher colour: after the flowers are past, in the hot countries, but neuer in ours, there come vp long bending or crooked flat pods, whose outward shell is hard, almost woody, and of a browne colour, wherein is contained small flat brownish seede, wrapped in a great deale of a brownish yellow doun, as fine almost as filke, somewhat like vnto the huskes of *Aesculus*, or *Periploca*, but larger, flatter and harder; as my selfe can testifie, who had some of the pods of this Rose bay, brought mee out of Spaine, by Master Doctor John More, the seedes whereof I sowed, and had diuers plants that I raised vp vnto a reasonable height, but they require, as well old as young, to bee defended from the colde of our winters.

#### 3. *Laurocerasus*. The Bay Cherry.

This beautifull Baye in his naturall place of growing, groweth to bee a tree of a reasonable bignesse and height, and oftentimes with vs also if it bee pruned from the lower branches; but more vsually in these colder Countries, it groweth as a shrub or hedge bush, shooting forth many branches, whereof the greater and lower are couered with a darke grayish greene barke, but the young ones are very greene, whereon are set many goodly, faire, large, thicke and long leaues, a little dented about the edges, of a more excellent fresh shining greene colour, and farre larger then any Bay leafe, and compared by many to the leaues of the *Pomeronion* tree (which because wee haue none in our Countrey, cannot be so well known) both for colour and largenesse, which yeeld a most gracefull aspect: it beareth long stalkes of whitish flowers, at the ioynts of the leaues both along the branches and towards the ends of them also, like vnto the Birds Cherry or *Padus Theophrasti*, which the French men call *Putier & Ceriser blanc*, but larger and greater, consisting of five leaues with many thredes in the middle: after which commeth the fruite or berries, as large or great as Flanders Cherries, many growing together one by another on a long stalke, as the flowers did, which are very blacke and shining on the outside, with a little point at the end, and reasonable sweete in taste, wherein is contained a hard round stonye, very like vnto a Cherry stonye, as I haue obserued as well by those I received out of Italie, as by them I had of Master James Cole a Merchant of London lately deceas'd, which grew at his house in Higlegate, where there is a faire tree which hee defended from the bitternesse of the weather in winter by casting a blanket ouer the toppe thereof every yeare, thereby the better to preferue it.

#### The Place.

The first is not certainly knowne from whence it came, and is communicated by the suckers it yeeldeth. The second groweth in Spaine, Italie, Grece, and many other places: that with white flowers is recorded by Bellonius, to grow in Candy. The last, as Matthiolus, and after him Clusius report, came first from Constantinople: I had a plant hereof by the friendly gift of Master James Cole, the Merchant before remembred, a great louer of all rarities, who had it growing with him at his countrey house in Higgate aforesaid, where it hath flowred diuers times, and borne ripe fruit also.

#### The Time.

The first flowreth many times in the end of the yeare before Christmas, and often also in Januari, but the most kindly time is in March and Aprill, when the flowers are sweetest. The second flowreth not vntill Iuly. The last in May, and the fruit is ripe in August and September.

## The Names.

The first is called *Laurus silvestris*, and *Laurus Tinus*: in English Wilde Bay, or Sweete flowring Bay. The second is called *Laurus Rosca*, *Oleander*, *Nerium*, and *Rhododendros*: in English The Rose Bay, and Oleander. The last was sent by the name of *Trebezoni Carmesi*, that is to say, *Daphylus Trapezuntina*, but not hauing any affinitie with any kinde of Date, Bellonius as I thinke first named it *Lauocerasus*, and *Cerasus Trapezuntina*. Dalechampius thinketh it to bee *Lotus Apricana*, but Clusius refuteth it. Those stones or kernels that were sent me out of Italie, came by the name of *Laurus Regia*, The Kings Bay. Wee may most properly call it according to the Latine name in the title, The Cherry bay, or Bay Cherry, because his leaues are like vnto Bay-leaues, and both flowers and fruit like vnto the Birdes Cherry or Cluster Cherry, for the manner of the growing; and therfore I might more fitly I confess haue placed it in my Orchard among the sorts of Cherries: but the beautifulnesse of the plant caused mee rather to insert it here.

## The Vertues.

The wilde Bay hath no propertie allotted vnto it in Phisick, for that it is not to be endured, the berries being chewed declare it to be so violent hot and choking. The Rose Bay is said by Dioscorides, to be death to all four footed beasts, but contrariwise to man it is a remedie against the poison of Serpents, but especially if Rue bee added vnto it. The Cherry Bay is not knowne with vs to what phisick vse it may be applyed.

## CHAP. CIIII.

*Cerasus flore multiplici*. The Rose or double blossomed Cherry.  
*Malus flore multiplici*. The double blossomed Apple tree. And  
*Malus Persica flore multiplici*. The double blossomed Peachtree.

**T**He beautifull shew of these three sorts of flowers, hath made me to insert them into this garden, in that for their worthinesse I am vnwilling to bee without them, although the rest of their kindes I haue transferred into the Orchard, where among other fruit trees, they shall be remembred: for all these here set downe, seldome or neuer beare any fruite, and therefore more fit for a Garden of flowers, then an Orchard of fruite.

*Cerasus flore pleno vel multiplici*.  
 The Rose Cherry, or double blossomed Cherry.

The double blossomed Cherry tree is of two sorts for the flower, but not differing in any other part, from the ordinary English or Flanders Cherry tree, growing in the very like manner: the difference consisteth in this, that the one of these two sorts hath white flowers lesse double, that is, of two rowes or more of leaues, and the other more double, or with more rowes of leaues, and besides I haue obserued in this greater double blossomed Cherry, that some yeares most of the flowers haue had another smaller and double flower, rising vp out of the middle of the other, like as is to bee seene in the double English Crow-foote, and double redde *Ranunculus* or Crowfoote, before described: this I say doth not happen every yeare, but sometimes. Sometimes also these trees will give a few berries, here and there scattered, and that with lesse double flowers more often, which are like vnto our English Cherries both for taste and bignesse. These be very fit to be set by Arbours.

Malus

1 *Cerasus flore pleno*. The double blossomed Cherry tree. 2 *Malus flore multiplici*. The double blossomed Apple tree. 3 *Malus persica*. The double blossomed Peachtree. 4 *Periclymenum perforatum*. Double Honifuckle. 5 *Periclymenum reticulatum*. Vright Honifuckle.

*Malus flore multiplo. The double blossomed Apple tree.*

This double blossomed Apple tree is altogether like vnto our ordinary Pippin tree in body, branch and leafe, the only difference is in the flower, which is altogether whitish, sauing that the ianner leaues towards the middle are more reddish, but as double and thicke as our double Damaske Roses, which fall away without bearing fruit.

*Malus Persica flore multiplo. The double blossomed Peach tree.*

This Peach tree for the manner of growing, is so like vnto an ordinary Peach tree, that vntill you see it in blossom you can perceiue no difference : the flower is of the same colour with the blossomes of the Peach, but consisting of three or four, or more rowes of leaues, which fall often away likewise without bearing any fruite ; but after it hath abiden some yeares in a place doth forme into fruite, especially being planted against a wall.

**The Place.**

Both the Cherry trees are frequent in many places of England, nurst for their pleasant flowers. The Apple is as yet a stranger. And the Peach hath not been seen or knowne, long before the writing hereof.

**The Time.**

They all flower in April & May, which are the times of their other kinds.

**The Names.**

Their names are also sufficiently expressed to know them by.

**The Vertues.**

Cherries, Peaches and Apples, are recorded in our Orchard, and there you shall finde the properties of their fruit : for in that these beare none or very few, their blossomes are of most vsse to grace and decke the persons of those that will weare or beare them.

**C H A P. C V.***Periclymenum. Honysuckles.*

**T**He Honysuckle that groweth wilde in evry hedge, although it be very sweete, yet doe I not bring into my garden, but let it rest in his owne place, to serue their senses that traueil by it, or haue no garden. I haue three other that furnish my Garden, one that is called double, whose branches spreade far, and being very fit for an arbour will soone couer it : the other two stand vpright, and spreade not any way far, yet their flowers declaring them to be Honysuckles, but of lesse delight, I comfort them with the other.

*Periclymenum persolvatum sine italicum. The double Honysuckle.*

The truncke or body of the double Honysuckle, is oftentimes of the bignesse of a good staffe, running out into many long spreading branches, couered with a whitish bark, which had neede of some thing to sustaine them, or else they will fall down to the ground (and therefore it is vsually planted at an arbour, that it may run thereon, or

or against a house wall, and fastened thereto in diuers places with nailes) from whence spring forth at seuerall distancies, and at the ioynts, two leaues, being like in forme vnto the wilde Honysuckles, and round pointed for the most part, these branches diuiding themselves diuers wayes, haue at the topes of them many flowers, set at certayne distancies one above another, with two greene leaues at every place, where the flowers doe stand, ioyned so close at the bottome, and so round and hollow in the middle, that it seemeth like a hollow cuppe or saucer of flowers : the flowers stand round about the middle of these cuppes or saucers, being long, hollow, and of a whitish yellow colour, with open mouthes daught ouer with a light shew of purple, and somethreds within them, very sweet in smell, like both in forme and colour vnto the common Honysuckles, but that these cuppes with the flowers in them are two or three standing one aboue another (which make a far better shew then the common, which come forth all at the heade of the branches, without any greene leaues or cuppes vnder them) and therefore these were called double Honysuckles.

*Periclymenum rectulum fractur rubro. Red Honysuckles.*

This vpright Woodbinde hath a straight woody stemme, diuided into seuerall branches, about three or four foote high, couered with a very thinne whitish bark, whereon stand two leaues together at the ioynts, being lesser then the former, smooth and plaine, and a little pointed : the flowers come forth vpon slender long footstalks at the ioynts where the leaues stand, alwayes two set together, and never more, but seldom one alone, which are much slimmer then the former, but of the same fashion, with a little button at the foote of the flower ; the buds of the flowers before they are open are very reddish, but being open are not so red, but tending to a kinde of yellowish blush colour : after which come in their places two small redberries, the one withered for the most part, or at least smaller then the other, but (as Clufius saith) in their naturall places they are both full and of one bignesse.

*Periclymenum rectulum fructu ceraso. Blew berried Honysuckles.*

This other vpright Woodbinde groweth vp as high as the former, or rather somewhat higher, couered with a blackish rugged bark, chapping in diuers places, the younger branches whereof are somewhat reddish, and couered with an hoary dounie : the leaues stand two together at the ioints, somewhat larger then the former, and more whitish vnderneath : the flowers are likewise two standing together, at the end of a slender footestalke, of a pale yellowish colour when they are blowne, but more reddish in the bud : the berries stand two together as the former, of a darke blewiffl colour when they are fully ripe, and full of a red liquor or iuice, of a pleasant taste, which doth not only dyer the hands of them that gather them, but serueth for a dying colour to the inhabitants where they grow plentifully, wherein are contained many flat seede : The roote is woody as the former is.

**The Place.**

The firw groweth in Italie, Spaine, and Prouence of France, but not in the colder countreyes, vnlesse it be there planted, as is most frequent in our countrey. The others grow in Austria, and Stiria, as Clufius saith, and are entertained into their gardens onely that are curious.

**The Time.**

The first flowreth vsually in Aprill, the rest in May.

**The Names.**

The first is called *Periclymenum*, *Caprifolium persolvatum*, and *italicum*, as a difference from the common kinde : In English Double Woodbinde, or

or double Honisuckles. The others, as they are rare, and little knowne, so are their names also : yet according to their Latine, I haue giuen them English names.

**The Vertues.**

The double Honisuckle is as effectuall in all things, as the single wilde kinde, and besides, is a speciall good wound herbe for the head or other parts. I haue not knowne the vpright kindes vsed in Physicke.

**C H A P. C V I .***Iasmium sive Gelsomina. Iasmine or Gesmine.*

**W**E haue but one sort of true Iasmine ordinarily in our Gardens throughout the whole Land ; but there is another greater sort, which is farre more tender, brought out of Spaine, and will hardly endure any long time with vs, vnsleſſe it be very carefully preferued. Wee haue a third kinde called a yellow Iasmine, but differeth much from their tribe in many notable points : but because the flowers haue ſome likeneſſe with the flowers of the true Iasmine, it hath been vſually called a Iasmine ; and therefore I am content for this Garden to conioyne them in one Chapter.

**1. Iasmium album. The white Iasmine.**

The white Iasmine hath many twiggy flexible greene branches, comming forth of the ſundry bigger booughes or ſtems, that riſe from the roote, which are couered with a grayiſh darke coloured barkē, hauiing a white pith within it like the Elder, but not fo much : the winged leaues ſtand alwaies two together at the ioynts, being made of manie ſmall and pointed leaues, ſet on each ſide of a middle ribbe, ſix moft vſually on both ſides, with one at the end, which is larger, more pointed then any of the reſt, and of a darke greene colour : at the toppe of the young branches ſtand diuers flowers together, as it were in an umbell or tuſt, each whercof ſtandeth on a long greene ſtakē, comming out of a ſmall huske, being ſmall, long, and hollow belowe, opeing into ſiue white ſmall, pointed leaues, of a very ſtrong ſweete ſmell, which fall away without bearing any fruit at all, that euer I could leare in our Country ; but in the hot Countries where it is naturall, it is ſaid to bear flat fruit, like Lupines : the rootes ſpread farre and deepe, and are long and hard to growe, vntill they haue taken ſtrong hold in the ground.

**2. Iasmium Catalonicum. The Spanish Iasmine.**

This Catalonia Iasmine growtheth lower then the former, neuer riſing halfe ſo high, and hath ſlender long greene branches, riſing from the toppe of the wooddy ſtemme, with ſuch like leaues ſet on them as the former, but ſomewhat ſhorter and larger : the flowers alſo are like vnto the former, and ſtand in the ſame manner at the end of the branches, but are muſch larger, being of a bluſh colour before they are blowne, and white with bluſh edges when they are open, exceeding ſweete of ſmell, moſtrong then the former.

**3. Iasmium luteum, ſive Trifolium fruticans alijs Polemonium.****The yellow Iasmine.**

This that is called the yellow Iasmine, hath many long ſlender twiggy branches riſing from the roote, greene at the first, and couered with a darke grayiſh barkē afterwards, whereon are ſet at certayne diſtances, three ſmall darke greene leaues together, the end leafe being alwaies the biggest : at the ioynts where the leaues come forth, ſtand

ſtand long ſtakēs, bearing long hollow flowers, ending in ſiue, and ſome in ſix leaues, very like vnto the flowers of the first Iasmine, but yellow, whereupon it is vſually caſted the Yellow Iasmine : after the flowers are paſt, there come in their places round blacke ſhining berries, of the bignesse of a great Peafe, or bigger, full of a purpliſh iuyce, which will dye ones fingers that bruife them but a little : the roote is tough, and white, creeping farre about vnder the ground, ſhooting forth plentily, whereby it greatly encreaſeth.

**The Place.**

The firſt is verily thought to haue been firſt brought to Spaine out of Syria, or thereabouts, and from Spaine to vs, and is to be ſeen very often, and in many of our Country Gardens. The ſecond hath his breeding in Spaine alſo, but whether it be his originaſ place we know not, and is ſcarce yet made well acquainted with our English ayre. The third groweth plentily about Mompelier, and will well abide in our London Gardens, and any where else.

**The Time.**

The firſt flowreth not vntill the end of July. The ſecond ſomewhat earliere. The third in July alſo.

**The Names.**

The firſt is generally called *Iasmium album*, and *Gelsomina album* : In English, The white Iasmine. The ſecond hath his name in his title, as muſch as may be ſaid of it. The third hath been taken of ſome to be a *Cycſus*, oþthers iudge it to be *Polemonium*, but the truſt name is *Trifolium fruticans*, although many call it *Iasmium luteum* : In English moſt vſually, The yellow Iasmine, for the reaſons aforesaid ; or elſe after the Latine name, Shrubbie Trefoile, or Make-bate.

**The Vertues.**

The white Iamſines haue beeſe in all times accepted into outward medicines, eyther for the pleaſure of the ſweete ſent, or profit of the warming properties. And in these dayes onely uſed as an ornament in Gardens, or for ſent of the flowers in the house, &c. The yellow Iasmine, althoſh ſome haue adiudged it to be the *Polemonium* of *Dioſcorides*, yet it is not uied to thoſe purpoſes by any that I know.

**C H A P. C V I I .***Syringa. The Pipe tree.*

**V**Nder the name of *Syringa*, is contained two ſpeciall kinds of Shrubs or Trees, differing one from another, namely, the *Lilac* of *Matthiolus*, which is called *Syringa carulea*, and is of two or three ſorts : And the *Syringa alba*, which alſo is of two ſorts, as haſh bee declared.

**1. Lilac ſive Syringa carulea. The blew Pipe tree.**

The blew Pipe tree riſeth ſometimes to be a great tree, as high and bigge in the bodie as a reasonable Apple tree (as I haue in ſome places ſeen and obſerved) but moſt vſually groweth lower, with many twigs or branches riſing from the roote, hauiing as muſch pith in the middle of them as the Elder hath, couered with a grayiſh greene barkē,

barke, but darker in the elder branches, with ioynts set at a good distance one from another, and two leaues at every ioynt, which are large, broad, and pointed at the ends, many of them turning or folding both the sides inward, and standing on long foote stalkes: at the topes of the branches come forth many flowers, growing spike-fashon, that is, a long branch of flowers vpon a stalke, each of these flowers are small, long, and hollow belowe, ending aboue in a pale bleuish flower, consisting of foure small leaues, of a pretty small sent: after the flowers are past, there come sometimes (but it is not often in our Country, vnlesse the tree haue stood long, and is grown great, the suckers being continually taken away, that it may growe the better) long and flat cods, consisting as it were of two sides, a thin skinne being in the midst, wherein are contained two long flattish red seede: the rootes are strong, and growe deepe in the ground.

2. *Syringa flore latico sive argenteo.*

The siluer coloured Pipe tree.

This Pipe tree differeth not from the former blew Pipe tree, either in stemme or branches, either in leaues or flowers, or manner of growing, but only in the colour of the flower, which in this is of a milke, or siluer colour, which is a kinde of white, wherein there is a thinne wals, or light shew of blew shad therin, comming somewhat neare vnto an ash-colour.

3. *Lilac lacimatus folijs.* The blew Pipe tree with cut leaues.

This Pipe tree should not differ from the first in any other thing then in the leaues, which are said to be cut in the edges into severall parts, as the relation is giuen *a viris fide dignis*; for as yet I never saw any such; but I here am bold to set it downe, to induce and prouoke some louer of plants to obtaine it for his pleasure, and others also.

4. *Syringa flore albo simplici.* The single white Pipe tree.

The single white Pipe tree or bush, never commeth to that height of the former, but abideth alwaies like a hedge tree or bush, full of shoothes or suckers from the roote, much more then the former: the young shoothes hereof are reddish on the outside, and afterward reddish at the ioynts, and grayish all the rest ouer: the young as well as the old branches, haue some pith in the middle of them, like as the Elder hath: the leaues stand two at a ioynt, somewhat like the former, but more rugged or crumpled, as also a little pointed, and dented about the edges: the flowers growe at the topes of the branches, diuers standing together, consisting of foure white leaues, like vnto small Muske Rosēs, and of the same creame colour, as I may call it, with many small yellowish threads in the middle, and are of a strong, full, or heady sent, not pleasing to a great many, by reaon of the strange quicknesse of the sent: the fruit followeth, being flat at the head, with many leafie shels or scales compassing it, wherein is enclosed small long seede: the rootes runne not deepe, but spread vnder the ground, with many fibres annexed vnto them.

5. *Syringa Arabica flore albo duplo.*

The double white Pipe tree.

This Pipe tree hath diuers long and slender branches, whereon growe large leaues, somewhat like vnto the leaues of the former single white kinde, but not so rough or hard, and not at all dented about the edges, two alwaies standing one against another at every ioynt of the stalke, but set or disposed on contrary sides, and not all vpon one side; at the ends whereof come forth diuers flowers, euery one standing on his owne foote-stalke, the hose or huske being long and hollow, like vnto the white Iasmine, and the flowers therin consisting of a double rowe of white and round peinted leaues, five or six in a rowe, with some yellownesse in the middle, which is hollow, of a very strong and heady sweet sent, and abiding a long time florring, especially in the hotter Countries, but is very tender, and not able to abide any the least cold weather with vs, for

1. *Jasminum vulgare.* 2. *Jasminum Americanum sive Convolvulus Americanus.* The Iasmine or Bindweed of America. 3. *Jasminum flavum sive Luteum.* The yellow Iasmine. 4. *Lilac sive Syringa carolina.* The blew Pipe tree. 5. *Syringa alba vulgaris.* The single white Syringa. 6. *Syringa flore albo duplo.* The double white Syringa. 7. *Sambucus nigra.* The Elder or Gelder Rose.

for the cold windes will (as I understand) greatly molest it : and therefore must as charily be kept as Orenge trees with vs, if wee will haue it to abide.

## The Place.

The first growtheth in Arabia (as Matthiolus thinketh, that had it from Constantinople.) We haue it plentifully in our Gardens. The second and third are strangers with vs as yet. The fourth is as frequent as the first, or rather more, but his originall is not knowne. The last hath his originall from Arabia, as his name importeth.

## The Time.

The first, second, and third flower in April, the other two not vntill May.

## The Names.

The first is called of Matthiolus *Lilac*, and by that name is most vsually called in all parts. It is also called *Syringa cerasaea*, because it commeth neare rest vnto those woods, which for their pithy substance, were made hollow into pipes. It is called of all in English, The blew Pipe tree. It seemeth likely, that Petrus Bellonius in his third Booke and fiftieth Chapter of his observations (making mention of a shrubbe that the Turkes haue, with liue leaues alwaies greene, bearing blew or violet coloured flowers on a long stalke, of the bignesse and fashion of a Foxe taile, and thereupon called in their language a Foxe taile) doth vnderstand this plant here expressed. The certainty whereof might easily be knowne, if any of our Merchants there residing, would but call for such a shrubbe, by the name of a Foxe taile in the Turkish tongue, and take care to send a young roote, in a small tubbe or basket with earth by Sea, vnto vs here at London, which would be performed with a very little paines and cost. The second and third, as kindes thereof, haue their names in their titles. The fourth is called by Clusius and others, *Frutex Coronarium*; some doe call it *Lilac flore albo*, but that name is not proper, in that it doth confound both kindes together. Lobel calleth it *Syringe Italica*. It is now generally called of all *Syringe alba*, that is in English, The white Pipe tree. Some would haue it to bee *Ostrya* of Theophrastus, but Clusius hath sufficiently cleared that doubt. Of others *Ligustrum Orientale*, which it cannot be neither; for the *Cypres* of Plinie is Dioscorides his *Ligustrum*, which may be called *Orientale*, in that it is most proper to the Easterne Countries, and is very sweete, whose seede is like vnto Coriander seede. The last is called by diuers *Syringe Arabica flore albo duplo*, as most fitly agreeing thereto. Of Basilius Beslerus that set forth the great booke of the Bishop of Eystot in Germany his Garden, *Syringe Italica flore albo pleno*, because, as it is likely, hee had it from Italy. It is very likely, that Prosper Alpius in his booke of Egyptian plants, doth meane this plant, which hee there calleth *Sambach*, *sive Iasmimum Arabicum*. Mattheus Caccini of Florence in his letter to Clusius entituleth it *Syringe Arabica*, *sive Iasmimum Arabicum*, *sive Iasmimum ex Gine*, whereby hee declareth that it may not vsifly be referred to either of them both. We may call it in English as it is in the title, The double white Pipe tree.

## The Vertues.

We haue no vse of these in Physicke that I know, although Prosper Alpius saith, the double white Pipe tree is much vsed in Egypt, to help women in their trauailes of childbirthe.

## C H A P. C VIII.

*Sambucus Rosea*. The Elder or Gelder Rose.

**A** lthough there be diuers kindes of Elders, yet there is but one kinde of Elder Rose, whereof I meane to increate in this Chapter, being of neare affinity in some things vnto the former Pipe trees, and which for the beauty of it deserueth to be remembred among the delights of a Garden.

*Sambucus Rosea*. The Gelder Rose.

The Gelder Rose (as it is called) groweth to a reasonable height, standing like a tree, with a trunke as bigge as any mans arme, couered with a darke grayish bark, somewhat rugged and very knotty : the younger branches are smooth and white, with a pithy substance in the middle, as the Elders haue, to shew that it is a kind thereof, whereon are set broad leaues, diuided into three parts or divisions, somewhat like vnto a Vine leafe, but smaller, and more rugged or crumpled, iagged or cut also about the edges : at the topes of euery one of the young branches, most vsually commeth forth a great tuft, or ball as it were, of many white flowers, set so close together, that there can be no distinction of any severall flower seene, nor doth it seeme like the double flower of any other plant, that hath many rowes of leaues set together, but is a clutter of white leaued flowers set together vpon the stalke that vpholdeth them, of a small sent, which fall away without bearing any fruit in our Country, that euer I could obserue or learne : The roote spreadeth neither farre nor deepe, but shooteth many small rootes and fibres, whereby it is fastened in the ground, and draweth nourishment to it, and sometimes yeeldeth suckers from it.

## The Place.

It should seeme, that the naturall place of this Elder is wet and moist grounds, because it is so like vnto the Marsh Elder, which is the fingle kind hereof. It is onely nourised vp in Gardens in all our Country.

## The Time.

It flowreth in May, much about the time of the double Peony flower, both whiche being set together, make a pleasant variety, to decke vp the windowes of a house.

## The Names.

It is generally called *Sambucus Rosea*: In English, The Elder Rose, and more commonly after the Dutch name, the Gelder Rose. Dalechampius seemeth to make it *Thraupalus* of Theophrastus, or rather the fingle Marsh Elder; for I thinke this double kinde was not knowne in Theophrastus his time.

## The Vertues.

It is not applyed to any Physicall vse that I know.

## C H A P. C I X.

## Rosa. The Rose tree or bush.

**T**He great varietie of Roses is much to be admired, beeing more then is to bee seene in any other shrubby plant that I know, both for colour, forme and smell. I haue to furnish this garden thirty sorts at the least, euery one notably differing from the other, and all fit to be here entertained : for there are some other, that being wilde and of no beautie or smell, we forbeare, and leauie to their wilde habitations. To distinguish them by their colours, as white, red, incarnate, and yellow, were a way that many might take, but I hold it not so conuenient for diuers respects : for so I should confound those of diuers sorts one among another, and I should not keepe that methode which to me seemeth most conuenient, which is, to place and ranke every kinde, whether single or double, one next vnto the other, that so you may the better vnderstand their varieties and differences : I will therefore beginne with the most ancient, and knowne Roses to our Countrey, whether naturall or no I know not, but assumed by our precedent Kings of all others, to bee cognisances of their dignitie, the white Rose and the red, whom shall follow the damaske, of the finest sent, and most vse of all the other sorts, and the rest in their order.

1. *Rosa Anglica alba*. The English white Rose.

The white Rose is of two kindes, the one more thicke and double then the other: The one riseth vp in some shadowie places, vnto eight or ten foote high, with a stocke of a great bignesse for a Rose. The other growing seldom higher then a Damaske Rose. Some doe judge both these to be but one kinde, the diuersitie happening by the ayre, or ground, or both. Both these Roses haue somewhat smaller and whiter greene leauies then in many other Roses, faine most vniually set on a stalke, and more white vnderneath, as also a whiter greene barke, armed with sharpe thornes or prickles, whereby they are soone known from other Roses, although the one not so easily from the other: the flowers in the one are whitish, with an eye or shew of a blussh, especially towards the ground or bottome of the flower, very thicke double, and close set together, and for the most part not opening it selfe so largely and fully as eyther the Red or Damaske Rose. The other more white, lesse thicke and double, and opening it selfe more, and some so little double as but of two or three rowes, that they might be held to be single, yet all of little or no smell at all. To describe you all the feuerall parts of the Rose, as the bud, the beards, the threds &c. were needleſſe, they are so conuerſant in euery ones hand, that I ſhall not neede but to touch the moſt ſpeciall parts of the varieties of them, and leauie a more exact relation of all things incident vnto them, vnto a generall worke.

2. *Rosa Incarnata*. The Carnation Rose.

The Carnation Rose is in moſt things like vnto the leſſer white rose, both for the growing of the stocke, and bignesse of the flower, but that it is more ſpreade abroade when it is blown then the white is, and is of a pale bluſh colour all the flower thoroughout, of as ſmall a ſent as the white one is almoſt.

This kinde of Rose is not very great, but very thicke and double, and is very variable in the flowers, in that they will be ſo diſſerent one from another: ſome being paler then others, and ſome as it were blaſted, which commeth not caſually, but naturally to this rose: but the beſt flowers (whereof there will bee ſtill ſome) will be of a bright pale murrey colour, neere vnto the Velvet rose, but nothing ſo darke a colour.

3. *Rosa Anglicarubra*. The English red Rose.

*Rosa Belgica*  
*fine Vitrea*  
The red Rose (which I call English, not only for the reaſon before expreſſed, but be-

cause (as I take it) this Rose is more frequent and vſed in England, then in other places) neuer growtheth ſo high as the damaske Rose bush, but moſt vniually abideth low, and ſhooteth forth many branches from the roote (and is but ſeldome ſuffered to grow vp as the damaske Rose into ſtaſtards) with a greene barke, thinner ſet with prickles, and larger and greener leauies on the vpperſide then in the white, yet with an eye of white vpon them, faine likewiſe moſt vniually ſet vpon a stalke, and grayiſh or whitish vnderneath. The Roses or Flowers doe very muſt vary, according to their ſite and abiding; for ſome are of an orient, red or deepe crimson colour, and very double (although neuer ſo double as the white) which when it is full blowne hath the lauie of any other Rose, ſome of them againe are paler, tending ſomewhat to a damaske; and ſome are of ſo pale a red, as that it is rather of the colour of the canker Rose, yet all for the moſt part with larger leauies then the damaske, and with many more yellow threds in the middle: the ſent hereof is much better then in the white, but not comparable to the excellencie of the damaske Rose, yet this Rose being well dried and well kept, will hold both colour and ſent longer then the damaske, bee it neuer so well kept.

4. *Rosa Damascena*. The Damaske Rose.

The Damaske Rose bush is more vniually nourfed vp to a competent height to ſtand alone, (which we call Standards) then any other Rose: the barke both of the ſtocke and branches, is not fully ſo greene as the red or white Rose: the leauies are greene with an eye of white vpon them, ſo like vnto the red Rose, that there is no great diuerſitie betwene them, but that the leauies of the red Rose ſeeme to bee of a darker greene. The flowers are of a fine deepe bluſh colour, as all know, with ſome pale yellow threds in the middle, and are not ſo thicke and double as the white, nor being blowne, with ſo large and great leauies as the red, but of the moſt excellent ſweet pleaſant ſent, far ſurpaſſing all other Roses or Flowers, being neyther heady nor too ſtrong, nor ſtuffing or vnpleafant ſweet, as many other flowers.

5. *Rosa Provincialis fine Hollandice Damascena*.  
The great double Damaske Prouince or Holland Rose.

This Rose (that ſome call *Centifolia Batavica incarnata*) hath his barke of a reddiſh or browne colour, whereby it is ſoone diſcerned from other Roses. The leauies are likewiſe more reddiſh then in others, and ſomewhat larger, it vniually growtheth very like the Damaske rose, and much to the ſame height: the flowers or roses are of the ſame deepe bluſh colour that the damaske roses are, or rather ſomewhat deeper, but much thicker, broader, and more double, or fuller of leauies by three parts almoſt, the outer leauies turning therſelues backe, when the flower hath stood long blowne, the middle part it ſelfe (which in all other roses almoſt haue ſome yellow threds in them to be ſeene) being folded hard with ſmall leauies, without any yellow almoſt at all to be ſeene, the ſent whereof commeth neere vnto the damaske rose, but yet is ſhort of it by much, howſoever many doe thiſke it as good as the damask, and to that end I haue known ſome Gentlewomen haue cauſed all their damaske ſtockes to bee graſted with prouince Roses, hoping to haue as good water, and more ſtore of them then of damask Roses; but in my opinion it is not of halfe ſo good a ſent as the water of damaske Roses: let euery one follow their own fancie.

6. *Rosa Provincialis rubra*. The red Prouince Rose.

As the former was cauſed *incarnata*, ſo this is cauſed *Batavica centifolia rubra*, the diuerſitie being not very great: the ſtemme or ſtocke, and the branches alſo in this, ſeeming not to be ſo great but greener, the barke being not ſo red; the leauies of the ſame largenesſe with the former damaske Prouince. The flowers are not altogether ſo large, thicke and double, and of a little deeper damaske or bluſh colour, turning to a red Rose, but not comming neere the full colour of the beſt red Rose, of a ſent not ſo ſweete as the damaske Prouince, but comming ſomewhat neerethe ſent of the ordinary

dinary red rose, yet exceeding it. This rose is not so plentifull in bearing as the damaske Prouince.

7. *Rosa Provincialis alba.* The white Prouince Rose.

It is said of diuers, that there is a white Prouince Rose, whereof I am not *conclusus*, and therfore I dare not give it you for a certaintie, and indeed I haue some doubt, that it is the greater and more double white rose, wherof I gaue you the knowledge in the beginning: when I am my selfe better satisfied, I shall bee ready to satisfie others.

8. *Rosa versicolor.* The party coloured Rose,  
of some Yorke and Lancaster.

This Rose in the forme and order of the growing, is neerest vnto the ordinary damaske rose, both for stemme, branch, leafe and flower: the difference consisting in this, that the flower (being of the same largenesse and doublenesse as the damask rose) hath the one halfe of it, sometimes of a pale whitish colour, and the other halfe, of a paler damaske colour then the ordinary; this happeneth so many times, and sometimes also the flower hath diuers stripes, and markes in it, as one leafe white, or striped with white, and the other halfe blush, or striped with blush, sometimes also all striped, or spotted ouer, and other times little or no stripes or markes at all, as nature listeth to play with varieties, in this as in other flowers: yet this I haue obserued, that the longer it abideth blowen open in the sun, the paler and the fewer stripes, markes or spots will be seene in it: the smell whereof is of a weake damask rose sent.

9. *Rosa Chrystallina.* The Chrystall Rose.

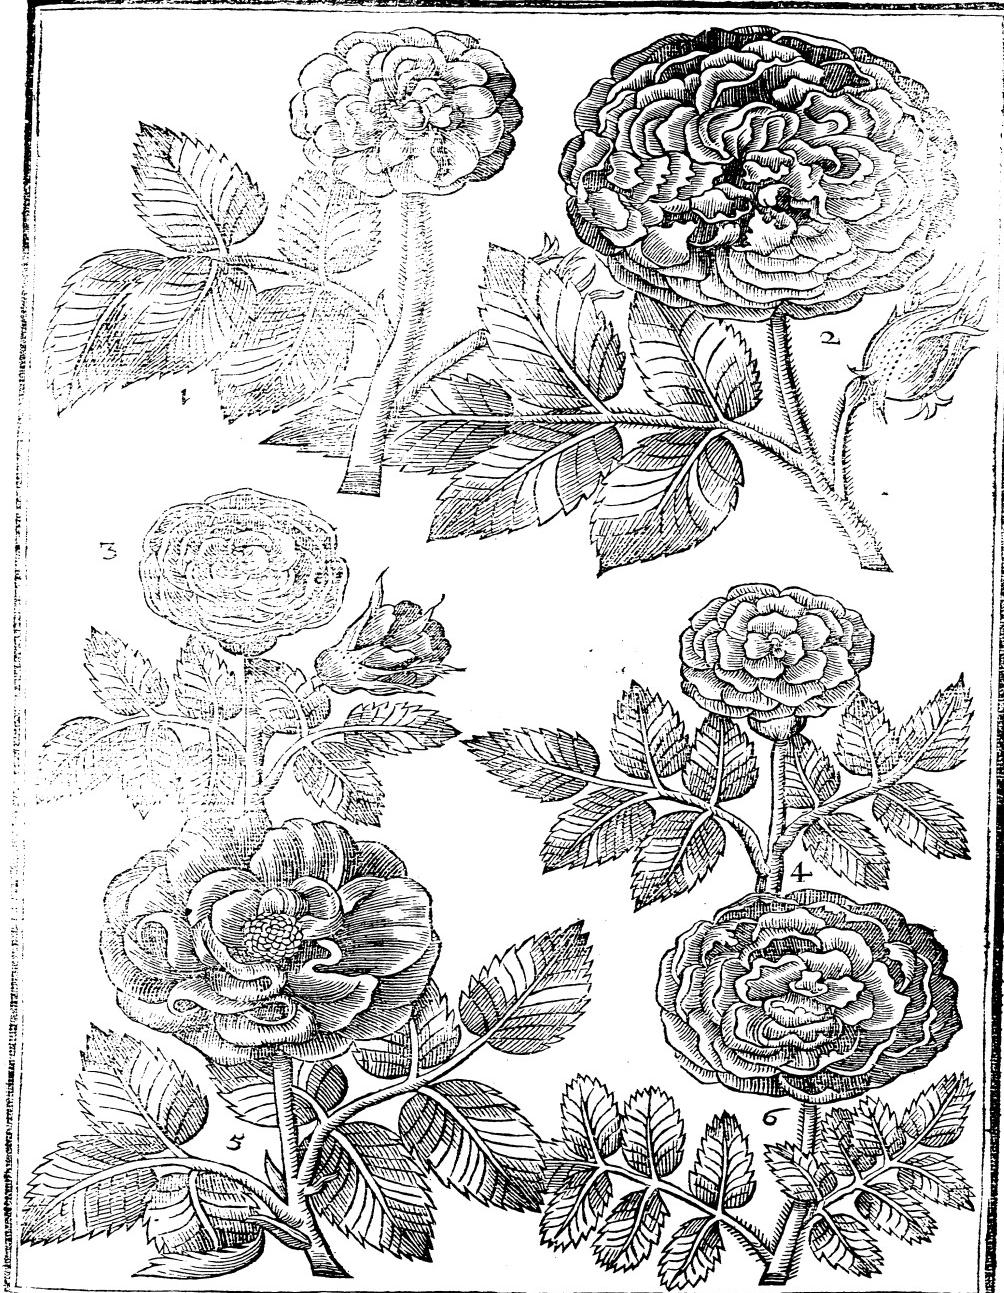

This Rose is very like vnto the last described, both for stocke, branch and leafe: the flower hereof is not much different from it, being no great large or double Rose, but of a meane size, striped and marked with a deeper blush or red, vpon the pale coloured leafe, that it seemeth in the marking and beauty thereof, to bee of as much delight as the Chrystall Gilloflower: this, euen like the former, soone fadeth and passeth away, not yeelding any great store of flowers any yeare.

10. *Rosa rubra humilis sive pumilio.*  
The dwarfe red Rose, or Gilloflower Rose.

This Rose growtheth alwayes low and small, otherwise in most respects like vnto the ordinary redd Rose, and with few or no thornes vpon it: the Flowers or Roses are double, thicke, small and close, not so much spread open as the ordinary red, but somewhat like vnto the first double white Rose before expressed; yet in some places I haue seene them more layde open then these, as they grew in my garden, being so euuen at the topes of the leaues, as if they had been clipt off with a paire of sheeres, and are not fully of so red a colour as the red Prouince Rose, and of as small or weak sent as the ordinary red Rose, or not so much.

11. *Rosa Francafurtenis.* The Franckford Rose.

The young shoothes of this Rose are couered with a pale purplish bark, set with a number of small prickes like haires, and the elder haue but very few thornes: the flower or rose it selfe hath a very great bud or button vnder it, more then in any other rose, and is thicke and double as a red rose, but so strongly swelling in the bud, that many of them breake before they can be full blowen, and then they are of a pale red rose colour, that is, betweene a red and a damaske, with a very thicke broade and hard vmbre of short yellow thredes or thrumes in the middle, the huske of the flower hauing long ends, which are called the beards of the rose, which in all other are iagged in some of them, in this hath no iagg at all: the smell is neerest vnto a red Rose.

12. *Ros/*

1. *Rosa Damascena.* The Damaske Rose. 2. *Rosa Provincialis sive Hollandica.* The great Prouince Rose. 3. *Rosa Francafurtenis.* The Franckford Rose. 4. *Rosa rubra humilis.* The dwarfe red Rose. 5. *Rosa Hungarica.* The Hungarian Rose. 6. *Rosa Intza multiplex.* The great double yellow Rose.

12. *Rosa Hungarica*. The Hungarian Rose.

The Hungarian Rose hath greene shoothes slenderly set with prickes, and seldom groweth higher then ordinarily the red Rose doth; the stemme or stocke being much about that bignesse: the flower or rose is as great, thicke and double, as the ordinary red Rose, and of the same fashion, of a paler red colour, and beeing neerely looked vpon is finely spotted with faint spots, as it were spreade ouer the red; the smell wherof is somewhat better then the smell of the ordinary red Rose of the best kinde.

13. *Rosa Holoferica simplex & multiplex*.  
The Velvet Rose single and double.

The old stemme or stock of the velvet Rose is couered with a dark coloured bark, and the young shoothes of a sad greene with very few or no thornes at all vpon them: the leaues are of a sadder greene colour then in most sorts of Roses, and very often seuen on a stalke, many of the rest hauing but five: the Rose is eyther single or double: the single is a broade spread flower, consisting of five or sixe broade leaues with many yellow thredes in the middle: the double hath two rowes of leaues, the one large, which are outermost, the other smaller within, of a very deepe red crimson colour like vnto crimson veluet, with many yellow thredes also in the middle; and yet for all the double rowe of leaues, these Roses stand but like single flowers: but there is another double kinde that is more double then this last, consisting oftentimes of sixteene leaues or more in a flower, and most of them of an equall bignesse, of the colour of the first single rose of this kinde, or somewhat fresher; but all of them of a smaller sent then the ordinary red Rose.

14. *Rosa sine spinis simplex & multiplex*.  
The Rose without thornes single and double.

The Rose without thornes hath diuers greene smooth shoothes, rising from the root, without any pricke or thorne at all vpon them, eyther young or old: the leaues are not fully so large as of the red rose: the flowers or roses are not much bigger then those of the double Cynamon Rose, thicke set together and short, of a pale red Rose colour, with diuers pale coloured veines through every leafe of the flower, which hath caused some to call it The marbled Rose, and is of a small sent, not fully equall to thered Rose. The single of this kinde differeth not in any other thing from the former, then in the doublenesse or singlenesse of the flowers, which in this are not halfe so double, nor yet fully single, and are of a paler red colour.

I haue heard likewise of a white Rose of this kinde, but I haue seene none such as yet, and therefore I can say no more thereof.

*Rosa sine spina*  
*flore alba*.

15. *Rosa Cynamomea simplex & multiplex*.  
The Cynamon Rose single and double.

The single Cynamon Rose hath his shoothes somewhat red, yet not so red as the double kinde, armed with great thornes, like almost vnto the Eglantine bush, thereby shewing, as well by the multiplicite of his shoothes, as the quicknesse and height of his shooting, his wilde nature: On the stemme and branches stand winged leaues, sometimes seuen or more together, which are small and greene, yet like vnto other Roses. The Roses are single, of five leaues a peece, somewhat large, and of a pale red colour, like vnto the double kinde, which is in shoothes redder, and in all other things like vnto the single, but bearing small, short, thicke and double Roses, somewhat like vnto the Rose without thornes, but a little lesser, of a paler red colour at the end of the leaues, and somewhat redder and brighter toward the middle of them, with many yellow short thrumes, the small sent of Cynamon that is found in the flowers hath caused it to beare the name.

16. *Rosa*

16. *Rosa lutea simplex*. The single yellow Rose.

This single yellow Rose is planted rather for variety then any other good vse. It often groweth to a good height, his stemme being great and wooddy, with few or no prickes vpon the old wood, but with a number of small prickes like haire, thicke set, vpon the younger branches, of a darke colour somewhat reddish, the bark of the young shoothes being of a sad greene reddish colour: the leaues of this Rose bush are smaller, rounder pointed, of a paler greene colour, yet finely snipt about the edges, and more in number, that is, seuen or nine on a stalke or ribbe, then in any other Garden kinde, except the double of the same kinde that followeth next: the flower is a small single Rose, consisting of five leaues, not so large as the single Spanish Muske Rose, but somewhat bigger then the Eglantine or sweets Briat Rose, of a fine pale yellow colour, without any great sent at all while it is fresh, but a little more, yet small and weake when it is dried.

17. *Rosa lutea multiplex* *sive flore pleno*.  
The double yellow Rose.

The double yellow Rose is of great account, both for the rarity, and doublenesse of the flower, and had it sent to the rest, wold of all other be of highest esteeme. The stemme or stocke, the young shoothes or branches, the small hairy prickes, and the small winged leaues, are in all parts like vnto the former single kinde; the chiefest difference consisteth in the doublenesse of the flower or Rose, which is so thicke and double, that very often it breaketh out on one side or another, and but a few of them abiding whole and faire in our Countrey, the cause whereof wee doe imagine to bee the much moisture of our Countrey, and the time of florwing being subiect to much raine and showers, many therefore doe either plant it against a wall, or other wayes defend it by couering: againe, it is so plentifull in young shoothes or branches, as also in flowers at the toppe of euery branch, which are small and weake for the most part, that they are not able to bring all the flowers to ripenesse, and therefore most of them fall or wither away without comming to perfection (the remedy that many doe vse for this inconuenience last recited is, that they nippe away most of the buds, leauing but some few vpon it, that so the vigour of the plant may be collected into a few flowers, whereby they may the better come to perfection, and yet euen thus it is hardly effected) which are of a yellowish greene colour in the bud, and before they be blowne open, but then are of a faire yellow colour, very full of leaues, with many short haire rather then leaues in the middle, and hauing short, round, greene, smooth buttons, almost flat vnder them: the flower being faire blowne open, doth scarce giue place for largenesse, thicknesse, and doublenesse, vnto the great Prouence or Holland Rose. This Rose bush or plant is very tender with vs here about London, and will require some more care and keeping then the single of this kinde, which is hardy enough; for I haue lost many my selfe, and I know but a few about this towne that can nurse it vp kindly, to beare or scarce to abide without perishing; but abideth well in every free aire of all or the most parts of this Kingdome: but(as I haere)not so well in the North.

18. *Rosa Moschata simplex & multiplex*.  
The Muske Rose single and double.

The Muske Rose both single and double, rise vp oftentimes to a very great height, that it overgroweth any arbour in a Garden, or being set by an house side, to bee ten or twelve foote high, or more, but more especially the single kinde, with many green farre spread branches, armed with a few sharpe great thornes, as the wilder sorts of Roses are, whereof these are accounted to be kindes, hauing small darke greene leaues on them, not much bigger then the leaues of Eglantine: the flowers come forth at the toppes of the branches, many together as it were in an umbell or tuft, which for the most part doe flower all at a time, or not long one after another, every one standing on a pretty long stalke, and are of a pale whitish or creame colour, both the single and the

## The Garden of pleasant Flowers.

the double; the single being small flowers, consisting of five leaves, with many yellow threads in the middle: and the double bearing more double flowers, as it they were once or twice more double then the single, with yellow thrummes also in the middle, both of them of a very sweete and pleasing smell, resembling Muske: some there be that haue auouched, that the chiefe sent of these Roses consisteth not in the leaves, but in the threads of the flowers.

19. *Rosa Moschata multiplex altera*: sive *Damascena alba*,  
vel *verisimilior Cinamomea* flore pleno albo.  
The double white Damaske Muske Rose.

This other kinde of Muske Rose (which with some is called the white Damaske Muske, but more truly the double white Cinamon Rose) hath his stemme and branches also shorter then the former, but as greene: the leaves are somewhat larger, and of a whiter greene colour; the flowers also are somewhat larger then the former double kinde, but standing in umbels after the same manner, or somewhat thicker, and of the same whitish colour, or a little whiter, and somewhat, although but a little, neare the smell of the other, but nothing so strong. This flowreth at the time of other Roses, or somewhat later, yet much before the former two sorts of Muske Roses, which flower not vntill the end of Summer, and in Autumn; both which things, that is, the time of the flowring, and the sent being both different, shew plainly it cannot be of the tribe of Muske Roses.

20. *Rosa Hispanica Moschata simplex*. The Spanish Muske Rose.

This Spanish Rose riseth to the height of the Eglantine, and sometimes higher, with diuers great greene branches, the leaves whereof are larger and greener then of the former kindes: the flowers are single Roses, consisting of five whiter leaves then in any of the former Muske Roses, and much larger, haing sometimes an eye of a blush in the white, of a very sweete smell, comming neare vnto the last recited Muske Rose, as also for the time of the flowring.

21. *Rosa Pomifera maior*. The great Apple Rose.

The stemme or stocke of this Rose is great, couered with a darke grayish barke, but the younger branches are somewhat reddish, armed here and there with great and sharpe thornes, but nothing so great or plentifull as in the Eglantine, although it be a wilde kinde: the leaves are of a whitish greene colour, almost like vnto the first white Rose, and five alwaies set together, but seldom seuen: the flowers are small and single, consisting of five leaves, without any sent, or very little, and little bigger then those of the Eglantine bush, and of the very same deepe blush colour, every one standing vpon a rough or prickly button, bearded in the manner of other Roses, which when the flowers are fallen growe great, somewhat long and round, peare-fashon, bearing the beards on the tops of them; and being full ripe are very red, keeping the small prickles still on them, wherein are many white, hard, and roundish seedes, very like vnto the seede of the Heppes or Eglantine berries, lying in a soft pulpe, like vnto the Hawthorne berries or Hawes: the whole beauty of this plant consisteth more in the gracefull aspect of the red apples or fruit hanging vpon the bushes, then in the flowers, or any other thing. It seemeth to be the same that Clusius calleth *Rosa Pumila*, but that with me it groweth much higher and greater then he saith his doth.

22. *Rosa silvestris odora* sive *Eglanteria simplex*.  
The single Eglantine or sweete Briar bush.

The sweete Briar or Eglantine Rose is so well knowne, being not onely planted in Gardens, for the sweetenesse of the leaves, but growing wilde in many woods and hedges, that I thinke it lost time to describe it; for that all know it hath exceeding long greene shoothes, armed with the cruellest sharpe and strong thornes, and thicker set then

## The Garden of pleasant Flowers.

1. Rosa sinensis multiplex. The double Rose without thorns. 2. Rosa Cinamomea Rose plena. The double Cinamomea Rose. 3. Rosa Hispanica simplex. The single Velvet Rose. 4. Rosa Hobsonica duplex. The double Velvet Rose. 5. Rosa Moschata multiplex. The double Muske Rose. 6. Rosa Moschata Hispanica simplex. The single Spanish Muske Rose. 7. Rosa Pomifera maior. The great Apple Rose. 8. Rosa silvestris sive Eglanteria duplex. The double Eglantine Rose.

then is in any Rose either wilde or tame : the leaues are smaller then in most of those that are nurised vp in Gardens, seuen or nine most vsually set together on a ribbe or stalk, very greene and sweete in smell, aboue the leaues of any other kinde of Rose: the flowers are small single blushe Rosas, of little or no sent at all, which turne into reddish berries, stuffed within with a dounie or flocky matter or substance, wherein doth lye white hard seede.

23. *Rosa silber Iris odora fine Eglanteria flore duplo.*  
The double Eglantine.

The double Eglantine is in all the places that I have seene it a grafted Rose, (but I doubt not, but that his originall was naturall, and that it may be made naturall againe, as diuers other Rosas are.) It groweth and spreadeth very well, and with a great head of branches, whereon stand such like leaues as are in the single kinde, but a little larger, not smelling fully so sweete as it : the flowers are somewhat bigger then the single, but not much, hauing but one other rowe of leaues onely more then the former, which are smaller, and the outer leaues larger, but of the same pale reddish purple colour, and smelleth somewhat better then the single.

24. *Rosa semper virens.* The euer greene Rose bush.

This Rose or bush is very like vnto a wilde single Eglantine bush in many respects, hauing many very long greene branches, but more slender and weake, so that many times they bead downe againe, not able to sustaine themselues without some helpe, and armed with hooked thornes as other Rosas be; the winged leaues consist of seuen for the most part, whereof those two that are lowest and oppofite, are smalllest, the next two bigger then they, the third couple bigger then any of the rest belowe, and the end leafe biggest of all: this proportion generally it holdeth in every winged leafe through the whole plant, which at the first comming forth are somewhat reddish, with the young branch that shootheit out with them, but being full growne, are of a deepe greene colour, and somewhat shining, dented about the edges, and fall not away from the branches as other Rosas doe, but abide thereon for the most part all the Winter: the flowers stand foure or fife together at the tops of the branches, being single Rosas, made of fife leaues a peece, of a pure white colour, much larger then the ordinary Muske Rose, and of a fine sent, comming nearest thereunto, with many yellow chiuces or threads in the middle.

The Place.

Some of these Rosas had their originall, as is thought in England, as the first and second; for these dried red Rosas that come ouer to vs from beyond the Seas, are not of the kinde of our red Rose, as may well be perceiued by them that will compare our English dried leaues with those. Some in Germany, Spaine, and Italy. Some againe in Turkie, as the double yellow Rose, which first was procured to be brought into England, by Master Nicholas Lete, a worthy Merchant of London, and a great louer of flowers, from Constantinople, which (as wee heare) was first brought thither from Syria; but perished quickly both with him, and with all other to whom hee imparted it: yet afterwards it was sent to Master John de France queille, a Merchant also of London, and a great louer of all rare plants, as well as flowers, from which is sprung the greatest store, that is now flourishing in this Kingdome.

The Time.

The Cinnamon Rose is the earliest for the most part, which flowreth with vs about the middle of May, and sometimes in the beginning. The ordinary Muske Rosas both single and double flower latest, as is said. All the other flower much about one time, in the beginning of June, or thereabouts, and continue flowring all that moneth, and the next throughout for the most part, and the red vntill August be halfe past.

The

The Names.

The feuerall names, whereby they are most commonly knowne vnto vs in this Countrey, are expressed in their titles; but they are much differing from what they are called in other Countries neare vnto vs, which to compare, conferre, and agree together, were a worke of more paines then vse: But to proportion them vnto the names set downe by Theophrastus, Pliny, and the rest of the ancient Authors, were a worke, wherein I might be sure not to escape without falling into errore, as I verily beleue many others haue done, that haue vndertaken to doe it: I will therefore for this worke desire that you will rest contented, with so much as hath already been deliuered, and expect an exact definition and complete satisfaction by such a methodicall course as a generall History will require, to be performed by them that shall publish it.

The Vertues.

The Rose is of exceeding great vse with vs; for the Damaske Rose (besides the superexcellent sweete water it yeeldeth being distilled, or the perfume of the leaues being dried, seruing to fill sweete bags) serueth to cause solublenesse of the body, made into a Syrupe, or preserued with Sugar moist or dry candid. The Damaske Prouince Rose, is not onely for sent nearest of all other Rosas vnto the Damaske, but in the operation of solubility also. The red Rose hath many Physicall vses much more then any other, seruing for many sorts of compositions, both cordiall and cooling, both binding and loosing. The white Rose is much vfed for the cooling of heate in the eyes: diuers doe make an excellente yellow colour of the iuyce of white Rosas, wherein some Allome is dissolued, to paint or colour flowers or pictures, or any other such things. There is little vse of any other sort of Rosas; yet some affirme, that the Muske Rosas are as strong in operation to open or loosen the belly as the Damaske Rose or Prouince.

C H A P. C X I.

*Ciftus.* The Holly Rose or Sage Rose.

**T**here are three principall kindes of *Ciftus*, the male, the female, and the gumme or sweete smelling *Ciftus* bearing *Ladanum*, called *Leden*. Of each of thefe three there are also diuers sorts: Of them all to intreate in this worke is not my minde, I will onely select out of the multitude some few that are fit for this our Garden, and leauue the rest to a greater.

1. *Ciftus mas.* The male Holly Rose or Sage Rose.

The male *Ciftus* that is most familiar vnto our Country, I meane that will best abide, is a small shrubby plant, growing seldom aboue three or foure foote high with vs, hauing many slender brittle wooddy branches, couered with a whitish bark, whereon are set many whitish greene leaues, long and somewhat narrow, crumpled or wrinckled as it were with veines, and somewhat hard in handling, especially the old ones; for the young ones are softer, somewhat like vnto Sage leaues for the forme and colour, but much smaller, two alwaies set together at a ioynt: the flowers stand at the toppe of the branches, three or foure together vpon severall slender footstalkes, consisting of fife small round leaues a peece, somewhat like vnto a small single Rose, of a fine reddish purple colour, with many yellow threads in the middle, without

N n

out any sent at all, and quickly fading or falling away, abiding seldome one whole day blowne at the most: after the flowers are past, there come vp round hard hairie heads in their places, containing small brownish seede: the roote is woody, and will abide some yeares with vs, if there be some care had to keepe it from the extremitie of our Winters frostes, which both this, and many of the other sorts and kinds, will not abide doe what we can.

2. *Cistus semina*. The female Holly Rose.

The female Holly Rose groweth lower, and smaller then the former male kinde, haing blackish branches, little woody, but not lesse brittle then it: the leaues are somewhat rounder and greener, but a little hard or rough withall, growing in the same manner vpon the branches by couples: the flowers grow at the topes of the branches, like vnto the former, consisting of fve leaues, but somewhat lesser, and wholly white, with yellow threds in the middle, as quickly fading, and of as little sent as the former: the heads and seede are somewhat bigger then in the former.

3. *Chamaecistus Frisicus*. The dwarfe Holly Rose of Friseland.

This dwarfe Cistus is a small low plant, haing diuers shoothes from the rootes, full of leaues that are long and narrow, very like vnto the leaues of the French Spikenard or *Spica Celica*; from among which leaues shoothe forth short stalkes, not above a span high, with a few smaller leaues thereon; and at the topes diuers small flowers one abone another, consisting of six small round leaues, of a yellow colour, haing two circles of reddish spots round about the bottome of the leaues, a little distant one from another, which adde much grace to the flower: after the flowers are past, there come in their places small round heads, being two forked at the end, containing within them small brownish chaffie seede: the root is small and slender, with many fibres therat creeping vnder ground, and shoothing forth in diuers places, whereby it much increaseth; the whole plant, and every par of it, smelleth strong without any pleasant sent.

4. *Cistus annuus*. The Holly Rose of a year.

This small Cistus that endureth but a year (and will require to be sowne euery year, if ye will haue it) riseth vp with straight, but slender hard stalkes, set here and there confusedly with long and narrow greenish leaues, very like vnto the leaues of the Gum Cistus or Ledon, being a little clammy withall: at the toppe of the stalkes, and at the ioynts with the leaues, stand two or three pale yellow flowers, consisting of fve leaues a piece, with a reddish spot neere the bottome of euery leafe of the flower, as quickly fading as any of the former: after which follow small three square heads, containing small seede, like vnto the first female kinde, but somewhat paler or yellower: the root is small and woody, and perisheth as soone as it hath borne seede.

5. *Cistus Ledon*. The Gum Cistus, or Sweete Holly Rose.

This sweete Holly Rose or Gum Cistus, riseth higher, and spreadeth larger then the former male kind doth, with many blackish woody branches, whereon are set diuers long and narrow dark greene leaues, but whitish vnderneath, two alwayes standing together at a ioint, both stalkes and leaues bedewied as it were continually with a clammy sweete moisture (which in the hot Countries is both more plentifull, and more sweet then in ours) almost transparent, and which being gathered by the inhabitants, with certaine instruments for that purpose (which in some places are leather thongs, drawne ouer the bushes, and after scraped off from the thongs againe, and put together) is that kind of blacke sweet gum, which is called *Ladanum* in the Apothecaries shops: at the tops of the branches stand single white flowers, like vnto single Roses, being larger then in any of the former kindes, consisting of fve leaues, whereof every one hath at the bottome a dark purplish spot, broad below, and small pointed vpwards, with some yellow threds in the middle: after which are past, there arise cornered heads,

1. *Cistus major*. The male Holly Rose. 2. *Chamaecistus Frisicus*. The dwarfe Holly Rose of Frisland. 3. *Cistus Ledon*. The sweet Holly Rose or gumme Cistus. 4. *Ledum Alpinum*. The mountaine Holly Rose. 5. *Ledum Silefacum*. The sweet Blary Rose of Silea. 6. *Loimiastrum auratum*. Gilded Rosemary.

heads, containing such small brownish seede as is in the former male kinde : the roote is woody, and spreadeth vnder ground, abiding some yeares, if it be placed vnder a wall, where it may bee defended from the windes that often breake it, and from the extremitie of our winters, and especially the snow, if it lye vpon it, which quickly causeth it to perish.

#### 6. *Ledum Alpinum seu Rosa Alpina*. The Mountaine sweet Holly Rose.

The fragrant smell with properties correspondent of two other plants, causeth me to inferre them in this Chapter, and to bring them to your knowledge, as well worthy a fit place in our Garden. The first of them hath diuers slender woody branches, two foote high or thereabouts, couered with a grayish coloured bark, and many times leaning downe to the ground, whereby it taketh roote againe : vpon these branches grow many thicke, short, hard greene leaues, thicke set together, confusedly without order, sometimes whitish vnderneath, and sometimes yellowish : the topes of the branches are laden with many flowers, which cause them to bend downwards, being long, hollow and reddish, opening into fve corners, spotted on the outside with many white spots, and of a paler red colour on the inside, of a fine sweet sent : after the flowers are past, there follow small heads, containing small brownish seede : the root is long, hard and woody, abiding better if it comprehend in the ground, then some of the former, because his originall is out of a colder country.

#### 7. *Ledum Silesiacum*. The sweete Mary Rose, or Rosemary of Silesia.

This other sweete plante riseth vp with woody ash-coloured branches two foote high or more, which shooe forth other branches, of a reddish or purplish colour, couered with a brownish yellow hoariness, on which are set many narrow long greene leaues, likevnto Rosemary leaues, but couered with the like hoariness as the stalks are (especially in the naturall places, but not so much being transplanted) and folding the fides of the leaues so close together, that they seeme nothing but ribbes, or stalkes, of an excellent sweet and pleasant sent ; at the ends of the branches there grow certaine brownish scaly heads, made of many small leaues set thicke together, out of which breaketh forth many flowers, standing in a tuft together, yet seuerally every one vpon his owne footstalke, consisting of fve white leaues, with certaine white thredes in the middle, smelling very sweete : after which rise small greene heads, spotted with brownish spots, wherein is contained very small, long, yellowish seede : the roote is hard and woodie.

#### The Place.

The first, second, fourth and fifth, grow in the hot Countries, as Italie, Spaine, &c. The third, and the two last in the colder Countries, as Frisia, Germanie, Bohemia.

#### The Time.

They do all flower in the Summer moneths of Iune, July and August, and their seede is ripe quickly after.

#### The Names.

The first, second, fourth and fifth, haue their names sufficiently expressed in their descriptions. The third was sent vnto Clusius, vnder the name of *Herculus Friesicus*, because of the strong sent : but he referreth it to the kinds of *Chamaecistus*, that is, dwarfe or low *Cistus*, both for the low growth, and for the flowers and seede sake. The sixt is diuersly called, for Clusius calleth it *Ledum Alpinum* : others, *Nerium Alpinum*, making it to bee a Rose Bay. Gesner

Gesner according to the Countrey peoples name, *Rosa Alpina*, and *Rosa Montana*. Lobel calleth it *Balsamum Alpinum*, of the fragrant smell it hath, and *Chamerbododendros Chamaleas folio*. And some haue called it *Euonymus*, without all manner of judgement. In English wee may call it, The Mountaine Rose, vntill a fitter name be given it. The last is called of *Matriolus*, *Rosmarinum silvestre*, but of *Clulus Ledum*, referring it to their kindred ; and *Silesicum*, because he found it in that Countrey ; or for distinction sake, as he faith, it may bee called, *Ledum folijs Rosmarini*, or *Ledum Bohemicum*. Cordus, as it feineth in his History of Plants, calleth it *Chamepeuce*, as though he did account it a kinde of low Pine, or Pitch tree.

#### The Vertues.

The first, second, and fift, are very astringent, effectuall for all sorts of fluxes of humours. The sweet Gum called *Ladanum*, made artificially into oyle, is of singular vse for *Alopecia*, or falling of the haire. The seed of the fourth is much commended against the stone of the Kidneys. The sweete Rosemary of Silesia is vsed of the inhabitants, where it naturally groweth, against the shrinking of newnes, crampes, or other such like diseases, wherof their daily experiance makes it familiar, being vsed in bathing or otherwise.

#### C H A P. C X I I .

#### *Rosmarinum*. Rosemary.

Here hath beene vsually knowne but one sort of Rosemary, which is frequent through all this Country : but there are some other sorts not so well knowne, the one is called Gilded Rosemary, the other broadleaved Rosemary ; a third I will adioyne, as more rare then all the other, called Double flowered Rosemary, because few haue heard thereof, much lesse seene it, and my selfe am not well acquainted with it, but am bold to deliuere it vpon credit.

#### 1. *Libazotis Coronaria fiae Rosmarinum vulgare*. Our Common Rosemary.

This common Rosemary is so well knowne through all our Land, being in euery womans garden, that it were sufficient but to name it as an ornament among other sweete herbes and flowers in our Garden, seeing every one can describe it : but that I may say something of it. It is well obserued, as well in this our Land (where it hath been planted in Noblemens, and great mens gardens against bricke wals, and there continued long) as beyond the Seas, in the naturall places where it groweth, that it riseth vp in time vnto a very great height, with a great and woody stemme (of that compasse, that being clouen out into thin boards) it hath serued to make lutes, or such like instruments, and herc with vs Carpenters rules, and to diuers other purposes) branching out into diuers and sundry armes that extend a great way, and from them againe into many other smaller branches, wheron are set at seueral distances, at the ioynts, many very narrow long leaues, greene aboue, and whitish vnderneath ; among which come forth towards the topes of the stalkes, diuers sweet gaping flowers, of a pale or bleake bleuish colour, many set together, standing in whitish huskes ; the seed is small and red, but therof seldom doth any plants arise that will abide without extraordinary care ; for although it will spring of the seede reasonable well, yet it is so small and tender the first yeare, that a sharpe winter killeth it quickly, vnlesse it be very well defended : the whole plant as well leaues as flowers, smelleth exceeding sweete.

#### 2. *Rosmarinum striatum*, fiae *aureum*. Gilded Rosemary.

This Rosemary differeth not from the former, in forme or manner of growing, nor  
N n 3 in

in the forme or colour of the flower, but only in the leaues, which are edged, or striped, or pointed with a faire gold yellow colour, which so continueth all the yeare throughout, yet fresher and fairer in Summer then in Winter; for then it will looke of a deader colour, yet so, that it may be discerned to be of two colours, green & yellow.

*3. Rosmarinum latifolium.* Broade leaved Rosemary.

This broad leaved Rosemary groweth in the same manner that the former doth, but that we haue not seene it in our Countrey since we had it to grow so great, or with such woody stemmes: the leaues stand together vpon the long branches after the same fashion, but larger, broader and greener then the other, and little or nothing whitish vnderneath: the flowers likewise are of the same forme and colour with the ordinary, but larger, and herein consisteth the difference.

*4. Rosmarinum flore duplo.* Double flowered Rosemary.

The double flowered Rosemary thus far differeth from the former, that it hath stronger stalkes, not so easie to breake, fairer, bigger and larger leaues, of a faire greene colour, and the flowers are double, as the Larkes heele or spurre: This I haue onely by relation, which I pray you accept, vntill I may by sight better enforme you.

**The Place.**

Our ordinary Rosemary groweth in Spaine, and Prouence of France, and in others of those hot Countries, neere the Sea side. It will not abide (vnlesse kept in stoues) in many places of Germany, Denmarke, and those colder Countries. And in some extreme hard winters, it hath well neare perished here in England with vs, at the least in many places: but by slipping it is vsually, and yearly encreased, to replenish any garden.

**The Time.**

It flowreth oftentimes twice in the yeare, in the Spring first, from April vntill the end of May or Iune, and in August and September after, if the yeare before haue beene temperate.

**The Names.**

Rosemary is called of the ancient Writers, *Libanotis*, but with this distinction, *Stephanomatica*, that is, *Coronaria*, because there were other plants called *Libanotis*, that were for other vses, as this for garlands, where flowers and sweete herbes were put together. The Latines call it *Rosmarinum*. Some would make it to be *Cneorum nigrum* of Theophrastus, as they would make Lauander to bee his *Cneorum album*, but Matthiolus hath sufficiently confuted that error.

**The Vertues.**

Rosemary is almost of as great vs as Bayes, or any other herbe both for inward and outward remedies, and as well for ciuill as physicall purposes. Inwardly for the head and heart; outwardly for the finewes and ioynts: for ciuill vses, as all doe know, at weddings, funerals, &c. to bestow among friends: and the physicall are so many, that you might bee as well tyred in the reading, as I in the writing, if I should set down all that might be said of it. I will therefore onely giue you a taste of some, desiring you will be content therewith. There is an excellent oyle drawne from the flowers alone by the heate of the Sunne, auailable for many diseases both inward and outward, and accounted a fowcraigne Balsame: it is also good to helpe dim-

nesse of sight, and to take away spots, markes and scarres from the skin; and is made in this manner. Take a quantitie of the flowers of Rosemary, according to your owne will eyther more or lesse, put them into strong glasse close stopped, set them in hot horse dung to digest for fourteen dayes, which then being taken forth of the dung, and vnstopped, tye a fine linnen cloth ouer the mouth, and turne downe the mouth thereof into the mouth of another strong glasse, which being set in the hot Sun, an oyle will distill downe into the lower glasse, which preserue as precious for the vses before recited, and many more, as experience by practice may enforme diuers.

There is another oyle Chymically drawne, auailable in the like manner for many the same inward and outward diseases, viz. for the heart, rheumaticke braines, and to strengthen the memory, outwardly to warme and comfort cold benummed sinewes, whereof many of good judgement haue had much experience.

**CHAP. CXIII.**

*Myrtus.* The Mirtle tree or bush.

**I**N the hot Countreyes, there haue been many sorts of Mirtles found out, naturally growing there, which will not fructifie in this of ours, nor yet abide without extraordinary care, and conuenience withall, to preserue them from the sharpenesse of our winters. I shall only bring youto view three sorts in this my Garden, the one with a greater, the other two with lesser leaues, as the remainder of others which wee haue had, and which are preserued from time to time, not without much paine and trouble.

*1. Myrtus latifolia.* The greater leaved Mirtle.

The broader leaved Mirtle riseth vp to the height of foure or five foote at the most with vs, full of branches and leaues growing like a small bush, the stemme and elder branches whereof are couered with a dark coloured bark, but the young with a green, and some with a red, especially vpon the first shooting forth, whereon are set many fresh greene leaues, very sweet in smell, and very pleasant to behold, so neer resembling the leaues of the Pomegranate tree that groweth with vs, that they soone deceiu many that are not expert therein, being somewhat broade and long, and pointed at the ends, abiding alwaies green: at the ioynts of the branches where the leaues stand, come forth the flowers vpon small footestakes, every one by it selfe consisting of fve small white leaues, with white threds in the middle, smelling also very sweet: after the flowers are past, there doe arise in the hot Countries, where they are naturall, round blacke berries, when they are ripe, wherein are contained many hard white crooked seedes, but neuer in this Countrey, as I said before: the roote disperseth it selfe into many branches, with many fibres annexed thereto.

*2. Myrtus minor, seu minore folio.* The smaller leaved Mirtle.

The smaller leaved Mirtle is a low shrub or bush, like vnto the former, but scarce rising so high, with branches spreading about the stemme, much thicker set with leaues then the former, smaller also, and pointed at the ends, of a little deeper greene colour, abiding greene also winter and summer, and very sweete likewise: the flowers are white like vnto the former, and as sweete, but shew not themselues so plentifull on the branches: the fruit is blacke in his naturall places, with seedes therein as the former.

*3. Myrtus minor rotundifolio.* Boxe Mirtle.

Wee haue another sort of this small kinde of Mirtle, so like vnto the former both for smalnesse, deepe greene colour of the leaues, and thick growing of the branches, that

that it will be thought of most, without good heede, and comparing the one with the other, to be the very same with the former: but if it bee well viewed, it will shew, by the roundnesse at the ends of the leaues very like unto the small Boxe leaues, to be another differing kinde, although in nothing else. Wee nurse them with great care, for the beautifull aspect, sweete sent and raritie, as delights and ornaments for a garden of pleasure, wherein nothing should be wanting that art, care and cost might produce and preserue: as also to set among other euer greene plants to sort with them.

#### The Place.

These, and many other sorts of Mirtles grow in Spaine, Portugall, Italie, and other hot Countries in great abundance, where they make their hedges of them: wee (as I said) keepe them in this Countrey, with very great care and diligence.

#### The Time.

The Mirtles doe flower very late with vs, not vntill August at the soonest, which is the cause of their not fructifying.

#### The Names.

They are called in Latine *Mirtus*, and in English Mirtle tree, without any other diversitie of names, for the generall title. Yet the feuerall kindes haue had severall denominations, in Pliniestime, and others, as *Romana*, *Coniagata*, *Terentina*, *Egyptia*, *alba*, *nigra*, &c. which haue noted the differences, even then well obserued.

#### The Vertues.

The Mirtle is of an astringent qualitie, and wholly vsed for such purposes.

### C H A P. C X I I I .

#### *Malus Punica* sive *Granata*. The Pomegranet tree.

There are two kindes of Pomegranet trees. The one tame or manured, bearing fruit, which is distinguished of some into two sorts, of others into three, that is, into sower, and sweet, and into sower sweete. The other wilde, which beareth no fruite, because it beareth double flowers, like as the Cherry, Apple, and Peach tree with double blossomes, before described, and is also distinguished into two sorts, the one bearing larger, the other lesser flowers. Of the manured kinde wee haue only one sort (so farre as we know) for it neuer beareth ripe fruit in this our Countrey which for the beautifull aspect, both of the greene verdue of the leaues, and faire proportion and colour of the flowers, as also for the raritie, are nursered in some few of their gardens that delight in such rarities: for in regard of the tendernesse, there is neede of diligent care, that is, to plant it against a brick wall, and defend it conueniently from the sharpenesse of our winters, to give his Master some pleasure in seeing it beare flowers: And of the double kinde we haue as yet obtained but one sort, although I shall giue you the knowledge and description of another.

#### 1. *Malus Punica sativa*. The tame Pomegranet tree.

This Pomegranet tree growtheth not very high in his naturall places, and wirth vs sometimes it shoothe forth from the roote many brownish twigges or branches, or if it bee pruned from them, and suffered to grow vp, it riseth to bee seuen or eight foote high, spreading

1. *Myrsus lanigera major*. The broad leaved Myrtle. 2. *Myrsus angustifolia minor*. The small leaved Myrtle. 3. *Myrsus buxifolia minor*. The Box-leaved Myrtle. 4. *Malus Granata sativa siccata*. The ordinary Pomegranate tree. 5. *Balaustina Ramentum frumentum*. The lesser double-flowered Pomegranate. 6. *Balaustina major siccata Cyprium*. The greater double-flowered Pomegranate. 7. *Pseudocarpus siccus Amerianum Plag.* The Winter Cherry tree. 8. *Ficus Indica cum fructu*. The Indian Figtree and his fruit.

## The Garden of pleasant Flowers.

spreading into many small and slender branches, here and there set with thornes, and with many very faire greene shining leaues, like in forme and bignesse vnto the leaues of the larger Myrtle before described, every one hauing a small reddish foote-stalke vpon these branches: among the leaues come forth here and there, long, hard, and hollow reddish cups, diuided at the brimmes, wherein doe stand large singule flowers, every one consisting of one whole leafe, smaller at the bottome then at the brimme, like bels, diuided as it were at the edges into fve or six parts, of an orient red or crimson colour in the hotter Countries; but in this it is much more delayed, and tenderly neare vnto a blush, with diuers threads in the middle. The fruit is great and round, haung as it were a crowne on the head of it, with a thicke tough hard skinne or rinde, of a brownish red colour on the outside, and yellow within, stuffed or packt full of small graine, every one encompaft with a thin skin, wherein is contained a cleare red iuyce or liquor, either of a sweet (as I said before) or sower taste, or betweene them both of a winie taste: the roote disperseth it selfe very much vnder ground.

2. *Balanstium minus* sive *Malus Punica filicifolia major*.  
The greater wilde or double blossomed Pomegranet tree.

The wilde Pomegranet is like vnto the tame in the number of purplish branches, haung thornes, and shining faire greene leaues, somewhat larger then the former: from the branches likewise shoothe forth flowers, farre more beautifull then those of the tame or manured sort, because they are double, and as large as a double Prouince Rose, or rather more double, of an excellent bright crimson colour, tending to a silken carnation, standing in brownish cups or huskes, diuided at the brims vsually into foure or fve seuerall points, like vnto the former, but that in this kinde there never followeth any fruit, no not in the Country, where it is naturally wilde.

3. *Balanstium minus*. The smaller wilde Pomegranet tree.

This smaller kinde differeth from the former in his leaues, being of a darker greene colour, but not in the height of the steme, or purplishnesse of his branches, or thornes vpon them; for this doth shew it selfe more like vnto a wilde kind then it: the flowers hereof are much smaller, and not so thicke and double, of a deeper or fadder red Orenge tawny colour, set also in such like cups or huskes.

The Place.

The tame or manured kinde groweth plentifully in Spaine, Portugall, and Italy, and other in other warme and hot countries. Wee (as I said before) preferue it with great care. The wilde I think was never seene in England, before John Tradescante my very louing good friend brought it from the parts beyond the Seas, and planted it in his Lords Garden at Canterbury.

The Time.

They flower very late with vs, that is, not vntill the middle or end of August, and the cold eueninges or frosts comming so soone vpon it, doth not onely hinder it from bearing, but many times the sharpe winters so pinch it, that it withereth it downe to the ground, so that oftentimes it hardly springeth againe.

The Names.

The name *Malus Punica* for the tree, and *Malam Punicum* for the fruit, or *Malus Granata*, and *Malam Granatum*, is the common name giuen vnto this tree, which is called in English the Pomegarnet or Pomegranet tree. The flowers of the tame kinde are called *Cytinus*, as Dioscorides saith, although Plinie seemeth either to make *Cytinus* to be the flower of the wilde kinde, or *Balanstium*

## The Garden of pleasant Flowers.

*Balanstium* to be the flower of both tame and wilde kinde: but properly, as I take it, *Cytinus* is the cup wherin the flower as well of the tame as wilde kinde doth stand; for vnto the similitude of them, both the flowers of *Ageratum*, and the seede vessels of *Hypocratea* are compared and resembled, and not vnto the whole flower: the barke or rinde of the fruit is called of diuers *Sidion*, and in the Apothecaries shoops *Psidium*, and cortes *Granatum*. The wilde kinde is called *Malus Punica filicifolia*: In English, The wilde Pomegranet tree; the flower thereof is properly called *Balanstium*. The lesser kind is vsually called *Balanstium Romanum*, as the greater is called *Creticum* and *Cyprinum*, because they growe in Candy and Cyprus.

The Vertues.

The vse of all these Pomegranets is very much in Physick, to coole and binde all fluxibility both of body and humours: they are also of singular effect in all vlcers of the mouth, and other parts of the body, both of man and woman. There is no part of them but is applied for some of these respects. The rinde also of the Pomegrane: is vsed of diuers in stead of Gaules, to make the best sort of writing Inke, which is durable to the worlds end.

C H A P. C X V.

*Amonum Pliny seu Pseudocapiscum*.  
Tree Night shade or the Winter Cherry tree.

I Haue adioyned this plant, for the pleasurable beauty of the greene leaues, and red berries. It groweth vp to be a yard or foure foote high at the most, hauing a small wooddy steme or stocke, as bigge as ones finger or thumbe, couered with a whitish greene bark, set full of greene branches, and faire greene leaues, somewhat vneuen sometimes on the edges, narrower then any Night shade leaues, and very neare resembling the leaues of the *Capiscum*, or Ginny pepper, but smaller and narrower, falling away in the Winter, and shooting fresh in the Spring of the yeare: the flowers growe often two or three together, at the ioynts of the branches with the leaues, being white, opening starre-fashion, and sometimes turning themselues backe, with a yellow pointell in the middle, very like vnto the flowers of Night shade: after the flowers are past, come forth in their stead smallicone buttons, which after turne to be pleasant round red berries, of the bignesse of small Cherries when they are ripe, which with vs vsually ripen not vntill the Winter, or about Christmas, wherein are contained many small whitish seede that are flat: all the whole plant, as well leaues and flowers as seede, are without either smell or taste: the roote hath many yellowish strings and fibres annexed vnto it.

The Place.

The originall place hereof is not well knowne, but is thought to bee the West Indies. It hath been planted of long time in most of these Countries, where it abideth reasonable well, so that some care bee had thereof in the extremity of the Winter.

The Time.

It flowreth sometimes in June, but vsually in July and August, and the fruit is not ripe (as is said) vntill the Winter.

**The Names.**

This plant hath diuers names ; for it is thought to be that kinde of *Anomum* that Plinie setteth downe. Dodonaeus calleth it *Pseudocapsicum*, for some likenesse in the leafe and fruit vnto the small *Capsicum* or Ginnie Pepper, although much vnlike in the taste and property. Others doe call it *Strichnedendron*, that is, *Solanum arboreum*, and wee in English according thereunto, Tree Night shade. But some Latine asles corrupting the Latin word *Anomum*, doe call it the Mumme tree. Dalechampius calleth it *Solanum Americum, seu Indicum*, and saith the Spaniards call it in their tongue, *Guindas de las Indias*, that is, *Cerasa Indiana*, Indian Cherries, which if any would follow, I would not bee much against it : but many Gentlewomen doe call them Winter Cherries, because the fruit is not throughly ripe vntill Winter.

**The Vertues.**

I finde no Physicall property allotted vnto it, more then that by reason of the insipiditie, it is held to be cooling.

**C H A P. C X VI.***Ficus Indica minor. The smaller Indian Figgetree.*

**T**HIS Indian Figgetree, if you will call it a tree (because in our Country it is not so, although it groweth in the naturall hot Countries from a wooddy stemme or body into leaues) is a plant consisting only of leaues, one springing out of another, into many branches of leaues, and all of them growing out of one leafe, put into the ground halfe way, which taking roote, all the rest rise out thereof, those belowe for the most part being larger then those aboue ; yet all of them somewhat long, flat, and round pointed, of the thicknesse of a finger vsually, and smallest at the lower end, where they are ioyned or spring out of the other leaues, hauing at their first breaking out a shew of small, red, or browne prickes, thicke set ouer all the vpper side of the leaues, but with vs falling away quickly, leauing onely the markes where they stood : but they haue besides this shew of great prickes, a few very fine, and small, hard, white, and sharpe, almost insensible prickes, being not so bigge as haire on the vnderside, which will often sticke in their fingers that handle them vnauidisely, neither are they to be discerned vniess one look precisely for them : the leaues on the vnderseite having none of those other great prickes or marks at all, being of a faire fresh pale green colour : out of the vppermost leaues break forth certaine greene heads, very like vnto leaues (so that many are deceiued, thinking them to be leaues, vntill they mark them better, and be better experiented in them) but that they growe round and not flat, and are broad at the toppe ; for that out of the tops of every of them shooteth out a pale yellow flower, consisting of two rowes of leaues, each containing five leaues a peccce, laid open with certaine yellow threads, tipt with red in the middle : this greene head, vntill the flower be past, is not of halfe that bignesse that it attainteth vnto after, yet seldome or never commeth vnto perfection with vs, being long and round, like vnto a Figge, small belowe, and greater aboue, bearing vpon the flat or broad head the marke of the flower ; some holding still on them the dried leaues, and others hauing lost them, shew the hollownesse which they haue in the toppe or middle of the head, the sides round about being raised or standing vp higher : this head or figge in our Country abideth greene on the outside, and little or nothing reddish within (although it abide all the Winter, and the Summer following, as sometimes it doth) for want of that heate and comfort of the Sunne it hath in his naturall place, where it groweth reddish

reddish on the outside, and containing within it a bloudy red clammy iuyce, making the vrine of them that eate of them as red as bloud, which many seeing, were in doubt of themselues, lest their vrine were not very bloud ; of what sweetnesse, like a figge, in the naturall places, I am not well assured, yet affirmed : but those that haue beeene brought vnto me, whose colour on the outside was greenish, were of a reddish purple within, and contained within them round, small, hard seede, the taste was flat, waterish, or insipide : the roote is neither great, nor dii perseth it selfe very deepe or farre, but shooteth many small rootes vnder the upper crust of the earth.

There is a greater kinde hereof, whose leaues are twice or thrice as bigge, which haing been often brought vs, will seldome abide more then one Summer with vs, our Winters alwaies rotting the leaues, that it could not be longer kept.

**The Place.**

This Indian Figge tree groweth dispersedly in many places of America, generally called the West Indies : The greater kinde in the more remote and hot Countries, as Mexico, Florida, &c. and in the Bermudas or Summer Islands, from whence wee haue often had it. The lesser in Virginia, and those other Countries that are nearer vnto vs, which better endureth with vs.

**The Time.**

It flowreth with vs sometimes in May, or June ; but (as I said) the fruit neuer commeth to perfection in this Country.

**The Names.**

Diuers doe take it to bee *Opuntia Pliny*, whereof hee speaketh in the 21. Booke and 17. Chapter of his Naturall History : but he there saith, *Opuntia* is an herbe, sweete and pleasant to be eaten, and that it is a wonder that the roote should come from the leafe, and so to growe ; which words although they decipher out the manner of the growing of this plant, yet because this is a kinde of tree, and not an herbe, nor to be eaten, it cannot bee the same : but especially because there is an herbe which groweth in the same manner, or very neare vnto it, one leafe standing on the toppe or side of another, being a Sea plant, fit to be eaten with vinegar and oyle (as many other herbes are that growe in the salt marshes, or neare the Sea, whereof Sea Purflane is one) which Clusius calleth *Lycben Marinus*, and (as Clusius saith) Cortusus very fitly called *Opuntia marina*, and out of doubt is the verie same *Opuntia* that Theophrastus maketh mention of, and Plinie out of him. Our English people in Virginia, and the Bermuda Island, where it groweth plentifully, because of the form of the fruit, which is somewhat like to a Pear, & not being so familiarly acquainted with the growing of Figs, sent it vnto vs by the name of the prickly Pearce, from which name many haue supposed it to be a Pearce indeede, but were therein deceiued.

**The Vertues.**

There is no other especiall property giuen hereunto, by any that haue written of the West Indies, then of the colouring of the vrine, as is before said.

## CHAP. CXVII.

*Tuca sine Iucca.* The supposed Indian Iucca.

This rare Indian plant hath a great thicketuberous roote (spreading in time into many tuberous heads) from the head whereof shooeth forth many long, hard, and guttured leaues, very sharpe pointed, compassing as it were one another at the bottome, of a grayish greene colour, which doe not fall away, but abide euer greene on the plant; from the middle whereof springeth forth (now and then, but not every year) a strong round stalke, diuided into diuers branches, whereon stand diuers white, and somewhat large flowers, hanging downe their heads, consisting of six leaues, with diuers veines, of a weake reddish or blushe colour, spread on the backe of the three outer leaues, especially from the middle of the leaues to the bottome, and not rising to the edge of the leafe of any flower, which fall away without bearing any seede in our Country, as farre as euer could be obserued either in the plant that Master Gerard kept a long time by him, or by Robinus at Paris his plant, which Master Gerard sent vnto him, or yet by that plant, that Vespasian Robin the sonne of old Robin sent vnto Master Iohn de Franqueville, and now abideth and flourishest in my Garden.

## The Place.

It was first brought into England (as Master Gerard saith) from the West Indies, by a seruant of Master Thomas Edwards, an Apothecary of Exeter, and imparted to him, who kept it vnto his death: but perished with him that got it from his widow, intending to send it to his Country house.

## The Time.

It flowreth not vntill July, and the flowers fall away sodainely, after they haue beeene blowne open a while.

## The Names.

Master Gerard first as I thinke called it *Iucca*, supposing it to bee the true *Tuca of Thenuet*, wherewith the Indians make bread, called *Cassans*: but the true *Iucca* is described to haue a leafe diuided into seuen or nine parts, which this hath not: Yet not knowing by what better name to call it, let it hold still his first imposition, vntill a fitter may be giuen it.

## The Vertues.

Wee haue not heard of any, that hath either read, heard, or experimeted the faculties hereof, nor yet whether it hath good or euill taste; for being rare, and possessed but by a few, they that haue it are loth to cut any thereof, for feare of spoiling and losing the whole roote.

Some haue affirmed, that in some parts of Turkie, where as they say this plant groweth, they make a kinde of cloth from the threads are found running through the leaues; but I finde the threads are so strong and hard, that this cannot be that plant the relators meane is vsed in that manner.

## C H A P. C X V I I I .

*Arbor vita.* The tree of life.

**T**He tree of life riseth vp in some places where it hath stood long, to be a tree of a reasonable great bignesse and height, covered with a redder bark than any other tree in our Country that I know, the wood whereof is firme and hard, and spreadeth abroad many armes and branches, which againe send forth many smaller twigges, bending downewards; from which twiggy or slender branches, being flat themselves like the leaues, come forth on both sides many flat winged leaues, somewhat like vnto Sauine, being short and small, but not pricking, seeming as if they were brayded or folded like vnto a lace or point, of a darke yellowish greene colour, abiding greene on the branches Winter and Summer, of a strong resinous taste, not pleasing to most, but in some ready to procure casting, yet very cordiall and pectorall also to them that can endure it: at the topes of the branches stand small yellowish dounie flowers, set in small scaly heads, wherein lye small, long, brownish seede, which ripen well in many places, and being sowne, doe spring and bring forth plants, which with some small care will abide the extreamest Winters we haue.

## The Place.

The first or originall place where it naturally groweth, as farre as I can learne or vnderstand, is that part of America which the French doe inhabite, about the riuier of Canada, which is at the backe of Virginia Northward, and as it seemeth, first brought by them from thence into Europe, in the time of Francis the first French King, where it hath so plentifully encraced, and so largely beeene distributed, that now few Gardens of respect, either in France, Germany, the Lowe Countries, or England, are without it.

## The Time.

It flowreth in the end of May, and in June; the fruit is ripe in the end of August and Sptember.

## The Names.

All the Writers that haue written of it, since it was first knowne, haue made it to be *Thuya genus*, a kinde of Thuya, which Theophrastus compareth vnto a Cyppresse tree, in his fifth Book and fifth Chapter: but *Omnes si- mile non est idem*, and although it haue some likenesse, yet I verily beleue it is *proprium sui genus*, a proper kinde of it owne, not to bee paralleld with any other. For wee finde but very few trees, herbes, or plants in America, like vnto those that growe in Europe, the hither part of Africa, or in the lesser Asia, as experiance testifieth. Some would make it to be *Cedrus Lycia*, but so it cannot be. The French that first brought it, called it *Arbor vita*, with what reason or vpon what ground I know not: but euer since it hath continued vnder the title of the Tree of life.

## The Vertues.

It hath beeene found by often experiance, that the leaues hereof chewed in the morning fasting, for some few dayes together, haue done much good to diuers, that haue beeene troubled with shortnesse of breath, and to helpe to expetorate thinne purulentous matter stuffing the lungs. Other properties I haue not heard that it hath; but doubtlesse, the hot resinous smell and taste

taste it hath, both while it is fresh, and after it hath beene long kept dry, doth evidently declare his tenuitie of parts, a digesting and cleansing quality it is possessed with, which if any industrious would make tryall, hee should finde the effects.

## C H A P. C X I X .

*Arbor Iuda.* Iudas tree.

**I**Vdas tree riseth vp in some places, where it standeth open from a wall, and alone free from other trees (as in a Garden at Bathersay, which sometimes agoe belonged to Master Morgan, Apothecary to the late Queene Elizabeth of famous memory) to be a very great and tall tree, exceeding any Apple tree in height, and equall in bignesse of body thereunto (as my selfe can testifie, being an eye witnesse thereof) when as it had many stalkes of flowers, being in the bud, breaking out of the body of the tree through the bark in diuers places, when as there was no boough or branch near them by a yard at the least, or yet any leafe vpon the tree, which they gathered to put among other flowers, for Nosegays) and in other places lit growtheth to bee but an hedge bush, or plant, with many suckers and shoothes from belowe, covered with a darke reddish bark, the young branches being more red or purplish: the flowers on the branches come forth before any shew or budding of leaues, three or four standing together vpon a small foote-stalke, which are in fashion like vnto Pease blossomes, but of an excellent deepe purplish crimson colour: after which come in their places so many long, flat, large, and thinn cods, of a brownish colour, wherein are contained small, blackish browne, flat, and hard seede: the roote is great, and runneth both deepe, and farre spreading in the earth: the leaues come forth by themselves, every one standing on a long stalke, being hard & very round, like vnto the leafe of the largest *Ajaram*, but not so thick, of a whitish green on the vpper side, and grayish vnderneath, which fall away euery yeare, and spring afresh after the Spring is well come in, and the buds of flowers are sprung.

There is another of this kinde, growing in some places very high, somewhat like *Lore alba*: the former, and in other places also full of twiggy branches, which are greener then the former, as the leaues are likewise: the flowers of this kinde are wholly white, and the cods nothing so red or browne, in all other things agreeing together.

## The Place.

The former groweth plentifully in many places of Spaine, Italy, Provence in France, and in many other places. The other hath beeene sent vs out of Italy many times, and the seede hath sprung very well with vs, but it is somewhat tender to keepe in the Winter.

## The Time.

The flowers (as I said) appeare before the leaues, and come forth in Aprill and May, and often sooner also, the leaues following shortly after: but neither of them beareth perfect seede in our Country, that euer I could learne, or know by mine owne or others experiance.

## The Names.

Some would referre this to *Cereus*, whereof Theophrastus maketh mention in his first Booke and eighteenth Chapter, among those trees that beare their fruit in cods, like as Pulse doe: and hee remembreth it againe in the fourteenth Chapter of his third Booke, and maketh it not vnlke the white Poplar

Poplar tree, both in greatnesse and whitenesse of the branches, with the leafe of an Iuie, without corners on the one part, cornered on the other, and sharpe pointed, greene on both sides almost alike, haing so slender long footestalkes that the leaues cannot stand forthright, but bend downwards, with a more rugged bark then the white Poplar tree. Clusius thinketh this large description is but an ample description of the third kinde of Poplar, called *Lybica*, the Aspen tree, which *Gaza* translateth *Alpina*: but who so will well consider it, shall finde it neyther answerable to any Poplar tree, in that it beareth not cods as *Cercis* doth; nor vnto this *Arbor Iude*, because it beareth not white branches. Clusius saith also, that the learned of Mompelier in his time, referred it to *Colytæa* of Theophrastus in his third booke and seventeenth chapter, where he doth liken it to the leaues of the broadest leaved Bay tree, but larger and rounder, green on the vpperside, and whitish vnderneath, and whereunto (as he saith) Theophrastus giueth cods in the fourteenth chapter of the same third booke: and by the contracting of their descriptions both together, saith, they agree vnto this Iudas tree. But I find some doubts and differences in these places: for the *Colytæa* that Dioscorides mentioneth in the said fourteenth chapter of his third booke, hath (as he saith there) a leafe like vnto the Willow, and therefore cannot bee the same *Colytæa* mentioned in the seventeenth chapter of the same third book, which hath a broade Bay leafe: indeede hee giueth seede in cods: but that with broade Bay leaues is (as he saith) without eyther flower or fruite; and besides all this, he saith the rootes are very yellow, which is not to bee found in this *Arbor Iude*, or Iudas tree: let others now judge if these things can bee well reconciled together. Some haue for the likenesse of the cods vnto Beane cods, called it *Fabago*. And Clusius called it *Siliqua filuestris*. It is generally in these dayes called *Arbor Iude*, and in English after the Latine name, vntill a fitter may be had, Iudas tree.

#### The Vertues.

There is nothing extant in any Author of any Physicall vsce it hath, neyther hath any later experiance found out any.

#### CHAP. CXX.

##### *Laburnum. Beane Trefoile.*

Here be three sorts of these coddled trees or plants, one neere resembling another, whereof *Anagryis* of Dioscorides is one. The other two are called *Laburnum*; the larger whereof Matthiolus calleth *Anagryis altera*, and so doe some others also: the third is of the same kinde with the second, but smaller. I shall not for this our Garden trouble you or my selfe with any more of them then one, which is the lesser of the two *Laburnum*, in that it is more frequent, and that it will far better abide then the *Anagryis*, which is so tender, that it will hardly endure the winters of our Countrey: and the greater *Laburnum* is not so easly to be had.

##### *Laburnum. Beane Trefoile.*

This coddled tree riseth vp with vs like vnto a tall tree, with a reasonable great body, if it abide any long time in a place, couered with a smooth greene bark; the branches are very long, greene, pliant, and bending any way, whereon are set here and there diuers leaues, three alwaies standing together vpon a long stalk, being somewhat long, and not very narrow, pointed at the ends, greene on the vpperside, and of a siluer shinning colour vnderneath, without any smell at all: at the ioynts of these branches, where the leaues stand, come forth many flowers, much like vnto broome flowers, but not so large

large or open, growing about a very long branch or stalke, sometimes a good span or more in length, and of a faire yellow colour, but not very deepe; after which come flattin cods, not very long or broade, but as tough and hard as the cods of Broome, wherein are contained blackish seede, like, but much lesse then the seede of *Anagryis vera* (which are as big as a kidney beane, purplish and spotted): the roote thruster down deepe into the ground, spreading also farre, and is of a yellowish colour.

#### The Place.

This tree groweth naturally in many of the woods of Italie, and vpon the Alpes also, and is therefore still accounted to be that *Laburnum* that Plinius calleth *Arbor Alpina*. It groweth in many gardens with vs.

#### The Time.

It flowreth in May, the fruit or cods, and the seedes therein are ripe in the end of August, or in September.

#### The Names.

This tree (as I said before) is called of Matthiolus *Anagryis altera*, sive *secunda*, of Cordus, Gesner and others, especially of most now adayes, *Laburnum*. It is probable in my opinion, that this should bee that *Colytæa* of Theophrastus, mentioned in the fourteenth Chapter of his third book with the leafe of a Willow; for if you take any one leafe by it selfe, it may well resemble a Willow leafe both for forme and colour, and beareth small seede in cods like vnto pulseas that doth. Of some it hath beene taken for a kinde of *Cytisus*, but not truely. We call it in English, Beane Trefoile, in regard of his cods and seede therein, somewhat like vnto Kidney Beanes, and of the leaues, three alwaies standing together, vntill a more proper name may bee giuen it.

#### The Vertues.

There is no vsce hereof in Physicke with vs, nor in the naturall place of the growing, saue only to prouoke a vomit, which it will doe very strongly.

#### CHAP. CXXI.

##### *Cytisus. Tree Trefoile.*

Here are so many sorts of *Cytisus* or Tree trefoiles, that if I should relate them all, I should weary the Reader to ouerooke them, whereof the most part pertaine rather to a generall worke then to this abstract. I shall not therefore trouble you with any superfluous, but only with two, which we haue nourised vp to furnish waste places in a garden.

##### *Cytisus Maranthe. Horned Tree Trefoile.*

This Tree Trefoile which is held of most Herbarists to bee the true *Cytisus* of Dioscorides, riseth vp to the height of a man at the most, with a body of the bignesse of a mans thumbe, couered with a whitish bark, breaking forth into many whitish branches spreading farre, beset in many places with small leaues, three alwaies set together vp on a small short footestalke, which are rounder, and whiter then the leaues of Beane Trefoile: at the ends of the branches for the most part, come forth the flowers three or four together, of a fine gold colour, and of the fashion of Broome flowers, but not

not so large : after the flowers are past, there come in their places crooked flat thinne cods, of the fashion of a halfe moone, or crooked horne, whitish when they are ripe, wherein are contained blackish seede : the roote is hard and woody, spreading diuers wayes vnder the ground : the whole plant hath a pretty small hot sent.

*Cytisus vulgaris.* The common Tree Trefoile.

This *Cytisus* is the most common in this Land, of any the other sorts of tree trefoiles, haing a blackish colourd barke, the stemme or body whereof is larger then the former, both for height and spreading, bearing also three leaues together, but smaller and greener then the former : the flowers are smaller, but of the same fashion and colour: the cods blackish and thin, and not very long, or great, but lesser then Broome cods, wherein there lyeth small blackish hard seede : the roote is diuersly dispersed in the ground.

The Place.

The first growtheth in the kingdome of Naples, and no doubt in many other places of Italie, as Matthiolus saith. The other growtheth in diuers places of France.

The Time.

They flower for the most part in May or June : the seede is ripe in August or September.

The Names.

The first (as I said) is thought of most to be the true *Cytisus* of Dioscorides, and as is thought, was in these later dayes first found by Bartholomæus Maranta of Naples, who sent it first to Matthiolus, and thereupon hath euer since beeene called after his name, *Cytisus Maranthe*. Some doe call it *Cytisus Lunatus*, because the cods are made somewhat like vnto an halfe Moone. We call it in English, Horned Tree Trefoile. The other is called *Cytisus vulgaris* or *vulgaris*; in English, The common Tree Trefoile, because we haue not any other so common.

The Vertues.

The chiefest vertues that are appropriate to these plants, are to procure milke in womens breasts, to fatten pullen, sheep &c. and to be good for bees.

CHAP. CXXII

*Colutea.* The Bastard Sena Tree.

We haue in our Gardens two or three sorts of the Bastard Sena tree ; a greater as I may so call it, and two lesser : the one with round thin transparent skins like bladders, wherein are the seede : the others with long round cods, the one bunched out or swelling in diuers places, like vnto a Scorpions tale, wherein is the seede, and the other very like vnto it, but smaller.

1. *Colutea Vesicaria.* The greater Bastard Sena with bladders.

This shrub or tree, or shrubby tree, which you please to call it, riseth vpto the height of a pretty tree, the stemme or stock being sometimes of the bignesse of a mans arm, couered with a blackish greene rugged barke, the wood whereof is harder then an Elder,

Elder, but with an hollownesse like a pith in the heart or middle of the branches, which are diuided many wayes, and whereon are set at seuerall distances, diuers wensed leaues, composed of many small round pointed, or rather flat pointed leaues, one set against another, like vnto Licoris, or the Hatchet Fitch ; among these leaues come forth the flowers, in fashion like vnto Broome flowers, and as large, of a very yellow colour : after which appeare cleare thinne swelling cods like vnto thinne transparent bladders, wherein are contained blacke seede, set vpon a middle ribbe or finew in the middle of the bladder, which if it be a little crushed betweene the fingers, will giue a cracke, like as a bladder full of winde. The roote groweth branched and woody.

2. *Colutea Scoparioides maior.* The greater Scorpion podded Bastard Sena.

This Bastard Sena groweth nothing so great or tall, but shooteth out diuersly, like vnto a shrub, with many shoots springing from the root : the branches are greener, but more rugged, haing a white barke on the best part of the elder growne branches ; for the young are greene, and haue such like winged leaues set on them as are to be seen in the former, but smaller, greener, and more pointed : the flowers are yellow, but much smaller, fashioned somewhat like vnto the former, with a reddish stripe downe the backe of the uppermost leafe : the long cods that follow are small, long and round, distinguished into many diuisions or dents, like vnto a Scorpions tayle, from whence hath risen the name : in these seuerall diuisions lye seuerall blacke seede, like vnto the seede of Fenigrecke : the roote is white and long, but not so woody as the former.

3. *Colutea Scoparioides minor.* The lesser Scorpion Bastard Sena.

This lesser Bastard Sena is in all things like the former, but somewhat lower, and smaller both in leafe, flower, and cods of seede, which haue not such eminent bunches on the cods to be seene as the former.

The Place.

They grow as Matthiolus saith about Trent in Italie, and in other places : the former is frequent enough through all our Countrey, but the others are more rare.

The Time.

They flower about the middle or end of May, and their seede is ripe in August. The bladders of the first will abide a great while on the tree, if they be suffered, and vntill the winde cause them to rattle, and afterwards the skins opening, the seed will fall away.

The Names.

The name *Colutea* is imposed on them, and by the iudgement of most writers, the first is taken to bee that *Colutea* of *Lipara* that Theophrastus maketh mention of, in the seventeenth chapter of his third booke. But I should rather thinke that the *Scoparioides* were the truer *Colutea* of Theophrastus, because the long pods thereof are more properly to bee accounted *Siliques*, then the former which are *Vesiculae*, bladders, and not *Siliques* : and no doubt but Theophrastus would haue giuen some peculiar note of difference if he had meant those bladders, and not these cods. Let others of judgement be vmpires in this case ; although I know the currant of writers since Matthiolus, doe all hold the former *Colutea vesicaria* to be the true *Colutea Lipara* of Theophrastus. Wee call it in English, Bastard Sena, from Ruellius, who as I thinke first called it Sena, from the forme of the leaues. The second and third (as I said before) from the forme of the cods received their names, as it is in the titles and descriptions ; yet they may as properly be called *Siliques*, for that their fruite are long cods.

## The Vertues.

Theophrastus saith it doth wonderfully helpe to fatten sheepe : But sure it is found by experience, that if it be giuen to man it caufeth strong castings both vpwards and downwards ; and therefore let every one beware that they vfe not this in steede of good Sena, lest they feele to their cost the force thereof.

## C H A P. C X I I.

*Spartum Hispanicum frutex.* Spanish Broome.

**A**lthough Clusius and othes haue found diuers sorts of this shrubby Spartum or Spanish Broome, yet because our Climate will nourse vp none of them, and euen this very hardly, I shall leue all others, and describe vnto you this one only in this manner : Spanish Broome growth to bee five or sixe foote high, with a woody stemme below, couered with a darke gray, or ash-coloured barke, and having aboue many pliant, long and slender greene twigs, whereon in the beginning of the yeare are set many small long greene leaues, which fall away quickly, not abiding long on ; towards the tops of thele branches grow the flowers, fashioned like unto Broom on ; but larger, as yellow as they, and smelling very well ; after which come small flowers, but larger, as yellow as they, and smelling very well ; after which come small long cods, crested at the backe, wherein is contained blackish flat seede, fashioned long cods, crested at the backe, wherein is contained blackish flat seede, fashioned very like vnto the Kidney beanes: the roote is woody, dispersing it selfe diuers waies.

## The Place.

This growtheth naturally in many places of France, Spaine and Italie, wee haue it as an ornament in our Gardens, among other delightfull plants, to please the senses of sight and smelling.

## The Time.

It flowreth in the end of May, or beginning of June, and beareth seede, which ripeneth not with vs vntill it be late.

## The Names.

It is called *Spartium Graecorum*, and *Spartum frutex*, to distinguish it from the sedge or rush, that is so called also. Of some it is called *Genista*, and thought not to differ from the other *Genista*, but they are much deceiued; for euen in Spaine and Italie, the ordinary *Genista* or Broome growtheth with it, which is not pliant, and fit to binde Vines, or such like things withall as this is.

## The Vertues.

There is little vse hereof in Physicke, by reason of the dangerous qualtie of vomiting, which it doth procure to them that take it inwardly : but being applyed outwardly, it is found to helpe the *Sciatica*, or paine of the hippes.

## C H A P.

<sup>1</sup> *Colutea vulgaris*. Ordinary bastard Sena. <sup>2</sup> *Periploca recta Virginiana*. Virginian Silke. <sup>3</sup> *Colutea Scorpoides*. Scorpion bastard Sena. <sup>4</sup> *Spartum Hispanicum*. Spanish Broome. <sup>5</sup> *Ligustrum Priuet*. <sup>6</sup> *Salvia variegata*. Party coloured Sage. <sup>7</sup> *Majorana Italica*. Gilded Marjoram.

## C H A P. C X X I I I .

*Periploca recta Virginiana.* Virginian Silke.

**L**est this stranger should finde no hospitality with vs, being so beautifull a plant, or not finde place in this Garden, let him be here received, although with the last, rather then not at all. It riseth vp with one or more strong and round stalkes, three or four foote high, whereon are set at the seuerall ioynts thereof two faire, long, and broad leaues, round pointed, with many veines therein, growing close to the stemme, without any foote-stalke: at the tops of the stalkes, and sometimes at the ioynts of the leaues, groweth forth a great bush of flowers out of a thinneskinne, to the number of twenty, and sometimes thirty or forty, every one with a long foote-stalke, hanging downe their heads for the most part, especially those that are outermost, every one standing within a small huske of greene leaues, turned to the stalkeward, like vnto the *Lysimachia* flower of Virginia before described, and each of them consisting of fife small leaues a peece, of a pale purplish colour on the vpper side, and of a pale yellowish purple vnderneath, both sides of each leafe being as it were folded together, making them seeme hollow and pointed, with a few short chives in the middle: after which come long and crooked pointed cods standing vpright, wherein are contained flat brownish seede, dispersedly lying within a great deale of fine, soft, and whitish brownne silke, very like vnto the cods, seede, and silke of *Aesclepias*, or *Swallow-wort*, but that the cods are greater and more crooked, and harder also in the outer shell: the roote is long and white, of the bignesse of a mans thumbe, running vnder ground very far, and shooting vp in divers places, the heads being set full of small white grumes or knots, yeelding forth many branches, if it stand any time in a place: the whole plant, as well leaues as stalkes, being broken, yeeld a pale milke.

## The Place.

It came to me from Virginia, where it groweth abundantly, being raised vp from the seede I received.

## The Time.

It flowreth in July, and the seede is ripe in August.

## The Names.

It may seeme very probable to many, that this plant is the same that Prosper Alpinus in the twenty fift Chapter of his Booke of Egyptian plants, nameth *Beidelfar*; and Honorius Bellus in his third and fourth Epistles vnto Clusius (which are at the end of his History of plants) calleth *Ossifrage*: And Clusius himselfe in the same Booke calleth *Apocynum Syriacum*, *Palestinianum*, and *Egyptiacum*, because this agreeith with theirs in very many and notable parts; yet verily I thinke this plant is not the same, but rather another kinde of it selfe: First, because it is not *frutex*, a shrub or woody plant, nor keepeth his leaues all the yeare, but loseth both leaues and stalks, dying downe to the ground every yeare: Secondly, the milke is not cauisticke or violent, as Alpinus and Bellus say *Ossifrage* is: Thirdly, the cods are more crooked then those of Clusius, or of Alpinus, which Honorius Bellus acknowledgeth to be right, although greater then those he had out of Egypt: And lastly, the rootes of these doe runne, whereof none of them make any mention. Gerard in his Herball giueth a rude figure of the plant, but a very true figure of the cods with seede, and saith the Virginians call it *wisank*, and referreth it to the *Aesclepias*, for the likenesse of the cods stuffed with silken

filken doun. But what reason Caspar Bauhinus in his *Pinax Theatri Botanici* had, to call it (for it is Clusius his *Apocynum Syriacum*) by the name of *Lepathrum Egyptiacum laetificans sanguine Aesclepiadis*, I know none in the world: for but that he would shew an extreme singularity in giuing names to plants, contrary to all others (which is very frequent with him) how could he thinke, that this plant could haue any likenesse or correspondencie, with any of the kindes of Dockes, that euer he had seene, read, or heard of, in face, or shew of leaues, flowers, or seede; but especially in giuing milke. I haue you see (and that not without iust and evident cause) giuen it a differing Latine name from Gerard, because the *Aesclepias* giueth no milke, but the *Periploca* or *Apocynum* doth; and therefore fitter to be referred to this then to that. And because it should not want an English name answerable to some peculiar property thereof, I haue from the silken doun called it Virginian Silke: but I know there is another plant growing in Virginia, called Silke Grasse, which is much differing from this.

## The Vertues.

I know not of any in our Land hath made any tryall of the properties hereof. Captaigne John Smith in his booke of the discouery and description of Virginia, saith, that the Virginians vse the rootes hereof (if his be the same with this) being bruised and applied to cure their hurts & diseases,

## C H A P. C X X V .

*Ligustrum.* Primme or Priuet.

**B**ecause the vse of this plant is so much, and so frequent throughout all this Land, although for no other purpose but to make hedges or arbours in Gardens, &c. whereunto it is so apt, that no other can be like vnto it, to bee cut, lead, and drawne into what forme one will, either of beasts, birds, or men armed, or otherwise: I could not forget it, although it be so well knowne vnto all, to be an hedge bush growing from a woody white roote, spreading much within the ground, and bearing manie long, tough, and pliant sprigs and branches, whereon are set long, narrow, and pointed sad greene leaues by couples at every ioynt: at the tops whereof breaketh forth great tufts of sweete smelling white flowers, which when they are fallen, turne into small blacke berries, haing a purple iuyce within them, and small seede, flat on the one side, with an hole or dent therein: this is seene in those branches that are not cut, but suffered to beare out their flowers and fruit.

## The Place.

This bush groweth as plentifully in the Woods of our owne Countrey, as in any other beyond the Seas.

## The Time.

It flowreth sometimes in June, and in July; the fruit is ripe in August and September.

## The Names.

There is great controuersie among the moderne Writers concerning this plant, some taking it to be *Asperges* of Dioscorides, other to be *Phillyrea* of Dioscorides, which followeth next after *Cyprus*. Plinie maketh mention of *Cyprus* in two places; in the one he saith, *Cyprus* hath the leafe of *Ziziphus*, *pp* or

or the Iuiube tree: in the other he saith, that certain do affirme, that the *Cypris* of the East Country, and the *Ligustrum* of Italy is one and the same plant: whereby you may plainly see, that our Priuet which is *Ligustrum*, cannot be that *Cypris* of Plinie with Iuiube leaues: Besides, both Dioscorides & Plinic say, that *Cypris* is a tree; but all know that *Ligustrum*, Priuet, is but an hedge bush: Againe, Dioscorides saith, that the leaues of *Cypris* giue a red colour, but Priuet giueth none. Bellonius and Prosper Alpinus haue both recorded, that the true *Cypris* of Dioscorides groweth plentifully in Egypt, Syria, and those Easterne Countries, and nourseth vp also in Constantinople, and other parts of Greece, being a merchandise of much worth, in that they transport the leaues, and young branches dried, which laid in water giue a yellow colour, wherewith the Turkish women colour the nailes of their hands, and some other parts of their bodies likewise, delighting much therein: and that it is not our *Ligustrum*, or Priuet, because *Cypris* beareth round white seede, like Coriander seede, and the leaues abide greene alwaies vpon the tree, which groweth (if it bee not cut or pruned) to the height of the Pomegranet tree. I haue (I confesse) beyond the limits I set for this worke spoken concerning our Priuet, because I haue had the seede of the true *Cypris* of Dioscorides sent mee, which was much differing from our Priuet, and although it sprang vp, yet would not abide any time, whereas if it had beeene our Priuet, it would haue beeene familiar enough to our Countrey.

#### The Vertues.

It is of small vse in physicke, yet some doe vse the leaues in Lotions, that serue to coole and dry fluxes or sores in diuers parts.

#### CHAP. CXXVI.

*Salvia variegata*. Party coloured Sage. And  
*Maiorana versicolor* *sive aurea*. Yellow or golden Marierome.

**V**NTO all these flowers of beauty and rarity, I must adioyne two other plants, whose beauty consisteth in their leaues, and not in their flowers: as also to separate them from the others of their tribe, to place them here in one Chapter, before the sweete herbes that shall follow, as is fittest to furnish this our Garden of pleasure. This kinde of Sage groweth with branches and leaues, very like the ordinary Sage, but somewhat smaller, the chiefeſt difference consisteth in the colour of the leaues, being diuersly marked and spotted with white and red among the greene: for vpon one branch you shall haue the leaues ſeverally marked one from another, as the one halfe of the leafe white, and the other halfe greene, with red shadowed ouer them both, or more white then greene, with ſome red in it, either parted or shadowed, or dasht here and there, or more greene then white, and red therein, eyther in the middle or end of the leafe, or more or leſſe parted or ſtriped with white and red in the greene, or elfe ſometimes wholly greene the whole branch together, as nature liſteth to play with ſuch varieties: which manner of growing riſing from one and the ſame plant, because it is the more variable, is the more delightful and much reſpected.

There is another ſpeckled Sage parted with white and greene, but it is nothing of that beauty to this, because this hath three colours evidently to bee diſcerned in every leafe almoſt, the red adding a ſuperabundant grace to the reſt.

*Maiorana aurea* *sive versicolor*. Yellow or golden Marierome.

This kinde of Marierome belongeth to that ſort is called in Latine *Maiorana latifolia*,

*lia*, which Lobel setteth forth for *Hippopus Gracorum genuina*: In English Winter Marierome, or pot Marierome: for it hath broader and greater leaues then the ſweete Marierome, and a diſſerent vmbell or tuft of flowers. The diſference of this from that ſet forth in the Kitchin Garden, conſiſteth chiefly in the leaues, which are in Summer wholly yellow iſforme, or bat a little greene, or parted with yellow and greene more or leſſe, as nature liſteth to play: but in Winter they are of a darke or dead greene colour, yet recouering it ſelfe againe: the ſent hereof is all one with the pot Marierome.

Wee haue another parted with white and greene, much after the manner with the former.

The Place, Time, Names, and Vertues of both theſe plants, ſhall be deſclared where the others of their kindeſ are ſpecified hereaſter, and in the Kitchen Garden, for they diſfer not in properties.

#### CHAP. CXXVII.

*Lauendula*. Lauender Spike.

**A**fter all theſe faire and ſweete flowers before ſpecified, I muſt needeſ adde a few ſweete herbes, both to accomplish this Garden, and to pleafe your ſenſes, by placing them in your Noſegayes, or elfe where, as you liſt. And althoſ I bring them in the end or laſt place, yet are they not of the leaſt account.

##### 1. *Lauendula maior*. Garden Lauender.

Our ordinary Garden Lauender riſeth vp with a hard wooddy ſtemme aboue the ground, parted into many ſmall branches, whereon are ſet whitish, long, and narrow leaues, by couples one againſt another, from among which riſeth vp naked ſquare ſtakles, with two leaues at a ioynt, and at the toppe diuers ſmall huſkes ſtanding round about them, formed in long and round heads or ſpikes, with purple gaping flowers ſpringing out of each of them: the roote is wooddy, and ſpreadeth in the ground: The whole plant is of a ſtrong ſweete ſent, but the heads of flowers much more, and more piercing the ſenſes, which are much uſed to bee put among linnen and apparel.

There is a kinde hereof that beareth white flowers, and ſomewhat broader leaues, *Flore albo*, but it is very rare, and ſeene but in few places with vs, because it is more tender, and will not ſo well endure our cold Winters.

##### 2. *Lauendula minor* *sive Spica*. Small Lauender or Spike.

The Spike or ſmall Lauender is very like vnto the former, but groweth not ſo high, neither is the head or ſpike ſo great and long, but shorter and ſmaller, and of a more purpliſh colour in the flower: the leaues alſo are a little harder, whiter, and shorter then the former, the ſent alſo is ſomewhat sharper and stronger. This is not ſo frequent as the firſt, and is nourished but in ſome places that are warme, and where they delight in rare herbes and plants.

#### The Place.

Lauender groweth in Spaine abundantly, in many places ſo wilde, and little regarded, that many haue gone, and abiden there to diſtill the oyle thereof whereof great quantity now commeth ouer from thence vnto vs: and alſo in Lanquedocke, and Prouence in France.

#### The Time.

It flowreth early in thoſe hot Countries, but with vs not vntill June and July.

## The Names.

It is called of some *Nardus Italica*, and *Lauendula*, the greater is called *Femina*, and the lesser *Mas*. We doe call them generally Lauender, or Lauender Spike, and the lesser Spike, without any other addition.

## The Vertues.

Lauender is little vsed in inward physick, but outwardly, the oyle for cold and benummed parts, and is almost wholly spent with vs, for to perfume linnen, apparrell, gloues, leather, &c. and the dried flowers to comfort and dry vp the moisture of a cold braine.

## C H A P. C X X V I I I .

*Stachus. Sticadoue, Caffidony, or French Lauender.*

**C**affidony that groweth in the Gardens of our Countrey, may peraduenture somewhat differ in colour, as well as in strength, from that which groweth in hotter Countries; but as it is with vs, it is more tender a great deale then Lauender, and groweth rather like an herbe then a bush or shrub, not aboue a foote and a halfe high, or thereabouts, hauing many narrow long greene leaues like Lauender, but softer and smaller, set at severall distances together about the stalkes, which spread abroad into branches: at the tops whereof stand long and round, and sometimes foure square heads, of a darke greenish purple colour, compact of many scales set together, from among which come forth the flowers, of a bleuish purple colour, after which follow seede vessels, which are somewhat whitish when they are ripe, containing blackish brown seede within them: the roote is somewhat wooddy, and will hardly abide the iniuries of our cold Winters, except in some places onely, or before it haue flowered: The whole plant is somewhat sweete, but nothing so much as Lauender.

## The Place.

Caffidony groweth in the Islands Stæchades, which are ouer against Macelles, and in Arabia also: we keep it with great care in our Gardens.

## The Time.

It flowreth the next yeare after it is sowaie, in the end of May, which is a moneth before any Lauender.

## The Names.

It is called of some *Lauendula fluestris*, but most vsually *Stachus* in English, of some Stickadoue, or French Lauender; and in many parts of England, Caffidony.

## The Vertues.

It is of much more vse in physick then Lauender, and is much vsed for old paines in the head. It is also held to be good for to open obstructions, to expell melancholy, to cleanse and strengthen the liner, and other inward parts, and to be a Pectorall also.

## C H A P.

## C H A P. C X X I X .

*Abrotanum femina sive Santolina. Lauender Cotton.*

**T**HIS Lauender Cotton hath many wooddy, but brittle branches, hoary or of a whitish colour, whereon are set many leaues, which are little, long, and foure square, dented or notched on all edges, and whitish also: at the tops of these branches stand naked stalkes, bearing on every one of them a larger yellow head or flower, then eycher Tansie or Maudeline, whereunto they are somewhat like, wherein is contained small darke coloured seede: the roote is hard, and spreadeth abroad with many fibres: the whole plant is of a strong sweete sent, but not vnpleasant, and is in many places planted in Gardens, to border knots with, for which it will abide to be cut into what forme you thinke best; for it groweth thicke and bushy, very fit for such workes, besides the comely shew the plant it selfe thus wrought doth yeld, being alwayes greene, and of a sweet sent; but because it quickly groweth great, and will soon runne out of forme, it must be every second or third yeare taken vp, and new planted.

## The Place.

It is onely planted in Gardens with vs, for the vse aforesaid especially.

## The Time.

It flowreth in July, and standeth long in the hot time of the yeare in his colour, and so will doe, if it be gathered before it haue stood ouer long.

## The Names.

Diuers doe call it as Matthiolus doth, *Abrotanum femina*, and *Santolina*; and some call it *Chamacyparis*, because the leaues thereof, are somewhat like the leaues of the Cypresse tree: Wee call it in English generally Lauender Cotton.

## The Vertues.

This is vsually put among other hot herbes, eyther into bathes, ointments, or other things, that are vsed for cold causes. The seede also is much vsed for the wormes.

## C H A P. C X X X .

*Ocimum. Baffill.*

**B**AFFILL is of two sorts (besides other kindes) for this our Garden, the one whereof is greater, the other lesse in every part thereof, as shall be shewed.

1. *Ocimum Citratum. Common Baffill.*

Our ordinary Garden Baffill hath one stalke rising from the root, diversly branched out, whereon are set two leaues alwayes at a ioynt, which are broad, somewhat round, and pointed, of a pale greene colour, but fresh, a little snipt or dented about the edges, and of a strong or heady sent, somewhat like a Pomeciron, as many haue compared it, and thereof call it *Citratum*: the flowers are small and white, standing at the tops of the branches, with two smal leaues at every ioynt vnder them, in some plants green, in others

ther's browne vnder them : after which commeth blackish seede : the roote perisheth at the first approach of winter weather, and is to be new sownen euery yeare.

2. *Ocimum minimum* sive *Gariophyllum*. Bush Basill.

The bush Basill groweth not altogether so high, but is thicker spreade out into branches, whereon grow smaller leaues, and thicker set then the former, but of a more excellent and pleasant smell by much : the flowers are white like the former, and the seede blacke also like it, and perisheth as suddenly, or rather sooner then it, so that it requireth more paines to get it, and more care to nourse it, because we seldome or neuer haue any seede of it.

*Ocimum Indicum*. Indian Basill.

The Indian Basill hath a square reddish greene stalke, a foote high or better, from the ioynts whereof spreade out many branches, with brāde fat leaues set thereon, two alwayes together at the ioynt, one against another, as other Basils haue, but somewhat deeply cut in on the edges, and oftentimes a little crumpled, standing vpon long reddish footestalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesser: the flowers stand at the tops of the stalkes spike-fashion, which are of a white colour, with reddish stripes and veines running through them, set or placed in darke purple coloured huskes : the seede is greater and rounder then the former, and somewhat long withall : the roote perisheth in like manner as the other former doe. The whole plant smellethe strong, like vnto the other Basils.

The Place.

The two last sorts of Basils are greater strangers in our Country then the first which is frequent, and only sownen and planted in curious gardens. The last came first out of the West Indies.

The Time.

They all flower in August, or July at the soonest, and that but by degrees, and not all at once.

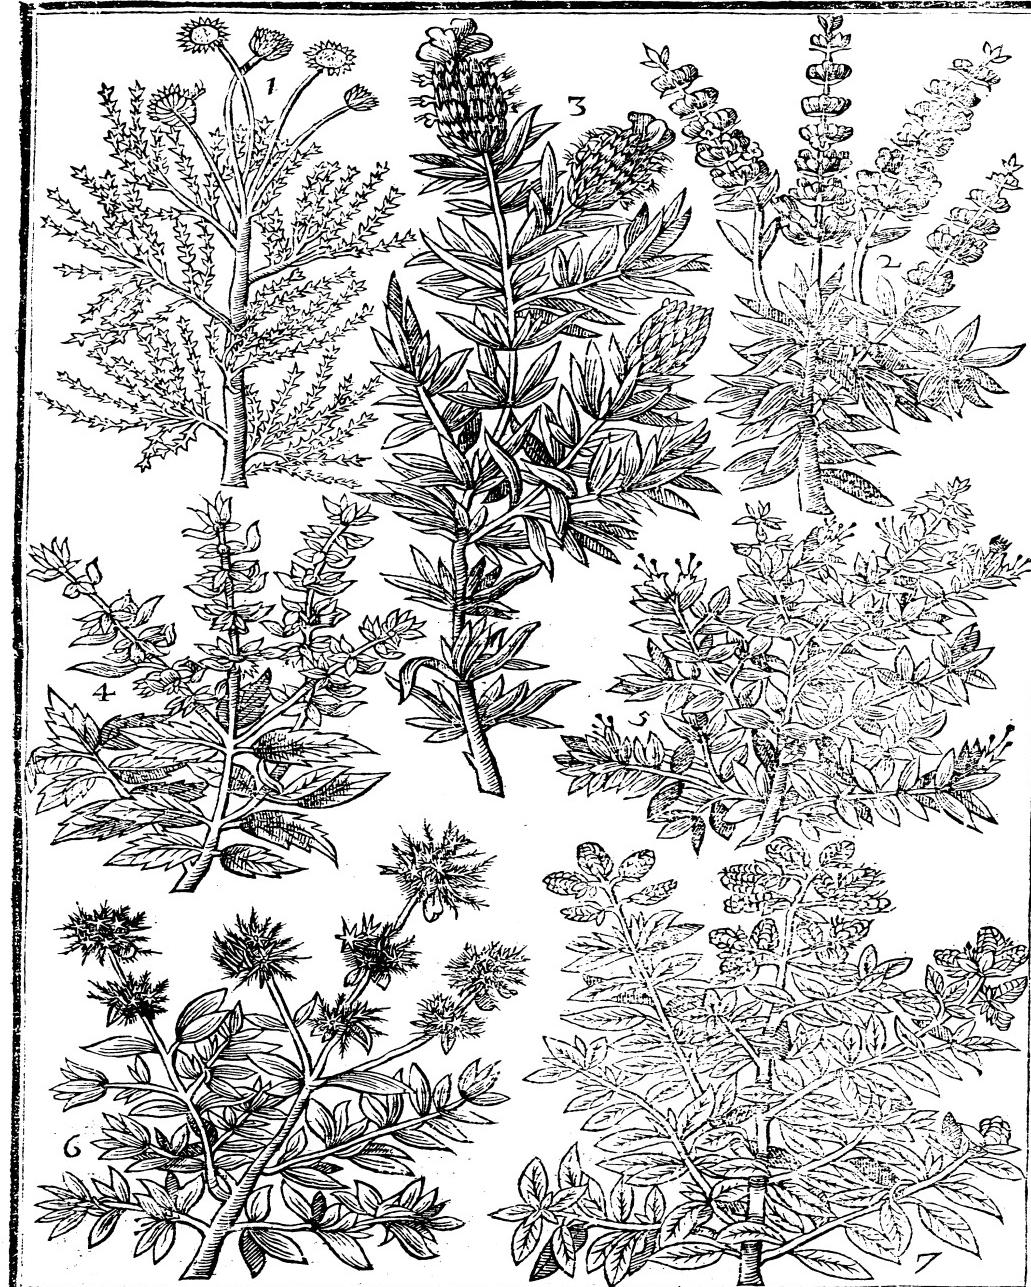

The Names.

The first is vsually called *Ocimum vulgare*, or *vulgatum*, and *Ocimum Citratum*. In English, Common or Garden Basill. The other is called *Ocimum minimum*, or *Gariophyllum*, Cloue Basill, or Bush Basill. The last eyther of his place, or forme of his leaues, being spotted and curled, or all, is called *Ocimum Indicum maculatum*, *latifolium* & *crispum*. In English according to the Latine, Indian Basill, broade leaved Basill, spotted or curled Basill, which you please.

The Vertues.

The ordinary Basill is in a manner wholly spent to make sweet, or washing waters, among other sweet herbes, yet sometimes it is put into nosegays. The Physicall properties are, to procure a cheerefull and merry heart, whervnto the seede is chiefly vsed in powder, &c. and is most vsed to that, and to no other purpose.

C A P E,

1. Sanvilia. Lavender Cotton. 2. Lantana. Lavender Spike. 3. Stachys. Catnip. 4. Chamaesyce. Germanander. 5. Ocimum minus. Fine Basill. 6. Maruia. Herbe Malicie. 7. Matia. Sweet Marjoram.

## C H A P. C X X I.

*Maiorana. Sweete Marierome.*

**V**ee haue many sorts of Marierome ; some that are sweete, and but Summer plants ; others that are greater and not so sweete, and some also that are wilde. Of all these I will onely select some of the choicest that are fit for this place, and leave the other for the next garden, and the garden of simples, or a generall worke : yet hereunto I will adioyne another sweete plant called Masticke, as participating neerer with them then with Time, whereto many doe referre it.

1. *Maiorana major estina. Common sweet Marierome.*

The sweet Marierome that is most frequently sowne in our Country, is a low herbe little aboue a foote high when it is at the highest, full of branches, and small whitish soft roundish leaues, smelling very sweete : at the topes of the branches stand diuers small scaly heads, like vnto knots, (and therefore of some called knotted Marierome) of a whitish greene colour, out of which come here and there small white flowers, and afterwards small reddish seede : the roote is composed of many small threds or strings, which perish with the whole plant every yeare.

2. *Maiorana tenuifolia. Marierome gentle.*

This Marierome hath likewise diuers small branches, growing low, and not higher then the former, but hauing finer and smaller leaues, hoary and soft, but much sweeter: the heads are like vnto the former, and so are the flowers and seede, and the whole plant abiding but a Summer in the like manner.

3. *Marum. Herbe Masticke.*

The neerer resemblance that this herbe hath with Marierome then with Tyme (as I said before) hath made me place it next vnto the small sweet Marierome. It riseth vp with a greater, and a more woody stalk then Marierome, two foote high or better in some places, where it liketh the ground and ayre, branching out on all sides towards the vpper part, leauing the stemme bare below, if it bee old, otherwise being young, thinly furnishing the branches from the bottome with small greene leaues, bigger then the leaues of any Tyme, and comming neere vnto the bignesse and forme of the last recited finer Marierome, but of a greener colour : at the topes of the branches stand small white flowers on a head, which afterwards turne into a loose tuft of a long white hoary matter, like vnto soft dounie, with some leaues vnderneath and about it, which abide not long on the stalkes, but are blowne away with the winde : the seede is so small if it haue any, that I haue not obserued it : the roote is threddy : the whole plant is of a sweete resinous sent, stronger then the Marierome, and abideth our winters, if it be carefully planted and regarded.

## The Place.

The sweete Marieromes grow naturally in hot Countreyes : the first in Spaine &c. the second is thought to come out of Syria, or Persia first into Italie, where they much esteeme it, and plant it curiously and carefully in pots, and set them in their windowes, beeing much delighted therewith for the sweet sent it hath. The first is vsually sowne every yeare in most gardens with vs : but the second is very rare and daintie, and must be daintely be preserved, being more tender then the former. The herbe Masticke is thought to be first brought out of Candie, Clusius saith he found it in Spaine : It is planted by slippes, (and not sowne) in many gardens, and is much replanted for

for increase, but prospereth onely, or more frequently, in loamie or clay grounds then in any other soyle.

## The Time.

The sweete Marieromes beare their knots or scaly heads in the end of Iuly, or in August. Herbe Masticke in Iune many times, or in the beginning of Iuly.

## The Names.

The first of the two sweet Marieromes called *Maiorana* in Latine *a maiore cura*, is taken of most writers to be the *Amaracus* or *Sampſuchum* of Dioscorides, Theophrastus and Plinie, although Galen doth seem a little to dissent therefrom. The other sweet Marierome hath his name in his title as much as can be said of it. The next is thought by the best of the moderne Writers to be the true *Marum* that Galen preferreth for the excellent sweetnesse, before the former Marierome in making the *Oleum, or unguentum Amaricinum*, and seemeth to incline to their opinion that thought *Amaracus* was derived from *Marum*. It is the same also that Galen and others of the ancient Writers make mention of, to go into the composition of the *Trockisci Hedychroii*, as well as *Amaracus* among the ingredients of the *Theriaca Andromachi*. In English we call it Masticke simply, or Herbe Masticke, both to distinguish it from that Tyme that is called Masticke Tyme, and from the Masticke Tree, or Gum, so called. Some of later times, and Clusius with them, haue thought this to be Dioscorides his *Tragoriganum*, which doth somewhat resemble it : but there is another plant that Matthiolus setteth forth for *Marum*, that in Lobels opinion and mine is the truest *Tragoriganum*, and this the truest *Marum*.

## The Vertues.

The sweete Marieromes are not onely much vsed to please the outward sensis in nosegayes, and in the windowes of houses, as also in sweete pouders, sweete bags, and sweete washing waters, but are also of much vsfe in Physicke, both to comfort the outward members, or parts of the body, and the inward alfo : to prouoke vrine being stopped, and to ease the paines thereof, and to cause the feminine courses. Herbe Masticke is of greater force to helpe the stopping of vrine, then the Marierome, and is put into Antidotcs, as a remedie against the poyon of venomous Beasts.

## C H A P. C X X I.

*Tbymmum. Tyme.*

**T**here are many kindes of Tyme, as they are vsually called with vs, some are called of the garden, and others wilde, which yet for their sweetnesse are brought into gardens, as Muske Tyme, and Lemon Tyme ; and some for their beauty, as embroidered or gold yellow Tyme, and white Tyme. But the true Tyme of the ancient Writers, called *Capitatum*, as a speciaill note of distinction from all other kindes of Tyme, is very rare to be seen with vs here in England, by reason of the tendernes, that it will not abide our Winters. And all the other sortes that with vs are called garden Tymes, are indeede but kindes of wilde Tyme, although in the defect or want of the true Tyme, they are vsed in the stead of it. With the Tymes I must doe as I did with the Marieromes in the Chapter before, that is, reserue the most common in vs, for the common vsfe of the Kitchen, and shew you only those here, that are not put to that vsfe : and first with the true Tyme, because it is knowne but to a few.

i, *Tbymmum*

1. *Thymum legitimum capitatum*. The true Tyme.

The true Tyme is a very tender plant, hauing hard and hoary brittle branches, spreading from a small woody steme, about a foote and a halfe high, whereon are set at severall ioynts, and by spaces, many small, long, whitish, or hoary greene leaues, of a quicke sent and taste : at the tops of the branches stand small long whitish greene heads, somewhat like vnto the heads of *Stachas*, made as it were of many leaues or scales, out of which start forth small purplish flowers (and in some white, as Bellonius saith) after which commeth small seede, that soone falleth out, and if it be not carefully gathered, is soone lost, which made (I thinke) Theophrastus to write, that this Tyme was to be sowne of the flowers, as not hauing any other feede : the root is small and woody. This holdeth not his leaues in Winter, no not about Seuill in Spaine, where it groweth abundantly, as Clusius recordeth, finding it there naked or spoiled of leaues. And will not abide our Winters, but perisheth wholly, roote and all.

2. *Serpillum hortense sive maius*. Garden wilde Tyme.

The wilde Tyme that is cherished in gardens growtheth vpright, but yet is lowe, with diuers slender branches, and small round greene leaues, somewhat like vnto small fine Marierome, and smelling somewhat like vnto it : the flowers growe in roundels at the toppes of the branches, of a purplish colour : And in another of this kinde they are of a pure white colour.

There is another also like hereunto, that smellethe somewhat like vnto Muske ; and therefore called Muske Tyme, whose greene leaues are not so small as the former, but larger and longer.

3. *Serpillum Citratum*. Lemon Tyme.

The wilde Tyme that smellethe like vnto a Pomecitron or Lemon, hath many weake branches trayling on the ground, like vnto the first described wilde Tyme, with small darke greene leaues, thinly or sparsedly set on them, and smelling like vnto a Lemon, with whitish flowers at the toppes in roundels or spikes.

4. *Serpillum aureum sive varicolor*. Guilded or embroidered Tyme.

This kinde of wilde Tyme hath small hard branches lying or leaning to the ground, with small party coloured leaues vpon them, diuided into stripes or edges, of a gold yellow colour, the rest of the leafe abiding greene, which for the variable mixture or placing of the yellow, hath caused it to be called embroidered or guilded Tyme.

## The Place.

The first groweth as is said before, about Seuill in Spaine, in very great abundance as Clusius saith, and as Bellonius saith, very plentifully on the mountaines through all Greece. The others growe some in this Country, and some in others : but wee preserue them with all the care wee can in our gardens, for the sweete and pleasant sentes and varieties they yeld.

## The Time.

The first flowreth not vntill August, the rest in Iune and July.

## The Names.

Their names are severally set downe in their titles, as is sufficient to distinguish them ; and therefore I shall not neede to trouble you any further with them.

The

## The Vertues.

The true Tyme is a speciall helpe to melancholike and spleneticke diseases, as also to flatulent humours, either in the vpper or lower parts of the body. The oyle that is Chimically drawne out of ordinary Tyme, is vied (as the whole herbe is, in the stead of the true) in pills for the head and stomach. It is also much vsed for the toothach, as many other such like hot oyles are.

## C H A P. C X X X I I .

*Hyssopus. Hyssope.*

**T**here are many varieties of Hyssope, beside the common or ordinary, which I reserue for the Kitchen garden, and intend only in this place to give you the knowledge of some more rare : viz. of such as are nourised vp by those that are curious, and fit for this garden : for there are some other, that must be remembred in the Physicke garden, or garden of Simples, or else in a generall worke.

1. *Hyssopus folijs niveis*. White Hyssope.

This white Hyssope is of the same kinde and smell with the common Hyssope ; but differeth, in that this many times hath diuers leaues, that are wholly of a white colour, with part of the stalk also : others are parted, the one halfe white, the other halfe greene, and some are wholly greene, or with some spots or stripes of white within the greene, which makes it delightfull to most Gentlewomen.

2. *Hyssopus folijs cinereis*. Russet Hyssope.

As the last hath party coloured leaues, white and greene, so this hath his leaues of an ash-colour, which of some is called russet ; and hath no other difference either in forme or smell.

3. *Hyssopus aureus*. Yellow or golden Hyssope.

All the leaues of this Hyssope are wholly yellow, or but a little greene in them, and are of so pleasanter a colour, especially in Summer, that they proteoke many Gentlewomen to weare them in their heads, and on their armes, with as much delight as many fine flowers can give : but in Winter their beautifull colour is much decayed, being of a whitish greene, yet recouer themselves againe the next Summer.

4. *Hyssopus surculis densis*. Double Hyssope.

As this kinde of Hyssope groweth lower then the former or ordinary kinde, so it hath more branches, slenderer, and not so woody, leaning somewhat downe toward the ground, so wonderfully thicke set with leaues, that are like vnto the other, but of a darker greene colour, and somewhat thicker withall, that it is the only fine sweete herbe, that I know fittest (if any be minded to plant herbes) to set or border a knot of herbes or flowers, because it will well abide, and not growe too woody or great, nor be thinnne of leaues in one part, when it is thicke in another, so that it may be kept with cutting as smooth and plaine as a table. If it be suffered to growe vp of it selfe alone, it riseth with leaues as before is specified, and flowreth as the common doth, and of the same sent also, not differing in any thing, but in the thicknesse of the leaues on the stalkes and branches, and the aptnesse to be ordered as the keeper pleaseth.

5. *Chamedrys*

## Chamadrys. Germander.

Left Germander should be utterly forgotten, as not worthy of our Garden, seeing many (as I said in my treatise or introduction to this Garden) doe border knots therewith: let me at the least give it a place, although the last, being more vsed as a strewing herbe for the house, then for any other vse. It is (I thinke) sufficiently knowne to haue many branches, with small and somewhat round endanted leaues on them, and purplish gaping flowers: the rootes spreading far abroad, and rising vp againe in many places.

## The Place.

These Hyssopes haue beeene most of them noured vp of long time in our English Gardens, but from whence their first originall shold be, is not well knowne. The Germander also is onely in Gardens, and not wilde.

## The Time.

They flower in Iune and July.

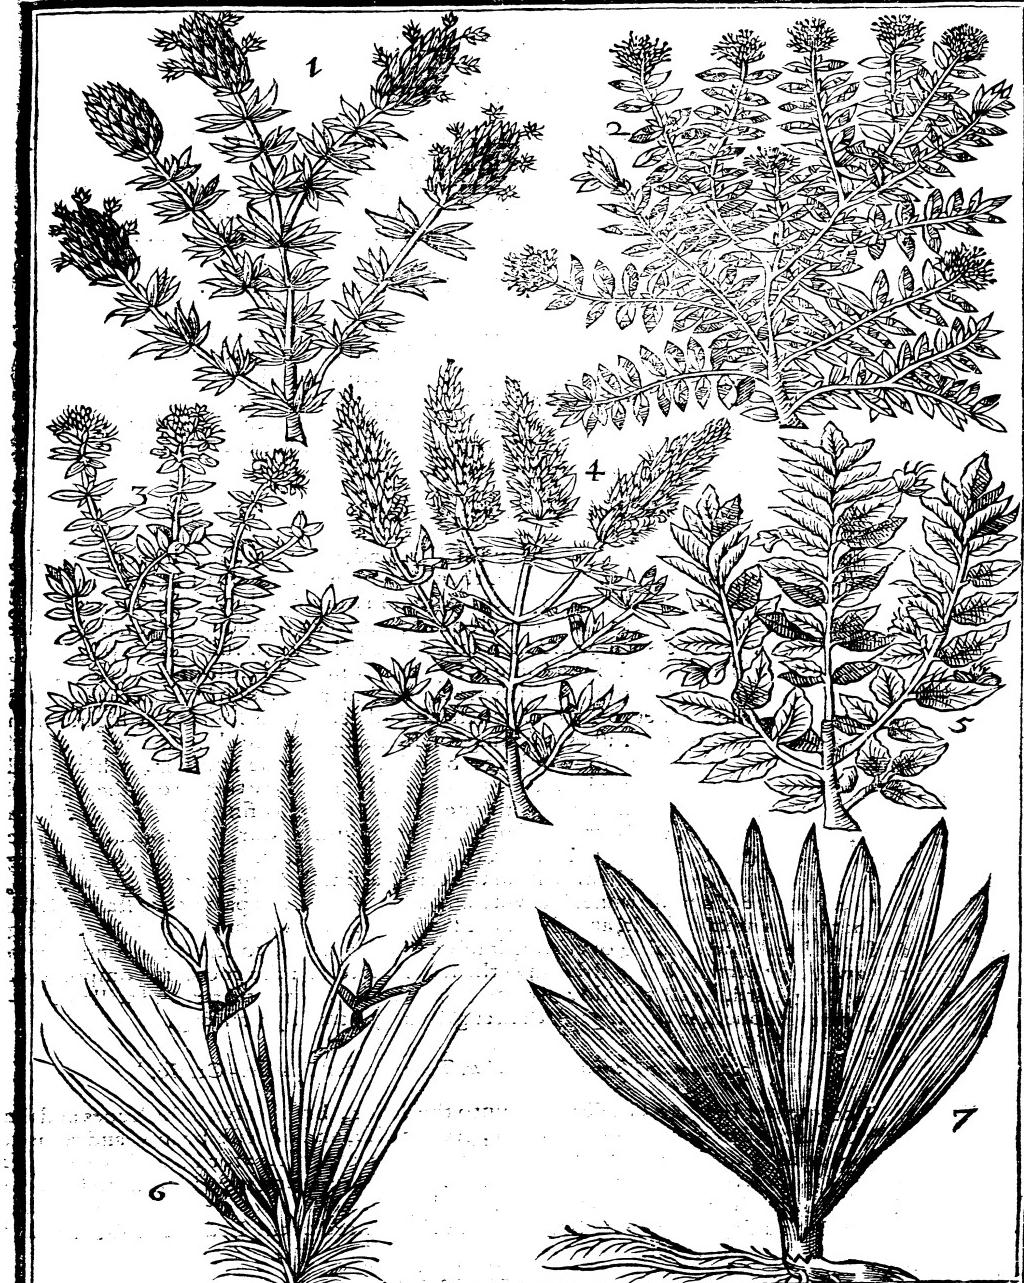

## The Names.

The seuerall names whereby they are knowne to vs, are set forth in their titles; and therefore I neede not here say more of them then onely this, that neyther they here set downe, nor the common or ordinary sort, nor any of the rest not here expressed, are any of them the true Hyssope of the ancient Greeke Writers, but *suppositio*, vsed in the stead thereof. The Germander, from the forme of the leaues like vnto small oaken leaues, had the name *Chamadrys* giuen it, which signifieth a dwarfe Oake.

## The Vertues.

The common Hyssope is much vsed in all pectorall medicines, to cut deagme, and to caufe it easly to be auoided. It is vsed of many people in the Country, to be laid vnto cuts or fresh wounds, being bruised, and appleyed eyther alone, or with a little Sugar. It is much vsed as a sweet herbe, to be in the windowes of an house. I finde it much commended against the Falling Sicknesse, especially being made into Pils after this manner: Of Hyssope, Horhound, and Castor, of each halfe a dramme, of Peony rootes (the male kinde is onely fit to be vsed for this purpose) two drams, of *Afia fetida* one scruple: Let them be beaten, and made into pills with the iuyce of Hyssope; which being taken for seuen dayes together at night going to bed, is held to be effectual to giue much ease, if not thoroughly to cure those that are troubled with that disease. The vse of Germander ordinarily is as Tyme, Hyssope, and other such herbes, to border a knot, whereunto it is often appropriate, and the rather, that it might be cut to serue (as I said) for a strewing herbe for the house among others. For the phisicall vse it serueth in diseases of the spleene, and the stopping of vrine, and to procure wemens courses.

Thus haue I led you through all my Garden of Pleasure, and shewed you all the varieties of nature noured therein, pointing vnto them, and describing them one after another. And now lastly (according to the vse of our old ancient Fathers) I bring you to rest on the Graffe, which yet shall not be without some delight, and that not the least of all the rest.

1. *Thymus vulgaris*. The true Tyme. 2. *Serpyllum major* hortense. Garden Tyme. 3. *Satureja hortensis*. Lemon Tyme. 4. *Hyssopus officinalis*. Golden Hyssop. 5. *Chamaesyce*. Germander. 6. *Spiranthes spiralis* ssp. *Gramine plumarium minus*. The letter feather Graffe. 7. *Gramine plumarium* vel *sulcata*. Painted Graffe or Ladies Laces.

## C H A P. CXXXIII.

*Gramina. Grasses.*

**T**here are among an infinite number (as I may so say) of Grasses, a few only which I thinke fit to be planted in this Garden, both for the rarity of them, and also for your delight, and the excellent beauty that is in them above many other plants. One of them hath long agoe bin respeted, and cherisched in the country gardens of many Gentlewomen, and others. The others are knowne but vnto a few.

1. *Gramen briatum.* Painted Grasse or Ladies laces.

This kinde of Grasse hath many stiffe, hard, round stalkes, full of ioynts, whereon are set at every ioynt one long leafe, somewhat broad at the bottome, where it compassesthe stalke, and smaller to the end, where it is sharpe pointed, hard or rough in handling, and striped all the length of the leafe with white streakes or lines, that they seeme party coloured laces of white and greene: the tops of the stalkes are furnished with long spikie tufts, like vnto the tufts of Couch Grasse: the rootes are small, white, and threddy, like the rootes of other Grasses.

2. *Gramen Plumarium minus.* The lesser Feather-Grasse.

This lesser Feather-Grasse hath many small, round, and very long leaues or blades, growing in tufts, much finer and smaller then any other Grasse that I know, being almost like vnto haires, and of a fresh greene colour in Summer, but changing into gray, like old hay in Winter, being indeede all dead, and neuer reviving; yet hardly to be plucked away vntill the Spring, and then other greene leaues or rushes rise vp by them, and in their stead, and are about a foote in length: from the middle of these tufts come forth rounder and bigger rushes, which are the stalkes, and which haue a chaffie round eare about the middle thereof, which when it is full growne, is somewhat higher then the topes of the leaues or rushes, opening it selfe (being before clofe) at the top, and shewing forth three or four long ayles or beards, one aboue another, which bend themselues a little downewards (if they stand ouer long before they are gathered, and will fall off, and be blowne away with the winde) being so finely feathered on both sides, all the length of the beard, and of a pale or grayish colour, that no feather in the taile of the Bird of Paradise can be finer, or to be compared with them, hauing sticking at the end of euery one of them, within the eare, a small, long, whitish, round, hard, and very sharpe pointed graine, like vnto an oaten graine, that part of the stalke of the feather that is next vnder it, and aboue the seede for some two or three inches, being stiffe and hard, and twining or curling it selfe, if it be suffered to stand too long, or to fall away, otherwise being straight as the feather it selfe: the roote is composed of many long, hard, small threddy strings, which runne deepe and far, and will not willingly be remoued, in that it gaineth strength euery yeare by standing.

3. *Gramen Plumarium maius.* The greater Feather-Grasse.

The greater Feather-Grasse is like vnto the lesser, but that both the leades and the feathers are greater, and nothing so fine, grosser also, and of lesse beauty and respect, though whiter then it, and therefore is not so much regarded: for I haue knowne, that many Gentlewomen haue vsed the former lesser kinde, being tyed in tufts, to set them in stead of feathers about their beds, where they haue lyen after childe-bearing, and at other times also, when as they haue beene much admired of the Ladies and Gentles that haue come to visit them.

## The Place.

The first of these Grasses, as Lobel saith, groweth naturally in the woods and hils of Sauoy. It hath long agoe beeane received into our English gar-dens.

dens. The second, as Clusius saith, in Austria, from whence also (as I take it) the greater came, and are both in the gardens of those, that are curious obseruers of these delights.

## The Time.

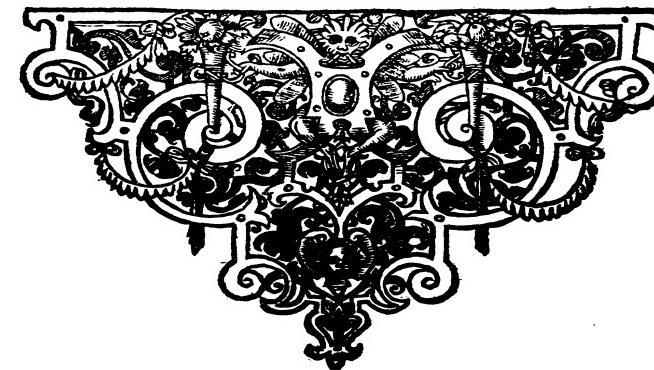

The first is in its pride for the leaues all the Spring and Summer, yeelding his bush in June. The other giue their feather-like sprigs in July and August, and quickly (as I said) are fhed, if they be not carefully gathered.

## The Names.

The first is called by Lobel *Gramen sulcatum*, or *sulcatum album*; of others *Gramen pictum*. The French call it *Aiguellettes d'armes*, of the fashion that their Ensignes, Pennons, or Streamers vsed in wars were of, that is, like vnto a party coloured curtaine. In English vsually Ladies laces, and Painted Grasse. The first of the other two is called *Gramen plumarium* or *plumosum*, and *minus* is added for the distinction of it. Clusius calleth it *Spartum austriacum*, of the likenesse and place where he found it. The last is called *Gramen plumarium*, or *plumosum maius*, The greater Feather-Grasse.

## The Vertues.

These kindes of Grasses are not in any time or place that I doe heare of applied to any Physicall vse; and therefore of them I will say no more: but here I will end the prime part of this worke.

# THE ORDERING OF THE KITCHEN GARDEN.

## CHAP. I.

*The situation of a Kitchen Garden, or Garden of Herbes, and what sort of manure is fittest to helpe the decaying of the soyle thereof.*

**H**Aving giuen you the best rules and instructions that I can for your flower Garden, and all the flowers that are fit to furnish it, I now proceede to your herbe garden, which is not of the least respect belonging to any mans house, nor vtterly to bee neglected for the many vtilities are to be had from it, both for the Masters profit and pleasure, and the meynies content and nourishment : all which if I should here set down, I had a large field to wander in, and matter sufficient to entreat of, but this worke permitteth not that libertie : and I thinke there are but few but eyther know it already, or conceiue it sufficiently in their minds. Passing therefore no further in such discourses, I come to the matter in hand, which is to shew you where the fittest place is for an herbe garden. As before I shewed you that the beautie of any worthy house is much the more committended for the pleasant situation of the garden of flowers, or of pleasure, to be in the sight and full prospect of all the chiefe and choicest roomes of the house; so contrariwise, your herbe garden should bee on the one or other side of the house, and those best and choise roomes : for the many different serues that arise from the herbes, as Cabbages, Onions, &c. are scarce well pleasing to perfume the lodgings of any house, and the many ouertures and breaches as it were of many of the beds thereof, which must necessarily bee, are also as little pleasant to the sight. But for priuate mens houses, who must like their habitations as they fall vnto them, and cannot haue time or meanes to alter them, they must make a vertue of necessity, and conuert their places to their best aduantage, by making their profit their chiefest pleasure, and making one place serue for all vses. The choyce of ground for this Garden, is (as I said before) where it is fat, fertill and good; there needeth the lese labour and cost : and contrariwise, where it is cold, wet, dry or barren, there must bee the more helpe still added to keepe it in heart. For this Garden by reason of the much and continual stirring therein, the herbes and rootes drawing out the substance of the fertilitie thereof more abundantly then in the former, must be continually holpen with soyle, or else few things of goodnesse or worth will come forward thereia. The stalle soyle of horses is best and more proper for any colde grounds, for being the hottest, it will cause any the seedes for this Garden to prosper well, and be more forward then in any other ground that is not so holpen. The stalle soyle of Cattell is of a colder and moister nature, and is therefore more proper for the

the hot sandy or grauelly grounds, and although it bee longer before it bee brought to mould then that of horses, yet it will outlast it more then twice so long. Let every one therefore take according to the nature of the ground such helpe as are most fit and conuenient, as I haue here and before shewed. But I doe here ingenuously confess my opinion of these forcings and helpings of ground, that howsoeuer it doth much good to some particular things, which because they delight in heat, and cannot be brought to perfection without it in this our Countrey, which is colder then their naturall from whence they are brought, must therfore haue artificiall helpe to forward them; yet for many other things the compost doth much alter and abate the naturall vigour, and quickenesse of taste, that is perceiued in them that grow in a naturall fat or sandy soile that is not so holpen.

## C H A P. II.

*The forme of a Garden of herbes for necessary uses,  
with the ordering thereof.*

**A**S our former Garden of pleasure is wholly formable in every part with squares, trayles, and knots, and to bee still maintained in their due forme and beautie: so on the contrary side this Garden cannot long conserue any forme, for that every part thereof is subiect to mutation and alteration. For although it is convenient that many herbes doe grow by themselves on beds, cast out into some proportion fit for them, as Tyme, Hysope, Sage, &c. yet many others may bee sowne together on a plot of ground of that largenesse that may serue every mans particular vse as he shall haue occasion to employ it, as Reddish, Lettice and Onions, which after they are growne vp together may be drawne vp and taken away, as there is occasion to spend them: but Carrots or Parsneps being sowne with others must bee suffered to grow last, because they require a longer time before they be fit to be taken vp. Other herbes require some large compasse of ground whereon they may grow of themselves without any other herbes growing among them, as Artichokes, Cowcumbers, Melons, Pompions. And some will doe so with their Cabbages also, but the best and most frugall way now vsed, is to plant them round about the border of your plot or ground whereon you plant Cowcumbers, Pompions, or other things, in that by this meanes so much ground will be well saued, and the other things be no whit hindered thereby, which else a great deale of ground must be employed for them apart. So that by this that I haue here said, you may perceiue the forme of this Garden is for the most part, to bee still out of forme and order, in that the continual taking vp of the herbes and rootes that are sowne and planted, causeth the beds or parts of this Garden to lye broken, dismembered, and out of the order that at the first it was put into. Remember herewithall that (as I said before) this Garden requireth the continuall helpe of soyle to be brought into it, in that the plenty of these manner of herbes and rootes doe so much waste the fertilitie and farnesse of the ground, that without continual refreshing it would quickly become so poore and barren, that it would not yeelde the worth of the seede. The ordinary time to sayle a Garden, is to bring in manure or dung before Christmas, and eyther bury it some small depth, not too deepe, or else to lay it vpon the ground that the winter frostes may pierce it, and then turne it shallow into the ground to sow your seeds in the Spring.

## C H A P.

## C H A P. III.

*How to order divers Garden herbes, both for their sowing,  
spending, and gathering of the seede.*

**O**VR chiefest and greatest Gardiners now adayes, doe so prouide for themselves every yeare, that from their owne grounds they gather the seede of many herbes that they sowe againe: for haing gained the best kind of diuers herbes, they will be still furnished with the same, and be not to seeke every yeare for new that oftentimes will not yeelde them halfe the profit that their choyce seede will: I say of many herbes, but not of all, for the best of them all hath not ground sufficient for all sorts, nor will our climate bring some to that perfection that other forraine doth, and therefore the seede of some things are continually brought from beyond Sea vnto vs. And againe although our chiefe Gardiners doe still prouide their owne seede of diuers things from their owne ground, because as I said it is of the best kinde, yet you must understand also, that good store of the same sortes of seeds are brought from beyond the Seas, for that which is gathered in this Land is not sufficient to serue euery mans vse in the whole Kingdome by many parts, yet still it is true, that our English seede of many things is better then any that commeth from beyond the Seas: as for example, Reddish, Lettice, Carrots, Parsneps, Turners, Cabbbages, and Leekes, of all which I intend to write in this place; for thele are by them so husbanded, that they doe not tow their owne grounds with any other seede of these sortes but their owne: which that you may know the manner how to doe, I will here set it downe, that every one may haue the best directions if they will follow them. Of Reddish there are two sortes, one more early then the other: they vsetherfore to sow their early Reddish first, that they may haue the earliest profit of them, which is more worth in one fortnight, then in a moneth after. And to effect this they haue some artificiall helps also, which are these: They vse to digge vp a large plot of ground wherethey intend to sow their seede a little before or after Christmas, casting it into high balkes or ridges five or sixe foote a-funder, which they suffer to lye and take all the extreame frostes in January to mellow the earth, and when the frostes are past, they then beginne to bring into it good store of fresh stable dung, which they laye neyther too deepe nor too thicke, and couer it with the mould a hand breadth thicknesse aboue the dung, which doth giue such a warmth and comfort to whatsoeuer is sownen thereon, that it forceth it forward much sooner then any other way can doe: And to preuent both the frostes, and the cold bitter windes which often spoyle their seede new sprung vp, they vse to set great high and large mattes made of reedes, tyed together, and fastened vnto strong stakes, thrust into the ground to keepe them vp from falling, or being blowne down with the wind, which mattes they place on the North and East side to breake the force of these winds, and are so sure and safed defence, that a bricke wall cannot better defend any thing vnder it, then this fence will. In this manner they doe every yeare to bring forward their seede to gaine the more by them, and they that will haue Reddish early, must take the same course. The other sort of Reddish for the most part is sownen in Februarie, a fortnight after the other at the least, and likewise every moneth after vnto September, that they may haue young continually. For the blacke Reddish, although many in many places doe sowe it in the same time, and in the same manner that the ordinary is sownen, yet the nature thereof is to runne vp to seede more speedily then the other, if it haue so rich ground to grow vpon, and therefore the best time to sow it is in August, that so it may abide all winter, wherein is the chiefest time for the spending thereof, and to keepe it vntill the beginning of the next yeare from running vp to seede the gathering whereof, as also of the other sort, is all after one manner, that is, to be pulled vp when the pods change whitish, and then hanged vpon bulshes, pales, or such other thing, vntill they bee thorough dry, and then beaten or thrashed out vpon a smooth plancher, or vpon clothes, as euery ones store is, and their conuenience. Lettice is sownen oftentimes with the early Reddish, in the same manner before said, that they may haue Lettice likewise as early as the time of the year will permit them, which they

they pull vp where they grow too thicke, spending them first, and so taking vp from time to time, vntill they stand two foote in funder one from another, and beginne to spindle and shooe vp for seede. In this is vled some arte to make the plants strong to giue the better seede without danger of rotting or spoylng with the wet, which often happeneth to those about whom this caution is not obserued: Before your Lettice is shot vp, marke out the choyseft and strongest plantes which are fittest to grow for seede, and from those when they are a foote high, stripppe away with your hand the leaues that grow lowest vpon the stalke next the ground, which might rot, spoyle or hinder them from bearing so good seede, which when it is neere to be ripe, the stalkes must be cut off about the middle, and layde vpon mats or clothes in the Sunne, that it may there fully ripen and be gathered; for it would be blowne away with the winde if it should be suffered to abide on the stalkes long. Parsneps must be sownen on a deep trenched mellow ground, otherwise they may run to seede the first yeare, which then are nothing worth: or else the rootes will be small staruelings and short, and runne into many spires or branches, whereby they will not bee of halfe the worth. Some vse to sow them in August and September, that so they may bee well grownne to serue to spend in Lent following, but their best time is in February, that the Summers growth may make them the fairer and greater. When they runne vp to seede, you shall take the principall or middle heads, for those carry the Master seede, which is the best, and will produce the fairest rootes againe. You shall hardly haue all the seede ripe at one instant, for vsually the chieffest heads will be fallen before the other are ripe: you must therefore still looke them ouer, and cut them as they ripen. Carrots are vsually sownen in March and Aprill, and if it chance that some of them doe runne vp for seede the same year, they are to be weeded out, for neyther the seed nor roots of them are good: You must likewise pull them vp when they are too thicke, if you will haue them grow fair, or for seed, that they may grow at the least three or four foot in funder: the stalkes of Carrots are limber, and fall downe to the ground, they must therefore be sustainted by poles layde acrosse on stalkes thrust into the ground, and tyed to the poles and stalkes to keepe them vp from rotting or spoylng vpon the ground: the seed hereof is not all ripe at once, but must be tended and gathered as it ripeneth, and layd to dry in some dry chamber or floore, and then beaten out with a stick, and winnowed from the refuse. Turneps are sowne by themselves vpon a good ground in the end of July, and beginning of August, to haue their rootes best to spend in winter; for it often happeneth that those seedes of Turneps that are sownen in the Spring, runne vp to seede the same yeare, and then it is not accounted good. Many doe vse to sow Turneps on those grounds from whence the same yeare they haue taken off Reddish and Lettice, to make the greater profit of the ground, by hauing two crops of increase in one yeare. The stalkes of Turneps will bend downe to the ground, as Carrots doe, but yet must not be bound or ordered in that manner, but suffered to grow without staking or binding, so as they grow of some good distance in funder: when the seede beginneth to grow ripe, be very carefull to preserue it from the birds, which will be most busie to deuour them. You shall vnderstand likewise that many doe account the best way to haue the fairest and most principall seede from all these fore-recited herbes, that after they are sownen, and risen to a reasonable growth, they be transplanted into fresh ground. Cabbages also are not only sownen for the vse of their heads to spend for meat, but to gather their seede likewise, which howsoeuer some haue endeauoured to doe, yet few haue gained good seede, because our sharpe hard frostes in winter haue spoylng and rotted their stockes they preserued for the purpose; but others haue found out a better and a more sure way, which is, to take vp your stocks that are fittest to be preserued, and bring them into the house, and there wrap them eyther in clothes, or other things to defend them from the cold, and hang them vp in a dry place, vntill the beginning of March following, then planting them in the ground, and a little defend them at the first with straw cast ouer them from the cold nights, thereby you may be sure to haue perfect good seede, if your kinde be of the best: Sow your seed in the moneths of February or March, and transplant them in May where they may stand to grow for your vse, but be carefull to kill the wormes or Caterpillers that else will deuoure all your leaues, and be carefull also that none of the leaues bee broken in the planting, or otherwise rubbed, for that oftentimes hindereth the well closing of them. Leekes are for

for the most part wholly noursed vp from the seede that is here gathered; and because there is not so much store of them either sowne or spent, as there is of Onions by the twentieth part, we are still the more carefull to be prouided from our owne labours; yet there be diuers Gardiners in this Kingdome, that doe gather some small quantity of Onion seede also for their owne or their priuate friends spending. The sowing of them both is much about onetime and manner, yet most vsually Leeks are sowne later then Onions, and both before the end of March at the furthest; yet some sowe Onions from the end of July to the beginning of September, for their Winter prouision. Those that are sowne in the Spring, are to be taken vp and transplanted on a fresh bed prepared for the purpose, or else they will hardly abide a Winter; but hauing taken roote before Winter, they will beare good seede in the Summer following: You must stake both your Leekes and your Onion beds, and with poles laid a croffe, binde your loppie headed stalkes ynto them, on high as well as belowe, or else the winde and their owne weight will beare them downe to the ground, and spoile your seede. You must thinane them, that is, pull vp continually after they are first sprung vp those that growe too thicke, as you doe with all the other herbes before spoken of, that they may haue the more roome to thrive. Of all these herbes and rootes before spoken of, you must take the likeliest and fairest to keepe for your seede; for if you should not take the best, what hope of good seede can you expect? The time for the spending of these herbes and rootes, not particularly mentioned, is vntill they begin to runne vp for seede, or vntill they are to be transplanted for seede; or else vntill Winter, while they are good, as every one shall see cause.

## C H A P. I I I I.

*How to order Artichokes, Melons, Cowcumbres, and Pompions.*

**T**here are certayne other herbes to be spoken of, which are wholly noursed vp for their fruit sake, of whom I shall not need to say much, being they are so frequent in every place. Artichokes being planted offaire and large slips, taken from the roote in September and October (yet not too late) will most of them beare fruit the next yeare, so that they be planted in well dunged ground, and the earth raised vp like vnto an Anthill round about each roote, to defend them the better from the extreme frostes in Winter. Others plant slips in March and Aprill, or sooner, but although some of them will beare fruit the same yeare, yet all will not. And indeede many doe rather choose to plant in the spring then in the fall, for that oftentimes an extreme hard Winter following the new setting of slips, when they haue not taken sufficient heart and roote in the ground, doth vtterly pierce and perishe them. When as they that are set in the Spring haue the whole Summers growth, to make them strong before they feele any sharpe frostes, which by that time they are the better able to beare. Muske Melons haue beeene begua to bee noursed vp but of late dayes in this Land, wherein althoough many haue tryed and endeauoured to bring them to perfectiōn, yet few haue attained vnto it: but those rules and orders which the best and skilfullest haue vised, I will here set downe, that who so will, may haue as good and ripe Melons as any other in this Land. The first thing you are to looke vnto, is to prouide you a peice of ground fit for the purpose, which is either a sloping or sheluing banke, lying open and opposite to the South Sunne, or some other fit place not sheking, and this ground also you must so prepare, that all the art you can vse about it to make it rich is little enough; and therefore you must raise it with meere stable soyle, thorough rotten & well turned vp, that it may be at the least three foote deepe thereof, which you must cast also into high beds or balkes, with deepe trenches or furrowes betwene, so as the ridges may be at the least a foot and a halfe higher then the furrowes; for otherwise it is not possible to haue good Melons growe ripe. The choise of your seede also is another thing of especiall regard, and the best is held to be Spanish, and not French, which hauing once gained, be sure to haue still of the same while they last good,

good, that you may haue the seede of your owne ripe Melons from them that haue eaten them, or saue some of the best your selfe for the purpose. I say while they last good; for many are of opinion, that no seede of Muske Melons gathered in England, will endure good to sowe againe here aboue the third yeaer, but still they must be renewed from whence you had your choisest before. Then hauing prepared a hot bed of dung in Aprill, set your seedes therein to raise them vp, and couer them, and order them with as great care or greater then Cowcumbers, &c. are vsed, that when they are ready, they may be transplanted vpon the beds or balkes of that ground you had before prepared for them, and set them at the least two yards in funder, euery one as it were in a hole, with a circle of dung about them, which vpon the setting being watered with water that hath stood in the Sunne a day or two, and so as often as neede is to water, couer them with strawe (some vse great hollow glasses like vnto bell-heads) or some such other things, to defend them both from the cold euenings or dayes, and the heate of the Sunne, while they are young and new planted. There are some that take vpon them great skill, that mislike of the raising vp of Melons, as they doe also of Cowcumbers, on a hot bed of horse dung, but will put two or three seedes in a place in the very ground where they shall stand and growe, and thinke without that former manner of forcing them forwards, that this their manner of planting will bring them on fast and sure enough, in that they will plucke away some of the worst and weakest, if too many rise vp together in a place; but let them know for certaine, that howsoeuer for Cowcumbers their purpose and order may doe reasonable well, where the ground is rich and good, and where they striue not to haue them so early, as they that vse the other way, for Muske Melons, which are a more tender fruit, requiring greater care and trouble in the nourising, and greater and stronger heate for the ripening, they must in our cold climate haue all the art vsed vnto them that may be, to bring them on the more early, and haue the more comfort of the Sunne to ripen them kindly, or else they will not bee worth the labour and ground. After you haue planted them as aforesaid, some of good skill doe advise, that you be carefull in any dry season, to give them wa-ter twice or thrice every weeke while they are young, but more afterward when they are more growne, and that in the moraing especially, yea and when the fruit is growne somewhat great, to water the fruit it selfe with a watering pot in the heate of the day, is of so good effect, that it ripeneth them much faster, and will giue them the better taste and smell, as they say. To take likewise the fruit, and gather it at the full time of his ripenesse is no small art; for if it be gathered before his due time to be presently eaten, it will be hard and greene, and not eat kindly; and likewise if it be suffered too long, the whole goodness will be lost: You shall therefore know, that it is full time to gather them to spend presently, when they begin to looke a little yellowish on the outside, and doe smell full and strong; but if you be to send them farre off, or keepe them long vpon any occasion, you shall then gather them so much the earlier, that according to the time of the carriage and spending, they may ripen in the lyng, being kept dry, and couered with woollen clothes: When you cut one to eat, you shall know it to be ripe and good, if the seede and pulpe about them in the smiddle be very waterish, and will easily be separated from the meate, and likewise if the meate looke yellow, and be mellow, and not hard or greene, and taste full and pleasant, and not waterish: The vsuall manner to eate them is with pepper and salt, being pared and sliced, and to drowne them in wine, for feare of doing more harme. Cowcumbers and Pompions, after they are nourished vp in the bed of hot dung, are to be severally transplanted, each of them on a large plot of ground, a good distance in funder: but the Pompions more, because their branches take vp a great deale more ground, & besides, will require a great deale more watering, because the fruit is greater. And thus haue you the ordering of those fruits which are of much esteeme, especially the two former, with all the better sort of persons; and the third kinde is not wholly refused of any, although it serueth most vually for the meaner and poorer sort of people, after the first early ripe are spent.

## C H A P . V.

*The ordering of divers sorts of herbes for the pot, for meate, and for the table.*

**T**yme, Sauory, and Hyssope, are vsually sowne in the Spring on beds by themselves, euerie one a part; but they that make a gaine by selling to others the young rootes, to set the knots or borders of Gardens, doe for the most part sow them in July and August, that so being sprung vp before Winter, they will be the fitter to be taken vp in the Spring following, to serue any mans vse that would haue them. Sage, Lauender, and Rosemary, are altogether set in the Spring, by slipping the old stalkes, and taking the youngest and likeliest of them, thrusting them either twined or otherwise halfe a foote deepe into the ground, and well watered vpon the setting; if any seasonable weather doe follow, there is no doubt of their well thriuing: the hot Sunne and piercing drying Windes are the greatest hinderances to them, and therefore I doe aduise none to set too soone in the Spring, nor yet in Autumne, as many doe practise: for I could neuer see such come to good, for the extremity of the Winter comming vpon them so soone after their setting, will not suffer their young shoothes to abide, not haing taken sufficient strength in the ground, to maintain themselves against such violence, which doth often pierce the strongest plants. Marierome and Bassill are sowne in the Spring, yet not too early; for they are tender plants, and doe not spring vntill the weather bee somewhat warme: but Bassill would bee sowne dry, and not haue any wa-ter of two or three daies after the sowing, else the seede will turne to a gelly in the ground. Some vse to sow the seed of Rosemary, but it seldom abideth the first Winter, because the young plants being small, and not of sufficient strength, cannot abide the sharpnesse of some Winters, notwithstanding the courting of them, which killeth many old plants; but the vsuall way is to slippe and set, and so they thrive well. Many doe vse to sow all or the most sorts of Pot-herbes together on one plot of ground, that they neede not to goe farre to gather all the sorts they would vse. There are many sorts of them well knowne vnto all, yet few or none doe vse all sorts, but as euery one liketh, some vse those that others refuse, and some esteem those not to bee wholesome and of a good relish, which others make no scruple of. The names of them are as followeth, and a short relation of their sowing or planting.

Rosemary, Tyne, and Savorie are spoken of before, and Onions and Leekes.

Mints are to bee set with their rootes in some by-place, for that their rootes doe creepe so farre vnder ground, that they quickly fill vp the places neare adioyning, if they be not pull vp.

Clarrie is to bee sowne, and seedeth and dyeth the next yeaer, the herbe is strong, and therefore a little thereof is sufficient.

Nep is sowne, and dyeth often after seeding, few doe vse it, and that but a little at a time: both it and Clarrie are more vsed in Tansies then in Broths.

Costmarie is to bee set of rootes, the leaues are vsed with some in their Broths, but with more in their Ale.

Pot Marierome is set of rootes, being separated in funder.

Penniroyll is to bee set of the small heads that haue rootes, it creepeth and spreadeth quickly.

Alfalfaides are to bee sowne of seede, the tops of the rootes with the greens leaues are vied in Lent especially.

Parsley is a common herbe, and is sowne of seede, it seedeth the next yeaer and dyeth: the rootes are more vsed in broths then the leaues, and the leaues almost with all sorts of meates.

Fennell is sowne of seede, and abideth many yeaers yeelding seede: the rootes also are vsed in broths, and the leaues more seldom, yet serue to trimme vp many fish meates.

Borage is sowne of seede, and dyeth the next yeaer after, yet once being suffered to seede in a Garden, will still come of it owne shedding.

Bugloss commeth of seede, but abideth many yeares after it hath giuen seede, if it stand not in the coldest place of the Garden.

Marigolds are sowne of seede, and may be after transplanted, they abide two or three yeares, if they be not set in too cold a place: the leaues and flowers are both vsed.

Langedebefee is sowne of seede, which shedding it selfe will hardly be destroyed in a Garden.

Arrach is to be sowne of seede, this likewise will rise every yeaer of it owne seede, if it be suffered to shed it selfe.

Beetes are sowne of seede, and abideth some yeaers after, still giuing seede.

Blites are vied but in some places; for there is a generall opinion held of them, that they are naught for the eyes: they are sowne every yeaer of seede.

Bloodwort once sowne abideth many yeaers, if the extremity of the frosts kill it not, and feedeth plentifully.

Patience is of the same nature, and vsed in the same manner.

French Mallowes are to be sowne of seede, and will come of it owne sowing, if it be suffered to shed it selfe.

Ciuies are planted onely by parting the rootes; for it never giueth any seede at all.

Garlick is ordered in the same manner, by parting and planting the rootes euerie yeaer.

These be all the sorts are vsed with vs for that purpose, whereas I said before, none vseth all, but every one will vse those they like best: and so much shall suffice for pot-herbes.

## CHAP. VI.

### *The manner and ordering of many sorts of herbes and rootes for Sallets.*

If I should set downe all the sorts of herbes that are vsually gathered for Sallets, I shold not onely speake of Garden herbes, but of many herbes, &c. that growe wilde in the fields, or else be but weedes in a Garden; for the vsuall manner with many, is to take the young buds and leaues of every thing almost that groweth, as well in the Garden as in the Fields, and put them all together, that the taste of the one may amend the relish of the other: But I will only shew you those that are sowne or planted in gardens for that purpose. Asparagus is a principall & delectable Sallet herbe, whose young shoothes when they are a good handfull high aboue the ground, are cut an inch within the ground, which being boyled, are eaten with a little vinegar and butter, as a Sallet of great delight. Their ordering with the best Gardiners is on this wise: When you haue prouided seede of the best kinde, you must sowe it either before Christmas, as mest doe, or before the end of February; the later you sowe, the later and the more hardly will they spring: after they are growne vp, they are to be transplanted in Autumne on a bed well trenched in with dung; for else, they will not bee worth your labour, and set about a foote distance in sunder, and looke that the more carefull you are in the replanting of them, the better they will thriue, and the sooner growe great: after fve or six yeaers standing they vsually doe decay; and therefore they that sowe to haue continually faire and great heads, doe from seede raise vp young for their store. You must likewise see that you cut not your heads or young shoothe too nigh, or too much, that is, to take away too many heads from a roote, but to leau a sufficient number vncut, otherwise it will kill the heart of your rootes the sooner, causing them to dye, or to giue very small heads or shoothes; for you may well consider with your selfe, that if the roote haue not head enough left it aboue the ground to shoothe greene this yeaer, it will not, nor cannot prosper vnder ground to gaine encrease the next yeaer. The ordering of Lettice I haue spoken of before, and shall not neede here to repeate what hath beeene already said, but referre you therunto for the sowing, planting, &c. onely I will here shew you the manner of ordering them for Sallets. There are some sorts of Lettice that growe very great, and close their heads, which are called Cabbage

bage Lettice, both ordinary and extraordinary, and there are other sorts of great Lettice that are open, and close not, or cabbage not at all, which yet are of an excellent kinde, if they be vsed after that especiall manner is fit for them, which is, That when they are planted (for after they are sowne, they must be transplanted) of a reasoneable distance in sunder, and growne to be of some bignesse, every one of them must bee tyed together with bast or thread toward the topes of the leaues, that by this meanes all the inner leaues may growe whitish, which then are to be cut vp and vsed: for the keeping of the leaues close doth make them taste delicately, and to bee very tender. And these sorts of Lettice for the most part are spent after Summer is past, when other Lettice are not to be had. Lambes Lettice or Corne Sallet is an herbe, which abiding all Winter, is the first Sallet herbe of the yeaer that is vsed before any ordinarie Lettice is ready; it is therefore vsually sowne in August, when the seede thereof is ripe. Purlane is a Summer Sallet herbe, and is to be sowne in the Spring, yet somewhat late, because it is tender, and ioyleth in warmth; and therefore diuers haue sowne it vpon those beddes of dung, whereon they nourised vp their Cowcumbers, &c. after they are taken away, which being well and often watered, hath yeelded Sallet vntill the end of the yeaer. Spinach is sowne in the Spring, of all for the most part that vse it, but yet if it be sowne in Summer it will abide greene all the Winter, and then seedeth quickly: it is a Sallet that hath little or no taste at all therein, like as Lettice and Purlane; and therefore Cookes know how to make many a good dish of meate with it, by putting Sugar and Spice thereto. Coleworts are of diuers kinds, and although some of them are wholly spent among the poorer sort of people, yet some kindes of them may be dressed and ordered as may delight a curious palate, which is, that being boyled tender, the middle ribs are taken cold, and laid in dishes, and vinegar and oyle poured thereon, and so eaten. Coleflowers are to be had in this Countrey but very seldom, for that it is hard to meeke with good seede: it must bee sowne on beds of dung to force it forward, or else it would perish with the frost before it had giuen his head of flowers, and transplanted into verie good and rich ground, lest you losse the benefite of your labours. Endive is of two sorts, the ordinary, and another that hath the edges of the leaues curld or crumpled; it is to be whited, to make it the more dainty Sallet, which is vsually done in this manner: After they are grown to some reasonable greatness (but in any case before they shoothe forth a staike in the midst for seede) they are to be taken vp, and the rootes being cut away, lay them to dry or wither for three or foure houres, and then bury them in sand, so as none of them lye one vpon another, or if you can, one to touch another, which by this meanes will change whitish, and thereby become verie tender, and is a Sallet both for Autumne and Winter. Succorie is vsed by some in the same manner, but because it is more bitter then Endive, it is not so generally vsed, or rather vsed but of a verie few: and whereas Endive will seede the same year it is sowne, and then dye, Succorie abideth manie yeaers, the bitterness thereof causing it to be more Physicall to open obstructions; and therefore the flowers pickled vp, as diuers other flowers are vsed to be now adayes, make a delicate Sallet at all times when there is occasion to vse them. Of red Beetes, the rootes are onely vsed both boyled and eaten cold with vinegar and oyle, and is also vsed to trimme vp or garnish forth manie sorts of dishes of meate: the seede of the best kinde will not abide good with vs aboue three yeaers, but will degenerate and growe worse; and therefore those that delight therein must be curious, to be prouided from beyond Sea, that they may haue such as will giue delight. Sorrell is an herbe so common, and the vse so well knowne, both for sawce, and to season broths and meates for the sound as well as sicke persons, that I shall not neede to saye anie more thereof. Cheruill is a Sallet herbe of much vse, both with French and Datch, who doe much more delight in herbes of stronger taste then the English doe: it is sowne early, and vsed but a while, because it quickly runneth vp to seede. Sweete Cheruill, or as some call it, Sweete Cis, is so like in taste vnto Anise seede, that it much delighteth the taste among other herbes in a Sallet: the seede is long, thicke, blacke, and cornered, and must be sowne in the end of Autumne, that it may lye in the ground all the Winter, and then it will shoothe out in the Spring, or else if it be sowne in the Spring, it will not spring vp that yeaer vntill the next: the leaues (as I said before) are vsed among other herbes: the rootes likewise are not onely cordiall, but also helde to be preseruatiue against the Plague, either greene, dried, or preferre with

with sugar. Rampion rootes are a kinde of Sallet with a great many, being boyled tender, and eaten cold with vinegar and pepper. Cresses is an herbe of easie and quick growth, and while it is young eaten eyther alone, or with parsley and other herbs: it is of a strong taite to them that are not accustomed thereunto, but it is much vsed of strangers. Rocket is of the same nature and qualitie, but somewhat stronger in taste: they are both sownen in the Spring, and rise, seede and dye the same yeare. Tarragon is an herbe of as strong a taste as eyther Rocket or Cresses, it abideth not euery yeare, nor yet giueth ripe seede (as far as euer could bee found with vs) any yeare, but maketh lufficent increase within the ground, spreading his roots all abroad a great way off. Mustard is a common sawce both with fish and flesh, and the seed thereof (and no part of the plant besides) is well knowne how to be vsed being grownded, as every one I thinke knoweth. The rootes of horse Radish likewise beeing grownd like Mustard, is vsed both of strangers and our owne nation, as sawce for fish. Tansie is of great vse, almost with all manner of persons in the Spring of the yeare: it is more vsually planted of the rootes then otherwise; for in that the rootes spread far and neare they may be easily taken away, without any hurt to the rest of the rootes. Burnet, although it be more vsed in wine in the Summer time then any way else, yet it is likewise made a sallet herbe with many, to amend he harsh or weak rellish of some other herbs. Skirrets are better to be sownen of the seed then planted from the roots, and will come on more speedily, and be fairer rootes: they are as often eaten cold as a Sallet, being boyled and the pith taken out, as stewed with butter and eaten warme. Let not Parsley and Fenell be forgotten among your other Sallet herbes, wheroft I haue spoken before, and therefore need say no more of them. The flowers of Marigolds pickt cleane from the heads, and pickled vp against winter, make an excellent Sallet when no flowers are to be had in a garden. Cloue Gilloflowers likewise preserued or pickled vp in the same manner (which is *stratum super stratum*, a lay of flowers, and then strawed ouer with fine dry and powdered Sugar, and so lay after lay strawed ouer, vntill the pot bee full you meane to keepe them in, and after filled vp or couered ouer with vinegar) make a Sallet now adayes in the highest esteeme with Gentles and Ladies of the greatest note: the planting and ordering of them both is spoken of severally in their proper places. Goates bearbe that groweth in Gardens only, as well as that which groweth wilde in Medowes, &c. bearing a yellow flower, are vsed as a Sallet, the rootes beeing boyled and pared are eaten cold with vinegar, oyle and pepper; or else stewed with butter and eaten warme as Skirrets, Parsneps &c. And thus haue you here set downe all those most vsuall Sallers are vsed in this Kingdome: I say the most vsuall, or that are nourfed vp in Gardens; for I know there are some other wilde herbes and rootes, as Dandelion &c. but they are vsed onely of strangers, and of those whose curiositie searcheth out the whole worke of nature to satisfie their desires.

## C H A P. VII.

*Of divers Physical herbes fit to be planted in Gardens, to serue for the especiall uses of a familie.*

**H**Aving thus shewed you all the herbes that are most vsually planted in Kitchen Gardens for ordinary vses, let mee also adde a few other that are also nourfed vp by many in their Gardens, to preserue health, and helpe to cure such small diseases as are often within the compasse of the Gentlemens skils, who, to helpe their owne family, and their poore neighbours that are farre remote from Phisitians and Chirurgions, take much paines both to doe good vnto them, and to plant those herbes that are conducing to their desires. And although I doe recite some that are mentioned in other places, yet I thought it meete to remember them altogether in one place. Angelica, the garden kinde, is so good an herbe, that there is no part thereof but is of much vse, and all cordiall and preseruatiue from infectious or contagious diseases, whether you will distill the water of the herbe, or preserue or candie the rootes or the greene stalkes, or vse the seede in pouder or in distillations, or decoctions with other things: it is sownen of seede, and will abide vntill it

it give seede, and then dyeth. Rue or Herbe grace is a strong herbe, yet vsed inwardly against the plague as an Antidote with Figs and Wall-nuts, and helpeth much against windy bodies: outwardly it is vsed to bee layde to the wrestes of the hands, to drue away agues: it is more vsually planted of slips then raised from seede, and abideth long if sharpe frostes kill it not. Dragons being distilled are held to be good to expell any euill thing from the heart: they are altogether planted of the rootes. Setwall, Valerian, or Capons tayle, the herbe often, but the roote much better, is vsed to prouoke sweating, thereby to expell euill vapours that might annoy the heart: it is only planted of the rootes when they are taken vp, and the young replanted. Asarabacca, the leaues are often vsed to procure vomiting being stamped, and the strained iuice to a little quantitie, put into a draught of ale and drunke, thereby to ease the stomacke of many euill and grosse humours that there lye and offend it; diuers also take the leaues and rootes a little boyled in wine, with a little spice added thereunto, to expell both tertian and quartan agues: the rootes of our English growing is more auailable for these purposes then any outlandish: it is planted by the roote, for I could never see it spring of seede. Masterwort commeth somewhat neere in propertie vnto Angelica, and besides very effectuall to disperse winde in the bodie, whether of the collicke or otherwise; as also very profitable to comfort in all cold causes: it yeeldeth seede, but yet is more vsually planted from the rootes being parted. Balme is a cordiall herbe both in smell and taste, and is wholly vsed for those purposes, that is, to comfort the heart being distilled into water either simple or compound, or the herbe dried and vsed: it is set of the rootes being parted, because it giueth no seede that euer I could obserue. Camomill is a common herbe well knowne, and is planted of the rootes in alleyes, in walkes, and on bankes to sit on, for that the more it is troden on, and presed downe in dry weather, the closer it groweth, and the better it will thrive: the vse therof is very much, both to warme and comfort, and to ease paines being applied outwardly after many fashions: the decoction also of the flowers prouoketh sweat, and they are much vsed against agues. Featherfew is an herbe of greater vse for women then for men, to dissolve flatulent or windy humours, which causeth the paines of the mother: some vse to take the iuice thereof in drinke for agues: it is as well sownen of the seede as planted of the rootes. Costmary is vsed among those herbes that are put into ale to cause it haue a good rellish, and to be somewhat physicall in the moneth of May, and doth helpe to prouoke vrine: it is set of the rootes being parted. Maudlin is held to be a principall good herbe to open and cleane the liuer, and for that purpose is vsed many wayes, as in ale, in tansies, and in broths &c. the seed also is vsed, and so is the herbe also sometimes, to kill the wormes in children: it is sownen of the seede, and planted also of the separated rootes. Cassidone is a small kinde of Lauender, but differing both in forme and qualitie: it is much vsed for the head to ease paines thereof, as also put among other things to purge melancholike diseases: it is sownen of seede, and abideth not a winter vnlesse it bee well defended, and yet hardly giueth ripe seede againe with vs. Smallage is a great opening herbe, and much more then eyther Parsley or Fenell, and the rootes of them all are often vsed together in medicines: it is sownen of seede, and will not bee wanting in a Garden if once you suffer it to sow it selfe. Cardus Benedictus, or the Blessed Thistle, is much vsed in the time of any infection or plague, as also to expell any euill symptome from the heart at all other times. It is vsed likewise to be boyled in posset drink, & given to them that haue an ague, to helpe to cure it by sweating or otherwise. It is vsually sownen of seed, and dyeth when it hath gien seed. Winter Cherries are likewise nurfed vp in diuers gardens, for that their propertie is to helpe to them that are troubled eyther with the stopping or heate of their vrine, the herbe and berries are often distilled, but the berries alone are more often vsed: after it is once planted in a garden it will runne vnder ground, & abide well enough. Celondine is held to bee good for the iauandise, it is much vsed for to cleare dim eyes, eyther the iuice or the water dropped into them: it is sownen of seede, and being once brought into a garden, will hardly beweeded out; the seede that sheddeth will so sow it selfe, and therefore some corner in a garden is the fittest place for it. Tabacco is of two sorts, and both vsed to be planted in Gardens, yet the English kinde (as it is called) is moreto be found in our Countrey Gardens then the Indian sort: the leaues of both sorts indifferently, that is, of eyther of which is next at hand, being stamped and boyled

led eyther by it selfe, or with other herbes in oyle or hogs fuet, doc make an excellent saluer for greene wounds, and also to clese old vlcers or sores ; the iuice of the greene leaues drunke in ale, or a dried leafe steeped in wine or ale for a night, and the wine or ale drunke in the morning, prouoketh to cast, but the dried leafe much stronger then the greene : they are sowen of seede, but the Indian kinde is more tender, and will not abide a winter with vs abroade. Spurge that vsually groweth in Gardens, is a violent purger, and therefore it is needfull to be very carefull how it is vsed : the seede is more ordinarily vsed then any other part of the plant, which purgeth by vomiting in some, and both vpwards and downwards in many ; the iuice of the herbe, but especially the milke thereof, is vsed to kill wartes : it is sowen of seede, and when it doth once shew it selfe, it will till continue springing of the fallen seede. Bearefoote is sowen of seede, and will hardly abide transplanting vnlesse it bee while it is young ; yet abideth diuers yeares, if it stand not in too cold a place. This I speake of the greater kinde ; for the lower small wilde kind (which is the most ordinary in this land) will neuer decay : the leaues are sometimes vsed greene, but most vsually dried and poudered, and giuen in drinke to them that haue the wormes : it purgeth melancholy, but especially the roots. In many Countries of this Land, and elsewhere, they vsē to thrust the stalk of the great kinde through the eare or de-wlap of Kine and Cattell, to cure them of many diseases. Salomons Seale, or (as some call it) Ladder to heauen, although it doth grow wilde in many places of this Land, yet is planted in Gardens : it is accounted an excellent wound herbe to consolidate, and binde, insomuch that many vsē it with good successe to cure ruptures, and to stay both the white and the red fluxe in women : it is planted altogether of the rootes, for I could neuer finde it spring from the seede, it is so strong. Comfry likewise is found growing wilde in many places by ditch sides, and in moist places, and therefore requireth some moist places of the garden : it is wholly vsed for knitting, binding, and consolidating fluxes and wounds, to be applyed either inwardly or outwardly : The rootes are stronger for those purposes then any other parts of the plant. Licoris is much vsed now adies to bee planted in great quantitie, euen to fill many acres of ground, whereof rifeth a great deale of profit to those that know how to order it, and haue fit grounds for it to thriue in ; for euery ground will not be aduantagious : It will require a very rich, deepe and mellow ground, eyther natural or artificiall ; but for a private house where a small quantitie will serue, there needeth not so much curiositie : it is vsually planted of the top heads, when the lower rootes (which are the Licoris that is vsed) and the runners are cut from them. Some vsē to make an ordinary drinke or beuerage of Licoris, boyled in water as our vsuall ale or beere is with malt, which fermenteth with barne in the same manner, and tunned vp, serueth in stead thereof, as I am credibly informed : It is otherwise in a manner wholly spent for colds, coughes and rheumies, to expectorate flegme, but vsed in diuers formes, as in iuice, in decoctiōns, syrrups, ſoules, trochisces, and the greene or dried roote of it ſelfe.

And these are the most ordinary Phyſicall herbes that are vsed to be planted in gardens for the vſe of any Country familie, that is (as I ſaid before) farre remote from Phyſicians or Chirurgions abidings, that they may vſe as occation serueth for themſelues or their neighbours, and by a little care and paines in the applying may doe a great deale of good, and ſometimes to them that haue not wherewith to ſpend on themſelues, much leſſe on Phyſicians or Chirurgions, or if they haue, may oftentimes receive leſſe good at their hands then at others that are taught by expeſience in their owne families, to be the more able to giue helpe to others.

The

## THE KITCHEN GARDEN.

### THE SECOND PART,

Ontaining as well all ſorts of herbes, as rootes and fruits, that are vsually planted in Gardens, to ſerue for the vſe of the Table whether of the poore or rich of our Countrey : but herein I intend not to bring any fruite bearing trees, shrubbes, or buſhes ; for I reſerve them for my Orchard, wherin they ſhal be ſet forth. So that in these three parts, I ſuppoſe the exquife ornament of any worthy house is conſummate for the exteriour bounds, the benefit of their riches extending alſo to the furniſhing of the moſt worthy inward parts thereof : but because many take pleaſure in the ſight and knowledge of other herbes that are Phyſicall, and muſt more in their properties and vertues, if vnto theſe three I ſhould add a Phyſicke Garden, or Garden of Simples, there would be a quadripartite complement, of whatſoever arte or nature, neceſſarie or delight could affect : which to effect (as many my friends haue intreated it at my hands) will require more paines and time then all this worke together : yet to ſatisfie their deſires and all others herein, that would bee enformed in the truthe, and reformed of the many errores and ſlips ſet forth and published heretofore of plants by diuers, I ſhall (God assisting and granting life) labour to performe, that it may ſhew it ſelfe to the light in due conueniencie, if theſe bee well and gratefully accepted. And because I ended with ſome iweete herbes in the former part, I will in this part beginne with the reſt, which I reſerved for this place, as fitter for the pot and kitchen then for the hand or boſome, and ſo descend to other herbes that are for meat or ſallets : and after them to thoſe rootes that are to be eaten, as meate or as ſallets : and laſtly the fruits that grow neere, or vpon the ground, or not much aboue it ; as the Artichoke, &c. in which I make a ſhorter deſcription then I did in the former, rather endeavouring to ſhew what they are, and whereunto they are vsed, then the whole varietie or any exact declaration : which methode, althoſh in ſome ſort it may bee fitting for this purpose, yet it is not for an history or herball : I ſhall therefore require their good acceptance for whose ſake I doe it, not doubting, but that I, or others, if they write againe of this ſubiect, may poliſh and amende what formerly hath beeene eyther miſſet, or not foſthoroughly exprefſed, beſides ſome additions of new conceits, ſeeing I treade out a new path, and therefore thoſe that follow may the eaſier ſee the Meanders, and ſo go on in a direct line.

## CHAP. I.

*Majorana latifolia, sive major Anglicæ.* Winter, or pot Maricerome.

**W**inter Maricerome is a small bushie herbe like unto sweete Maricerome, being parted or diuided into many branches, whereon doe grow broader and greener leaues, set by couples, with some small leaues likewise at the feuerall ioynts all along the branches: at the tops whereof grow a number of small purplish white flowers set together in a tuft, which turne into small and round seed, bigger then sweet Maricerome seede: the whole plant is of a small and fine sent, but much inferiour to the other, and is nothing so bitter as the sweete Maricerome, and thereby both the fitter and more willingly vsed for meates: the roote is white and threddy, and perisheth not as the former, but abideth many yeares.

## The Vse of winter Maricerome.

The vse of this Maricerome is more frequent in our Land then in others, being put among other pot-herbes and farling (or falting herbes as they are called) and may to good profit bee applied in inward as well as outward griefes to comfort the parts, although weaker in effect then sweete Mariceromes.

## CHAP. II.

*Thymum vulgaris sive dantis.* Ordinary Garden Tyme.

**T**he ordinary Garden Tyme is a small low woody plant with brittle branches, and small hard green leaues, as every one knoweth, haing small white purplish flowers, standing round about the tops of the stalkes: the seed is small and browne, darker then Maricerome seed: the root is woody, and abideth well diuers Winters.

*Thymus latifoliam.* Masticke Tyme.

This Tyme hath neyther so woody branches, nor so hard leaues, but growth lower, more spreading, and with somewhat broader leaues: the flowers are of a purplish white colour, standing in roundles round about the stalkes, at the ioynts with leaues at them likewise. This Tyme endureth better and longer then the former, and by spreading it selfe more then the former, is the more apt to bee propagated by slipping, because it hath beeene seldom seene to giue seede: It is not so quicke in sent or taste as the former, but is fitter to set any border or knot in a garden, and is for the most part wholly employed to such vses.

## The Vse of Tyme.

To set downe all the particular vses whereunto Tyme is applied, were to weary both the Writer and Reader; I will but only note out a few: for besides the physicall vses to many purposes, for the head, stomacke, spleene, &c. there is no herbe almost of more vse, in the houses both of high and low, rich and poore, both for inward and outward occasions; outwardly for bathings among other hot herbes, and among other sweete herbes for strewings: inwardly in most sorts of broths, with Rosmary, as also with other falting (or rather farling) herbes, and to make sawce for diuers sorts both fish and flesh, as to stuffe the belly of a Goose to bee rosted, and after put into the sawce, and the pouder with breade to strew on meat when it

1 *Majorana major Anglicæ.* Pot Maricerome. 2 *Thymum vulgaris.* Garden Tyme. 3 *Satureja.* Sauorie. 4 *Hyssopus.* Hyssop. 5 *Pulegium.* Penniroyall. 6 *Salvia major.* Common Sage. 7 *Salvia minor priuata.* Sage of vertue.

is rosted, and so likewise on rosted or fryed fish. It is held by diuers to bee a speedy remedy against the sting of a Bee, being bruised and layd theron.

## C H A P. III.

*Satureia sive Thymbra. Sauorie.*

**T**here are two sorts of Sauorie, the one called Summer, and the other Winter Sauorie : The Summer Sauorie is a small tender herbe, growing not aboue a foote and a halfe high, or thereabouts, rising vp with diuers brittle branches, slenderly or sparsely set with small long leaues, soft in handling, at every ioynt a couple, one against another, of a pleasant strong and quicke sent and taſte : the flowers are ſmall and purplish, growing at the topes of the stalkes, with two ſmall long leaues at the ioynts vnder them: the ſeede is ſmall, and of a darke colour, bigger then Tyme ſeede by the halfe : the roote is woody, and hath many ſtrings, perishing every yeaſe wholly, and muſt bee new ſowne againe, if any will haue it.

The Winter Sauorie is a ſmall low buſtie herbe, very like vnto Hyſſope, but nor aboue a foote high, with diuers ſmall hard branches, and hard darke green leaues thereon, thicker ſet together then the former by much, and as thicke as common Hyſſope, ſometimes with fourc leaues or more at a ioynt, of a reasonable ſtrong ſent, yet not ſo ſtrong or quicke as the former : the flowers are of a pale purplish colour, ſet at ſeverall diſtances at the topes of the stalkes, with leaues at the ioynts also with them, like the former : the roote is woody, with diuers ſmall ſtrings thereat, and abideth all the winter with his green leaues : it is more vſually encreaſed by ſlipling or diuiding the roote, and new ſetting it ſeverall againe in the Spring, then by ſowing the ſeed.

## The Vſe of Sauorie.

The Summer Sauorie is uſed in other Countreyes much more then with vs in their ordinary diets, as condiment or ſauce to their meates, ſometimes of it ſelue, and ſometimes with other herbes, and ſometimes ſtrewed or layde vpon the dishes as we doe Parsley, as alſo with beanes and peafe, rife and wheate ; and ſometimes the dried herbe boyled among peale to make pottage.

The Winter Sauorie is one of the (ſarfing) fasteing herbes as they call them, and ſo is the Summer Sauorie alſo ſometimes. This is uſed alſo in the ſame manner that the Summer Sauorie is, ſet downe before, and to the ſame purpoſes : alſo to put into puddings, ſawsages, and ſuch like kindes of meates. Some doe vſe the pouder of the herbe dryed (as I ſayd before of Tyme) to mixe with grated bread, to breade their meate, be it fish or fleſh, to giue it the quicker rellish. They are both effectuall to expell windē.

## C H A P. IIII.

*Hyſſopus. Hyſſope.*

**G**arden Hyſſope is ſo well knowne to all that haue beeene in a Garden, that I ſhall but allūge, to beſtow any time thereon, being a ſmall buſtie plant, not riſing aboue two foote high, with many branches, woody below, and tender aboue, whereon are ſet at certayne diſtances, ſundry ſmall, long and narrow green leaues : at the toppe of every ſtalke ſtand bleuiſh purple gaping flowers, one aboue another in a long ſpike or eare : after which followeth the ſeede, which is ſmall and blackiſh : the rootes are composed of many threddy ſtrings ; the whole plante of a ſtrong ſweet ſent.

The

## The Vſe of Hyſſope.

Hyſſope is much uſed in Ptifans and other drinkeſ, to help to expectorate flegme. It is many Countrey peoples medicine for a cut or greene wound, being bruised with ſugar and applyed. I finde it is alſo much commended againſt the falling ſickeneſſe, especially being made into pilſ after the manner before rehearſed. It is accounted a ſpeciall remedy againſt the ſting or biting of an Adder, if the place be rubbed with Hyſſope, bruized and mixed with honey, ſalt and cum min ſeede. A decoction thereof with oyle, and annoiſted, taketh away the itching and tingling of the head, and vermine alſo breeding therein. An oyle made of the herbe and floweres, being annoiſted, doth comfort benummed ſinewes and ioynts.

## C H A P. V.

*Pulegium. Pennyroyall.*

**P**ennyroyall alſo is an herbe ſo well knowne, that I ſhall not neede to ſpend much time in the deſcription of it : hauing many weake round ſtakles, diuided into ſundry branches, rather leaning or lying vpon the ground then ſtanding vpright, whereon are ſet at ſeverall ioynts, ſmall roundiſh darke greene leaues : the flowers are purpliſh that grow in gardens, yet ſome that grow wilde are white, or more white then purple, ſet in roundiſhes about the tops of the branches ; the ſtakles ſhoote forth ſmall fibres or rootes at the ioynts, as it lyeth vpon the ground, thereby fastening it ſelfe therein, and quickly increaſeth, and over-runneth any ground, especially in the ſhade or any moist place, and is replanted by breaking the ſprouted ſtakles, and ſo quickly growtheth.

Other ſorts of Pennyroyall are fit for the Phyfiche Garden, or Garden of Simples.

## The Vſe of Pennyroyall.

It is very good and wholesome for the lunges, to expell cold thin flegme, and afterwards to warme and dry it vp : and is alſo of the like proprietie as Mintes, to comfort the ſtomacke, and ſtay vomiting. It is alſo uſed in womeſ baths and washings : and in mens alſo to comfort the ſinewes. It is yet to this day, as it hath bee in former times, uſed to bee put into puddings, and ſuch like meates of all ſorts, and therefore in diuers places they know it by no other name then Pudding-graffe.

The former age of our great Grandfathers, had all theſe hot herbes in much and familiar uſe, both for their meates and medicines, and therewith preſerued themſelues in long life and much health : but this delicate age of ours, which is not pleased with any thing almoſt, be it meat or medicine, that is not pleauant to the palate, doth wholly refuſe theſe almoſt, and therefore cannot be partaker of the benefit of them.

## C H A P. VI.

*Salvia. Sage.*

**T**here are two espeſiall kindes of Sage nurſed vp in our Gardens, for our ordinary uſe, whereof I intend to write in this place, leauing the reſt to his fitter place. Our ordinary Sage is reckoned to bee of two ſorts, white and red, both

both of them bearing many four square wooddy stalkes, in some whiter, in others redder, as the leaues are also, standing by couples at the ioynts, being long, rough, and wrinkled, of a strong sweete sent: at the tops of the stalkes come forth the flowers, set at certaine spaces one aboue another, which are long and gaping, like vnto the flowers of Clary, or dead Nettles, but of a blewifh purple colour; after which come small round seede in the huske that bore the flower: the roote is wooddy, with diuers strings at it: It is more vsually planted of the slips, pricked in the Spring time into the ground, then of the seed.

*Salvia minor fine pinata.* Small Sage or Sage of vertue.

The lesser Sage is in all things like vnto the former white Sage, but that his branches are long and slender, and the leaues much smaller, hauing for the most part at the bottome of each side of the leafe a peece of a leafe, which maketh it shew like finnes or eares: the flowers also are of a blewifh purple colour, but lesser. Of this kinde there is one that beareth white flowers.

The Vse of Sage.

Sage is much vsed of many in the moneth of May fasting, with butter and Parsley, and is held of most much to conduce to the health of mans body.

It is also much vsed among other good herbes to bee tund vp with Ale, which thereupon is termed Sage Ale, whereof many barrels full are made, and drunke in the said moneth chiefly for the purpose afore recited: and also for teeming women, to helpe them the better forward in their childebearing, if there be feare of abortion or miscarrying.

It is also vsed to be boyled among other herbes, to make Gargles or waters to wash sore mouths and throates: As also among other herbes, that serue as bathings, to wash mens legs or bodies in the Summer time, to comfort nature, and warme and strengthen aged cold sinewes, and lengthen the strength of the younger.

The Kitchen vse is either to boyle it with a Calues head, and being minced, to be put with the braines, vinegar and pepper, to serue as an ordinary fawce thereto: Or being beaten and iuyced (rather then minced as manie doe) is put to a rosted Pigges braines, with Currans for fawce thereto. It is in small quantity (in regard of the strong taste thereof) put among other fasting herbes, to serue as fawce for peeces of Veale, when they are farced or stuffed therewith, and rosted, which they call Ollies.

For all the purposes aforesaid, the small Sage is accounted to be of the more force and vertue.

CHAP. VII.

*Horminum sativum.* Garden Clary.

There is but one sort of Garden Clary, though many wilde, which hath four square stalks, with broad rough wrinkled whitish leaues, somewhat vacuenly cut in on the edges, and of a strong sweete sent, growing some next the ground, & some by couples vpon the stalkes: the flowers growe at certaine distances, with two small leaues at the ioynts vnder them, somewhat like vnto the flowers of Sage, but lesser, and of a very whitish or bleake blew colour: the seede is of a blackish browne colour, somewhat flat, and not so round as the wilde: the rootes spread not farre, and perish every yeare that they beare flowers and seede. It is altogether to bee sowne of seed in the Spring time, yet sometimes it will rise of it owne sowing.

The

The Vse of Clary.

The most frequent and common vse of Clary, is for men or women that haue weake backes, to helpe to comfort and strengthen the raines, being made into Tansies and eaten, or otherwise. The seede is vsed of some to be put into the corner of the eye, if any mote or other thing haue happened into it: but assuredly although this may peraduenture doe some good, yet the seede of the wilde will doe much more. The leaues taken dry, and dipped into a batter made of the yolkes of egges, flower, and a little milke, and then fryed with butter vntill they be crispe, serue for a dish of meate accepted with manie, vnplesant to none.

CHAP. VIII.

*Nepeta.* Nep.

**A**Lthough those that are Herbarists do know three sorts of Nep, a greater & two lesser, yet because the lesser are not vsuall, but in the Gardens of those that delight in natures varieties, I do not here shew you them. That which is vsuall (and called of manie Cat Mint) beareth square stalkes, but not so great as Clarie, hauing two leaues at every ioynt, somewhat like vnto Balme or Speare Mintes, but whiter, softer, and longer, and ticked about the edges, of a strong sent, but nothing so strong as Clary: the flowers growe at the topes of the stalkes, as it were in long spikes or heads, somewhat close together, yet compassing the stalkes at certaine ioynts, of a whitish colour, for forme and bignesse like vnto Balme, or somewhat bigger: the rootes are composed of a number of strings, which dye not, but keepe greene leaues vpon them all the Winter, and shoothe anew in the Spring. It is propagated both by the seede, and by slipping the rootes.

The Vse of Nep.

Nep is much vsed of women either in baths or drinke to procure their feminine courses: as also with Clarie, being fryed into Tansies, to strengthen then their backes. It is much commended of some, if the iuyce thereof be drunke with wine, to helpe those that are bruised by some fall, or other accident. A decoction of Nep is availeable to cure the scabbe in the head, or other places of the body.

CHAP. IX.

*Melissa.* Baulme.

**T**He Garden Baulme which is of common knowne vse, hath diuers square blackish greene stalkes, and round, hard, darke, greene pointed leaues, growing thereon by couples, a little notchid about the edges, of a pleasant sweete sent, drawing nearest to the sent of a Lemon or Cirron; and therefore of some called Citrages: the flowers growe about the topes of the stalkes at certaine distancies, being small and gaping, of a pale carnation colour, almost white: the rootes fasten themselves strongly in the ground, and endure many yeares, and is increased by diuiding the rootes; for the leaues dye downe to the ground: every yeare, leaving no shew of leafe or stalke in the Winter.

The

*The Vse of Baulme.*

Baulme is often vsed among other hot and sweete herbes, to make baths and washings for maens bodies or legges, in the Summer time, to warme and comfort the veines and sinewes, to very good purpose and effect, and hath in former ages beeene of much more vse then now adayes. It is also vsed by diuers to be stilled, being steeped in Ale, to make a Baulme water, after the manner they haue beeene taught, which they keepe by them, to vse in the stead of *Aqua vita*, when they haue any occasion for their owne or their neighbours Families, in suddaine qualmes or passions of the heart: but if they had a little better direction (for this is somewhat too rude) it would doe them more good that take it: For the herbe without all question is an excellent helpe to comfort the heart, as the very smell may induce any so to beleeue. It is also good to heale greene wounds, being made into salves: and I verily thinke, that our forefathers hearing of the healing and comfortable properties of the true naturall Baulme, and finding this herbe to be so effectuall, gaue it the name of Baulme, in imitation of his properties and vertues. It is also an herbe wherein Bees doe much delight, as hath bee found by experiance of thole that haue kept great store; if the Hives bee rubbed on the inside with some thereof, and as they thinke it draweth others by the smell thereof to resort thither. Plinie saith, it is a present remedy against the stinging of Bees.

## C H A P. X.

*Mentha, Mintes.*

**T**here are diuers sorts of Mints, both of the garden, and wilde, of the woods, mountaines, and standing poolles or waters: but I will onely in this place bring to your remembrance two or threē sorts of the most vsuall that are kept in gardens, for the vses whereunto they are proper.

Red Mint or browne Mint hath square brownish stalkes, with somewhat long and round pointed leaves, nicked about the edges, of a darke greene colour, set by couples at every ioynt, and of a reasonable good sent: the flowers of this kinde are reddish, standing about the topes of the stalkes at distances: the rootes runne creeping in the ground, and as the rest, will hardly be cleared out of a garden, being once therein, in that the smalleſt pece thereof will growe and encrease apace.

Speare Mint hath a square greene stalke, with longer and greener leaues then the former, set by couples, of a better and more comfortable sent, and therefore of much more vse then any other: the flowers hereof growe in long eares or spikes, of a pale red or bluſh colour: the rootes creepe in the ground like the other.

Party coloured or white Mint hath square greene stalkes and leaues, somewhat larger then Speare Mint, and more nicked in the edges, whereof many are parted, halfe white and halfe greene, and ſome more white then greene, or more green then white, as nature listeth: the flowers stand in long heads close ſet together, of a bluſh colour: the rootes creepe as the rest doe.

*The Vſe of Mintes.*

Mintes are oftentimes vsed in baths, with Baulme and other herbes, as a helpe to comfort and strengthen the nerues and sinewes.

It is much vsed either outwardly applyed, or inwardly drunke, to ſtrengthen and comfort weake ſtomackes, that are much giuen to casting: as alſo for feminine fluxes. It is boyled in milke for thoſe whose ſtomackes are apt

1. *Horminum sativum*. Garden Clary. 2. *Nepeta*. Nep. 3. *Melissa*. Baulme. 4. *Mentha sativa*. Garden Mintes.  
5. *Balsamum*, ſen *Costus horridus*. Costmary. 6. *Ageratum*. Maudeline.

## The Kitchen Garden.

apt to cause it to curdle. And applied with salt, is a good helpe for the biting of a mad dogge.

It vsed to be boyled with Mackarell, and other fish.

Being dryed, is often and much vsed with Penniroyll, to bee put into puddings : as also among pease that are boyled for pottage.

Where Dockes are not ready at hand, they yse to bruise Mintes, and lay them vpon any place that is stung with Bees, Wasps, or such like, and that to good purpose.

### CHAP. XI.

*Balsamita major & minor, seu Costus hortorum maior & minor.*  
Costmary and Maudeline.

**C**ostmary or Alecoast is a sweet herbe, bearing many broad and long pale green leaues, snipt about the edges, euery one vpon a long foote-stalke ; among which rise vp many round greene stalkes, with such like leaues on them, but lesser vp to the toppe, where it spreadeth it selfe into three or fourre branches, every one bearing an umbell or tuft of gold yellow flowers, somewhat like vnto Tanfie flowers, but lesser, which turne into small heads, containing small flat long seede : the roote is somewhat hard and stringy, and being diuided, is replanted in the Spring of the yeare for increase.

Maudeline hath somewhat long and narrow leaues, snipt about the edges : the stalks are two foot high, bearing many yellow flowers on the tops of the branches, in an umbell or tuft like vnto Tanfie : the whole herbe is sweete, and somewhat bitter, and is replanted by slipping.

#### The Vse of Costmary and Maudeline.

Costmary is of especiall vse in the Spring of the yeare, among other such like herbes, to make Sage Ale, and thereupon I thinke it tooke the name of Alecoast.

It is also vsed to be put among other sweete herbes, to make sweete washing water, whereof there is great store spent.

The leaues haue an especiall vertue to comfort both the stomack and heart, and to warme and dry a moist braine. The seede is much vsed in the Country, to be giuen to children for the wormes, in the stead of wormseed, and so is the seede of Maudeline also.

Maudeline is much vsed with Costmary and other sweete herbes, to make sweete washing water : the flowers also are tyed vp with small bandels of Lauender toppes, these being put in the middle of them, to lye vpon the toppes of beds, presses, &c. for the sweete sent and saavour it casteth. It is generally accounted of our Apothecaries to be the true *Eupatorium* of Aucien, and the true *Ageratum* of Dioscorides ; but Dodonaeus seemeth to contradict both.

### CHAP. XII.

*Tanacetum vulgare & crispum. Tanfie.*

**O**ur Garden Tanfie hath many hard greene leaues, or rather wings of leaues ; for they are many small ones, set one against another all along a middle ribbe or stalke, and snipt about the edges : in some the leaues stand closer and thicker, and somewhat crumpled, which hath caused it to be called double or curld Tanfie,

## The Kitchen Garden.

sie, in others thinner and more sparsedly : It riseth vp with many hard stalks, whercon growe at the tops vpon the severall small branches gold yellow flowers like buttons, which being gathered in their prime, will hold the colour fresh a long time : the seede is small, and as it were chaffie : the roote creepeth vnder ground, and shooeth vp againe in diuers places : the whole herbe, both leaues and flowers, are of a sharpe, strong, bittci smell and taste, but yet pleasant, and weel to be endured.

#### The Vse of Tanfie.

The leaues of Tanfie are vsed while they are young, either shred small with other herbes, or else the iuyce of it and other herbes fit for the purpose, beaten with eggs, and fryed into cakes (in Lent and the Spring of the yeare) which are vsually called Tanfies, and are often eaten, being taken to be very good for the stomack, to helpe to digest from thence bad humours that cleave therunto : As also for weak raines and kidneyes, when the vrine passeth away by drops : This is thought to be of more vfe for men then for women. The seed is much commended against all sorts of wormes in children.

### CHAP. XIII.

*Pimpinella seu Sanguisorba. Burnet.*

**B**urnet hath many winged leaues lying vpon the ground, made of many small, round, yet pointed greene leaues, finely nicked on the edges, one set against another all along a middle ribbe, and one at the end thereof ; from among which rise vp diuers round, and sometimes crested browne stalkes, with some few such like leaues on them as growe belowe, but smaller : at the topes of the stalkes growe small browne heads or knaps, which shooe forth small purplish flowers, turning into long and brownish, but a little cornered seede : the roote groweth downe deepe, being small and brownish : the whole plant is of a stipticke or binding taste or quality, but of a fine quicke sent, almost like Baulme.

#### The Vse of Burnet.

The greatest vse that Burnet is commonly put vnto, is to put a few leaues into a cup with Claret wine, which is presently to be drunke, and giueth a pleasant quicke taste thereto, very delightfull to the palate, and is accounted a helpe to make the heart merrie. It is sometimes also while it is young, put among other Sallet herbes, to give a finer rellysh therunto. It is also vsed in vulnerary drinke, and to stay fluxes and bleedings, for which purposes it is much commended. It hath beeene also much commended in contagious and pestilentiall agues.

### CHAP. XIV.

*Hippopatathum sativum, sive Rhabarbarum Monachorum.*  
Monkes Rubarbe or Patience.

**G**arden Patience is a kinde of Docke in all the parts thereof, but that it is larger and taller then many others, with large and long greene leaues, a great, strong, and high stalke, with reddish or purplish flowers, and three square seede, like as all other Dockes haue : the roote is great and yellow, not having any shew of flesh coloured veines therein, no more then the other kinde with great round thin leaues, commonly

commonly called *Hippopatrum or anisifolium*, Bastard Rubarbe, or Monkes Rubarbe, the properties of both which are of very weake effect : but I haue a kinde of round leaved Dock growing in my Garden, which was sent me from beyond Sea by a worthy Gentleman, M<sup>r</sup>. Dr<sup>r</sup>. Matth. Lister, one of the Kings Phyſitians, with this title, *Rhaponticum verum*, and first grew with me, before it was euer ſeen or known elsewhere in England, w<sup>ch</sup> by proof I haue found to be ſo like vnto the true Rubarbe, or the Rha of Pontus, both for forme and colour, that I dare ſay it is the very true Rubarbe, our climate only making it leſſe ſtrong in working, leſſe heavy, and leſſe bitter in taste: For this hath great and thicke rootes, as diuerſly diſcoloured with flesh coloured veines as the true Rubarbe, as I haue to ſhew to any that are diſtrous to ſee and know it ; and alſo other ſmaller ſprays or branches of rootes, ſpreading from the maieſt great root, which ſmaller branches may well be compared to the *Rhaponticum* which the Merchants haue brought vs, whiche we haue ſene to be longer and ſlenderer then Rubarbe, but of the very fame colour: this beareth ſo goodly large leaues, that it is a great beauty in a gaſten to beholde them : for I haue measured the ſtalke of the leate at the botome next the root to bee of the bignesse of any mans thumbe ; and from the root to the leafe it ſelfe, to bee two foote in length, and ſometimes more ; and likewiſe the leafe it ſelfe, from the lower end where it is ioynd to the ſtalke, to the end or point thereof, to bee alſo two foote in length, and ſometimes more ; and alſo in the broadeſt part of the leafe, to be two foote or more ouer in breadth: it beareth whitish flowers, contrary to all other Docks, and three ſquare browniſh ſeede as other Docks doe, but bigger, and therefore assuredly it is a Docke, and the true Rubarbe of the Arabians, or at the leaſt the true *Rhaponticum* of the Ancients. The figure of the whole plant I haue cauſed to be cut, with a dried root as it grew in my gaſten by it ſelfe, and haue iuſted it here, both because Matthiolus giueth a falſe figure of the true Rubarbe, and that this hath not beene expreſſed and ſet forth by any before.

#### The Vſe of Patience, and of the Rubarbe.

The leaues of Patience are often, and of many uſed for a pot-herbe, and ſeldome to any other purpose: the root is often uſed in Diet-beere, or ale, or in other drinckes made by decoction, to helpe to purge the liuer, and cleane the blood. The other Rubarbe or *Rhaponticum*, wherof I make mention, and giue you here the figure, I haue tryed, and found by experiance to purge gently, without that aſtriction that is in the true Rubarbe brought vs from the Eaſt Indies, or China, and is alſo leſſe bitter in taste; whereby I coniecture it may bee uſed in hot and feaueriſh bodies more eſſually, because it doth not binde after the purging, as the Eaſt India Rubarbe doth: but this muſt bee giuen in double quantitie to the other, and then no doubt it will doe as well: The leaues haue a fine acide taste: A ſyruppe therefore made with the iuice and ſugar, cannot but be very effectuall in diected appetites, and hot fits of agues; as alſo to helpe to open obſtructions of the liuer, as diuers haue often tryed, and found auailable by experiance.

#### CHAP. XV.

##### *Lapathum sanguineum*. Blood-wort.

**A**mong the ſorts of pot-herbes Blood-wort hath alwayes beeene accounted a principall one, although I doe not ſee any great reaſon therein, eſpecially ſeeing there is a greater efficacie of binding in this Docke, then in any of the other: but as common uſe hath receiu'd it, ſo I here let it downe. Blood-wort is one of the ſorts of Docks, and hath long leaues like vnto the ſmaller yellow Docke, but ſtriped with red veines, and ouer-ſhadowed with red vpon the greene leafe, that it ſeemeth almoſt wholly red ſometimes: the ſtalke is reddiſh, bearing ſuch like leaues, but ſmaller

1 Tanacetum. Tanie. 2 Pimpinella. Burnet. 3 Rhabonticum verum seu potius Rhubarbarum verum. True Raphontick or rather true Rubarbe. 4 Lapathum sativum seu Patientia. Monkes Rubarbe or Patience. 5 Lepidium sanguineum. Bloudwort. 6 Aceria. Sorrel.

smaller vp to the toppe, where it is diuided into diuers small branches, whereon grow purplish flowers, and three square darke red seede, like vnto others : the roots are not great, but somewhat long, and very red, abiding many yeares, yet sometimes spoiled with the extremitie of winter.

## The Vse of Blood-worte.

The whole and onely vse of the herbe almost, serueth for the pot, among other herbes, and, as I said before, is accounted a most especiall one for that purpose. The seede therof is much commended for any fluxe in man or woman, to be inwardly taken, and so no doubt is the roote, being of a stipticke qualitie.

## C H A P. XVI.

*Oxalis sine Acetosa. Sorrell.*

**S**orrell must needs bee reckoned with the Docks, for that it is so like vnto them in all things, and is of many called the sower Docke. Of Sorrels there are many sorts, but I shall not trouble you with any other in this place, then the common Garden Sorrell, which is most knowyne, and of greatest vse with vs ; which hath tender green long leaues full of iuice, broade, and bicorned as it were, next vnto the stalke, like as Arrach, Spinach, and our English Mercurie haue, of a sharpe sower taste : the stalkes are slender, bearing purplish long heads, wherein lye three square shining browne seede, like, but lesser then the other : the root is smaller then any of the other Docks, but browne, and full of strings, and abideth without decaying, having greene leaues all the winter, except in the very extremitie thereof, which often taketh away all or most of his leaues.

## The Vse of Sorrell.

Sorrell is much vsed in sawces, both for the whole, and the sicke, cooling the hot liuers, and stomackes of the sicke, and procuring vnto them an appetite vnto meate, when their spirits are almost spent with the violence of their furious or fierie fits ; and is also of a pleasant rellysh for the whole, in quickning vp a dull stomacke that is ouer-loaden with evry daies plenty of dishes. It is diuers waies dressed by Cooks, to please their Masters stomacks.

## C H A P. XVII.

*Buglossum lateum, sive Lingua Bonis. Langdebeefe.*

**V**nto this place may well bee referred our ordinary Borage and Buglosse, set forth in the former Booke, in regard of the properties whereunto they are much employed, that is, to scruie the pot among other herbes, as is sufficiently knowne vnto all. And yet I confesse, that this herbe (although it bee called *Buglossum lateum*, as if it were a kind of Buglosse) hath no correspondency with Buglosse or Borage in any part, sauing only a little in the leafe; & our Borage or Buglosse might more fitly, according to the Greeke name, bee called Oxe tongue or Langdebeefe; and this might in my iudgement more aptly be referred to the kinds of *Hieracium* Hawkeweed, whereunto it nearest approacheth : but as it is commonly receiued, so take it in this place, vntill it come to receiue the place is proper for it. It hath diuers broad and long darke green leaues, lying vpon the ground, very rough in handling, full of small haires or prickes, ready to enter into the hands of any that handle it ; among which riseth vp

1. *Lingua bonis sive Buglossum lateum. Langdebeefe.* 2. *Atriplex sive Olaus aureum. Arrach.* 3. *Blitum. Blites.*  
4. *Beta. Beetes.* 5. *Hippocrateum sive Olaus armum. Allifanders.* 6. *Selinum dulce. Sweete Parsley.*

vp a round greene hairy or prickly stalk, bearing at the toppe, among a few small green leaues, diuers small yellow flowers in rough heads, which turne into dounes, containing within them browne yellowish small long seedes, somewhat like vnto the seede of Hawkeweede : the roote is wooddy, wch perishesth quickly after it hath borne seed; but is tender while it is young.

#### *The Vse of Langdebeefe.*

The leaues are onely vsed in all places that I know, or euer could learne, for an herbe for the pot among others, and is thought to bee good to loosen the belly.

#### **C H A P. X VIII.**

##### *Atriplex sicc Olus Aureum. Arrach.*

**T**here be diuers kindes of Arrach, or Orach, as some doe call them; some of the Garden, whereof I meane to entreate in this place; others wilde of the Fieldes, &c. and others of the Sea, which are notto bee spoken of in this worke, but referred to a generall historie. The white garden Arrach, or Orach, hath diuers leaues, standing vpon their severall footestalkes, broade at the bottome, ending in two points like an arrow, with two feathers at the head, and small pointed at the end of the leafe, of a whitish yellow greene colour, and as it were strewed ouer with flower or meale, especially while they are young : the stalke likewise is mealy, bearing many branches with small yellow flowers on them, which turne into small leaue seedes: the rooote groweth somewhat deepe in the ground, with many small threds fastened thereto: it quickly springeth vp of the seede, groweth great, and fadeth away as soon as it hath borne seede.

The purple Arrach is in all things like vnto the white, sauing onely in the colour of the leafe, stalk, seede, &c. which are all of a mealy dusky purplish colour.

#### *The Vse of Arrach.*

Arrach is cold and moist, and of a lubricke or slippery qualitie, whereby it quickly passeth through the stomacke and belly, and maketh it soluble, and is of many vsed for that purpose, being boyled and buttered, or put among other herbes into the pot to make pottage.

There are many dishes of meate made with them while they are young, for being almost without sauour of themselves, they are the more conuertible into what relish any one will make them with Sugar, Spice &c.

#### **C H A P. XIX.**

##### *Blitum. Blites.*

**T**here be diuers sorts of Blites, some whereof I haue entreated in the former part of this worke, vnder the title of *Amaranthus*. Flower gentle: others that are noysed vp in Gardens, I will set forth in this place, which are onely two, that haue come to my knowledge, that is, the white and the red, and are of a qualitie as neere vnto Arrach as vnto Beetes, participating of both, and therefore I haue placed them betwixt them. The white Blite hath leaues somewhat like vnto Beetes, but smaller, rounder, and of a whitish greene colour, every one standing vpon a small long footestalke : the stalke riseth vp two or three foote high, with many such like leaues thereon: the flowers grow at the top in long round tufts or clusters, wherein are contained

tained small round seede: the roote is very full of threds or strings.

The red Blite is in all things like the white, but that his leaues and tufted heades are exceeding red at the first, and after turne more purplish.

#### *The Vse of Blites.*

Blites are vsed as Arrach, eyther boyled of it selfe or stewed, which they call Loblolly, or among other herbes to bee put into the pot; and yet some doe vtterly refuse it, because in diuers it pronoketh castings. It is altogether insipide or without taste, but yet by reason of the moist slippery qualitie it hath, it helpeth to loosen the belly. The vnsauoriness whereof in many Countries growne into a prouerbe, or by-word, to call dull, flow, or lazie persons by that name: They are accounted more hurtfull to the stomacke, and so to the head and eyes, then other herbes, and therefore they are the lesse vsed.

#### **C H A P. X X.**

##### *Beta. Beetes.*

**T**here are many diuersities of Beetes, some growing naturally in our own Country, others brought from beyond Sea, whereof some are white, some greene, some yellow, some red: the leaues of some are of vse only, and the root not vsed: others the roote is only vsed, and not the leaues: and some againe, both roote and leafe. The ancient Authors, as by their workes appeare, knew but two sorts, the white and the blacke Beete, whereof the white is sufficiently known, and was of them termed *Sicula*, of the later *Physicians Sicla*, because it was thought first to be brought from Sicilie: the blacke abideth some controvries; some thinking that our common greene Beete, because it is of a darke greene colour, was that they called the blacke Beete; others that our small red Beete, which is of a darke red colour, was their blacke Beete, which in my opinion is the more likely: But to come to the mater in hand, and give you the descriptions of them which are in use, and leaue controvries to such a worke as is fit for them, wherein all such matters may be discusst at large.

The common white Beete hath many great leaues next the ground (in some hot Countries growing to be three foote long, and very broade, in our Countrey they are very large, but nothing neere that proportion) of a whitish greene colour; the stalke is great, strong, and ribbed or crested, bearing great store of leaues vpon it vp to the very toppe almost: the flowers grow in very long tufts, small at the ends, and turning down their heads, which are small pale greenish yellow burres, giuing cornered prickly seede: the roote is great, long and hard, when it hath giuen seede, of no vse at all, but abideth a former winter with his leaues vpon it, as all other sorts following do.

The common red Beete differeth not from the white Beete, but only that it is so great, and both the leaues and rootes are somewhat red: the leaues bee in some more red then in others, which haue but red veines or strakes in them, in some also of a frost red, in others very darke red: the roote hereof is red, spongy, and not vsed to bee eaten.

The common greene Beete is also like vnto the white Beete, but of a darke greene colour. This hath beeene found neere the salt Marshes by Rochester, in the soore way going from the Lady Leveons house thereto, by a worthy, diligent and painefull obseruer and preseruer: both of plants and all other natures varieties, often remembred before in this worke, called Iohn Tradescante, who there finding it, gaue me the knowledge thereof, and I haue vpon his report set it here down in this manner:

The Romane red Beete, called *Beta raposa*, is both for leafe and roote the most excellent Beete of all others: his rootes bee as great as the greatest Carrot, exceeding red both within and without, very sweete and good, fit to bee eaten: this Beete groweth higher then the last red Beete, whose rootes are not vsed to bee eaten: the leaues likewise

wife are better of taste, and of as red a colour as the former red Beete : the roote is sometimes short like a Turnep, whereof it took the name of *Rape* or *raposa*; and sometimes as I said before, like a Carrot and long : the seede is all one with the lesser red Beete.

The Italian Beete is of much respect, whose faire greene leaues are very large and great, with great white ribbes and veines therein: the stalke in the Summer time, when it is growen vp to any height, is six square in shew, and yellowish withall, as the heades with seede vpon them seeme likewise.

The great red Beete that Master Lete a Merchant of London gaue vnto Master Gerard, as he setteth it downe in his Herball, seemeth to bee the red kinde of the last remembred Beete, whose great ribbes as he saith, are as great as the middle ribbe of the Cabbage leafe, and as good to bee eaten, whose stalke rose with him to the height of eight cubits, and bore plenty of seede.

#### The Vse of Beetes.

Beetes, both white, greene and red, are put into the pot among other herbes, to make pottage, as is commonly known vnto all, and are also boyled whole, both in France vsually with most of their boyled meates, and in our Country, with diuers that delight in eating of herbes.

The Italian Beete, and so likewise the lastred Beete with great ribbes, are boyled, and the ribbes eaten in fallets with oyle, vinegar and pepper, and is accounted a rare kinde of fallet, and very delicate.

The roote of the common red Beete with some, but more especially the Romane red Beete, is of much vse among Cookes to trimme or set out their dishes of meate, being cut out into diuers formes and fashions, and is grown of late dayes into a great custome of seruice, both for fish and flesh.

The rootes of the Romane red Beete being boyled, are eaten of diuers while they are hot with a little oyle and vinegar, and is accounted a delicate fallet for the winter; and being cold they are so vfed and eaten likewise.

The leaues are much vfed to mollifie and open the belly, being vfed in the decoction of Glifters. The roote of the white kinde scraped, and made vp with a little honey and salt, rubbed on and layd on the belly, prouoketh to the stoole. The vse of eating Beetes is likewise held to bee helpefull to spleneticke persons.

#### C H A P. XXI.

##### *Hippocelimum, sine Olys atrum.* Alisanders.

**A**lisanders hath beene in former times thought to be the true Macedonian Parsley, and in that error many doe yet continue : but this place giueth not leauer to discusse that doubt : but I must here only shew you, what it is, and to what vse it is put ordinarily for the Kitchen. The leaues of Alisanders are winged or cut into many parts, somewhat resembling Smallage, but greater, broader, and more cut in about the edges : the stalkes are round and great, two foote high or better, bearing diuers leaues on them, and at the toppe spokie roundles of white flowers on severall small branches, which turne into blacke seede, somewhat cornered or crested, of an aromaticall bitter taste : the roote is blacke without, and white within, and abideth well the first year of the sowing, perishing after it hath borne seed.

#### The Vse of Alisanders.

The tops of the rootes, with the lower part of the stalkes of Alisanders, are vfed in Leat especially, and Spring of the yeare, to make broth, which although it be a little bitter, yet it is both wholsome, and pleasing to a great many,

many, by reason of the aromaticall or spicie taste, warming and comforting the stomach, and helping it digest the many waterish and flagmaticke meates are in those times much eaten. The rootes also either rawe or boyled are often eaten with oyle and vinegar. The seede is more vsed physically then the roote, or any other part, and is effectuall to prouoke plenty of vrine in them that pisse by drops, or haue the Strangury : It helpeth wemens courses, and warmeth their benummed bodies or members, that haue endured fierce cold daies and nights, being boyled and drunke.

#### C H A P. XXII.

##### *Selinum dulce.* Sweete Parsley or sweete Smallage.

**T**his kinde of sweete Parsley or Smallage, which souuer you please to call it, for it ressembleth Smallage as well in the largenesse of the leaues, as in the taste, yet sweeter and pleasanter, is (as I take it) in this like vnto sweete Fennell (that hath his sweetnesse from his naturall soyle and clymate ; for howsover it bee reasonable sweete the first yeare it is sowne with vs, yet it quickly doth degenerate, and becommeth no better then our ordinarie Fennell afterwards). The first yeare it is sowne and planted with vs (and the first that euer I saw, was in a Venetian Ambassadours Garden in the Spittle yard, neare Bishops gate streete) is so sweete and pleasant, especially while it is young, as if Sugar had beeene mingled with it : but after it is growne vp high and large, it hath a stronger taste of Smallage, and so likewise much more the next yeare ; that it groweth from the seede gathered here : the leaues are many, spreading farre about the roote, broader and of a fresher greene colour then our ordinary Smallage, and vpon longer stalkes : the seede is as plentifull as Parsley, being small and very like vnto it, but darker of colour.

#### The Vse of sweete Parsley.

The Venetians vse to prepare it for meate many waies, both the herbe and the roote eaten rawe, as many other herbes and rootes are, or boyled or fried to be eaten with meate, or the dried herbe poudered and strewed vpon meate ; but most vsually either whitened, and so eaten rawe with pepper and oyle, as a dainty Sallet of it selfe, or a little boyled or stewed : the taste of the herbe being a little warming, but the seede much more, helpeth cold windy stomackes to digest their meate, and to expell winde.

#### C H A P. XXIII.

##### *Petroselinum & Apium.* Parsley and Smalledge.

**W**e have three sorts of Parsley in our Gardens, and but one of Smalledge : Our common Parsley, Curld Parsley, and Virginia Parsley ; which last, although it be but of late knowne, yet it is now almost growne common, and of as good vse as the other with diuers. Our common Parsley is so well knowne, that it is almost needless to describe it, having diuers fresh greene leaues, three alwaies placed together on a stalke, and snipt about the edges, and three stalkes of leaues for the most part growing together : the stalkes growe three or fourte foote high or better, bearing spikie heads of white flowers, which turne into small seede, somewhat sharpe and hot in taste : the roote is long and white.

Curld Parsley hath his leaues curled or crumpled on the edges, and therein is the only difference from the former.

Virginia

Virginia Parsley is in his leafe altogether like vnto common Parsley for the forme, consisting of three leaues set together, but that the leaues are as large as Smallage leaues, but of a pale or whitish greene colour, and of the same taste of our common Parsley : the seede hereof is as the leaues, twice if not thrice as bigge as the ordinary Parsley, and perishest when it hath gauen seede, abiding vsually the first yeare of the sowynge.

Smallage is in forme somewhat like vnto Parsley, but greater and greener, and lesse pleasant, or rather more bitter in taste : the seede is smaller, and the root more stringy.

#### *The Vse of Parsley.*

Parsley is much vsed in all sorts of meates, both boyled, roasted, fryed, stewed, &c. and being greene it serueth to lay vpon sundry meates, as also to draw meatē withall. It is also shred and stopped into powdered beefe, as also into legges of Mutton, with a little beefe suet among it, &c.

The rootes are often vsed to be put into broth, to helpe to open obstructions of the liuer, reines, and other parts, helping much to procure vrine.

The rootes likewise boyled or stewed with a legge of Mutton, stopped with Parsley as aforesaid, is very good meatē, and of very good relish, as I haue proued by the taste ; but the rootes must bee young, and of the first yeares growth, and they will haue their operation to caule vrine.

The seed also is vsed for the same cause, when any are troubled with the stone, or grauell, to open the passages of vrine.

Although Smallage groweth in many places wilde in moist grounds, yet it is also much planted in Gardens, and although his euill taste and fauour doth cause it not to be accepted into meates as Parsley, yet it is not without many speciall good properties, both for outward and inward diseases, to helpe to open obstructions, and prouoke vrine. The iuyce cleanseth vlcers, and the leaues boyled with Hogs grease, healeth felonys on the ioynts of the fingers.

#### CHAP. XXIIII.

##### *Feniculum. Fenell.*

There are three sorts of Fenell, whereof two are sweete. The one of them is the ordinary sweete Fenell, whose seedes are larger and yellower then the common, and which (as I said before in the Chapter of sweete Parsley) doth soone degenerate in this our Country into the common. The other sweete Fenell is not much knowne, and called Cardus Fenell by those that sent it out of Italy, whose leaues are more thicke and bushie then any of the other. Our common Fenell, whereof there is greene and red, hath many faire and large spread leaues, finely cut and diuided into many small, long, greene, or reddish leaues, yet the thicker tufted the branches be, the shorter are the leaues : the stalkes are round, with diuers ioynts and leaues at them, growing five or six foot high, bearing at the top many spakie runders of yellow flowers : the Common, I meane, doth turne into a darke grayish flat seede, and the Sweete into larger and yellower : the roote is great, long, and white, and endureth diuers yeares.

#### *The Vse of Fenell.*

Fenell is of greavte to trimme vp, and strowe vpon fish, as also to boyle or put among fish of diuers sorts, Cowcumbers pickled, and other fruits, &c. The rootes are vsed with Parsley rootes, to be boyled in broths and drinke to open obstructions. The seed is of much vse with other things to expell windē. The seede also is much vsed to be put into Pippin pies, and diuers other

1. Petroselinum. Parsley. 2. Asium. Smallage. 3. Feniculum. Fenell. 4. Anethum. Dill. 5. Myrrhis pia. Celeriolum magnum. Sweete Chervill. 6. Cerefolium tuzigete. Common Celeri. Celeri.

other such baked fruits, as also into bread, to giue it the better relish.

The sweete Cardus Fenell being sent by Sir Henry Wotton to Iohn Tradescante, had likewise a large direction with it how to dresse it; for they vse to white it after it hath been transplanted for their vses, which by reason of the sweetnesse by nature, and the tendernesse by art, causeth it to be the more delightfull to the taste, especially with them that are accustomed to feede on greene herbes.

## C H A P. X X V.

*Anetham. Dill.*

**D**ill doth much growe wilde, but because in many places it cannot be had, it is therefore sowne in Gardens for the vses whereunto it serueth. It is a smaller herbe then Fenell, but very like, hauing fine cut leaues, not so large, but shorter, smaller, and of a stronger and quicker taste: the stalke is smaller alio, and with few ioynts and leaues on them, bearing spoakie tufts of yellow flowers, which turne into thinne, small, and flat seedes: the roote perisheth every yeare, and riseth againe for the most part of it owne sowing.

## The Vse of Dill.

The leaues of Dill are much vsed in some places with Fish, as they doe Fenell; but because it is so strong many doe refuse it.

It is also put among pickled Cowcumbers, wherewith it doth very well agree, giuing vnto the cold fruit a pretty spicie taste or relish.

It being stronger then Fenell, is of the more force to expell wind in the body. Some vse to eate the seed to stay the Hickocke.

## C H A P. X X VI.

*Myrrhis sive Cerefolium minus & vulgare.*  
Sweet Cheruill and ordinary Cheruill.

**T**he great or sweete Cheruill (which of some is called Sweete Cicely) hath diuers great and faire spread winged leaues, consisting of many leaues set together, deeply cut in the edges, and euery one also dented about, very like, and resembling the leaues of Hemlockes, but of so pleasant a taste, that one would verily thinke, he chewed the leaues or seedes of Aniseedes in his mouth: The stalke is reasonable great, and somewhat cornered or crested about three or foure foote high, at the toppe whereof stand many white spoakie tufts of flowers, which change into browne long cornered great seede, two alwaies ioyned together: the roote is great, blackish on the outside, and white within, with diuers fibres annexed vnto it, and perisheth not, but abideth many yeares, and is of a sweete, pleasant, and spicie hot taste, delightfull vnto many.

The common Cheruill is a small herbe, with slender leaues, finely cut into long peeces, at the first of a pale yellow with greene colour, but when the stalke is growne vp to seede, both stalkes and leaues become of a darke red colour: the flowers are white, standing vpon scattered or thin spread tufts, which turne into small, long, round, and sharpe pointed seedes, of a brownish blacke colour: the roote is small, with diuers long slender white strings, and perisheth euery yeare.

The

## The Vses of these Cheruils.

The common Cheruill is much vsed of the French and Dutch people, to bee boyled or stewed in a pipkin, eyther by it selfe, or with other herbes, whereof they make a Loblolly, and so eate it. It is vsed as a pot-herbe with vs.

Sweete Cheruill, gathered while it is young, and put among other herbes for a fallet, addeth a meruellous good relish to all the rest. Some command the greene seedes sliced and put in a fallet of herbes, and eaten with vinegar and oyle, to comfort the cold stomacke of the aged. The roots are vsed by diuers, being boyled, and after eaten with oyle and vinegar, as an excellent fallet for the same purpose. The preserued or candid rootes are of singular good vse to warme and comfort a cold flegmaticke stomack, and is thought to be a good preuentive in the time of the plague.

## C H A P. X X VII.

*Malva Crispa. French Mallowes.*

**T**he curld or French Mallow groweth vp with an upright greene round stalke, as high vsually as any man, whereon from all sides grow forth round whitish greene leaues, curld or crumpled about the edges, like a ruffe, else very like vnto an ordinary great Mallow leafe: the flowers grow both vpon the stalke, and on the other branches that spring from them, being small and white; after which come small cases with blacke seedes like the other Mallowes: the roote perisheth when it hath borne seede, but abideth vsually the first yeare, and the second runneth vp to flower and seede.

## The Vse of French Mallowes.

It is much vsed as a pot-herbe, especially when there is cause to moue the belly downward, which by his slippery qualitie it doth helpe forward. It hath beene in times past, and so is to this day in some places, vsed to be boyled or stewed, eyther by it selfe with butter, or with other herbes, and so eaten.

## C H A P. X X VIII.

*Imutabum. Succorie and Endiue.*

**I**Put both Succorie and Endiue into one chapter and description, because they are both of one kindred, and although they differ a little the one from the other, yet they agree both in this, that they are eaten eyther greene or whited, of many.

Endiue, the smooth as well as the curld, beareth a longer and a larger leafe then Succorie, and abideth but one yeare, quickly running vp to stalke and seede, and then perisheth: whereas Succorie abideth many years, and hath long and narrower leaues, somewhat more cut in, or torne on the edges: both of them haue blew flowers, and the seede of the smooth or ordinary Endiue is so like vnto the Succorie, that it is very hard to distinguish them asunder by sight; but the curld Endiue giueth blackish and flat seede, very like vnto blacke Lettice seede: the rootes of the Endiue perish, but the Succorie abideth.

## The Vse of Succory and Endiue.

Although Succorie bee somewhat more bitter in taste then the Endiues,  
T t 2 yet

yet it is oftentimes, and of many eaten greene, but more vsually being buried a while in sand, that it may grow white, which causeth it to lose both some part of the bitterness, as also to bee the more tender in the eating; and Horace sheweth it to be vsed in his time, in the 32. Ode of his first Book, where he saith,

*Me pascunt Oliae, me Cithorea leuesq; Malvae.*

Endive being whited in the same, or any other manner, is much vsed in winter, as a sallet herbe with great delight; but the curld Endive is both farre the fairer, and the tenderer for that purpose.

### CHAP. XXIX.

*Spinacia, sine Clus Hispanicum. Spinach.*

**S**pinach or Spinage is of three sorts (yet some doe reckon of foure, accounting that herbe that beareth no seede to be a sort of it selfe, when it is but an accident of nature, as it falleth out in Hempe, Mercury, and diuers other herbes) two that bear prickly seede, the one much greater then the other: the third that beareth a smooth seede, which is more daintie, and nourseth vp but in few Gardens: The common Spinach which is the lesser of the two prickly sorts, hath long greene leaues, broad at the stalke, and rent, or torn as it were into foure corners, and sharpe pointed at the ends: it quickly runneth vp to stalke, if it be sownen in the Spring time; but else, if at the end of Summer, it will abide all the winter green, and then suddenly in the very beginning of the Spring, runne vp to stalke, bearing many leaues both below and at the toppe, where there doth appeare many smal greenish flowers in clusters, and after them prickly seede: The other greater sort that hath prickly seede, is in all things like the former, but larger both in stalke, leafe and seede. The smooth Spinach hath broader, and a little rounder pointed leaues then the first, especially the lower leaues; for those that grow vpwards vpon the stalke, are more pointed, and as it were three square, of as darke a greene colour as the former: at the severall ioynts of the stalkes and branches, stand cluttering many small greenish flowers, which turne into clusters of round whitish seede, without any prickles at all vpon them: the roote is long, white and small, like vnto the other, with many fibres at it: If it be often cut, it will grow the thicker, or else spindle vp very thinly, and with but few leaues vpon the stalke.

### The Vse of Spinage.

Spinage is an herbe fit for sallets, and for diuers other purposes for the table only, for it is not knowne to bee vsed Physically at all. Many English that haue learned it of the Dutch people, doe stew the herbe in a pot or pipkin, without any other moisture then it owne, and after the moisture is a little pressed from it, they put butter, and a littel spice vnto it, and make therewith a dish that many delight to eate of. It is vsed likewise to be made into Tartes, and many other varieties of dishes, as Gentlewomen and their Cookes can better tell then my selfe; vnto whom I leauue the further ordering of these herbes, and all other fruits and rootes of this Garden: For I intend only to give you the knowledge of them, with some briefe notes for their vse, and no more.

### CHAP.

1. *Malva crispa*. French Mallows. 2. *Endivia*, Endive. 3. *Cicoriun Saccory*. 4. *Spinacia Spinach*. 5. *Lactuca crispa*. Curld Lettice. 6. *Lactuca peruviana*. Open Lettice. 7. *Lactuca capitata vulgaris*. Ordinary cabbage Lettice. 8. *Lactuca capitata Romana*. The great Romane cabbage Lettice. 9. *Lactuca sativa*. Carse Salter or Lambes Lettice.

## C H A P. X X X.

*Lactuca.* Lettice.

**T**HERE are so many sorts, and so great diversitie of Lettice, that I doubt I shall scarce be beleueed of a great many. For I doe in this Chapter reckon vp vnto you eleauen or twelue differing sorts; some of little vse, others of more, being more common and vulgar; and some that are of excellent vse and seruice, which are more rare, and require more knowledge and care for the ordering of them, as also for their time of spending, as some in the spring, some in summer, others in autumn, and some being whited for the winter. For all these sorts I shall not neede many descriptions, but only shew you which doe cabbage, and which are loose, which of them are great or small, white, greene or red, and which of them beare white seeds, and which of them blacke. And lastly I haue thought good to adde another Sallet herbe, which because it is called Lambes Lettice of many, or Corne Sallet of others, is put in only to fill vp a number in this Chapter, and that I must speake of it, and not that I thinke it to be any of the kindes of Lettice.

All sorts of Lettice, after a while that they haue closed themselues, if they bee of the Cabbage kinde, or otherwise being loose, and neuer closing, send forth from among the middle of their leaues a round stalk (in some greater, in others lesser, according to their kinde) full of leaues like vnto the lower, branching at the toppe into fudry parts, whereon grow diuers small star-like flowers, of a pale yellowish colour; after which come seede, eyther white or blackish, as the plant yeeldeth, whereat hangeth some small peice of a cottony doun, wherewith the whole head is stord, and is carried away with the winde, if it be not gathered in time: the roote is somewhat long and white, with some fibres at it, and perisheth quickly after the seede is ripe.

The Romane red Lettice is the best and greatest of all the rest. For John Tradescante that first, as I thinke, brought it into England, and sowed it, did write vnto mee, that after one of them had been bound and whited, when the refuse was cut away, the rest weighed seuentene ounces: this hath blacke seede.

The white Romane Lettice is like vnto it, hauing long leaues like a Teafell, it is in goodnesse next vnto the red, but must be whited, that it may eate kindly: the seede hereof is white.

The Virginia Lettice hath single and very broade reddish leaues, and is not of any great regard, and therefore is kept but of a few: it beareth blacke seede.

The common Lombard Lettice that is loose, and another kinde thereof that doth somewhat cabbage, haue bothe white seedes.

The Venice Lettice is an excellent Cabbage Lettice, and is best to bee sownen after Midsummer for lateward Lettice; they be sometimes as great as the crowne of a mans hatt: the seede hereof is white, and growth to be of a meane height.

Our common Cabbage Lettice is well known, and beareth blacke seede.

The curld Lettice which is open, and differeth but little from Endive, beareth blacke seede.

Another sort of curld Lettice doth cabbage, and is called Flanders Cropers, or Cropers of Bruges; this groweth lowest, and hath the smallest head, but very hard and round, and white while it groweth: the seede is blacke.

A kinde of Romane Lettice is of a darke green colour, growing as low as the Venice Lettice, and is an excellent kinde, bearing blacke seede.

And lastly our winter Lettice is wonderfull hardy to endure our cold: It is but single, and must be sownen at Michaelmas, but will be very good, before any of the other good sorts sownen in the Spring, will be ready to be vsed, and beareth white seede.

To instruct a nouice (for I teach not a Gardiner of knowledge) how to gather his seede that it may be good, is in this manner: Let him marke out those plants that hee meaneth shall run vp for seede, which must be the most likely; & after they haue begun to shooete forth stalkes, strip away the lower leaues, for two or three hands breadth aboue the ground, that thereby in taking away the lowest leaues, the stalke doe not rot, nor the seede be hindered in the ripening.

There

There are two manner of wayes to whiten Lettice to make them eate the more tender: the one is by raysing vp earth like moale hills, round about the plants while they are growing, which will make them grow white: the other is by tying vp all the loote leaues round together while it groweth, that so the close tying may make it grow white, and thereby be the more tender.

Lambes Lettice or Corne Sallet is a small plant while it is young, growing close vp on the ground, with many whitish greene, long and narrow, round pointed leaues all the winter, and in the beginning of the spring (if it bee sownen in autumn, as it is vsual to serue for an early sallet) riseth vp with small round stalkes, with two leaues at euery joint, branching forth at the toppe, and bearing tufts of small bleake blew flowers, which turnes into small round whitish seede: the roote is small and long, with some small threds hanging thereat: the whole plant is of a waterish taste, almost insipide.

## The Vse of Lettice.

All sorts of Lettice are spent in sallerts, with oyle and vinegar, or as euery one please; for the most part, while they are fresh and greene, or whited, as is declared of some of the sorts before, to cause them to eate the more delicate and tender. They are also boyled, to serue for many sorts of dishes of meate, as the Cookes know best.

They all coole a hot and fainting stomacke.

The iuice of Lettice applyed with oyle of Rose to the foreheads of the sicke and weake wanring sleepe, procureth rest, and taketh away paines in the head: bound likewise to the cods, it helpeth those that are troubled with the Colts euill. If a little camphire be added, it restraineth immoderate lust: but it is hurtfull to such as are troubled with the shortnesse of breath.

Lambes Lettice is wholly spent for sallerts, in the beginning of the yeare, as I said, before any almost of the other sorts of Lettice are to be had.

## C H A P. X X X I.

*Portulaca.* Purflane.

Purflane hath many thicke round shining red stalkes, full of iuice, lying vpon the ground for the most part, whereon are set diuers long, thicke, pale green leaues, sometimes alone by themselues, and sometimes many small ones together with them; among which grow small yellow flowers, which stand in little greene huskes, containing blacke seede: the roote is small, and perisheth every yeare, and must be new sownen in Aprill, in the alleys of the Garden betweene the beds, as some haue heretofore vsed, where it may haue the more moisture, or, as I haue seene in some Gardens, vpon those beds of dung that Gardiners haue vsed to nourise vp their Cowcumbers, Melons, and Pompions, wherewhile after they haue beeene taken away, they haue sownen Purflane, whereof it be much watered, the warmth of the dung, and the water giuen it, the Purflane hath grown great and large, and continued vntill winter.

## The Vse of Purflane.

It is vsed as Lettice in sallerts, to coole hot and faint stomackes in the hot time of the yeare, but afterwards if only for delight, it is not good to bee too prodigall in the vse thereof.

The seede of Purflane doth coole much any inflammation inward or outward, and doth a little binde withall.

## C H A P. XXXII.

*Dracoherba sine Tarchon & Dracunculus bortensis.* Tarragon.

Tarragon hath long and narrow darke greene leaues, growing on slender and brittle round stalkes, two or three foore high, at the tops whereof grow forth long slender spikes of small yellowish flowers, which seldome give any good seede, but a dustie or chaffie matter, which flieth away with the wind: the roote is white, and creepeth abou vnder ground, whereby it much encreaileth: the whole herbe is of a hot and biting taste.

## The Vse of Tarragon.

It is altogether vsed among other cold herbes, to temper their coldnesse, and they to temper its heate, so to giue the better rellysh vnto the Sallet; but many doe not like the taste thereof, and so refuse it.

There are some Authors that haue held Tarragon not to be an herbe of it owne kinde, but that it was first produced, by putting the seede of Lin or Flaxe into the roote of an Onion, being opened and so set into the ground, which when it hath sprung, hath brought forth this herbe Tarragon, which absurd and idle opinion, Matthiolus by certaine experiance saith, hath been found false.

## C H A P. XXXIII.

*Nasturtium bortense.* Garden Cresses.

Garden Cresses growe vp to the height of two foote or thereabouts, hauing many small, whitish, broad, endented, torn leaues, set together vpon a middle ribbe next the ground, but those that growe higher vpon the stalkes are smaller and longer: the tops of the stalkes are storded with white flowers, which turne into flat pods or pouches, like vnto Shepheard purse, wherein is contained flat reddish seede: the roote perisheth euery yeare: the taste both of leaues and seedes are somewhat strong, hot, and bitter.

## The Vse of Cresses.

The Dutchmen and others vse to eate Cresses familiarly with their butter and bread, as also stewed or boylded, either alone or with other herbes, whereof they make a Hotch potch, and so eate it. Wee doe eate it mixed among Lettice or Purllane, and sometimes with Tarragon or Rocket, with oyle and vinegar and a little salt, and in that manner it is very sauoury to some mens stomackes.

The vse of Cresses physically is, it helpeth to expectorate tough flegme, as also for the paines of the breast, and as it is thought taketh away spots, being laid to with vinegar. The seede is giuen of many to children for the wormes.

## C H A P.

1. Portulaca Purllane. 2. Dracoherba sine Tarchon. Tarragon. 3. Erucasativa. Garden Rocket. 4. Nasturtium officinale. Garden Cresses. 5. Sinapis. Mustard. 6. Asparagus. Asparagus or Sprage.

## C H A P. XXXIIII.

*Eruca sativa.* Garden Rocket.

**O**Vr Garden Rocket is but a wilde kinde brought into Gardens ; for the true Romane Rocket hath larger leaues ; this hath many long leaues , much torne or rent on the edges, smaller and narrower then the Romane kinde : the flowers hereof are of a pale yellowish colour , whereas the true is whitish , consisting of foure leaues : the seede of this is reddish , contained in smaller and longer pods then the true, which are shorter and thicker, and the seede of a whitish yellow colour : the rootes of both perish as soone as they haue giuen seede. Some haue taken one sort of the wilde kinde for Mustard, and haue vsed the seede for the same purpose.

## The Vse of Rocket.

It is for the most part eaten with Lettice, Purslane, or such cold herbes, and not alone , because of its heate and strength ; but that with the white seede is milder. The seede of Rocket is good to prouoke vrine, and to stirre vp bodily lust.

The seede bruised, and mixed with a little vinegar, and of the gall of an Oxe , cleanneth the face of freckles, spots, and blew markes, that come by beatings, fals, or otherwais.

Matthiolus saith, that the leanes boyled, and giuen with some Sugar to little children, cureth them of the cough.

The seede is held to be helpfull to spleneticke persons ; as also to kill the wormes of the belly.

## C H A P. XXXV.

*Sinapis sativum.* Garden Mustard.

**T**He Mustard that is most vsuall in this Country, howsoever diuers doe for their priuate vses sow it in their Gardens or Orchards, in some conuenient corner, yet the same is found wilde also abroad in many places. It hath many rough long diuided leaues, of an ouerworne greene colour : the stalke is diuided at the toppe into diuers branches, whereon growe diuers pale yellow flowers , in a great length, which turne into small long pods , wherein is contained blackish seede , inclining to rednesse , of a fiery sharpe taste : the roote is tough and white, running deepe into the ground, with many small fibres at it.

## The Vse of Mustard.

The seede hereof grownd between two stones, fitted for the purpose, and called a Querne , with some good vinegar added vnto it , to make it liquid and running , is that kinde of Mustard that is vsually made of all sorts , to serue as sawce both for fish and flesh.

The same liquid Mustard is of good vse, being fresh, for Epilepticke persons, to warme and quicken thos dull spirits that are sōpīte and scarce ap-peare, if it be applyed both inwardly and outwardly.

It is with good successe also giuen to thos that haue short breathes , and troubled with a cough in the lungs.

## C H A P.

## C H A P. XXXVI.

*Asparagus. Sperage or Asparagus.*

**A**Sparagus riseth vp at the first with diuers whitish greene scaly heads, very brittle or easie to breake while they are young, which afterwards rise vp into very long and slender greene stalkes , of the bignesse of an ordinary riding wand at the bottome of most, or bigger or lesser, as the rootes are of growth , on which are set diuers branches of greene leaues, shorter and smaller then Fennell vp to the toppe , at the ioynts whereot come forth small mossie yellowish flowers, which turne into round berries, greene at the first, and of an excellent red colour when they are ripe, shewing as if they were beades of Corall , wherein are contained exceeding hard and blacke seede : the rootes are dispersed from a spongiouse head into many long , thicke, and round strings, whereby it sucketh much nourishment out of the ground, and encreaseth plentifully thereby.

We haue another kinde hereof that is of much greater account, because the shoothes are larger, whiter, and being dressed taste more sweete and pleafant , without any other difference.

## The Vse of Asparagus.

The first shoothes or heads of Asparagus are a Sallet of as much esteeme with all sorts of persons , as any other whatsoeuer , being boyled tender, and eaten with butter, vinegar, and pepper, or oyle and yngar, or as euery ones maaner doth please ; and are almost wholly spent for the pleasure of the pallate. It is specially good to prouoke vrine , and for those that are troubled with the stone or grauell in the reines or kidneyes, because it doth a little open and cleanse thole parts.

## C H A P. XXXVII.

*Brassica. Cabbages and Coleworts.*

**T**here is greater diuersity in the forme and colour of the leaues of this plant, then there is in any other that I know groweth vpon the ground. But this place requireth not the knowledge of all sorts which might be shewen, many of them being of no vse with vs for the table, but for delight, to behold the wonderfull variety of the workes of God herein. I will here therefore shew you onely those sorts that are ordinary in most Gardens, and some that are rare , receiued into some especiall Gardens : And first of Cabbages, and then of Coleworts.

Our ordinary Cabbage that clotheth hard and round, bath at the first great large thicke leaues, of a grayish greene colour, with thicke great ribbes , and lye open most part of the Summer without closing, but toward the end of Summer, being growne to haue many leaues, it then beginneth to growe close and round in the middle, and as it clotheth, the leaues growe white inward, yet there be some kindes that will haue so close as these, but will remaine halfe open, which wee doe not account to be so good as the other : in the middle of this head , the next yeare after the sowing , in other Countries especially, and sometimes in ours, if the Winter be milde, as may be seene in diuers Gardens (but to preuent the danger of our Winter frosts, our Gardiners now doe vse to take vp diuers Cabbages with their rootes , and tying a cloth or some such thing about the rootes, doe hang them vp in their houses, where they may be defended from cold , and then set them againe after the frosts are past) and then there shoothen out a great thicke stalke, diuided at the toppe into many branches, bearing thereon diuers small flowers , sometime white, but most commonly yellow , made of foure leaues, which turne into long , round , and pointed pods, containing therein small round

round seede, like vnto Turnep seede : the roote spreadeth not farre nor deepe, and dyeth vsually in any great frost ; for a small frost maketh the Cabbage eate the tenderer.

The red Cabbage is like vnto the white, last spoken of, but differing in colour and greatnessse ; for it is seldo me found so great as the white, and the colour of the leaues is very variable, as being in some stript with red, in others more red, or very deepe red or purple.

The sugar loafe Cabbage, so called because it is smaller at the toppe then it is at the bottome, and is of two sorts, the one white, the other greene.

The Sauoy Cabbadge, one is of a deepe greene coloured leafe, and curld when it is to be gathered ; the other is yellowish : neyther of both these doe close so well as the first, but yet are vsed of some, and accounted good.

The Cole flower is a kinde of Coleworte, whose leaues are large, and like the Cabbage leaues, but somewhat smaller, and endented about the edges, in the middle wherof, sometimes in the begining of Autumnne, and sometimes much sooner, there appeareth a hard head of whitish yellow tufts of flowers, closely thrust together, but never open, nor spreading much with vs, which then is fittest to be vsed, the green leaues being cut away close to the head : this hath a much pleasanter taste then eyther the Coleworte, or Cabbage of any kinde, and is therefore of the more regard and respect at good mens tables.

The ordinary Coleworte is sufficiently knowne notto close or cabbage, and gineth seeds plentifully enough.

The other Coleworts that are nourised vp with those that delight in curiosities, besides the aforesaid ordinary greene, which is much vsed of Dutchmen, and other strangers, are these : The Curld Coleworte eyther wholly of a greene colour, or of divers colours in one plant, as white, yellow, red, purple or crimson, so variably mixed, the leaues being curld on the edges, like a ruffe band, that it is very beautifull to behold.

There is also another curld Coleworte of lesse beauty and respect, being but a little curld on the edges, whose leaues are white, edged with red, or green edged with white.

Two other there are, the one of a popingaye greene colour : the other of a fine deepe greene, like vnto the Sauoyes.

Then there is the Cole rape, which is also a kinde of Coleworte, that beareth a white heade, or headed stalk above the ground, as bigge as a reasonable Turnep, but longer, and from the toppe thereof springeth out diuers great leaues, like vnto Coleworts, among which rise diuers stalkes that beare yellow flowers, and seede in pods, almost as small as Mustard seede : the roote is somewhat long, and very bushie with threds.

#### The Use of Cabbages and Coleworts.

They are most vsually boyled in poudered beefe broth vntil they be tender, and then eaten with much fat put among them.

The great ribs of the Popingay, and deepe greene Coleworts, beeing boyled and layde into dishes, are serued to the table with oyle and vinegar in the Lent time for very good sallets.

In the cold Countries of Russia and Muscouia, they pouder vp a number of Cabbages, which serue them, especially the poorer sort, for their most ordinary foode in winter ; and although they stinke most grieuously, yet to them they are accounted good meate.

It is thought, that the vse of them doth hinder the milke in Nurses breasts, causing it to dry vp quickly : but many women that haue giuen sucke to my knowledge haue denied that assertion, affirming that they haue often eaten them, and found no such effect. How it might proue in more delicate bodies then theirs that thus said, I cannot tell : but Matthiolus auerteth it to encrease milke in Nurses breastes ; so differing are the opinions of many. The seede grossely bruised and boyled a little in flesh broth, is a present remedie for the Collicke, the seede and the broth being taken together, easing them that are troubled therewith of all griping paines : as also for the stone in the kidneyes. A Lohoc or licking Electuary made of the pulpe of the

1. *Brassica capitata*. Cole Cabbage. 2. *Brassica oleracea*. Open Cabbage. 3. *Brassica Sabaudica crispa*. Curld Sauoy Colewort. 4. *Caulis floride*. Cole flower. 5. *Caulis crispa*. Curld Colewort. 6. *Caulis crispa varia*. Changeable curld Colewort. 7. *Rapacardis*. Cole Rape.

the boyled stalkes, and a little honey and Almond milke, is very profitable for shorntesse of breath, and those that are entring into a Consumption of the lunges. It hath beeene formerly held to be helpefull in all diseases: for Crisippus, an ancient Phyitian, wrote a whole Volume of the vertues, applying it to all the parts of the body: which thing neede not seeme wonderfull, in that it is recorded by writers, that the old Romanes hauing expelled Physicians out of their Common-wealthe, did for many hundred of yeares maintaine their health by the vse of Cabbages, taking them for euery disease.

## C H A P. XXXVIII.

*Sisarum. Skirrets.*

**A**fter all the herbes before rehearsed, fit for fallets, or otherwise to bee eaten, there must follow such rootes as are vsed to the same purpose: and first, Skirrets haue many leaues next the ground, composed of many small smooth green leaues, set each against other vpon a middle ribbe, and every one snipt about the edges: the stalke riseth vp two or three foote high, set with the like leaues, hauing at the toppe spoakie tufts of white flowers, which turne into small seede, somewhat bigger and darker then Parsley seede: the rootes be many growing together at one head, beeing long, slender, & rugged or vneuen, of a whitish colour on the outside, and more white within, hauing in the middle of the roote a long small hard pith or string: these heads are vsually taken vp in February and March, or sooner if any so please, the greater number of them being broken off to bee vsed, the rest are planted againe after the heads are separated, and hereby they are encreased euery yeare by many; but it is now adayes more sowne of the feed, which come forwards well enough if the ground be fat and good.

## The Vse of Skirrets.

The rootes being boyled, peeled and pithed, are stewed with butter, pepper and salt, and so eaten; or as others vse them, to roule them in flower, and fry them with butter, after they haue beeene boyled, peeled and pithed: each way, or any way that men please to vse them, they may finde their taste to be very pleasant, far beyond any Parflep, as all agree that taste them.

Some doe vse also to eate them as a fallet, colde with vinegar, oyle, &c. being first boyled and dressed as before said. They doe helpe to prouoke vrise, and as is thought, to procure bodily lust, in that they are a little windie.

## C H A P. XXXIX.

*Pastinaca sativa latifolia. Parsneps.*

**T**he common garden Parsnep hath diuers large winged leaues lying vpon the ground, that is, many leaues set one by another on both sides of a middle stalk, somewhat like as the Skirret hath, but much larger, and closer set: the stalke riseth vp great and tall, fife or six foot high somtimes, with many such leaues thereon at severall ioynts; the top whereof is spread into diuers branches, whereon stand spoakie ruckles of yellow flowers, which turne into brownish flat seede: the root is long, greate and white, very pleasant to bee eaten, and the more pleasant if it grow in a fat fandy soyle.

There is another sort of garden Parsnep, called the Pine Parsnep, that is not common in every Garden, and differeth from the former in three notable parts. The root is not so long, but thicker at the head and smaller below; the stalke is neither so bigge, nor

1. *Sisarum. Skirrets.* 2. *Pastinaca latifolia. Parsneps.* 3. *Pastinaca tenuifolia. Carrets.* 4. *Rapum. Turneps.* 5. *Dapesia tenuifolia. Turneps.* 6. *Rapana niger. Blaek Raddish.* 7. *Rapana vulgaris. Common. Raddish.*

nor so high; and the seede is smaller: yet as Iohn Tradescante saith (who hath given me the relation of this, and many other of these garden plants, to whom every one is a debtor) the roote hereof is not altogether so pleasant as the other.

Moreouer the wilde kinde, which groweth in many places of England (and wherof in some places there might be gathered a quarter sacke full of the seede) if it be sowne in Gardens, and there well ordered, will proue as good as the former kinde of Gardeyn Parfynps.

#### The Vse of Parsneps.

The Parfynp root is a great nourisher, and is much more vsed in the time of Lent, being boyled and stewed with butter, then in any other time of the yeare; yet it is very good all the winter long. The seede helpeth to diffolue wind, and to prouoke vrine.

#### CHAP. XL.

##### *Pastina sativa tenuisolia.* Carrots.

**T**He Carrot hath many winged leaues, rising from the head of the roote, which are much cut and diuided into many other leaues, and they also cut and diuided into many parts, of a deepe greene colour, some whereof in Autumnne will turne to be of a fine red or purple (the beautie whereof allureth many Gentlewomen oftentimes to gather the leaues, and sticke them in their hats or heads, or pin them on their armes in stead of feathers): the stalke riseth vp among the leaues, bearing many likewise vpon it, but nothing so high as the Parfynp, being about three foote high, bearing many spoakie tufts of white flowers, which turne into small rough seede, as if it were hairy, smelling reasonable well if it bee rubbed: the roote is round and long, thicke aboue and small below, eyther red or yellow, eyther shorter or longer, according to his kinde; for there is one kinde, whose roote is wholly red quite thoroughout; another whose roote is red without for a pretty way inward, but the middle is yellow.

Then there is the yellow, which is of two sorts, both long and short: One of the long yellow sorts, which is of a pale yellow, hath the greatest and longest roote, and likewise the greatest head of greene, and is for the most part the worst, being spongy, and not firme.

The other is of a deepe gold yellow colour, and is the best, hauing a smaller head, or tuft of greene leaues vpon it.

The shorte rootes are likewise distinguished, into pale and deepe yellow colours.

#### The Vse of Carrots.

All these sorts being boyled in the broth of beefe, eyther fresh or salt, but more vsually of salted beefe, are eaten with great pleasure, because of the sweetnesse of them: but they nourish lesse then Parfynps or Skirrets.

I haue not often knownne the seede of this Garden kinde to bee vsed in Physicke: but the wilde kinde is often and much vsed to expell wind, &c.

#### CHAP. XLI.

##### *Rapum horatense.* Turneps.

**T**here are divers sorts of Turneps, as white, yellow, and red: the white are the most common, and they are of two kinds, the one much sweeter then the other.

The yellow and the red are more rare, and nourised vp only by those that are curious: as also the Navewe, which is seene but with very few.

The

The ordinary Garden Turnep hath many large, and long rough greene leaues, with deepe and vneuen gashes on both sides of them: the stalke riseth vp among the leaues, about two foote high, spread at the toppe into many branches, bearing theron yellow flowers, which turne into long pods, with blackish round seede in them: the roote is round and white, some greater, some smaller, the best kinde is knowne to be flat, with a small pigges tayle-like roote vnderneath it; the worser kinde which is more common in many places of this land, both North and West, is round, and not flat, with a greater pigges tayle-like roote vnderneath.

The yellow kinde doth often grow very great, it is hardly discerned from the ordinary kinde while it groweth, but by the greatness and spreading of the leaues beeing boyled, the roote changeth more yellow, somewhat neare the colour of a Carrot.

The red Turnep groweth vsually greater then any of the other, especially in a good ground, being of a faire red colour on the outside, but being pared, as white as any other on the inside. This, as Matthiolus saith, doth grow in the Countrey of Anania, where hee hath seene an infinite number of them that haue waighed fifty pound a peice, and in some places heefalghty, a hundred pound a peice, both which we would thinke to be incredible, but that we see the kind is greatly giuen to grow, and in warme Countries they may so thrive, that the bulke or bignesse of the roote may so farre passe the growth of our Countrey, as that it may rise to that quantity aboue specified.

The Navew gentle is of two kindes, a smaller and a greater; the smaller is vsually called in France, *Naveas de Cane*, the roote is somewhat long with the roundnesse; this kinde is twice as bigge as a mans thumbe, and many of them lesse: The other is long and great, almost as big as the short Carrot, but for the most part of an vneuen length, and roundnesse vnto the very end, where it spreadeth into diuers small long fibres: neyther of them doth differ much from the Turnep, in leafe, flower or seed.

#### The Vse of Turneps.

Being boyled in salt broth, they all of them eate most kindly, and by reason of their sweetnesse are much esteemed, and often seene as a dish at good mens tables: but the greater quantitie of them are spent at poore mens feasts. They nourish much, and engender moist and loose flesh, and are very windie. The seede of the Navew gentle is (as I take it) called of Andromachus in the composition of his Treakle, *Bunias dulcis*: for Dioscorides and Plinic doe both say, that the seede of the tame Bunias or Napus is put into Antidoties, and not the seede of the wilde, which is more sharpe and bitter; neyther the seede of the Turnep, which is called in Greeke *ροπής*, in Latiane *Rapum*, because the seede is not sweete.

#### CHAP. XLII.

##### *Raphanus.* Raddish.

**T**here are two principall kindes of Garden Raddish, the one is blackish on the outside, and the other white; and of both these there is some diuision againe, as shall be shewed. Dittander and horse Raddish be reckoned kinds thereof.

The ordinary Raddish hath long leaues, vneuenly gashed on both sides, the stalke riseth vp to the height of three or foure foote, bearing many purplish flowers at the top, made of foure leaues a peice, which turne into thicke and short pods, wherein are contained round seede, greater then Turnep or Coleworts seede, and of a pale reddish colour: the roote is long, white, and of a reddish purple colour on the outside toward the toppe of it, and of a sharpe biting taste.

There is a small kind of Raddish that commeth earlier then the former, that we haue had out of the low Countries, not differing in any thing else.

The blacke Raddish I haue had brought me out of the lowe Countries, where they sell them in some places by the pound, and is accounted with them a rare winter sallet:

Vv 3

the roote of the best kinde is blackish on the outside (and yet the seede gathered from such an one, hath after the sowing againe, giuen rootes, whereof some haue beene blacke, but the most part white on the outside) and white within, great and round at the head, almost like a Turnep, but ending shorter then a Raddish, and longer then a Turnep, almost peare-fashion, of a firmer and harder substance then the ordinary Raddish, but no lesse sharpe and biting, and somewhat strong withall; the leaues are somewhat smaller, and with deeper gashes, the flower and seede are like the former, but smaller.

Another sort of blacke Raddish is like in leafe and seede to the former, but the flower is of a lighter purple colour: the roote is longer and smaller, and changeth also to bee white as the former doth, so that I thinke they haue both risen from one kinde.

The Horse Raddish is a kinde of wilde Raddish, but brought into Gardens for the vse of it, and hath great large and long greene leaues, which are not so much diuided, but dented about the edges: the roote is long and great, much stronger in taste then the former, and abideth diuers yeares, spreading with branches vnder ground.

Dittander is likewise a wilde kinde hereof, hauing long pointed blewiflourie greene leaues, and a roote that creepeth much vnder ground: I confesse this might haue bin placed among the herbes, because the leaues and not the rootes are vsed, but let it passe now with the kindes of Raddish.

#### The Vse of these Raddishes.

Raddishes doe serue vsually as a *stimulum* before meat, giuing an appetite therewerto; the poore eate them alone with bread and salt. Some that are early sownen, are eaten in Aprill, or sooner if the season permit; others come later, and some are sownen late to serue for the end of Summer: but (as of all things else) the earlier are the more accepted.

The blacke Raddishes are most vsed in the winter, (yet some in their naturall and not forc'd grounds, haue their rootes good most part of the Summer) and therefore must bee sownen after Midsummer; for if they should bee sownen earlier, they would presently runne vp to stalke and seed, and so lose the benefit of the roote. The Physicall propertie is, it is often vsed in medicines that helpe to breake the stome, and to auoyde grauell.

The Horse Raddish is vsed Physically, very much in Melancholieke, Splenetickke and Scorbuticke diseases. And some vse to make a kinde of Mustard with the rootes, and eate it with fish.

Dittander or Pepperworte is vsed of some cold churliflourie stomackes, as a fawce or sallet sometimes to their meate, but it is too hot, bitter and strong for weake and tender stomackes.

Our Gardiners about London vse great fences of reede tyed together, which seemeth to bee a mat set vpright, and is as good as a wall to defend the cold from those things that would be defended, and to bring them forwards the earlier.

#### CHAP. XLIII.

##### Cepa. Onions.

**W**ee haue diuers sorts of Onions, both white and red, flat, round and long, as shall be presently shewed: but I will doe with these as I doe with the rest, only give you one description for them all, and afterwards their severall names and varieties, as they are to be known by.

Our common Garden Onion hath diuers long greene hollow leaues, seeming halfe flat; among which riseth vp a great round hollow stalke, bigger in the middle then any where else, at the toppe whereof standeth a close round head, couered at the first with a thin skinne, which breaketh when the head is growne, and sheweth forth a great umbell!

1 Rapanastrum. 2 Horie Raddish. 3 Lepidium sativum. 4 Dittander. 5 Cepa rotundata. 6 Cepa longa. 7 Cepa rufa. 8 Allium. 9 Ramps. 10 Tragopogon. 11 Goates b. 12

bell of white flowers, which turne into blacke seede : but then the head is so heauie that the stalke cannot sustaine it, but must be vpheld from falling to the ground, lest it rot and perish : the roote as all know is round, in some greater, in others lesser, or flat, in some red on the outside only, in others quite thorough out, in some white, and very sharpe and strong, in others milder, and more pleasant, and some so pleasant that they may be eaten as an Apple : All these kindes of Onions, contrary to the nature of all other bulbous rootes, haue no off-set, or other roote growing to it, but are euery one alone singel by themselues ; and therefore it seemeth, the Latines, as Columella recordeth, haue giuen it the name *Vrio*, and the French it should seeme following the Latine, and the English the French, do call it *Oignon* and *Onion*, as an vnite, or as if they were but one and one, and dye euery yeare after seed bearing.

The red flat kinde is most vsually with vs the strongest of them all, yet I haue had a great red Onion brought mee from beyond Sea, that was as great almost as two mens fistes, flat and red quite throughout, and very pleasant both to smell vnto, and to eate, but did quickly degenerate, so that we plainly see, that the soyle and climate doth giue great alteration to plants of all sorts.

The long kinde wee call St. Omers Onions, and corruptly among the vulgar, St. Thomas Onions.

The other red kinde we call Strasborough Onions, whose outside onely is red, and are very sharpe and fierce.

The white Onions both long and flat, are like vnto Chalke-stones lying vpon the ground, when they are ripe and fit to be gathered.

And lastly, there is the Spanish Onion, both long and flat, very sweete, and eaten by many like an apple, but as Iohn Tradescante saith, who hath beeene in Spaine, that the Spaniards themselues doe not eate them so familiarly, as they doe those white Onions that come out of our owne Countrey, which they haue there more plentifully then their sweete Onions.

#### The Vse of Onions.

Onions are vsed many wayes, as sliced and put into pottage, or boyled and peeled and layde in dishes for salters at supper, or sliced and put into water, for a sawce for mutton or oysters, or into meate roasted being stuffed with Parsly, and so many waies that I cannot recount them, every one pleasing themselues, according to their order, manner or delight.

The iuice of Onions is much vsed to be applyed to any burnings with fire, or with Gun-pouder, or to any scaldings with water or oyle, and is most familiar for the Country, where vpon such sudden occasions they haue not a more fit or speedy remedie at hand : The strong smell of Onions, and so also of Garlick and Leekes, is quite taken away from offending the head or eyes, by the eating of Parsley leaues after them.

#### CHAP. XL IIII.

##### *Porrums.* Leekes.

Here be likewise fundry sorts of Leekes, both great and small. Leekes are very like vnto Onions, hauing long green hollow-like leaues, flatish on the one side, and with a ridge or creft on the backe side : if they bee suffered to grow vncut, then in the second or third yeare after the sowing, they will send forth a round and slender stalke, euere quite throughout, and not swolleyn or bigger in the middle like the Onion, bearing at the toppe a head of purplish flowers, and blacke seede after them, very like vnto Onion seede, that it is hard to distinguish them : the roote is long and white, with a great bush of fibres hanging at it, which they call the beards.

The vnset Leek hath longer and slenderer roots then the other, which being transplanted, groweth thicker and greater.

The

The French Lecke, which is called the Vine Lecke, is the best of all others. Our common kinde is of two sorts, one greater then another. Another sort encreaseth altogether by the roore, as Garlick doth. And then Cuius, which are the smallest, and encrease abundantly only by the root. Some doe account Scallions to be rather a kinde of Onions then Leekes, and call them *Cepa Ascalonica*, or *Ascalonitides*, which will quickly spend it selfe, if it be suffered to be vncut ; but all Authors affirme, that there is no wilde kinde of Onion, vncleste they would haue it to be *Gesbyum*, whereof Theophrastus maketh mention, saying, that it hath a long necke (and so these Scallions haue) and was also of some called *Gesbyllides*, which antiquity accounted to be dedicated to Latona, the mother of Apollo, because when she was bigge with childe of Apollo, she longed for these Leekes.

#### The Vse of Leekes.

The old World, as wee finde in Scripture, in the time of the children of Israels being in Egypt, and no doubt long before, fed much vpon Leekes, Onions, and Garlick boyled with flesh ; and the antiquity of the Gentiles relate the same manner of feeding on them, to be in all Countries the like, which howsoeuer our dainty age now refuseth wholly, in all sorts except the poorest ; yet Myscouia and Russia vse them, and the Turkes to this day, (as Bellonius writeth) obserue to haue them among their dishes at their tables, yea although they be *Besbas*, *Cedes*, or *Vaiuodas*, that is to say, Lords, Judges, or Gouernours of countries and places. They are vsed with vs also sometimes in Lent to make porrage, and is a great and generall feeding in Wales with the vulgar Gentlemen.

Onions boyled or rosted vnder the embers, and mixed with sugar and butter, are good for those that are troubled with coughes, shortnesse of breath, and wheesing. An Onion made hollow at the bottome, and some good Treakle put into it, with a little iuyce of Citrons (or Lemons in the stead thereof) being well baked together vnder the embers, after the hole is stopped againe, and then strained forth, and giuen to one that hath the plague, is very helpefull, so as hee be laid to fweate vpon it.

Cuius are vsed as well to be shred among other herbes for the pot, as to be put into a Sallet among other herbs, to giue it a quicker relish.

Leekes are held to free the chest and lungs from much corruption and rotten flegme, that sticketh fast therein, and hard to be auoided, as also for them that through hoarsenesse haue lost their voice, if they be eyther taken rawe, or boyled with broth of barley, or some such other supping, fit and conducing therunto. And baked vnder hot embers is a remedy against a surfeit of Mushromes.

The greene blades of Leekes being boyled and applied warme to the *Hemorrhoides* or piles, when they are swolne and painfull, giue a great deale of ease.

#### CHAP. XL V.

##### *Allium.* Garlick.

I haue spoken of diuers sorts of Garlick called Moly, in the former booke : I shall neede in this place to shew onely those kindes, that this Garden nouriseth vp, and leauet the rest to his fit time and place.

Garlick hath many long greene leaues, like vnto Onions, but much larger, and not hollow at all as Onions are : the stalke riseth vp to be about three foote high, bearing such a head at the toppe thereof as Onions and Leekes doe, with purplish flowers, and blacke seede like Leekes : the roote is white within, couered ouer with many pur-

plish

plish skins, and is diuided into many parts or cloues, which serue both to set againe for increase, and also to vse as neede shall require, and is of a very strong smell and taste, as every one knoweth, passing either Onions or Leekes, but exceeding wholsome withall for them that can take it.

*Allium Ursinum.* Ramsons.

Ramsons are another kinde of Garlick, and hath two or three faire broad leaues, of a fresh or light greene colour, pointed at the end: the stalke growtheth about an hand length high, bearing many small and pure white starre-like flowers at the toppe, and afterwards small, blacke, and smooth round seede: the roote is also diuided into many parts, whereby it is much encreased, and is much milder then the former, both in smell and taste.

The Vse of Garlick.

It being well boyled in salt broth, is often eaten of them that haue strong stomackes, but will not brooke in a weake and tender stomacke.

It is accounted, and so called in diuers Countries, The poore mans Treacle, that is, a remedy for all diseases. It is never eaten rawe of any man that I know, as other of the rootes aforesaid, but sodden alwaies and so taken.

Ramsons are oftentimes eaten with bread and butter, and otherwise also, as every mans affection and course of life leadeth him to vse.

CHAP. XLVI.

*Rapunculus sine Rapuntium.* Rampions.

**G**arden Rampions are of two sorts, the one greater, the other lesser: the leaues of Rampions are in the one somewhat broad like a Beete, in the other somewhat long and narrow, and a little broader at the end, of a light greene colour, lying flat vpon the ground all the first winter, or yeare of the springing, and the next Spring shooteth forth stalkes two or three foote high, bearing at the toppe, in the bigger sort, a long slender spike of small horned or crooked flowers, which open their brimmes into foure leaues; in the lesser many small purplish bels, standing vpon seuerall small foote-stalkes, which turne into heads, bearing small blackish seede: the root is white, branched into two or threerootes, of the bignesse and length of a mans finger or thumb.

The Vse of Rampions.

The rootes of both are vsed for Sallets, being boyled, and then eaten with oyle and vinegar, a little salt and pepper.

CHAP. XLVII.

*Tragopogon.* Goates beard.

**G**oates beard hath many long and narrow leaues, broader at the bottomme, and sharper at the end, with a ridge downe the backe of the leafe, and of a pale greene colour; among which riseth vp a stalke of two or three foote high, smooth and hollow, bearing thereon many such like leaues, but smaller and shorter, and at the toppe thereof on every branch a great double yellow flower, like almost vnto the flower of a Dandelion, which turneth into a head, stored with dounce, and long whitish seede therein, hauing on the head of every one some part of the dounce,

and is carried away with the windc if it bee neglected: the roote is long and round, somewhat like vnto a Parsnep, but farre smaller, blackish on the outside, and white within, yelding a milkie iuyce being broken, as all the rest of the plant doth, and of a very good and pleasant taste. This kinde, as also another with narrower leaues, almost like grafe, growe wilde abroad in many plâces, but are brought into diuers Gardens. The other two kindes formerly described in the first part, the one with a purple flower, and the other with an ash-coloured, haue such rootes as these here described, and may serue also to the same purpose, being of equall goodnessse, if any will vse them in the same manner; that is, while they are young, and of the first yeares sowing; else they all growe hard, in running vp to seede.

The Vse of Goates beard.

If the rootes of any of these kindes being young, be boyled and dressed as a Parsnep, they make a pleasant dish of meate, farre passing the Parsnep in many mens iudgements, and that with yellow flowers to be the best.

They are of excellent vse being in this manner prepared, or after any other fit and conuenient way, to strengthen thosethat are macilent, or growing into any consumption.

CHAP. XLVIII.

*Carum.* Carawayes.

**C**arawayes hath many very fine cut and diuided leaues lying on the ground, being alwaies greene, somewhat resembling the leaues of Carrors, but thinner, and more finely cut, of a quicke, hot, and spacie taste: the stalke riseth not much higher then the Carrot stalke, bearing some leaues at the ioynts along the stalke to the toppe, where it brancheth into threec or fource parts, bearing spoakie vmbels of white flowers, which turne into small blackish seede, smaller then Aniseede, and of a hotter and quicker taste: the roote is whitish, like vnto a Parsnep, but much smaller, more spreading vnder ground, and a little quicke in taste, as all the rest of the plant is, and abideth long after it hath giuen seede.

The Vse of Carawayes.

The rootes of Carawayes being boyled may be eaten as Carrots, and by reason of the spacie taste doth warme and comfort a cold weake stomacke, helping to dissolve winde (whereas Carrots engender it) and to prouoke vrine, and is a very welcome and delightfull dish to a great many, yet they are somewhat stronger in taste then Parsneps.

The seede is much vsed to bee put among baked fruit, or into bread, cakes, &c. to giue them a relissh, and to helpe to digest winde in them are subiect thereto.

It is also made into Comfits, and put into Trages, or as we call them in English, Dredges, that are taken for the cold and winde in the body, as also are serued to the table with fruit.

CHAP.

## CHAP. XLIX.

*Pappas sine Battatas. Potatoes.*

**T**HREE sorts of Potatoes are well knowne vnto vs, but the fourth I rest doubtfull of, and dare not affirme it vpon such termes as are giuen vnto it, vntill I may be better informed by mine owne sight.

The Spanish kinde hath (in the Islands where they growe, either naturally, or planted for increase, profit, and vse of the Spaniards that nourise them) many firme and verie sweete rootes, like in shape and forme vnto Asphodill rootes, but much greater and longer, of a pale browne on the outside, and white within, set together at one head; from whence rise vp many long branches, which by reason of their weight and weaknesse, cannot stand of themselves, but traile on the ground a yard and a halfe in length at the least (I relate it, as it hath growne with vs, but in what other forme, for flower or fruit, we know not) whereon are set at severall distancies, broad and in a manner three square leaues, somewhat like trianguled Iuie leaues, of a darke greene colour, the two sides whereof are broad and round, and the middle pointed at the end, standing reasonable close together: thus much we haue seene growe with vs, and no more: the roote rather decaying then increasing in our country.

The Potatoes of Virginia, which some foolishly call the Apples of youth, is another kinde of plant, differing much from the former, sauing in the colour and taste of the roote, hauing many weake and somewhat flexible branches, leaning a little downwards, or easily borne downe with the winde or other thing, beset with many winged leaues, of a darke grayish greene colour, whereof diuers are smaller, and some greater then others: the flowers growe many together vpon a long stalke, comming forth from betweene the leaues and the great stalkes, every one severally vpon a short foot-stalke, somewhat like the flower of Tabacco for the forme, being one whole leafe six cornered at the brimmes, but somewhat larger, and of a pale blewish purple colour, or pale doue colour, and in some almost white, with some red threads in the middle, standing about a thicke gold yellow pointell, tipped with greene at the end: after the flowers are past, there come vp in their places small round fruit, as bigge as a Damson or Bulleis, greene at the first, and somewhat whitish afterwards, with many white seedes therein, like vnto Nightshade: the rootes are rounder and much smaller then the former, and some much greater then others, dispersed vnder ground by many small threads or strings from the rootes, of the same light browne colour on the outside, and white within, as they, and neare of the same taste, but not altogether so pleasant.

The Potatos of Canada, (which hath diuers names giuen it by diuers men, as Bauhinus vpon Matthiolis calleth it, *Solanum tuberosum esculentum*, Pelleterius of Middleborough in his *Plantarum Synonymia*, *Heliotropium Indicum tuberosum*, Fabius Columna in the second part of his *Phytobasanos*, *Flos Solis Farnesianus*, sive *Aster Peruanus tuberosus*: We in England, from some ignorant and idle head, haue called them Artichokes of Ierusalem, only because the roote, being boyled, is in taste like the bottome of an Artichoke head: but they may most fitly be called, Potatos of Canada, because their rootes are in forme, colour and taste, like vnto the Potatos of Virginia, but greater, and the French brought them first from Canada into these parts) ricerth vp with diuers stiffe, round stalkes, eight or tenne foote high in our Country, where they haue scarce shewed their flowers, whereas the very head of flowers in other Countries, as Fabius Columna expresteth it, being of a Pyramis or Sugar loafe fashion, broade spreading below, and smaller pointed vpwards towards the toppe, is neere of the same length, whereon are set large and broade rough greene leaues, very like vnto the leaues of the flower of the Sunne, but smaller, yet growing in the very same manner, round about the stalkes: at the very later end of Summer, or the beginning of Autumne, if the roote bee well planted and defended, it will giue a shew of a few small yellow flowers at the top, like vnto the flowers of *Aster* or *Starre-wort*, and much smaller then any flower of the Sunne, which come to no perfection with vs: the roote, while the plant is

1. *Carum Carawayes.* 2. *Battatas Hispanorum.* Spanish Potatoes. 3. *Papas sine Battatas Virginianorum.* Virginia Potatoes. 4. *Battatas de Canada.* Potatoes of Canada, or Artichokes of Ierusalem.

is growing aboue ground, encreaseth not to his full growth, but when the Summer is well spent, and the springing of the stalk is past, which is about the end of August, or in September, then the root is perceiued to be encreased in the earth, and will before Autumn be spent, that is, in October, swell like a mound or hillocke, round about the foote of the stalkes, and will not haue his rootes fit to be taken vp, vntill the stalkes be halfe withered at the soonest ; but after they be withered, and so all the winter long vntill the Spring againe, they are good, and fit to bee taken vp and vsed, which are a number of tuberous round rootes, growing close together, so that it hath been obserued, that from one roote, being set in the Spring, there hath been forty or more taken vp againe, and to haue ouer-filled a pecke measure, and are of a pleasant good taste as many haue tryed.

#### The Vse of all these Potato's.

The Spanish Potato's are roasted vnder the embers, and being pared or peeled and sliced, are put into facke with a little sugar, or without, and is delicate to be eaten.

They are vsed to be baked with Marrow, Sugar, Spice, and other things in Pyes, which are a daintie and costly dish for the table.

The Comfit-makers preferre them, and candy them as diuers other things, and so ordered, is very delicate, fit to accompany such other banqueting dishes.

The Virginia Potato's being dressed after all these waies before specified, maketh almost as delicate meate as the former.

The Potato's of Canada are by reaon of their great increasing, growne to be so common here with vs at London, that even the most vulgar begin to despise them, wherevs when they were first receiued among vs, they were dainties for a Queene.

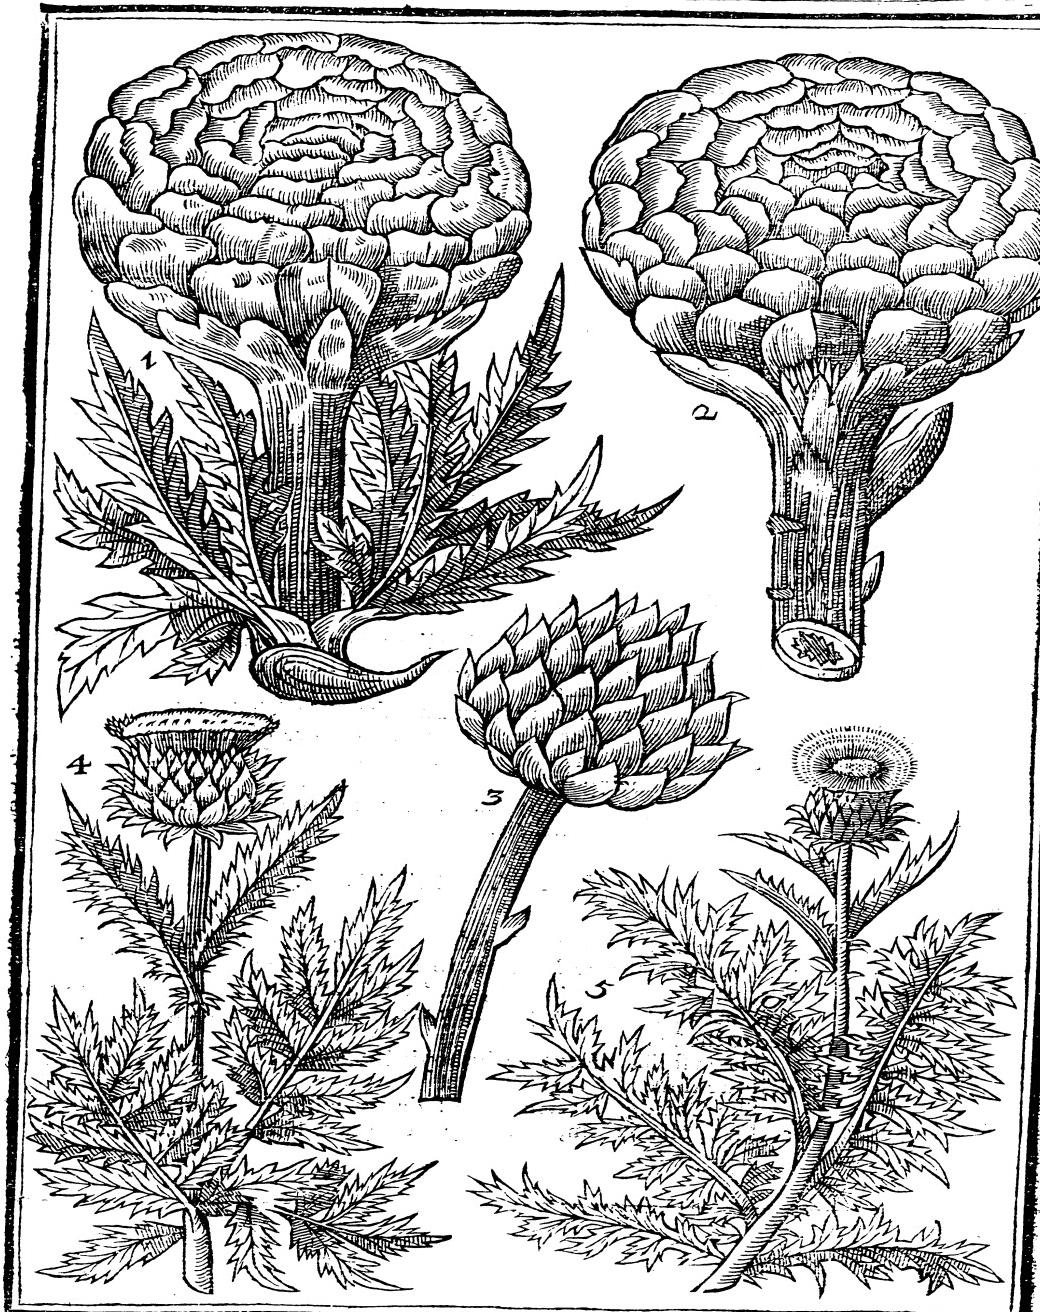

Being put into seething water they are soone boyled tender, which after they bee peeled, sliced and stewed with butter, and a little wine, was a dish for a Queene, beeing as pleasant as the bottome of an Artichoke : but the too frequent vse, especially being so plentifull and cheape, hath rather bred a loathing then a liking of them.

#### C H A P. L.

##### *Cinara. Artichokes.*

**T**He fruits that grow vpon or neere the ground, are next to be entreated of, and first of Artichokes, whereof there be diuers kindes, some accounted tame and of the Garden, others wilde and of late planted in Gardens, Orchards or Fieldes, of purpose to be meate for men.

The Artichoke hath diuers great, large, and long hollowed leaues, much cut in or torn on both edges, without any great shew of prickles on them, of a kinde of whitish greene, like vnto an ash colour, whereof it tooke the Latine name *Cinara* : the stalk is strong, thicke and round, with someskins as it were downe all the length of them, bearing at the toppe one scaly head, made at the first like a Pine-apple, but after growing greater, the scales are more separate, yet in the best kindes lying close, and not staring, as some other kindes doe, which are cyther of a reddish browne, whitish, or greenish colour, and in some broade at the ends, in others sharpe or prickly : after the head hath stood a great while, if it bee suffered, and the Summer prove hot and kindly, in some there will breake forth at the toppe thereof, a tuft of bleuish purple thrumes or threds, vnder which grow the seede, wrapped in a great deale of dounie substance : but that roote that yeeldeth flowers will hardly abide the next winter ; but else being cut off when it is well growne, that dounie matter abideth close in the middle of the head, hauing the bottome thereof flat and round, which is that matter or substance that is vsed to be eaten : the roote spreadeth it selfe in the ground reasonable

*Cinara Cetina umbra.* The red Artichoke. *2. Cinara sativa alba.* The white Artichoke. *3. Cinara pitaia.* The French Artichoke. *4. carduus nutans.* The Thistle Artichoke. *5. Carduus esculentus.* The Chardon.

## The Kitchen Garden.

ble well, yeelding diuers heads of leaues or suckers, whereby it is increased. The white Artichoke is in all things like the red, but that the head is of a whitish ashe colour, like the leaues, whereas the former is reddish. We haue also another, whose head is greene, and very sharpe vpwards, and is common in many places.

Wee haue had also another kinde in former times that grew as high as any man, and branched into diuers stalkes, euery one bearing a head thereon, almost as bigge as the first.

There is another kinde, called the Muske Artichoke, which groweth like the French kinde, but is much better in spending, although it haue a lesser bottome.

The French Artichoke hath a white head, the scales whereof stand staring far asunder one from another at the ends, which are sharpe: this is well known by this qualite, that while it is hot after it is boyled, it swelleth so strong, that one would verily thinke it had bin boyled in stinking water, which was brought ouer after a great froste that had well nigh consumed our best kindes, and are now almost cleane cast out again, none being willing to haue it take vp the roome of better.

There is a lowe kinde that groweth much about Paris, which the French esteeme more then any other, and is lower then the former French kinde, the head whereof as well as the leaues, is of a fresher greene colour, almost yellowish.

Then there is the Thistle Artichoke, which is almost a wilde kinde, and growth smaller, with a more open and prickly head then any of the former.

And lastly, the Chardon as they call it, because it is almost of the forme and nature of a Thistle, or wilde Artichoke. This groweth high, and full of sharpe prickles, of a grayish colour. John Tradescante assured mee, hee saw three acres of Land about Brussells planted with this kinde, which the owner whited like Endive, and then sold them in the winter: Wee cannot yet finde the true manner of dressing them, that our Countrey may take delight therein.

All these kindes are encreased by slipping the young shoothes from the root, which being replanted in February, March, or Aprill, haue the same yeare many times, but the next at the most, borne good heads.

Wee finde by dayly experiance, that our English red Artichoke is in our Countrey the most delicate meate of any of the other, and therefore diuers thinking it to bee a severall kinde, haue sent them into Italie, France, and the Lowe Countries, where they haue not abode in their goodnessse aboue two yeaers, but that they haue degenerated; so that it seemeth, that our soyle and climate hath the preheminence to nourish vp this plant to his highest excellencie.

### The Vse of Artichokes.

The manner of preparing them for the Table is well knowne to the youngest Housewife I thinke, to bee boyled in faire water, and a little salt, vntill they bee tender, and afterwards a little vinegar and pepper, put to the butter, poured vpon them for the sawce, and so are serued to the Table.

They vse likewisefo to take the boyled bottomes to make Pyes, which is a delicate kinde of baked meate.

The Chardon is eaten rawe of diuers, with vinegar and oyle, pepper and salt, all of them, or some, as every one liketh for their delight.

CHAP.

## The Kitchen Garden.

### CHAP. LI.

#### Fabe & Phaseoli. Garden and French Beanes.

**T**He Garden Beane is of two colours, red or blacke, and white, yet both rise from one; the small or field Beanes I make no mention of in this place; but the French or Kidney Beane is almost of infinite sorts and colours: we doe not for all that intend to trouble you in this place, with the knowledge or relation of any more then is fit for a Garden of that nature, that I haue propounded it in the beginning.

Our ordinary Beanes, seruing for foode for the poorer sort for the most part, are planted as well in fieldes as in gardens, because the quantity of them that are spent taketh vp many acres of land to be planted in, and rise vp with one, two or three stalkes, according to the fertilitie of the soyle, being smooth and square, higher then any man oftentimes, whereon are set at certaine distances, from the very bottome almost to the toppe, two long smooth fleshy and thicke leaues almost round, one standing by another at the end of a small footestalke: betweene these leaues and the stalke, come forth diuers flowers, all of them looking one way for the most part, which are close a little turned vp at the brimmes, white and spotted with a blackish spot in the middle of them, and somewhat purplish at the foot or bottome, of the forme almost of Broome or Pease flowers, many of which that grow vpward toward the toppe, doe seldom beare fruit, and therefore are gathered to distill, and the toppes of the stalkes cut off, to cause the rest to thriue the better; after which grow vp long great smooth greene pods, greater then in any other kinde of Pulse, which grow blacke when they are ripe, and containe within them two, three or fourre Beanes, which are somewhat flat and round, eyther white or reddish, which being full ripe grow blackish: the roote hath diuers fibres annexed vnto the maine roote, which dyeth every yeare.

The French or Kidney Beane riseth vp at the first but with one stalke, which afterwards divideth it selfe into many armes or branches, euery one of them being so weak, that without they be sustainted with stickes or poles, whereon with their winding and claspers they take hold, they would lye fruitlesse vpon the ground: vpon these branches grow forth at severall places long footestalkes, with euery of them three broade, round and pointed greene leaues at the end of them, towards the tops whereof come forth diuers flowers, made like vnto Pease blossomes, of the lame colour for the most part that the fruit will be of, that is to say, eyther white, or yellow, or red, or blackish, or of a deepe purple &c. but white is most vsuall for our Garden; after which come long and slender flat pods, some crooked, and some straight, with a string as it were running downe the backe thereof, wherein are contained flattish round fruit, made to the fashion of a kidney: the roote is long, and spreadeth with many fibres annexed vnto it, perishing every yeare.

### The Vse of these Beanes.

The Garden Beanes serue (as I said before) more for the vse of the poore then of the rich: I shall therefore only shew you the order the poore take with them, and leaue curiositie to them that will bestow time vpon them. They are only boyled in faire water and a little salt, and afterwards stewed with some butter, a little vinegar and pepper being put vnto them, and so eaten: or else eaten alone after they are boyled without any other sawce. The water of the blossomes distilled, is vsed to take away spots, and to cleer the skin. The water of the greene huskes or cods is good for the stone.

The Kidney Beanes boyled in water huske and all, onely the ends cut off, and the string taken away, and stewed with butter &c. are esteemed more sauyor meate to many mens pallates, then the former, and are a dish more oftentimes at rich mens Tables then at the poore.

## CHAP. LII.

*Pisum. Pease.*

**T**HERE is a very great variety of manured Pease known to vs, and I think more in our Country then in others, whereof some prosper better in one ground and country, and some in others: I shall give you the description of one alone for all the rest, and recite vnto you the names of the rest.

Garden Pease are for the most part the greatest and sweetest kinds, and are sustained with stakes or bushes. The Field Pease are not so vsed, but growe without any such adoe. They spring vp with long, weake, hollow, and brittle (while they are young and greene) whitish greene stalkes, branched into diuers parts, and at euery ioynt where it parteth one broad round leafe compassing the stalke about, so that it commeth as it were thorough it: the leaues are winged, made of diuers small leaues set to a middle ribbe, of a whitish greene colour, with claspers at the ends of the leaues, whereby it taketh hold of whatsoeuer standeth next vnto it: betweene the leaues and the stalkes come forth the flowers, standing two or three together, every one by it selfe on his owne severall stalke, which are either wholly white, or purple, or mixed white and purple, or purple and blew: the fruit are long, and somewhat round cods, whereof some are greater, others lesser, some thicke and short, some plaine and smooth, others a little crooked at the ends; wherein also are contained diuers formes of fruit or pease; some being round, others cornered, some small, some great, some white, others gray, and some spotted: the roote is small, and quickly perisath.

## The kindes of Pease are these:

The Rounchiuell.

The greene Hastings.

The Sugar Pease.

The Spotted Pease.

The Scottish or tufted Pease, which some call the Rose Pease, is a good white Pease fit to be eaten.

The early or French Pease, which some call Fulham Pease, because those grounds thereabouts doe bring them soonest forward for any quantity, although sometimes they miscarry by their haste and earliness.

*Cicer Arietinum. Rams Ciches.*

This is a kinde of Pulse, so much vsed in Spaine, that it is vsually one of their daintie dishes at all their feasts: They are of two sorts, white and red; the white is onely vsed for meate, the other for medicine. It beareth many vpright branches with winged leaues, many set together, being small, almost round, and dented about the edges: the flowers are either white or purple, according to the colour of the Pease which follow, and are somewhat round at the head, but cornered and pointed at the end, one or two at the most in a small roundish cod.

## The Vse of Pease.

Pease of all or the most of these sorts, are either vsed when they are greene, and be a dish of meate for the table of the rich as well as the poore, yet euery one obseruing his time, and the kinde: the fairest, sweetest, youngest, and earliest for the better sort, the later and meaner kindes for the meaner, who doe not giue the dearest price: Or

Being dry, they serue to boyle into a kinde of broth or pottage, wherein many doe put Tyme, Mints, Sauory, or some other such hot herbes, to giue it the better relish, and is much vsed in Towne and Countrey in the Lent time,

1. *Fabasativa*. Garden Beans. 2. *Phaseolusvatus*. French Beans. 3. *Pisumvulgare*. Garden Pease. 4. *Pisumumbellatum sive Roseum*. Rose Pease or Scottish Pease. 5. *PisumSaccharatum*. Sugar Pease. 6. *Pisummaculatum*. Spotted Pease. 7. *CicerArietinum*. Rams Ciches or Cicers.

time, especially of the poorer sort of people.

It is much vsed likewise at Sea for them that goe long voyages, and is for change, because it is fresh, a welcome diet to most persons therein.

The Rams Ciches the Spaniards call *Grauancos*, and *Grauancillos*, and eat them boyled and stewed as the most dainty kinde of Pease that are, they are of a very good rellysh, and doe nourish much; but yet are not without that windy quality that all sorts of Pulse are subiect vnto: they increase bodily lust much more then any other sorts, and as it is thought, doth helpe to encrease seede.

### CHAP. LIII.

#### Cucumer. The Cowcumber.

**O**F Cowcumbers there are diuers sorts, differing chiefly in the forme and colour of the fruit, and not in the forme of the plant; therefore one description shall serue in stead of all the rest.

The Cowcumber bringeth forth many trailing rough Greene branches lying on the ground, ali along whereof grove seuerall leaues, which are rough, broad, vneuen at the edges, and pointed at the ends, with long crooked tendrels comming forth at the same ioynt with the leafe, but on the other side therof: between the stalks & the leaues at the ioynts come forth the flowers seuerally, euery one standing on a short foot-stalke, opening it selfe into ffe leaues, of a yellowish colour, at the bottome whereof groweth the fruit, long and greene at the first, but when it is thorough ripe, a little yellowish, having many furrowes, and vneuen bunches all the length of it, wherin is a white firme substance next vnto the skin, and a cleare pulpe or watery substance, with white flat seede lying dispersed through it: the roote is long and white, with diuers fibres at it.

#### The kindes.

The first described is called, The long greene Cowcumber.

There is another is called, The short Cowcumber, being short, and of an equal bignesse in the body thereof, and of an vnequal bignesse at both ends.

The long Yellow, which is yellowish from the beginning, and more yellow when it is ripe, and hath beene measured to be thirteene inches long: but this is not that small long Cowcumber, called of the Latines, *Cucumis anginus*.

Another kinde is early ripe, called The French kinde.

The Dantfiske kinde beareth but small fruit, growing on short branches or runners: the pickled Cowcumbers that are vsually sold are of this kind.

The Muscouie kinde is the smalleſt of all other, yet knowne, and beareth not aboue fourre or ffe at the most on a roote, which are no bigger then ſmall Lemons.

#### The Vſe of Cowcumbers.

Some vſe to cast a little ſalt on their ſliced Cowcumbers, and let them ſtand halfe an houre or more in a dish, and then poure away the water that commeth from them by the ſalt, and after put vinegar, oyle, &c. thereon, as euery one liketh: this is done, to take away the ouermuch wäteriſhneſſe and coldneſſe of the Cowcumbers.

In many countries they vſe to eate Cowcumbers as wee doe Apples or Peares, paring and giuing ſlices of them, as we would to our friends of ſome dainty Apple or Peare.

The pickled Cowcumbers that come from beyond Sea, are much vſed with

with vs for ſawce to meat all the Winter long. Some haue ſtriven to equalle them, by pickling vp our Cowcumbers at the later end of the yeare, when they are cheapeſt, taking the little ones and ſcalding them thoroughly well, which after they put in brine, with ſome Dill or Fenell leaues and ſtaſkes: but theſe are nothing comparable to the former, wee either miſſing of the right and orderly pickling of them, or the kinde it ſelfe diſſering much from ours (as I ſaid of the Dantfiske kinde) for ours are neither ſo tender and firme, nor ſo ſauoury as the other.

The rawe or greene Cowcumbers are fitteſt for the hotter time of the yeare, and for hot ſtomackes, and not to be vſed in colder weather or cold ſtomackes, by reaſon of the coldneſſe, whereby many haue been ouertaken.

The ſeede is vſed physically in many medicines that ſerue to coole, and a little to make the paſſages of vrine ſlippery, and to giue eaſe to hot diſeaſes.

### CHAP. LIV.

#### Melo. Milions or Muske Melons.

**T**here bee diuers ſorts of Melons found out at this day, differing muſt in the goodneſſe of taste one from another. This Country hath not had vniſſ of late yeareſ the ſkill to noſtre them vp kindly, but now there are many that are ſo well experienced therein, and haue their ground ſo well prepared, as that they will not miſſe any year, if it be not too extreme vnkindly, to haue many ripe ones in a reaſonable time: yet ſome will be later then others alwayes.

The Melon is certainly a kinde of Cowcumber, it doth ſo neare reſemble it, both in the manner of his growing, haung rough trailing branches, rough vneuen leaues, and yellow flowers: after which come the fruit, which is rounder, thicker, bigger, more rugged, and ſpotted on the outside then the Cowcumber, of a ruffet colour, and green vnderneath, which when it groweth full ripe, will change a little yellowish, being as deepe furrowed and ribbed as they, and beſides haung chaps or rifts in diuers places of the rinde: the inward hard ſubſtance is yellow, which onely is eaten: the ſeede which is bigger, and a little yellower then the Cowcumber, lying in the middle onely among the moifer pulpe: the ſmell and changing of his colour, foreſhew their ripeneſſe to them that are experienced: the roote is long, with many fibres at it. The fruit requireth much watering in the hot time of the day, to cauſe them to ripen the ſooner, as I haue obſerved by diuers of the beſt ſkill therein.

#### The Vſe of the kindes of Melons.

The beſt Melon ſeede doe come to vs out of Spaine, ſome haue come out of Turkie, but they haue been nothing ſo good and kindly.

Some are cauſed Sugar Melons, others Peare Melons, and others Muske Melons.

They haue beene formerly only eaſen by great perſonages, because the fruit was not only delicate but rare, and therfore diuers were brought from France, and ſince were noſtreſ vp by the Kings or Noblemenſ Gardiners onely, to ſerue for their Masters delight: but now diuers others that haue ſkill and conuenience of ground for them, doe plant them and make them more common.

They paire away the outer rinde, and cut out the inward pulpe where the ſeede lyeth, ſlice the yellow firme inward rinde or ſubſtance, & ſo eate it with ſalt and pepper (and good ſtore of wine, or elſe it will hardly diſgēſt) for this is firmer, & hath not that moisture in it that the Cowcumbers haue. It is alſo more delicate, and of more worth, which recompenſeth the paine.

The ſeede of theſe Melons are vſed as Cowcumbers physically, and together with them moſt vſually.

### CHAP.

## CHAP. LV.

*Pepo. Pompions.*

**W**E haue but one kinde of Pompion (as I take it) in all our Gardens, notwithstanding the diuersities of bignesse and colour.

The Pompion or great Melon (or as some call it Milion) creepeth vp on the ground (if nothing bee by it whreenon it may take hold and climbe) with very great, ribbed, rough, and prickly branches, whereon are set very large rough leaues, cut in on the edges with deepe gashes, and dented besides, with many claspers also, which winde about euery thing they meeet withall: the flowers are great and large, hollow and yellow, diuided at the brims into fife parts, at the bottomme of which, as it is in the rest, groweth the fruit, which is very great, sometimes of the bignesse of a mans body, and oftentimes lesse, in some ribbed or bunched, in others plaine, and either long or round, either green or yellow, or gray, as Nature listeth to shew her selfe; for it is but waste time, to recite all the formes and colours may be obserued in them: the inner rinde next vnto the outer is yellowish and firme: the seede is great, flat, and white, lying in the middle of the watery pulpe: the roote is of the bignesse of a mans thumbe or greater, dispersed vnder ground with many small fibres ioyned thereunto.

Gourds are kindes of Melons; but because wee haue no vse of them, wee leaue them vnto their fit place.

## The Vse of Pompions.

They are boyled in fairewater and salt, or in powdered beefe broth, or sometimes in milke, and so eaten, or else buttered. They vse likewise to take out the inner watery substance with the seedes, and fill vp the place with Pippins, and having laid on the couer which they cut off from the toppe, to take out the pulpe, they bake them together, and the poore of the Citie, as well as the Country people, doe eat thereof, as of a dainty dish.

The seede hereof, as well as of Cowcumbers and Melons, are cooling, and serue for emulsions in the like manner for Almond milkes, &c. for thole are troubled with the stone.

## CHAP. LVI.

*Fragaria. Strawberries.*

**T**HERE be diuers sorts of Strawberries, whereof those that are nourised vp in Gardens or Orchards I intend to giue you the knowledge in this place, and leaue the other to a fitter; yet I must needs shew you of one of the wilde sorts, which for his strangeness is worthy of this Garden: And I must also enforme you, that the wilde Strawberry that groweth in the Woods is our Garden Strawberry, but bettered by the soyle and transplanting.

The Strawberry hath his leaues closed together at the first springing vp, which afterwards spread themselues into three diuided parts or leaues, every one standing vpon a small long foote-stalke, greene on the vpper side, grayish vnderneath, and snipped or dented about the edges; among which rise vp diuers small stalkes, bearing fife or fife flowers at the tops, consisting of fife white round pointed leaues, somewhat yellowish in the bottome, with some yellow threads therein; after which come the fruit, made of many small graines set together, like vnto a small Mulberry or Raspis, reddish when it is ripe, and of a pleasent winy taste, wherein is enclosed diuers small blackish seede: the roote is reddish and long, with diuers small threads at it, and sendeth forth

1. *Cucumis sativus vulgaris*. The ordinary Cowcumber. 2. *Cucumis Hispanicus*. The long yellow Spanish Cowcumber. 3. *Mel vulgaris*. The ordinary melon. 4. *Melo maximus optimus*. The greatest Muske Melon. 5. *Pepo*. The Pompion. 6. *Fragaria vulgaris*. Common strawberries. 7. *Fragaria Bohemica maxima*. The great Bohemia Strawberries. 8. *Fragaria aciculata*. The prickly Strawberry.

## The Kitchen Garden.

forth from the head therof long reddish strings running vpon the ground, which shott forth leaucs in many places, whereby it is much encreased.

The white Strawberry differeth not from the red, but in the colour of the fruite, which is whiter then the former when it is thorough ripe, enclining to rednesse.

The greene Strawberry likewise differeth not, but that the fruit is green on all sides when it is ripe, saue on that side the Sun lyeth vpon it, and there it is somewhat red.

The Virginia Strawberry carryeth the greatest leafe of any other, except the Bohemian, but scarce can one Strawberry be feene ripe among a number of plants; I thinke the reason thereof to be the want of skill, or industry to order it aright. For the Bohemia, and all other Strawberries will not beare kindly, if you suffer them to grow with many strings, and therefore they are still cut away.

There is another very like vnto this, that Iohn Tradescante brought with him from Brussels long agoe, and in seuen yeares could never see one berry ripe on all sides, but still the better part rotten, although it would every yeare flower abundantly, and beare very large leaves.

The Bohemia Strawberry hath beene with vs but of late dayes, but is the goodliest and greatest, both for leafe next to the Virginian, and for beauty farre surpassing all; for some of the berries haue beene measured to bee neere five inches about. Master Quester the Postmaster first brought them ouer into our Country, as I vnderstand, but I know no man so industrious in the carefull planting and bringing them to perfection in that plentifull maner, as Master Vincent Sion who dwelt on the Banck side, neer the old Paris garden staires, who from seuen rootes, as hee affirmed to me, in one yeare and a halfe, planted halfe an acree of ground with the increase from them, besides those he gaue away to his friends, and with him I haue seen such, and of that bignesse before mentioned.

One Strawberry more I promised to shew you, which although it be a wilde kinde, and of no vse for meate, yet I would not let this discourse passe, without giuing you the knowledge of it. It is in leafe much like vnto the ordinary, but differeth in that the flower, if it haue any, is greene, or rather it beareth a small head of greene leauers, many set thicke together like vnto a double ruffe, in the midst whereof standeth the fruit, which when it is ripe, sheweth to be soft and somewhat reddish, like vnto a Strawberry, but with many small harmlesse prickles on them, which may be eaten and chewed in the mouth without any maner of offence, and is somewhat pleasant like a Strawberry: it is no great bearer, but those it doth beare, are set at the toppes of the stalks close together, pleasant to behold, and fit for a Gentlewoman to weare on her arme, &c. as a raritie in stead of a flower.

### The Vse of Strawberries.

The leaues of Strawberries are alwaies vsed among other herbes in cooling drinke, as also in lotions, and gargles for the mouth and throatte: the rootes are sometimes added to make it the more effectuall, and withall somewhat the more binding.

The berries them selues are often brought to the Table as a rare seruice, whereunto claret wine, creame or milke is added with sugar, as every one liketh; as also at other times, both with the better and meaner sort, and are a good cooling and pleasant dish in the hot Summer season.

The water distilled of the berries, is good for the passions of the heart, caused by the perturbation of the spirits, being eyther drunke alone, or in wine; and maketh the heart merry.

Some doe hold that the water helpeth to cleane the face from spots, and to adde some cleerenesse to the skinne.

### CHAP.

## The Kitchen Garden.

### CHAP. LVII.

#### Angelica. Garden Angelica.

**H**Aving thus furnished you out a Kitchen Garden with all sorts of herbes, roots & fruits fit for it, and for any mans priuate vse, as I did at the first appropriate it, let me a little transcend, and for the profit & vse of Country Gentlewomen and others, furnish them with some few other herbes, of the most especiall vse for those shall need them, to be planted at hand in their Gardens, to spend as occasion shall serue, and first of Angelica.

Angelica hath great and long winged leaues, made of many broade greene ones, diuided one from another vpon the stalk, which is three foot long or better somtimes, among which rise vp great thicke and hollow stalkes with some few ioynts, whereat doth alwayes stand two long leaues compassing the stalke at the bottome, in some places at the ioynts spring out other stalkes or branches, bearing such like leaues but smaller, and at the tops very large vmbels of white flowers, that turne into whitish seede somewhat thicke: the roote groweth great with many branches at it, but quickly perisheth after it hath borne seede: to preserue the roote therefore the better, they vs to cut it often in the yeare, thereby to hinder the ruaning vp to seede: the whole plant, both leafe, roote and seede, is of an excellent comfortable sent, saour and taste.

### The Vse of Angelica.

The distilled water of Angelica, eyther simple or compound, is of espe-  
ciall vse in deliquium animi, vel cordis tremores & passiones, that is, swoonings, when the spirits are overcome and faint, or tremblings and passions of the heart, to expell any windie or noysome vapours from it. The green stalkes or the young rootes being preferred or candied, are very effectuall to comfort and warme a colde and weake stomacke: and in the time of infection is of excellent good vse to preserue the spirits and heart from infection. The dried roote made into pouder, and taken in wine or other drinke, will abate the rage of lust in young perelons, as I haue it related vnto me vpon credit: A Syrupe made thereof in this manner, is very profitable to expectorate flegme out of the chest and lungen, and to procure a sweete breath. Into the greene stalke of Angelica as it standeth growing, make a great gashe or incision, wherein put a quanticie of fine white Sugar, letting it there abide for three dayes, and after take it forth by cutting a hole at the next ioynt vnder the cut, where the Syrupe resteth, or cut off the stalke, and turne it downe, that the Syrupe may drayne forth; which keepe for a most delicate medecine.

### CHAP. LVIII.

#### Draconcula hercynia sine Serpentaria. Dragons.

**D**RAGONS riseth out of the ground with a bare or naked round whitish stalke, spotted very much with purplish spots and strakes, bearing at the toppe therof a few greene leaues very much diuided on all sides, standing vpon long foote-stalkes, in the middle whereof (if the roote be old enough) commeth forth a great long huske or hose, green on the outside, and of a darke purplish colour on the inside, with a slender long reddish pestell or clapper in the middle: the roote is great, round, flat and whitish on the outside, and whiter within, very like vnto the rootes of Arum, or Wakerobin, and tasting somewhat sharpe like it.

## The Use of Dragons.

The chiefe vse wherunto Dragons are applyed, is, that according to an old received custome and tradition (and not the judgement of any learned Author) the distilled water is giuen with Mithridatum or Treakle to expell noysome and pestilentiall vapours from the heart.

## CHAP. LIX.

*Ruta.* Garden Rue, or Herbe Grace.

**G**arden Rue or Herbe Grace groweth vp with hard whitish wooddy stalkes, whereon are set diuers branches of leaues, being diuided into many small ones, which are somewhat thicke and round pointed, of a bleuish greene colour: the flowers stand at the tops of the stalkes consisting of foure small yellow leaues, with a greene button in the middle, and diuers small yellow threds about it, which growing ripe, containe within them small blacke seede: the roote is white and wooddy, spreading farre in the ground.

## The Use of Rue.

The many good properties wherunto Rue serueth, hath I thinke in former times caused the English name of Herbe Grace to be giuen vnto it. For without doubt it is a most wholesome herbe, although bitter and strong, and could our dainty stomackes brooke the vse thereof, it would worke admirable effects being carefully and skilfully applyed, as time and occasion did require: but not vndiscreetly or hand ouer head, as many vse to doe that haue no skill. Some doe rippe vp a beade rowle of the vertues of Rue, as Macer the Poet and others, in whom you shall finde them set downe, to bee good for the head, eyes, breast, liuer, heart, spleene, &c. In some places they vse to boyle the leaues of Rue, and keep them in pickle, to eate them as Sarcopire for the helpe of weake eyes. It is very auailable in glisters or drinke against the wnde or the collicke, and to procure vrine that is stayed by the paines therof. The distilled water is often vsed for the same purposes aforesaid: but beware of the too frequent or ouermuch vse thereof, because it heateth exceedingly, and wasteth nature mightily.

## CHAP. LX.

*Carduus Benedictus.* The Blessed Thistle.

**C**arduus benedictus or the blessed Thistle, hath many weake tender branches lying for the most part on the ground, whereon are set long and narrow leaues, much cut in or waued about the edges, hairy or rough in handling, yet without any hard or sharpe thornes or prickles at all, that the tenderest hand may touch them without harme: but those that grow toward the topes of the stalkes are somewhat more prickly, and the heads which grow on the tops of the severall branches are somewhat sharpe, set with prickles like a Thistle: the flower is yellow, and the seede lying within the woolly or flocky downe like to all other thistles, are blackish, long and round, with a few haire on the head of them: the roote is white, and perisheth every year after it hath given seede.

## The Use of the blessed Thistle.

The distilled water hereof is much vsed to be drunke against agues of all sortes, eyther pestilentiall or humorall, of long continuance or of lesse: but

1. Angelica. 2. Dracunculus. 3. Ruta. 4. Carduus benedictus. 5. Solanum. 6. Arum. 7. Ligustrum.

but the decoction of the herbe giuen in due time, hath the more forcible operation : it helpeth to expell wormes, because of the bitternesse, and is thereby also a friend to the stomach ouercharged with choliar, and to clese the liuer : it prouoketh sweate and vrine, is helpefull to them are troubled with the stome, and to ease paines in the sides.

## C H A P. L X I.

*Solanum vesicarium*, sive *Alkakengi*. Winter Cherries.

**T**He Winter Cherry hath a running or creeping roote in the ground, of the bignesse wany times of ones little finger, shooting forth at seuerall ioynts in seuerall places, whereby it quickly spreadeth a great compasse of ground : the stalke riseth not aboue a yard high, whereon are set many broade and long greene leaues, somewhat like vnto the leaues of Nighthshade, but larger: at the ioynts whereof come forth whitish flowers made of fwe leaues a peece, which after turne into green berries, inclosed with thin skins or bladders, which change to bee reddish when they grow ripe, the berry likewise being reddish, and as large as a Cherry, wherein are contained many flat and yellowish seed lying within the pulpe : which being gathered and strung vp, are kept all the yere to be vsed vpon occasion.

## The Vse of Winter Cherries.

The distilled water of the herbe and fruit together, is often taken of them that are troubled with the sharpenesse or difficultie of vrine, and with the stome in the kidneyes, or gruel in the bladder: but the berries themselves either greene or dried boyled eyther in broth, in wine, or in water, is much more effectuall : It is likewise conducing to open obstructions of the liuer, &c. and thereby to helpe the yellow Iaudise.

## C H A P. L X I I.

*Afaram*. Afarabacca.

**A**saracca, from a small creeping roote set with many fibres, shooteth forth divers heads, and from every of them sundry leaues, euery one standing vpon a long greene stalke, which are round, thicke, and of a very sad or darke greene colour, and shining withall: from the rootes likewise spring vp short stalkes, not fully foure fingers high, at the toppe of euery one of which standeth the flower, in fashion very like the seede vessel of Henbane seede, of a greenish purple colour, which changeth not his forme, but groweth in time to containe therein small cornered seed: the greene leaues abide all the winter many times, but vsually sheddeth them in winter, and recovereth fresh in the spring.

## The Vse of Afarabacca.

The leaues are much and often vsed to procure vomits, fwe or seuen of them bruised, and the iuice of them drunke in ale or wine. An extract made of the leaues with wine artificially performed, might bee kept all the yere thorough, to bee vsed vpon any present occasion, the quantitie to bee proportioned according to the constitution of the patient. The roote worketh not so strongly by vomit, as the leaues, yet is often vsed for the same purpose, and besides is helpefull to prouoke vrine, to open obstructions in the liuer and spleene, and is put among diners other simples, both into Mithridatum and Andromachus Treakle, which is vsually called Venice Treakle. A dram of the dried roots in pouder giuen in white wine a little before the fit of an ague, taketh away the shaking fit, & therby cause the hot fit to be the more remisse, and in twice taking expell it quite.

## C H A P. L X I I I.

*Glycyrrhiza fwe Liqueritia*. Licorice.

**A**Lthough there are two sorts of Licorice set downe by diuers Authors, yet because this Land familiarly is acquainted but with one sort, I shall not neede for this Garden, to make any further relation of that is vñknowne, but onely of that sort which is sufficiently frequent with vs. It riseth vp with diuers wooddy stalks, whereon are set at seuerall distances many winged leaues, that is to say, many narrow long greene leaues set together on both sides of the stalke, and an odde one at the end, very well resembling a young Ashe tree sprung vp from the seede : this by many yeares continuance in a place without remouing, and not else, will bring forth flowers many standing together spike-fashion one aboue another vpon the stalkes, of the forme of Peale bloffomes, but of a very pale or bleake blew colour, which turne into long somewhat flat and smooth cods, wherein is contained small round hard seede : the roote runneth downe exceeding deep into the ground, with diuers other smaller roots and fibres growing with them, and shooe out suckers from the maine rootes all about, whereby it is much encreased, of a brownish colour on the outside, and yellow within, of a farre more weake sweete taste, yet far more pleasing to vs then that Licorice that is brought vs from beyond Sea ; because that, being of a stronger sweete taste hath a bitternesse ioyned with it, which maketh it the lesse pleasing and acceptable to most.

## The Vse of Licorice.

Our English Licorice is now adayes of more familiar vse (as I said before) then the outlandish, and is wholly spent and vsed to helpe to digest and expectorate flegme out of the chest and lunges, and doth allay the sharpenesse or saltnesse thereof. It is good also for those are troubled with shortnesse of breath, and for all sorts ofoughes. The iuice of Licorice artificially made with Hysope water, serueth very well for all the purposes aforesaid. It being dissolved with Gum Tragacanth in Rose water, is an excellent Lohoc or licking medicine to breake flegme, and to expectorate it, as also to avoyde thin frothy matter, or thin salt flegme, which often fretterth the lunges. It doth also lenifie exulcerated kidneyes, or the bladder, and helpeth to heale them. It is held also good for those that cannot make their water but by drops, or a small deale at a time.

The dried root finely minced, is a speciaill ingredient into all Trageas or Dredges, seruing for the purposes aforesaid, but the vse of them is almost wholly left now adayes with all sorts.

Thus haue I shewed you not only the herbes, rootes and fruities, nurst vp in this Garden, but such herbes as are of most necessary vses for the Country Gentlewomens houses: And now I will shew you the Orchard alio.

# THE ORDERING OF THE ORCHARD.

The third part, or ORCHARD.

## CHAP. I.

*The situation of an Orchard for fruit-bearing trees, and how to amend the defects of many grounds.*

S I haue done in the two former parts of this Treatise, so I meane to proceede in this; first to set downe the situation of an Orchard, and then other things in order: And first, I hold that an Orchard which is, or should bee of forme reasonable large extent, should be so placed, that the house shal haue the Garden of flowers iust before it open vpon the South, and the Kitchen Garden on the one side thereof, should also haue the Orchard on the other side of the Garden of Pleasure; for many good reasons: First, for that the fruit trees being grown great and tall, will be agreat shelter from the North and East windes, which may offend your chieffest Garden, and although that your Orchard stand a little bleake vpon the windes, yet trees rather endure these strong bitter blasts, then other smaller and more tender shrubs and herbes can doe. Secondly, if your Orchard should stand behinde your Garden of flowers more Southward, it would shadow too much of the Garden, and besides, would so binde in the North and East, and North and West windes vpon the Garden, that it would spoile many tender things therein, and so much abate the edge of your pleasure thereof, that you would willingly wish to haue no Orchard, rather then that it should so much annoy you by the so ill standing thereof. Thirdly, the falling leaues being still blowne with the winde so abundantly into the Garden, woulde either spoile many things, or haue one daily and continual attending thereon, to cleanse and sweepe them away. Or else to auoide these great inconueniences, appoint out an Orchard the farther off, and set a greater distance of ground betweene. For the ground or foile of the Orchard, what I haue spoken concerning the former Garden for the bettering of the severall grounds, may very well serue and be applyed to this purpose. But obserue this, that whereas your Gardens before spoken of may be turned vp, manured, and bettered with foile if they growe out of heart, your Orchard is not so easilie done, but must abide many yeares without altering; and therefore if the ground be barren, or not good, it had the more neede to bee amended, or wholly made good, before you make an Orchard of it; yet some there be that

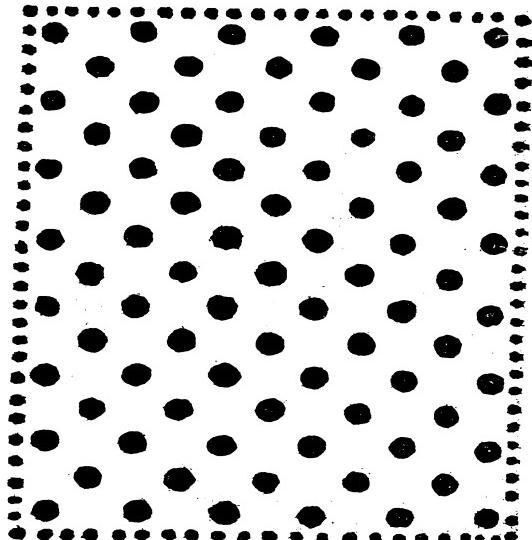

that doe appoint, that where every tree should bee set, you onely digge that place to make it good: but you must know, that the rootes of trees runne further after a little times standing, then the first compasse they are set in; and therefore a little compasse of ground can maintaine them but a little while, and that when the rootes are runne beyond that small compasse wherein they were first set, and that they are come to the barren or bad ground, they can thrive no better then if they had bee set in that ground at the first, and if you should afterwards digge beyond that compasse, intending to make the ground better further off, you should much hurt the spreading rootes, and put your trees in danger: the situation of hils in many places is grauelly or chalky, which is not good for trees, because they are both too stonie, and lacke mellow earth, wherein a tree doth most ioy and prosper, and want moisture also (which is the life of all trees) because of the quicke descent of raine to the lower grounds: and besides all these inconueniences there is one more; your trees planted either on hils or hill sides, are more subiect to the fury and force of windes to be ouerturned, then those that growe in the lower grounds; for the strongest and most forcible windes come not vniually out of the North East parts, where you prouide best defence, but from the South and West, whence you looke for the best comfort of the Sunne. To helpe therefore manie of the inconueniences of the hils sides, it were fit to cause manie leauels to bee made thereon, by raising the lower grounds with good earth, and sustaining them with bricke or stone wals, which although chargeable, will counteruaile your cost, beside the pleasure of the walkes, and prospect of so worthy a worke. The plaine or leuell grounds as they are the most frequent, so they are the most commendable for an Orchard, because the moulds or earths are more rich, or may better and sooner be made so; and therefore the profits are the more may be raised from them. A stiffe clay doth nourish trees well, by reason it containeth moisture; but in regard of the coldnesse thereof, it killeth for the most part all tender and early things therein: sea-coaleshes therefore, bucke ashes, streete soyle, chaulke after it hath lyen abroad and been broken with many yeares frosts and raine, and sheepe dung, are the most proper and fittest manure to helpe this kinde of soyle. The dry sandy soile, and grauelly ground are on the contrary side as bad, by reaon of too much heate and lacke of moisture: the dung of kine or cattell in good quantity bestowed thereon, will much helpe them. The amending or bettering of other sorts of grounds is set down toward the end of the first Chapter of the first part of this worke, whereunto I will referre you, not willing to repeate againe the same things there set downe. The best way to auoide and amend the inconueniences of high, boisterous, and cold windes, is to plant Walnut trees, Elmes, Oakes or Ashes, a good distance without the compasse of your Orchard, which after they are growne great, will bee a great safeguard thereunto, by breaking the violence of the windes from it. And if the boyle of your Orchard want moisture, the conueying of the sinke of the house, as also any other draine of water thereto, if it may be, will much helpe it.

## C H A P. II.

*The forme of an Orchard, both ordinary, and of more grace and rarity.*

**A**ccording to the situation of mens grounds, so must the plantation of them of necessitie be also; and if the ground be in forme, you shall haue a formall Orchard: if otherwise, it can haue little grace or forme. And indeed in the elder ages there was small care or heed taken for the formality, for every tree for the most part was planted without order, euen where the master or keeper found a vacant place to plant them in, so that oftentimes the ill placing of trees without sufficient space betweene them, and negligence in not looking to uphold them, procured more waste and spoile of fruit, then any accident of winde or weather could doe. Orchards in most places haue not bricke or stone wals to secure them, because the extent thereof being larger

larger then of a Garden, would require more cost, which every one cannot vndergoe; and therefore mud wals, or at the best a quicke set hedge, is the ordinary and most vsual defence it findeth almost in all places: but with those that are of ability to compasse it with bricke or stone wals, the gaining of ground, and profit of the fruit trees planted there against, will in short time recompence that charge. If you make a doubt how to be sure that your Orchard wall shall haue sufficient comfort of the Sunne to ripen the fruits, in regard the trees in the Orchard being so nigh thereunto, and so high withall, will so much shadow the wall, that nothing will ripen well, because it will want the comfort of the Sunne: you may follow this rule and aduise, to remedy those inconueniences. Having an Orchard containing one acre of ground, two, three, or more, or lesse, walled about, you may so order it, by leauing a broad and large walke betweene the wall and it, containing twenty or twenty foote (or yards if you will) that the wall shall not be hindered of the Sun, but haue sufficient comfort for your trees, notwithstanding the height of them, the distance betweene them and the wall being a sufficient space for their shadow to fall into: and by compassing your Orchard on the inside with a hedge (wherein may bee planted all sorts of low shrubs or bushes, as Roses, Cornelian Cherry trees plashed lowe, Gooseberries, Curran trees, or the like) you may enclose your walke, and keepe both it and your Orchard in better forme and manner, then if it lay open. For the placing of your trees in this Orchard, first for the wals: Those sides that lye open to the South & Southwest Sunne, are fitteſt to bee planted with your tenderest and earliest fruits, as Apricockes, Peaches, Nectarius, and May or early Cherries: the East, North and West, for Plums and Quinces, as you shall like best to place them. And for the Orchard it ſelue, the ordinary manner is to place them without regard of measure or diſference, as Peares among Apples, and Plums among Cherries promiscuously; but ſome keepe both a diſtance and a diuision for euery ſort, without intermingling: yet the moſt gracefull Orchard containeth them all, with ſome others, ſo as they be placed that one doe not hinder or ſpoile another; and therefore to deſcribe you the modell of an Orchard, both rare for comelineſſe in the proportion, and pleaſing for the profitablenesse in the uſe, and alſo durable for continuance, regard this figure is here placed for your direcſion, where you muſt obſerve, that your trees are here ſet in ſuch an euall diſtance one from another, euery way, & as is fitteſt for them, that when they are grown great, the greater branches ſhall not gall or rubbe one againſt another; for which purpoſe twenty or fifteen foot is the leaſt to be allowed for the diſtance euery way of your trees, & being ſet in rowes, every one in the middle diſtance, will be the moſt gracefull for the plantation, and beſides, giue you way ſufficient to paſſe through them, to pruine, loppe, or drefſe them, as need ſhall require, and may alſo bee brought (if you pleaſe) to that gracefull delight, that euery alleys or diſtance may be formed like an arch, the branches of either ſide meeting to be enterlaced together. Now for the ſeverall ſorts of fruit trees that you ſhall place in this modell, your beſt direcſion is to ſet Damſons, Bulleis, and your taller growing Plums on the outside, and your lower Plums, Cherries, and Apples on the inside, hauiing regard, that you place no Peare tree to the Sunward, of any other tree, leſt it overſhadow

shadow them: Let your Peare trees therefore be placed behinde, or on the one side of your lower trees, that they may be as it were a shelter or defence on the North & East side. Thus may you also plant Apples among Plums and Cherries, so as you suffer not one to ouer-grove or ouer-toppe another; for by pruning, lopping, and shredding those that growe too fast for their fellowes, you may still keepe your trees in such a conformity, as may be both most coniney for the fight, and most profitable for the yeelding of greater and better store of fruit. Other sorts of fruit trees you may mixe among these, if you please, as Filberds, Cornelian Cherries in standers, and Medlers: but Seruice trees, Baye trees, and others of that high sort, must be set to guard therest. Thus haue I giuen you the fairest forme could as yet be devised; and from this patterne, if you doe not follow it precisely, yet by it you may proportion your Orchard, be it large or little, be it walled or hedged.

## C H A P. III.

*Of a nursery for trees, both from sowing the kernels, and planting fit stockes to graft vpon.*

**A**lthough I know the greater sort (I mean the Nobility and better part of the Gentrie of this Land) doe not intend to keepe a Nursery, to raise vp those trees that they meane to plant their wals or Orchards withall, but to buy them already grafted to their hands of them that make their living of it: yet because many Gentlemen and others are much delighted to bestowe their paines in grafting themselves, and esteeme their owne labours and handie worke farre aboue other mens: for their encouragement and satisfaction, I will here set downe some conuenient directions, to enable them to raise an Orchard of all sorts of fruits quickly, both by sowing the kernels or stones of fruit, and by making choise of the best sorts of stockes to graft on: First therefore to begin with Cherries: If you will make a Nursery, wherein you may bee stored with plenty of stockes in a little space, take what quantitie you thinke good of ordinarie wilde blacke Cherry stones, cleansed from the berries, and sowe them, or pricke them in one by one on a peece of ground well turned vp, and large enough for the quantitie of stones you will bestowe thereon, from the midst of August vnto the end of September, which when they are two or three yeares old, according to their growth, you may remoue them, and set them anew in some orderly rows, hauing pruned their tops and their rootes, which at the next yeares growth after the new planting in any good ground, or at the second, will be of sufficient bignesse to graft vpon in the bud what sorts of Cherries you thinke best: and it is fittest to graft them thus young, that prunning your stockes to raise them high, you may graft them at five or six foote high, or higher, or lower, as you shall see good, and being thus grafted in the bud, will both more speedily and safely bring forward your grafts, and with lesse danger of losinge your stockes, then by grafting them in the stocke: for if the bud take not by inoculating the first yeare, yet your tree is not lost, nor put in any hazard of losse; but may be grafted anew the yeare following, if you will, in another place thereof, whereas if you graft in the stocke, and it doe not take, it is a great chance if the stocke dye not wholly, or at least be not so weakened both in strength and height, that it will not bee fit to bee grafted a yeare or two after. In the same manner as you doe with the blacke, you may deal with the ordinary English red Cherry stones, or kernels, but they are not so apt to growe so straight and high, nor in so short a time as the blacke Cherry stones are, and besides are subiect in time to bring out suckers from the rootes, to the hinderance of the stockes and grafts, or at the least to the deformitie of your Orchard, and more trouble to the Gardiner, to pull or digge them away. Plumme stones may bee ordered in this manner likewise, but you must make choise of your Plums, for although every Plumme is not so fit for this purpose, as the white Peare Plumme, because it groweth the goalest and freest, the bark being smooth and aptest to be raised, that they may be grafted vpon; yet diuers other Plummes may be taken, if they be not at hand, or to be had, as the blacke and red Peare Plumme, the white

white and red Wheate Plumme, because they are nearest in goodness vnto it. Peach stones will be soone raised vp to graft other sorts of Peaches or Nectoris vpon, but the nature of the Peach roote being sponge, is not to abide long. As for Almonds, they will be castised from their stones to be trees of themselves, but they will hardly abide the remouing, and lesse to bee grafted vpon. Apricocke stones are the worst to dealt withall of any sort of stone fruit; for altho the Apricocke branches are the fittest stockes to graft Nectoris of the best sorts vpon, yet those that are raised from the kernels or stones will never thrive to be brought on for this purpose, but will starue and dye, or hardly grow in a long time to be a straight and fit stocke to be grafted, if it be once removed. Your Cornelian Cherry trees are wholy, or for the most part raised from the stones or kernels; yet I know diuers doe increase them, by laying in their lowest branches to take roote: and thus much for stone fruits. Now for Apples and Peares, to be dealt withall in the same manner as aforesaid. They vs to take the prefing of Crabs wherea Veruyde is made, as also of Cedar and Perry where they are made, and sowing them, doeraise vp great store of stockes; for although the beating of the fruit doth spoile many kernels, yet there will bee enough left that were never toucht, and that will spring: the Crab stockes some preferre for the fittest, but I am sure, that the better Apple and Peare kernels will growe fairer, straighter, quicklier, and better to be grafted on. You must remember, that after two or three yeares you take vp these stockes, and when you haue pruned both toppe and roote, to set them againe in a thinner and fitter order, to be afterwards grafted in the bud while they are young, as I shall shew you by and by, or in the stocke if you will suffer them to growe greater. Now likewise to know which are the fittest stockes of all sorts to choose, thereto to graft every of these sorts of fruits, is a point of some skill indeede, and therefore obserue them as I doe here set them downe: for bee you assured, that they are certaine rules, and knowne experiances, whereunto you may trust without being deceiued. Your blacke Cherry stockes (as I said before) are the fittest and best for all sorts of Cherries long to abide and prosper, and even May or early Cherry will abide or live longer, being grafted thereon, either in the budde or in the stocke, then on the ordinary red Cherry stocke; but thered Cherry stocke is in a manner the onely tree that most Nursery men doe takē to graft May Cherries on in the stocke (for it is but a late experiance of many, to graft May Cherries in the bud) many also doe graft May Cherries on Gascoigne Cherry stockes, which doe not onely thrive well, but endure longer then vpon any ordinay Cherry stocke: For indeede the May Cherries that are grafted vpon ordinary red Cherry stockes, will hardly hold aboue a dozen yeares bearing well, although they come forwarder at the first, that is, doe beare sooner then those that are grafted on Gascoigne or blacke Cherry stockes; but as they are earlier in bearing, so they are sooner spent, and the Gascoigne and blacke Cherry stockes that are longer in comming forward, will last twice or thrice their time; but many more grafts will misse in grafting of these, then of those red Cherry stockes, and besides, the natures of the Gascoigne and blacke Cherry stockes are to rise higher, and make a goodlier tree then the ordinary red stocke will, which for the most part spreadeth wide, but riseth not very high. The English red Cherry stocke will serue very well to graft any other sort of Cherry vpon, and is vsed in most places of this Land, and I know no other greater inconuenience in it, then that it shoothe out many suckers from the roote, which yet by looking vnto may soone bee remoued from doing any harme, and that it will not last so long as the Gascoigne or blacke Cherry stocke will. May Cherries thus grafted lowe, doe most vsually serue to be planted against a wall, to bring on the fruit the earliar; yet some graft them high vpon standards, although not many, and it is, I thinke, rather curiositie (if they that doe it haue any wals) then anie other matter that causeth them thus to doe: for the fruit is naturally small, though early, and the standard Cherries are alwaies later then the wall Cherries, so that if they can spare any roome for them at their wals, they will not plant many in standards. Now concerning Plummes (as I said before) for the sowing or setting of the stones, so I say here for their choise in grafting of them, either in the budde or stocke. The white Peare Plumme stocke, and the other there mentioned, but especially the white Peare Plumme is the goodliest, freest, and fittest of all the rest, as well to graft all sort of Plummes vpon, as also to graft Apricockes, which can be handfomely, and to any good

good purpose grafted vpon no other Plum stocke, to rise to beeworth the labour and paine. All sorts of Plums may be grafted in the stocke, and so may they also in the bud, for I know none of them that will refuse to be grafted in the bud, if a cunning hand performe it well; that is, to take off your bud cleanly and well, when you haue made choice of a fit cyon: for, as I shal shew you anon, it is no small peecce of cuasing to chuse your cyon that it may yeeld fit buds to graft withall, for euery plum is not of a like aptenes to yeeld them: But Apricocks cannot be grafted in the stocke for any thing that euer I could heare or learne, but only in the bud, and therefore let your Plum stocke bee of a reasonable size for Apricocks especially, and not too small, that the graft ouer-grow not the stocke, and that the stocke bee large enough to nourish the graft. As your Plum stockes serue to graft both Apricocks and Plummes, so doe they serue also very well to graft Peaches of all sorts; and although Peach stockes will serue to be grafted with Peaches againe, yet the Peach stocke (as I said before) will not endure so long as the Plumme stocke, and therefore serueth but for necessity if Plum stocks be not ready, or at hand, or for the present time, or that they afterwards may graft that sort of Peach on a Plumme stocke: for many might lose a good fruit, if when they meeete with it, and haue not Plumme stockes ready to graft it on, they could not be assured that it would take vpon another Peach stocke or branch, or on the branch of an Apricocke eyther. Plumme stockes will serue likewise very well for some sorts of Nectarins; I say, for some sorts, and not for all: the greene and the yellow Nectarin will best thriue to be grafted immediately on a Plumme stocke; but the other two sorts of red Nectarins must not be immediately grafted on the Plumme stocke, but vpon a branch of an Apricocke that hath beene formerly grafted on a Plumme stocke, the nature of these Nectarins being found by experiance to be so contrary to the Plum stocke, that it will sterue it, and both dye within a yeaire, two or three at the most: Divers haue tryed to graft these red Nectarins vpon Peach stockes, and they haue endur'd well a while; but seeing the Peach stocke will not last long it selfe, being ouer-weake, how can it hold so strong a nature as these red Nectarins, which will (as I said before) sterue a Plum stocke that is sufficient durable for any other Plumme?

Apricocke stockes from the stones are hardly nurfed vp, and worse to be remoued, and if a red Nectarin should be grafted on an Apricot raysed from the stone, and not remoued, I doubt it might happen with it as it doth with many other trees raised from stones or kernels, and not remoued, that they would hardly beare fruit: for the nature of most trees raised from stones or kernels, and not remoued, is to send great downe-right rootes, and not to spread many forwards; so that if they be not cut away that others may preade abroad, I haue seldome seene or known any of them to beare in any reasonable time; and therefore in remouing, these great downe-right rootes are alwayes shred away, and thereby made fit to shoote others forwards. Hereby you may perceiue, that these red Nectarins will not abide to bee grafted vpon any other stocke well, then vpon an Apricocke branch, although the green and the yellow (as I said before) will well endure and thriue vpon Plums. The suckers or shoots both of Plums and Cherries that rise from their rootes, eyther neare their stockes, or farther off, so that they bee taken with some small rootes to them, will serue to bee stockes, and will come forward quickly; but if the suckers haue no small roots whereby they may comprehend in the ground, it is almost impossible it should hold or abide. There is another way to rayse vp eyther stockes to graft on, or trees without grafting, which is, by circumcising a faire and fit branch in this manner: About Midsomer, when the sappe is thoroughly risen (or before if the yeaire be forward) they vse to binde a good quantity of clay round about a faire and straight branch, of a reasonable good size or bignesse, with some conuenient bands, whither it be ropes of hay, or of any other thing, about an handfull aboue the ioynt, where the branch spreadeth from the tree, and cutting the barke thereof round about vnder the place where the clay is bound, the sap is hereby hindered from rising, or descending further then that place so circumcised, whereby it will shoote out small knubs and rootes into the clay, which they suffer so to abide vntill the beginning of winter, wheras with a fine Sawe they cut off that branch where it was circumcised, and afterwardes place it in the ground where they would haue it to grow, and stake it, and binde it fast, which will shoote forth rootes, and will become eyther a faire tree to beare fruite without grafting, or else a fit stocke to graft on according

ding to the kinde: but oftentimes this kinde of propagation misseth, in that it sendeth not forth rootes sufficient to cause it to abide any long time. Let me yet before I leaue this narration of Plummes, give you one admonition more, that vpon whatsoeuer Plumme stocke you doe graft, yet vpon a Damson stocke that you neuer striue to graft, for it (aboue all other sorts of Plumme stockes) will never giue you a tree worth your labour. It remaineth only of stone fruit, that I speake of Cornelles, which as yet I neuer saw grafted vpon any stocke, being as it should seeme vtterly repugnant to the nature thereof, to abide grafting, but is wholly raysed vp (as I said before) eyther from the stones, or from the suckers or layers. For Peares and Apples your vsuall stockes to graft on are (as I said before, speaking of the nursing vp of trees from the kernels) your Crabbe stockes, and they bee accepted in euery Countrey of this Land as they may conveniently be had, yet many doe take the stockes of better fruit, whether they bee suckers, or stockes raysed from the kernels (and the most common and knowne way of grafting, is in the stocke for all sorts of them, although some doe vse whipping, packing on, or incising, as every one list to call it: but now we doe in many places begin to deale with Peares and Apples as with other stone fruit, that is, graft them all in the bud, which is found the most compendious and safest way both to preserue your stocke from perishing, and to bring them the sooner to couer the stock, as also to make the goodlier and straighter tree, being grafted at what height you please:) for those stockes that are raysed from the kernels of good fruit (which are for the most part easilly knowne from others, in that they want those thornes or prickles the wilde kindes are armed withall:) I say for the most part; for I know that the kernels of some good fruite hath giuen stockes with prickles on them (which, as I thinke, was because that good fruite was taken from a wilde stocke that had not beeene long enough grafted to alter his wilde nature; for the longer a tree is grafted, the more strength the fruite taketh from the graft, and the lesse still from the stocke) being smoother and fairer then the wilde kinds, must needes make a goodlier tree, and will not alter any whit the taste of your fruit that is grafted thereon, but rather addc some better relish thereunto; for the Crabbe stockes yeelding harsh fruite, must giue part of their nature to the grafts are set thereon, and therefore the taste or relish, as well as some other naturall properties of most fruits, are somewhat altered by the stocke. Another thing I would willingly giue you to vnderstand concerning your fruits and stockes, that whereas diuers for curiositie and to try experiments haue grafted Cherries vpon Plumme stockes, or Plums on Cherry stockes, Apples vpon Peare stockes, and Peares vpon Apple stockes, some of these haue held the graft a yeaire, two or three peraduenture, but I neuer knew that ever they held long, or to beare fruite, much lesse to abide or doe well: besyow not therefore your paines and time on such contrary natures, vnlesse it be for curiositie, as others haue done: Yet I know that they that graft peares on a white thorne stocke haue had their grafts seeme to thriue well, and continue long, but I haue seldome seene the fruite thereof answerable to the naturall wilde Peare stocke; yet the Medlar is knowne to thriue best on a white thorne. And lastly, whereas diuers doe affirme that they may haue not only good stockes to graft vpon, but also faire trees to bear store of fruit from the kernels of Peares or Apples being prickt into the ground, and suffered to grow without remouing, and then eyther grafted or suffered to grow into great trees vngrafted; and for their bearing of fruite, assigne a dozen or twenty yeares from the first setting of the kernels, and abiding vngrafted, I haue not seene or heard that experiance to hold certaine, or if it should be so, yet it is too long time lost, and too much fruit also, to waite twenty yeares for that profit may be gained in a great deale of lesse time, and with more certainty. Vnto these instructions let mee adde also one more, which is not much known and vsed, and that is, to haue fruit within fourre or five years from the first sowing of your stones or kernels in this manner: After your stones or kernels are two or three yeares old, take the fairest toppe or branch, and graft it as you would doe any other cyon taken from a bearing tree, and looke what rare fruite, eyther Peare or Apple, the kernell was of that you sowed, or Peach or Plum &c. the stone was set, such fruite shall you haue within two or three yeares at the most after the grafting, if it take, and the stocke be good. And thus may you see fruit in farre lesse time then to stay vntill the tree from a kernel or stone beareth fruit of it selfe.

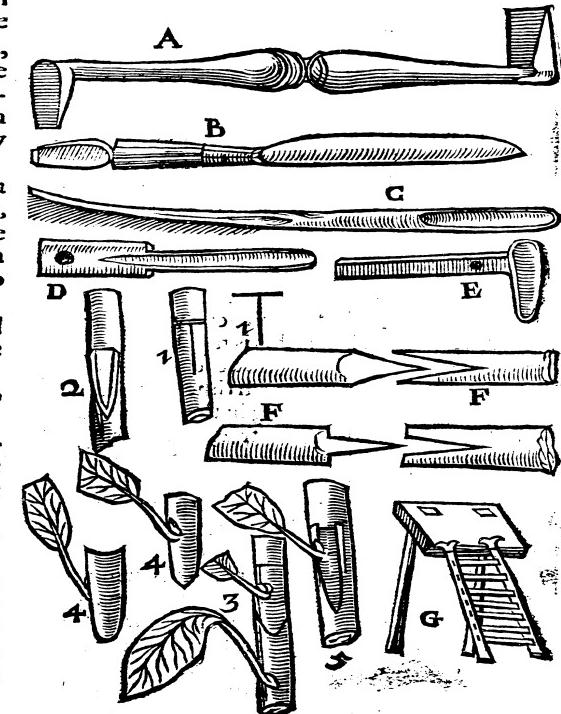

## C H A P. IIII.

*The diuers manners of grafting all sorts of fruits  
vsed in our Land.*

**T**He most vsuall manner of grafting in the stocke is so common and well known in this Land to every one that hath any thing to doe with trees or an Orchard, that I think I shall take vpon mee a needleſſe worke to ſet downe that is ſo well knowne to moſt; yet how common ſocuer it is, ſome direotions may profit every one, without which it is not eaſily learned. And I doe not ſo much ſpend my time and paines herein for their ſakes that haue knowledge, but for ſuch as not knowing would faine be taught priuately, I meane, to reade the rules of the arte ſet downe in priuate, when they would refufe to leare of a Gardiner, or other by ſight: and yet I diſcom mend not that way vnto them to leare by ſight; for one may ſee more in an instant by ſight, then he ſhall learn by his own practice in a great while, eſpecially if he be a little practiſed before he ſee a cunning hand to doe it. There are many other kindeſſe of grafting, which ſhall be ſpoken of hereafter, and peraduenture even they that knaw it well, may leare ſomething they knew not before.

1. The grafting in the stocke, is, to ſet the ſprigge of a good fruit into the body or stocke of another tree, bee it wilde or other, bee it young or old, to cauſe that tree to bring forth ſuch fruit as the tree bore from whence you took the ſprigge, and not ſuch as the stocke or tree would haue borne, if it had not beeengraſted, and is performed in this manner: Looke what tree or stocke you will chufe to graft on, you muſt with a ſmall fine ſaw and very ſharpe, whip off, or cut off the head or toppe thereof at what height you eyther thinke best for your purpoſe, or conuenient for the tree: for if you graft a great tree, you cannot without endangering the whole, cut it downe ſo low to the ground, as you may without danger doe a ſmall tree, or one that is of a reaſonable ſize; and yet the lower or neerer the ground you graft a young tree, the ſafer it is both for your stocke and graft, because the ſappe ſhall not ascend high, but ſoone giue viour to the graft to take and ſhoote quickly: After you haue cut off the toppe of your stocke, cut or ſmooth the head thereof with a ſharpe knife, that it may be as plaine and ſmooth as you can, and then cleaue it with a hammer or mallet, and with a ſtrong knife, cleaue or cheſſell, either in the middle of it if it be ſmall, or of a reaſonable ſize, or on the ſides an inch or more within the barke, if it be great: into both ſides of the cleft put your grafts, or into one if the stocke bee ſmaller, which grafts muſt bee made fit for the purpoſe on this fashion: Hauing made choiſe of your grafts from the toppe branches eſpecially, or from the ſides of that tree wherof you would haue the fruit, and that they be of a reaſonable good ſize, not too ſmall or too great for your stockes, and of one or the ſame yeares ſhoote, (and yet many doe cut an inch or more of the olde wood with the ſprigge of the laſt yeares growth, and ſo graft the old and young together (but both are good, and the old wood no better then the young) cut your graft not too long, but with two, three or four eyes or buds at the moſt, which at the lower or bigger end for an inch long or more (for the greater stockes, and an inch or leſſe for the leſſer ſort) muſt be ſo cut, that it be very thin on the one ſide from the ſhoulders downward, and thicker on the other, and thin also at the end, that it may goe downe close into the cleft, and rest at the ſhoulders on the head of the stocke: but take heed that in cutting your grafts your knife bee very ſharpe that you doe not rayſe any of the barke, eyther at the ſides or the end, for feare of loſing both your paines and graft, and stocke too peraduenture, and let not your grafts bee made long before you ſet them, or elſe put the ends of them in waſer to keepe them fresh and cleane: when you ſet them you muſt open the cleft of your stocke with a wedge or cheſſell as moſt doe, that the graft may goe eaſily into it, and that the barke of both graft and stocke may ioyne cloſe the one to the other, which without ſtirring or displacing muſt bee ſet in the cleft, and the wedge or cheſſell gently pulled forth; but because in the doing hereof conſiſteth in a manner the whole loſſe or gaige of your paines, graft and stocke, to preuent which inconuenience I doe vſe an iron Inſtrument, the forme whereof is ſhowne in the following

Iowing page, marked with the letter A, crooked at both ends, and broade like vnto a cheſſell, the one bigger, and the other leſſer, to fit all ſorts of stockes, and the iron han dle ſomewhat long betweene them both, that being thrust or knocked downe into the cleft, you may with your left hand open it as wide as is fit to let in your graft, without trayning, which being placed, this iron may bee pulled or knocked vp againe without any mouing of your graft: when you haue thus done, you muſt lay a good hand full or more (according to the bignesse of your stocke) of ſoft and well moistned clay or loame, well tempered together with ſhort cut hey, or horse dung, vpon the head of your stocke, as lowe or ſomewhat lower then the cleft, to keepe out all wind, raine or ayre from your graft vntill Midſomer at the leaſt, that the graft be ſhot forth ſomewhat strongly, which then if you please may be remoued, and the cleft at the head only filled with a little clay to keepe out carewigs, or other things that may hurt your graft.

- 
- A. The Iron Instrument with cheſſells at each end, the one bigger and the other leſſer, to keepe the cleft of the Tree open vntill the graft bee placed in the stocke, which with a knock vpwards will be eaſily taken away.  
 B. The ſmall Penne-knife with a broad and thinne ended haſte, to raife the ſides both of the bud and the down-right ſlit in the body or arme of a Tree to be grafted in the bud.  
 C. A pen or quill cut halfe round to take off a bud from the branch.  
 D. An Iuory Inſtrument made to the ſame fashion.  
 E. A ſhielde of braſſe made hollow before to be put into the ſlit, to keepe it open vntill the bud be put into its place.  
 F. The manner of grafting ca led inciſing or ſplicing.  
 G. A Ladder made with a ſtoole at the toppe, to ſerue both to graft higher or lower, and alſo to gather fruit without ſpoiling or hurting any buddes or branches of Trees.  
 1. The firſt ſlit in the body or arme of a Treē to be grafted in the bud with the croſſe cut at the head.  
 2. The ſame ſlit opened on both ſides, ready to receiue the budde ſhould be put there in: theſe ſmall peeces ſerue as well as trees to ſhew the manner and order of the grafting.  
 3. The branch of a Tree with one budde cut ready to be taken off, and another not yet touched.  
 4. The bud cleane taken off from the branch, both the foreſide and backſide.  
 5. The graft or bud now put into the stocke or tree you intend to be grafted: but the binding thereof is omitted.  
 6. Inarching is another manner of grafting in the stocke, and is more troublousome, and more eaſiall alſo then the former, and is rather a curioſity then any way of good ſpeece, certaintey or profit, and therefore uſed but of a few. Yet to ſhew you, the man-

manner thereof, it is thus: Hauing a tree well growne, bee it high or low, yet the lower the better, with young branches well spread, they vse to set stockes round about it, or on the one side as you please; into which stockes they ingraft the young branches of the well growne tree as they are growing (before they cut them from the tree) by bowing downe the branch they intend to graft, and putting it into the stocke, haung first cut off the head thereof, and cut a notch in the middle of the head a little slope on both sides, wherein the branch must be fitted: let the branch be cut thinne on the vnder-side, only of that length as may suffice to fit the notch in the stocke, leauing about halfe a yarde length of the branch, to rise aboue or beyond the stocke, which beeing bound on, and clayed ouer or couered with red or greeene soft waxe, they let so abide, that if it take in the stocke they cut off the branch a little below the grafting place in Nouember following, and remouing the stocke, they haue thus gained a grafted and growne tree the first yeare: but it is vsually seene, that where one branch taketh, three doe misse: yet this manner of grafting was much in vse for May Cherries, when they were first known to vs, and the way thought to be a rare manner of grafting to encrease them, vntill a better way was found out, which now is so common and good also, that this is not now scarce thought vpon.

3. Another kinde of grafting in the stocke is called of some whipping, of some splicing, of others incising, and of others packing on (and as I heare, is much vsed in the West parts especially, and also in the North parts of this Land) and is performed in this manner: Take and slice the branch of a tree (so as the branch be not too bigge) or else a young tree of two, or three, or foure yeares growth at the most, quite off slope wise, about an inch and a halfe long or more, and cut a deep notch in the middle thereof, then fit into it a graft iust of that size or bignesse, cut on both sides with shoulders, and thin at the end, that it may ioyne close in the notch, and neyther bigger or lesser, but that the barke of the one may bee fitted iust to the barke of the other, the figure wherof is expressed at the letters E. F. which shew the one to be with a shoulder & the other without; binde them gently together with bast, and put clay or waxe ouer the place, vntill it be taken: this is much vsed of late dayes for such young trees as are risen of stones or kernels after the second or third yeares growth, and thrive very well in that it not only saueth much time, but diuers checks by remouing and grafting.

4. Inoculating or grafting in the budde is another manner of grafting, which is the taking of a budde from one tree, and putting it into the barke of another tree, to the end, that thereby you may haue of the same kinde of fruit the tree bare from whence the budde was taken; and although it bee sufficiently knowne in many places of this Land, yet as I understand, good Gardiners in the North parts, and likewise in some other places, can scarce tell what it meaneth, or at the least how to doe it well. It is performed after a different fashion from the former, although they all tend vnto one end, which is the propagating of trees. You must for this purpose obserue, that for those trees you would graft, either with, or vpon, you choose a fit time in Summer, when the sappe is well risen, and your graft well shot, that the barke will rise easily and cleauly, both of stocke and graft, which time I cannot appoint, because both the years doe differ in earlinesse, and the severall parts or countries of this Land likewise one from another, but most vsually in these Southerne parts, from the beginning of Iune vnto the end of it, or to the middle of Iuly, or either somewhat before or after. First (as I said) hauing taken the fifties time of the yeare, you must take especiall care, that your grafts be well growne, and of the same yeaers shooote, and also that the buds or eyes haue but single leaues at them, as neare as you can: for I would vtterly refuse those buds that haue aboue two leaues as vnprofitable, either in Peaches or any other fruit; and therefore see that your grafts or cyons bee taken from the chieffest place of the tree, that is, either from the toppe, or from a sunnie side thereof, and not from the contrarie side if you may otherwife, nor from any vnder-booughes; for seeing your graft is so small a thing, you had neede take the more care that it be the best and fairest. You must to take off this eye or budde from the sprigge, haue a small sharpe pen-knife, the end of the haft being made flat and thinne, like a chessell or wedge, the figure wherof is set forth at the letter B, and a pen or goose quill cut, to be lesse then halfe round, and to be broad at the end, but not sharpe pointed like a penne, or else such a peice of bone or Iuorie made in that fashion as the quill is, to bee thinne, hollow, or halfe

halfe round, the figures of both which are marked with the letters C, D, with your knife cut the barke of the bud (hauing first cut off the leafe, leauing only the short foote stalke thereof at the bud) about a strawes breadth aboue the eye thereof halfe round, and then from that round or ouerthwart cut, with your knife cut it downe on both sides of the eye, close to the bud slopewise about an inch long or thereabouts, that it bee broad at the head aboue the eye, and pointing at the end like a shield or scutcheon; and then cutting away the rest of the barke from about it, with the thinne flat end of the haft of your knife raise vp both sides of your bud a littel, and with your quill or bone put vnder the barke, raise your budde, and thrust it quite off, beginning at the toppe or head of your eye; but see that you thrust it off close to the wood of the branch or sprigge, and that you doe not leau the eye of the budde behinde sticking vpon the branch; for if that eye be left or lost, your bud is worth nothing; you must cast it away, and cut another that may haue that eye abiding within the budde on the inside: you may perceiue if that eye be wanting, if you see an empie hole in the place where the eye should be, to fill it vp on the inside thereof; thus hauing taken off your bud well and cleanly, which is set forth vnto you at the figures 3 and 4, presently set it on the tree you would graft (for your small bud can abide no delay, lest by taking the ayre too long it become dry, and nothing worth) in this manner: Cut the barke of your tree you would graft in a smooth place, at what height you please, first aboue or ouerthwart, and then downe right in the middle thereof, more then an inch long, the figure wherof you shall haue at the figure 1, and then raise vp both sides of the barke, first one, and then another, with the flat and thinne haft end of your knife, a prettie way inwards (for if the barke will not rise easily, the stocke is not then fit to graft vpon) put in your budde into the cleft with the point downwards, holding the stalke of the leafe that is with the budde betweene your fingers of the one hand, and opening the cleft with the flat end of your knife with the other hand, that the head of your bud may be put close vnder the ouerthwart cut in the stocke or tree (which must not be raised or stirred as the sides are) & the eye of the bud stand iust in the middle of the slit that is downeright, and then closing the barke of the stocke or tree softly vnto the bud thus put in with your fingers, let it be bound gently with a small long peice of bast, or other such like soft thing, first aboue the eye, & then compassing it belowe as close as you can, but not too hard in any case, vntill you haue bound it all ouer the slit you made, especially the lower end, lest any wind get in to dry and spoile it; and hauing tyed both ends thereof fast, leaue it so for a fortnight or somewhat more, in which space it will take and hold, if it be well done, which you shall perceiue, if the bud abide green, and turne not blacke, when you haue vnloosed the tying; for if it hold fast to the tree, and be fresh and good, tye it vp gently againe, and so leaue it for a fortnight longer, or a moneth if you will, and then you may take away your binding cleane: this budde will (if no other mischance happen vnto it) spring and shooote forth the next year, (and sometimes the same yeare, but that is seldom) and therefore in the beginning of the yeare, cut off the head of the grafted tree about an handfull aboue the grafted place, vntill the graft be growne strong, and then cut it off close, that the head may be couered with the graft, and doe not suffer any buds to sprout besides the graft, either aboue or belowe it. If you graft diuers buds vpon one stocke (which is the best way) let that onely remaine and abide that shooeth best forth, and rubbe off, or take away the other: the severall parts of this grafting I haue caused to be exprefsed for your further information.

5. Grafting in the scutcheon is accounted another kinde of grafting, and differeth verie little from grafting in the budde: the difference chiefly confiseth in this, that in stead of the downeright slit, and that aboue ouerthwart, they take away iust so much barke of the great tree, as your bud is in bignesse, which vsually is a little larger then the former, and placing it therein, they binde it as formerly is said: Some vse for this purpose a pair of compasses, to giue the true measure both of bud and stocke; this manner of grafting is most vsed vpon greater trees, whose young branches are too high to graft vpon in the former maner, and whose tops they cut off (for the most part) at the latter end of the next yeare after the bud is taken: both these waies were invented to sau the losse of trees, which are more endangered by grafting in the stocke,

then any of these waies; and besides, by these waies you may graft at a farre greate height without losse.

## C H A P. V.

*Of the manner of grafting and propagating all sorts of Roses.*

**H**Aving now spoken of the grafting of trees, let mee adioyne the properties of Roses, which although they better fit a Garden then an Orchard, yet I could not in a fitter place expresse them then here, both for the name and affinity of grafting, & because I do not expresse it in the first part. All sorts of Roses may be grafted (although all sorts are not, some seruynge rather for stockes for others to be grafted on) as easly as any other tree, & is only performed, by inoculating in the same maner I haue set downe in the former Chapter of grafting trees in the bud; for both stocke and budde must bee dealt with after the same fashion. And although some haue boasted of grafting Roses by slicing or whipping, as they call it, or in the stocke, after the first manner, set downe in the former Chapter, yet I thinke it rather a bragge, not hauing seene or heard any true effect proceede from that relation. The sweete Briar or Eglantine, the white and the Damaske Roses, are the chiefeft stockes to graft vpon. And if you graft lowe or neare the ground, you may by laying downe that graft within the ground, after it hath bin shot out wel, and of a years growth, by pinning it fast downe with short sticke, a thwart or acrosse, cause that grafted branch, by taking roote, to become a naturall Rose, such as the graft was, which being separated and transplanted after it hath taken root wel, will prosper as well as any naturall sucker. And in this manner, by laying downe branchese at length into the ground, if they be full of spreading small branches, you may increase all sorts of Roses quickly and plentifully; for they will shooe forth rootes at the ioynt of every branch: But as for the manner of grafting white Roses or Damaske vpon Broome stalkes or Barbary bushes, to cause them to bring forth double yellow Roses, or vpon a Willowe, to beare greene Roses, they are all idle conceits, as impossible to be effected, as other things, whereof I haue spoken in the ninth Chapter of my first part, concerning a Garden of flowers, vnto which I referre you to be satisfied with the reasons there alledged. And it is the more needless, because we haue a naturall double yellow Rose of it owne growing. The sowing of the seedes of Roses (which are sometimes found vpoun most sorts of Roses, although not euery yeare, and in euerie place) hath bin formerly much vsed; but now the laying downe of the young shooetes is a way for increase so much vsed, being safe and verie speedie to take, especially for thoſe Roses that are not ſo apt to giue fuckers, that it hath almost taken quite away the vſe of ſowing of the seedes of Roses, which yet if anie one bee diſpoſed to make the triall, they muſt gather the ſeede out of the round heads, from amongſt the dounē, wherein they lye verie like vnto the berries of the Eglantine or sweete Briar bush, and especially of thoſe Roses that bee of the more ſingle kindeſ, which are more apt to giue berries for ſeed then the more double, although ſometimes the double Roses yeeld the like heads or berries. Their time of ſowing is in the end of September (yet ſome reſerve them vntill February) and their manner of nouring is to bee tranſplanted, after the firſt or ſecond yeares growth, and teadded carefully, that while they are young they be not lost for want of moisture in the dry time of Summer.

## C H A P. VI.

*Certaine rules and obſeruations in and after grafting, not remembred in the former Chapter.*

**T**He time of ſome manieres of grafting being not mentioned before, muſt here be ſpoken of. For the grafting of all ſorts of trees in the ſtocke, the moſt uſuall time is from the middle of February vntill the middle of March, as the yere and the countrie is more forward or backward, with vs about London weſtuer paſle midde March: but because the May Cherrie is firſt ripe, and therefore of a very forward nature, it doth require to be grafted ſomewhat ſooner then others. The time of gathering likewife, or cutting your grafts for grafting in the ſtocke, is to be obſerued, that they bee not long gathered before they bee grafted, for feare of being too dry, which I command, howſoever diuers ſay, if they be long kept they are not the worſe; and therefore if you be forced to haue your grafts from farre, or by ſome other chance to keepe them long, be carefull to keepe them moift, by keeping their ends ſtucke in moift clay; but if neare hand, negleſt no time I ſay after the cutting of them for their grafting, but either the fame, or the next day, or verie ſpeedily after, in the meantyme being put into the ground to keepe them fresh. The grafts taken from old trees, becauſe they are stronger, and ſhoote forth ſooner, are to bee ſooner grafted then thoſe that are taken from younger trees: of a good branch may bee made two, and ſometimes three grafts ſufficient for anie reaonable ſtocke. For whipping, the time is ſomewhat later then grafting in the ſtocke, because it is performed on younger trees, which (as I ſaid before) doe not ſo early bud or ſhoote forth as the elder. Inarching likewife is performed much about the later end of the grafting time in the ſtocke; for being both kindeſ thereof they require the ſame time of the yere. The times of the other manieres of graftings are before exprefſed, to bee when they haue ſhot forth young branchese, from whence your buds muſt be taken; and therefore need not here againe to be repeated. If a graft in the ſtocke doth happen not to ſhoote forth when oþers do (ſo as it holdeth green) it may perchance ſhoot out a moneth or two after, & do well, or else after Midsummer, when a ſecond time of ſhooting, or the after Spring appeareth: but haue an eſpeciall care, that you take not ſuch a graft that ſhal haue nothing but buds for flowers vpon it, and not an eye or bud for leaues (which you muſt be carefull to diſtinguifh) for ſuch a graft after it hath ſhot out the flowers muſt of neceſſitie dye, not hauing wherewith to maintaine it ſelue. Also if your good graft doe miſſ, and not take, it doth hazzard your ſtocke at the firſt time, yet manie ſtockes doe recover to be grafted the ſecond time; but twice to faile is deadly, which is not ſo in the inoculating of buds in the greene tree: for if you faile therein three, or three times three, yet euerie wound being ſmall, and the tree ſtill growing greene, will quickly recover it, and not be afterwards ſeen. Some vſe to graft in the ſtocke the ſame yere they remoue the ſtocke, to ſave time, & a ſecond checke by grafting; but I like better both in grafting in the ſtocke, and in the bud affo, that your trees might be planted in the places where you would haue them growe, for a yere or two at the leaſt before you graft them, that after grafting there ſhould be no remouall, I neede not be tedious, nor yet I hope verie ſollicitous to remember many other triuall, or at the leaſt common knowne things in this matter. First, for the time to remoue trees, young or old, grafted or vngrafted, to be from a fortnight after Michaelmas vntill Candlemas, or if neede be, ſomewhat after, yet the ſooner your remoue is, the better your trees will thriue, except it be in a very moift ground. For the manner or way to ſet them: viz. in the high and dry grounds ſet them deeper, both to haue the more moisture, and to be the better defended from windes; and in the lower and moifter grounds ſhallower, and that the earth be mellow, well turned vp, and that the finer earth bee put among the ſmall rootes, wherein they may ſpread, and afterwards gently troden downe, that no hollownesſe remaine among the rootes: as alſo that after ſetting (if the time be not ouermoift) there may be ſome water poured to the rootes, to moisten and fasten them the better; and in the dry time of Summer, after the ſetting, let them not want moisture, if you will haue

haue them thriue and prosper ; for the want thereof at that time, hath often killed manie a likely tree. To stake and fence them also if neede bee after they are new set, and so to continue for two or three yeares after, is verie expedient, lesse windes or other casualties spoile your paines, and ouerthrow your hopes. And likewise to defend your grafts from birds lighting on them, to breake or displace them, to sticke some prickes or sharpe pointed stickes longer then your graft into your clay, that so they may be a sure defence of it : As also to tye some woollen cloathes about the lower end of your stockes, or thrust in some thornes into the ground about the rootes, to defend them from hauing their barks eaten by Gronics, or hurt by some other noisome vermine.

## C H A P. VII.

*Observations for the dressing and well keeping of Trees and an Orchard in good order.*

**T**here are two manner of waies to dresse and keepe trees in good order, that they may bee both gracefull and fruitfull ; the one is for wall trees, the other is for standards : for as their formes are different, so is their keeping or ordering. Wall trees, because they are grafted lowe, and that their branches must be plash or tacked vnto the wall to fasten them, are to be so kept, that all their branches may be suffered to growe, that shooe forth on either side of the bodie, and led either along the wall, or vpright, and one to lappe ouer or vnder another as is conuenient, and still with peeces of lysts, parings of felt, peeces of soft leather, or other such like soft thing compassing the armes or branches, fastened with small or great nailes, as neede requireth, to the wals, only those buds or branches are to be nipp'd or cut off, that shooe forward, and will not so handsomely be brought into conformity, as is fitting ; yet if the branches growe too thick, to hinder the good of the rest, or too high for the wall, they may, nay they must be cut away or lopped off : and if anie dead branches also happen to be on the trees, they must be cut away, that the rest may haue the more libertie to thriue. Diuers also by carefully nipping away the waste and superfluous buds, doe keep their trees in conformity, without much cutting. Thetime to pruine or plash, or tye vp wall trees, is vsually from the fall of the leafe, to the beginning of the yeare, when they begin to blossom, and most especially a little before or after Christmas : but in any case not too late, for feare of rubbing off their buds. Some I know doe plash and tye vp their wall trees after bearing time, while the leaues are greene, and their reason is, the buds are not so easie or apt to bee rubbed from the branches at that time, as at Christmas, when they are more growne : but the leaues must needs be very cumbersome, to hinder much both the orderly placing, and close fastening of them to the wall. This labour you must perorme every yeare in its due time ; for if you shall neglect and ioverslip it, you shall haue much more trouble, to bring them into a fit order againe, then at the first. The standard trees in an Orchard must be kept in another order ; for whereas the former are suffered to spread at large, these must be pruined both from superfluous branches that overload the trees, & make them lesse fruitfull, as well as lesse sightly, and the vnder or water boughes likewise, that drawe much nourishment from the trees, and yet themselues little the better for it, I meane to giue fruit. If therefore your Orchard consist of young trees, with a little care and paines it may bee kept in that comely order and proportion it was first destined vnto ; but if it consist of old growne trees, they will not without a great deale of care and paines be brought into such conformitie, as is befitting good and comely trees : for the marke of those boughes or branches that are cut off from young trees, will quickly be healed againe, the bark growing quickly ouer them, whereby they are not worse for their cutting ; but an old tree if you cut off a bough, you must cut it close and cleanly, and lay a searcloth of tallow, waxe, and a little pitch melted together vpon the place, to keepe off both the winde, sunne, and raine, vntill the bark haue couered it ouer againe : and in this manner you must deale with all such short stumps of branches, as are either broken short off with the winde, or by carelesse or want

want of skill, or else such armes or branches as are broken off close, or flued from the body of the tree : for the raine beating and falling into such a place, will in short time rotte your tree, or put it in danger, besides the deformity. Some vse to fill vp such an hole with well tempered clay, and tacke a cloth or a peece of leather ouer it vntill it be recovered, and this is also not amisse. Your young trees, if they stand in anie good ground, will bee plentifull enough in shooting forth branches, bee carefull therefore if they growe too thicke, that you pruine away such as growe too close (and will, if they be suffered, spoile one another) as they may be best spared, that so the sunne, ayre, and taine may haue free acceſſe to all your branches, which will make them bear the more plentifull, and ripen them the sooner and the more kindly. If anie boughes growe at the toppe too high, cut them also away, that your trees may rather spread then growe too high. And so likewise for the vnder boughes, or anie other that by the weight of fruit fall or hang downe, cut them off at the halfe, and they will afterwards rise and shooe vpwards. You shall obserue, that at all those places where anie branches haue been cut away, the sappe will euer bee ready to put forth : if therefore you would haue no more branches rise from that place, rubbe off or nippe off such buddes as are not to your minde, when they are new shot : and thus you may keep your trees in good order with a little paines, after you haue thus pruined and dressed them. One other thing I would aduertise you of, and that is how to preserue a fainting or decaying tree which is ready to perish, if it be not gone too farre or past cure, take a good quantitie of oxe or horse bloud, mixe therewith a reasonable quantitie of sheepe or pigeons dung, which being laid to the roote, will by the often raines and much watering recover it selfe, if there bee anie possiblitie ; but this must bee done in Ianuarie or Februarie at the furthest.

## C H A P. VIII.

*Divers other observations to be remembred in the well keeping of an Orchard.*

**T**here be diuers other things to be mentioned, whereof care must be had, either to doe or auoide, which I thinke fit in this Chapter promiscuously to set down, that there may be nothing wanting to furnish you with sufficient knowledge of the care, paines, and casualties that befall an Orchard : for it hath many enemies, and euery one laboureth as much as in them ly, to spoile you of your pleasure, or profit, or both, which must bee both speedily and carefully prevented and helped, and they are these : Mosse, Caterpillars, Ants, Earwigs, Snails, Moales, and Birds. If Mosse begin to ouergrowe your trees, looke to it betimes, lest it make your trees barren : Some vse to hooke, and crossehooke, or cut the bark of the bodies of their trees, to cause it fall aways, but I feare it may endanger your trees. Others do either rubbe it off with a haire cloth, or with a long peece of wood formed like a knife, at the end of a long sticke or pole, which if it bee vsed cauetiously without hurting the buds, I like better. Caterpillars, some smoake them with burning wet strawe or hay, or such like stuffe vnder the trees ; but I doe not greatly like of that way : others cut off the boughes whereon they breed, and tread them vnder their feete, but that will spoile too manie branches ; and some kill them with their hands : but some doe vſe a new devised way, that is, a pompe made of latten or tin, spout-fashion, which being set in a tubbe of water vnder or neare your trees, they will cause the water to rise through it with such a force, and through the branches, that it will wash them off quickly. To destroy Ants, that eat your fruit before and when it is ripe, some vſe to annoiſt the bodies of their trees with tarre, that they may not creepe vp on the branches ; but if that doe not helpe, or you will not vſe it, you must be carefull to finde out their hill, and turne it vp, pouring in scalding water, either in Summer, but especially if you can in Winter, and that will surely destroy them. I haue spoken of Earwigs in the first part of this worke, entreating of the annoyances of Gillotowers, and therefore I referre you thereunto : yet one way more I will

will here relate which some doe vse, and that is with hollow canes of halfe a yard long or more, open at both ends for them to creepe in, and stooke or laid among the branches of your trees, will soone drawe into them many Earwigs, which you may soone kill, by knocking the cane a little vpon the ground, and treading on them with your foote. Sailes must be taken with your hands, and that euerie day, especially in the morning when they will be creeping abroad. Moales by running vnder your trees make them lesse fruitfull, and also put them in danger to be blowne downe, by leauing the ground hollow, that thereby the rootes haue not that strength in the ground, both to shoothe and to hold, that otherwise they might haue. Some haue vsed to put Garlickie, and other such like things into their holes, thinking thereby to drive them away, but to no purpose: others haue tryed manie other waies; but no way doth auiale anie thing, but killing them either with a Moale spade, or a trappe made for the purpose as manie doe know: and they must bee watched at their principall hill, and trenched round, and so to be caught. Birds are another enemie both to your trees and fruit, for the Bullfinch will destroy all your stone fruit in the budde, before they flower, if you suffer them, and Crows, &c. when your Cherries are ripe: for the smaller birds, Lime twigs set either neare your trees, or at the next water where they drinke, will helpe to catch them and destroy them. And for the greater birds, a stone bowe, a birding or fowling peece will helpe to leſen their number, and make the rest more quiet: or a mill with a clacke to scarre them away, vntill your fruit be gathered. Some other annoyances there are, as suckers that rise from the rootes of your trees, which must be taken away euerie yeare, and not suffered to grove anie thing great, for feare of robbing your trees of their liuelihood. Barke bound, is when a tree doth not shoothe and encrease, by reason the barke is as it were drie, and will not suffer the sappe to passe vnto the branches: take a knife therefore, and slit the barke downe almost all the length of the tree in two or three places, and it will remedy that euill, and the tree will thriue and come forward the better after. Barke pilled is another euill that happeneth to some trees, as well young as old, either by reason of casuall hurts, or by the gnawing of beasts, howsoever it bee, if it bee anie great hurt, lay a plaiſter thereon made of tallow, tarre, and a little pitch, and binde it thereto, letting it so abide vntill the wound bee healed: yet some doe only apply a little clay or loame bound on with ropes of hay. The Canker is a shrewd diseafe when it happeneth to a tree; for it will eat the barke round, and so kill the very heart in a little ſpace. It must be looked vnto in time before it hath runne too farre; moft men doe wholly cut away as much as is fretted with the Canker, and then drefſe it, or wet it with vinegar or Cowes piffe, or Cowes dung and vrine, &c. vntill it be destroyed, and after healed againe with your ſalve before appointed. There are yet ſome other enemies to an Orchard: for if your fence be not of bricke or ſtone, but either a muddie wall, or a quicke ſet or dead hedge, then looke to it the more carefully, and preuent the coming in of either horse, or kine, ſheepe, goates, or deere, hare, or conie; for ſome of them will breake through or ouer to barke your trees, and the leaſt hole almoft in the hedge will giue admittance to hares and conies to doe the like. To preuent all which, your care muſt be continuall to watch them and auoide them, and to ſtoppe vp their entrance. A dogge is a good ſeruant for many ſuch purpoſes, and ſo is a ſtone bowe, and a peecē to make vſe of as occaſion ſhall ſerue. But if you will take that medicine for a Canker ſpoken of before, which is Cowes dung and vrine mixed together, and with a brush wash your trees often to a reaſonable height, will keepe hares and conies from eating or barking your trees. Great and cold windes doe often make a great ſpoile in an Orchard, but great trees planted without the compasse thereof, as Wall-nuts, Oakes, Elmes, Ashes, and the like, will ſtand it in great ſtead, to defend it both early and late. Thus haue I ſhewed you moft of the euils that may happen to an Orchard, and the meaneſs to helpe them, and because the number is great and daily growing, the care and paines muſt be continuall, the more earnest and diligent, leſt you loſe that in a moment that hath been growing many years, or at the leaſt the profit or beauty of ſome yeares fruit.

## C H A P.

## C H A P. IX.

*The manner and way how to plant, order, and keepe other trees that beare greene leaues continually.*

The way to order thoſe trees that beare their leaues greene continually, is differing from all others that doe not ſo: for neyther are they to bee planted or remoued at the time that all other trees are ſet, nor doe they require that manner of dressing, pruining and keeping, that others doe. And although many ignorant persons and Gardiners doe remoue Bay trees, and are ſo likewife perfwaded that all other trees of that nature, that is, that carry their greene leaues continually, may bee remoued in Autumne or Winter, as well as all other trees may bee; yet it is certayne it is a great chance if they doe thriue and prosper that are ſet at that time, or rather it is found by expeience, that ſcarce one of ten prospereth well that are ſo ordered. Now in regard that there be diuers trees and shrubs mentioned here in this booke that beare euer greene leaues, wherein there is very great beauty, and many take pleaſure in them; as the ordinary Bay, the Rose Bay, and the Cherry Bay trees, the Indian Figge, the Cyprefſe, the Pine tree, the Mirtle and dwarfe Boxe, and many others; I will here ſhew you how to plant and order them, as is fitteſt for them. For in that they doe not ſhed their greene leaues in winter as other trees doe, you may in reaſon be perfwaded that they are of another nature; and ſo they are indeede: for ſeeing they all grow naturally in warme Countries, and are from thence brought vnto vs, we muſt both plant them in a warmer place, and transplant them in a warmer time then other trees be, or elſe it is a great hazzard if they doe not periſh and dye, the cold and froſts in the winter being able to pierce them through, if they ſhould bee transplanted in winter, before they haue taken roote. You muſt obſerue and take this therefore for a certaine rule, that you alwaies remoue ſuch trees or ſhrubbes as are euer greene in the ſpring of the yeaſe, and at no time elſe if you will doe well, that is, from the end of March, or beginning of Aprill, vnto the middle or end of May, eſpecially your more dainty and tender plants, shadowing them alſo for a while from the heate of the Sun, and giuing them a little water vpon their planting or transplanting; but ſuch water as hath not preſently been drawn from a Well or Pump, for that will go neer to kill any plant, but ſuch water as hath ſtood in the open ayre for a day at the leaſt, if not two or three. Yet for dwarfe Boxe I confeſſe it may endure one moneth to be earlier planted then the reſt, becauſe it is both a more hardy and lowe plant, and thereby not ſo much ſubiect to the extremitie of the colde: but if you ſhould plant it before winter, the froſts would raife it out of the ground, becauſe it cannot ſo ſoone at that time of the yeaſe take roote, and thereby put it in danger to be loſt. Moreouer all of them will not abide the extremitie of our winter froſts, and therefore you muſt of neceſſity haue ſome of them, as the Rose Bay, Mirtle, and ſome others, but the other ſorts being ſet where they may bee ſomewhat defended from the cold windes, froſts, and ſnow in winter, with ſome couering or ſhelter for the time, will reasonably well endure and beare their fruit, or the moſt of them. If any be deſirous to be furnished with ſtore of theſe kinds of trees that will be nourſed vp in our Country, he may by ſowing the ſeed of them in ſquare or long wooden boxes or cheſts made for that purpoſe, gaine plenty of them: but hee muſt be carefull to couer them in winter with ſome straw or fearene, or beane hame, or ſuch like thing layd vpon croſſe ſticks to beare it vp from the plants, and after two or three yeaſes that they are grovne ſomewhat great and ſtrong, they may bee transplanted into ſuch places you meane they ſhall abide: yet it is not amiffe to defend them the firſt yeaſe after they are transplanted, for their more ſecuritie: the ſeedes that are moft viually ſownen with vs, are, the Cyprefſe tree, the Pine tree, the Baye, the Pyracantha or prickly Corall tree, and the Mirtle: the Rose Bay I haue had alſo riſen from the ſeede that was fresh, and brought me from Spaine. But as for Orenge trees, becauſe they are ſo hardly perſerved in this our cold climate (vnleſſe it bee with ſome that doe beſtow the hoſting of them, beſides a great deale more of care and reſpect vnto them) from the bitterneſſe of our cold long winter weather (although their keruels

kernel being put into the ground in the Spring or Summer, and if care bee had of them and conuenient keeping, will abide, and by grafting the good fruite on the crab stocke they may bee in time nurfed vp) I doe not make any other especiall account of them, nor giue you any further relation of their ordering. Now for the ordering of these trees after they are eyther planted of young sets, or transplanted from the seede, it is thus : First for Bay trees, the most vsuall way is to let them grow vp high to bee trees, and many plant them on the North or East side of their houses that they may not bee scorched with the Sunne; but the bitter winters which we often haue, doe pinch them shrewdly, insomuch that it killeth euen well growne trees sometimes downe to the roote: but some doe make a hedge of them being planted in order, and keep them low by lopping of them continually, which will make them bushy and spread. The Cypresse tree is never lopped, but suffered to grow with all the branches from a foote aboue the ground, if it may be, straight vpright; for that is his natvie grace and greatest beautie, and therefore the more branches doe dye that they must bee cut away, the more you deform his properte. The Pine tree may be vsed in the same manner, but yet it wil better endure to sustaine pruining then the Cypresse, without any such deformite. The Laurocerasus or Cherry Bay may be diuersly formed, that is, it may be either made to grow into a tall tree by shredding still away the vnder branches, or else by suffering all the branches to grow to be a low or hedge bush, & both by the suckers and by laying downe the lower branches into the earth, you may soone haue much increase; but this way will cause it to bee the longer before it beare anie fruit. The Rose Baye will verie hardlie bee encreased either by suckers or by layers, but must bee suffered to grow without lopping, topping or cutting. The Pyracantha or Prickly Corall tree may bee made to grow into a reasonable tall tree by shredding away the lower branches, or it may be suffered to grow lowe into an hedge bush, by suffering all the branches to grow continually, you may also propagate it by the suckers, or by laying downe the lower branches. The Myrtle of all sorts abideth a low bush spreading his branches full of sweete leaues and flowers, without anie great encrease of it selfe, yet sometimes it giueth suckers or shoothes from the rootes: but for the more speedie propagating of them, some doe put the cuttings of them into the earth, and thereby increase them. There are some other trees that are not of any great respect, as the Yew tree, and the Savine bushe, both which may be encreased by the cuttings, and therefore I need not make any further relation or amplification of them, and to say thus much of them all, is (I thinke) sufficient for this Worke.

## C H A P. X.

*The ordering, curing, and propagating Vines of all sorts.*

**I**N most places of this countrie there is small care or paines taken about the ordering of Vines: it sufficeth for the most part with them that haue anie, to make a frame for it to spread vpon aboue a mans height, or to tacocke it to a wall or window, &c. and so to let it hang downe with the branches and fruit, vntill the weight thereof, and the force of windes doe teare it downe oftentimes, and spoile the grapes: and this way doth somewhat resemble that course that the Vineyard keepers obserue in the hot countries of Syria, Spaine, and Italy, and in the furthest parts of France as I hear likewise: for in most of these hot countries they vse to plant an Oliue betweene two Vines, and let them runne thereupon. But manie of the other parts of France, &c. doe not suffer anie trees to growe among their Vines; and therefore they plant them thicke, and pruine them much and often, and keepe them lowe in comparison of the other way, fastening them to pearches or poles to hold them vp. And according to that fashion many haue aduentured to make Vineyards in England, not onely in these later daies, but in ancient times, as may wel witnesse the sondrie places in this Land, entituled by the name of Vineyards; and I haue read, that manie Monasteries in this Kingdome hauing Vineyards, had as much wine made therfrom, as sufficed their couents yeare by yeare: but long since they haue been destroyed, and the knowledge how to order a Vineyard is also vtterly perished with them. For although diuers, both No-

bles and Gentlemen, haue in these later times endeauoured to plant and make Vineyards, and to that purpose haue caused French men, being skilfull in keeping and dresing of Vines, to be brought ouer to performe it, yet either their skill failed them, or their Vines were not good, or (the most likely) the soile was not fitting, for they could neuer make anie wine that was worth the drinking, being so small and heartlesse, that they soone gaue ouer their practice. And indeede the soile is a maine matter to bee chiefly considered to seate a Vineyard vpon: for eu'en in France and other hot countries, according to the nature of the soile, so is the rellish, strength, and durabilitie of the wine. Now although I think it a fruitlesse labour for any man to striue in these daies to make a good Vineyard in England, in regard not only of the want of knowledge, to make choise of the fittest ground for such Vines as you would plant therupon, but also of the true maner of ordering them in our country; but most chiefly & aboue all others, that our years in these times do not fal out to be so kindly and hot, to ripen the grapes, to make anie good wine as formerly they haue done; yet I thinke it not amisse, to giue you instructions how to order such Vines as you may nourishe vp for the pleasure of the fruit, to eate the grapes being ripe, or to preserue and keepe them to bee eaten almost all the winter following: And this may be done without any great or extraordinarie paines. Some doe make a lowe wall, and plant their Vines against it, and keepe them much about the height thereof, not suffering them to rise much higher: but if the high bricke or stone walles of your Garden or Orchard haue buttresses thereat, or if you cause such to bee made, that they bee somewhat broade forwards, you may the more conueniently plant Vines of diuers sorts at them, and by sticking down a couple of good stakes at every buttresse, of eight or ten foot high aboue ground, racking a few lathes acrosse vpon those stakes, you may therunto tye your Vines, & carry them theron at your pleasure: but you must be carefull to cut them every year, but not too late, and so keepe them downe, and from farre spreading, that they neuer runne much beyond the frame which you set at the buttresses: as also in your cutting you never leave too many ioynts, nor yet too few, but at the third or fourth ioint at the most cut them off. I doe aduise you to these frames made with stakes and lathes, for the better ripening of your grapes: for in the blooming time, if the branches of your vines bee too neare the wall, the reflexion of the Sunne in the day time, and the colde in the night, doe oftentimes spoile a great deale of fruit, by piercing and withering the tender footstalkes of the grapes, before they are formed, whereas when the blossomes are past, and the fruit growing of some bignesse, then all the heate and reflexion you can giue them is fit, and therefore cut away some of the branches with the leaues, to admit the more Sunne to ripen the fruit. For the diuers sorts of grapes I haue set them downe in the Booke following, with briefe notes vpon euerie of them, whether white or blacke, small or great, early or late ripe; so that I neede not here make the same relation again. There doth happen some diseases to Vines sometimes, which that you may helpe, I thinke it conuenient to informe you what they are, and how to remedy them when you shall be troubled with any such. The first is a luxurios spreading of branches and but little or no fruit: for remedie whereof, cut the branches somewhat more neere then vsuall, and bare the roote, but take heed of wounding or hurting it, and in the hole put either some good old rotten stable dung of Horses, or else some Ox blood new taken from the beasts, and that in the middle of Ianuarie or beginning of Februarie, which being well tempered and turned in with the earth, let it so abide, which no doubt, when the comfort of the blood or dung is well soaked to the bottome by the raines that fall thereon, will cause your Vine to fructifie againe. Another fault is, when a Vine doth not bring the fruit to ripenesse, but either it withereth before it be growne of any bignesse, or presently after the blooming: the place or the earth where such a Vine standeth, assuredly is too cold, and therefore if the fault bee not in the place, which cannot bee helped without remouing to a better, digge out a good quantity of that earth, and put into the place thereof some good fresh ground well heartned with dung, and some sand mixed therewith (but not salt or salt water, as some doe aduise, nor yet vrine, as others would haue) and this will hearten and strengthen your Vine to beare out the frut vnto maturitie. When the leaues of a Vine in the end of Summer or in Autumne, vntimely doe turne either yellow or red, it is a great signe the earth is

too hot and drie ; you must therefore in stead of dung and sand, as in the former defect is said, put in some fresh loame or short clay, well mixed together with some of the earth, and so let them abide, that the frosts may mellow them. And lastly, a Vine sometimes beareth some store of grapes, but they are too many for it to bring to ripenesse ; you shall therefore helpe such a Vine (which no doubt is of some excellent kinde, for they are most vsually subject to this fault) by nipping away the blossomes from the branches, and leauing but one or two bunches at the most vpon a branch, vntill the Vine be growne older, and thereby stronger, and by this meane inured to beare out all the grapes to ripenesse. These be all the diseases I know doe happen to Vines : for the bleeding of a Vine it seldomn happeneth of it selfe, but commeth either by cutting it vntimely, that is, too late in the yeare, (for after Ianuarie, if you will be well aduised, cut not any Vine) or by some casuall or wilfull breaking of an arme or a branch. This bleeding in some is vnto death, in others it stayeth after a certayne space of it selfe : To helpe this inconuenience, some haue feared the place where it bleedeth with an hot iron, which in many haue done but a little good ; others haue bound the barke close with packe-thred to stay it ; and some haue tied ouer the place, being first dried as well as may bee, a plaister made with waxe roffen and turpentine while it is warme. Now for the propagating of them : You must take the fairest and goalest shot branches of one yeares growth, and cut them off with a peece of the old wood vnto it, and these being put into the ground before the end of Ianuarie at the furthest, will shoothe forth, and take roote, and so become Vines of the same kinde from whence you tooke them. This is the most speedy way to haue increase : for the laying downe of branches to take roote, doth not yelde such store so plentifully, nor doe suckers rise from the rootes so abundantly ; yet both these waies doe yelde Vines, that being taken from the old stockes will become young plants, fit to bee disposed of as any shall thinke meete.

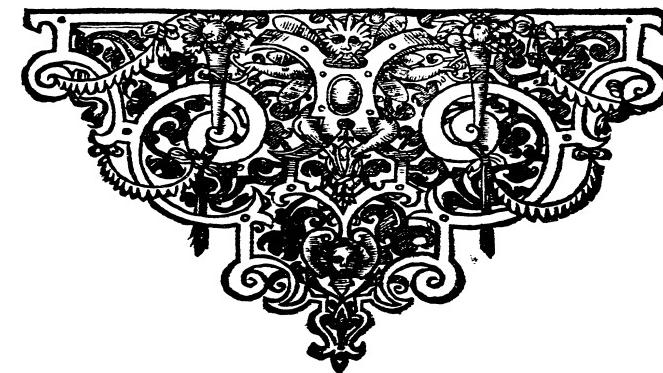

## C H A P. XI.

*The way to order and preserue grapes, fit to be eaten almost all the winter long, and sometimes vnto the Spring.*

**A**lthough it bee common and vsuall in the parts beyond the Sea to dry their grapes in the Sunne, thereby to preserue them all the year, as the Raisins of the Sunne are, which cannot bee done in our Countrie for the want of sufficient heate thereof at that time : or otherwise to scald them in hot water (as I haere) and afterwards to dry them, and so keepe them all the yeare, as our Malaga Raisins are prepared that are packed vp into Frayles : yet I doe intend to shew you some other waies to preserue the grapes of our Countrie fresh, that they may be eaten in the winter both before and after Christmas with as much delight and pleasure almost, as when they were new gathered. One way is, when you haue gathered your grapes you intend to keepe, which must be in a dry time, and that all the shrunke, dried, or euill grapes in euery bunch be picked away, and hauing prouidid a vessell to hold them, be it of wood or stome which you will, and a sufficient quantitie of faire and cleane drie sand ; make stratum super stratum of your grapes and the sand, that is, a lay of sand in the bottome first, and a lay of grapes vpon them, and a lay or strowing againe of sand vpon those grapes, so that the sand may couer euery lay of grapes a fingers breadth in thicknesse, which being done one vpon another vntill the vessell be full, and a lay of sand vppermost, let the vessell be stopped close, and set by vntill you please to spend them, being kept in some drie place and in no cellar : let them bee washed cleane in faire water to take away the sand from so many you will spend at a time. Another way is (which Camerarius setteth downe he was informed the Turkes vse to keepe grapes all the winter vnto the next summer) to take so much meale of Mustard seede, as will serue to strow vpon grapes, vntill they haue filled their vessells, whereon afterwards they poure new wine before it hath boyled, to fill vp their vessells therwith, and being stopped vp close, they keepe them a certayne time, and sellling them with their liuour to them that will vse them.

vse them, they doe wash the seedes or meale from them when they vse them. Another way is, that hauing gathered the fairest ripe grapes, they are to be cast vpon threds or strings that are fastened at both ends to the side walks of a chamber, neare vnto the seeing thereof, that no one bunch touch another, which will bee so kept a great while, yet the chamber must be well defended from the frosts, and cold windes that pierce in at the windowes, lest they perish the sooner : and some will dippe the ends of the branches they hang vp first in molten pitch, thinking by fearing vp the ends to keepe the bunches the better ; but I doe not see any great likelihood therein. Your chamber or closet you appoint out for this purpose must also bee kept somewhat warme, but especially in the more cold and frostie time of the yeare, lest it spoile all your cost and paines, and frustrate you of all your hopes : but although the frosts should pierce and spoile some of the grapes on a bunch, yet if you be carefull to keepe the place warme, the fewer will be spoiled. And thus haue I shewed you the best directions to order this Orchard rightly, and all the waies I know are vised in our Countrie to keep grapes good anie long time after the gathering, in regard wee haue not that comfort of a hotter Sunne to preserue them by its heat.

The fruits themselues shall follow euerie one in their order ; the lower shrubbes or bushes first, and the greater afterwards.

A a a 2

The

## THE THIRD PART CALLED THE ORCHARD,

 Ontaining all sorts of trees bearing fruit for mans vse to eate, proper and fit for to plant an Orchard in our climate and countrie : I bound it with this limitation, because both Dates, Oliues, and other fruits, are planted in the Orchards of Spaine, Italy, and other hot countries, which will not abide in ours. Yet herein I will declare whatsoeuer Art, strivinge with Nature, can cause to prosper with vs, that whosoever will, may see what can bee effected in our countrie. And first to begin with the lower shrubbes or bushes, and after ascend to the higher trees.

### C H A P. I.

#### *Rubus Idens.* Raspis.

**T**He Raspis berrie is of two sorts, white and red, not differing in the forme either of bush, leafe, or berry, but onely in the colour and taste of the fruit. The Raspis bush hath tender whitish stemmes, with reddish small prickes like haies set round about them, especially at the first when they are young ; but when they grow old they become more woody and firme, without any shew of thornes or prickles vpon them, and hath onely a little hairinesse that couereth them : the leaues are somewhat rough or rugged, and wrinkled, standing three or fve vpon a stalke, somewhat like vnto Roses, but greater, and of a grayer greene colour : the flowers are small, made of fine whitish round leaues, with a dash as it were of blush cast ouer them, many standing together, yet every one vpon his owne stalke, at the tops of the branches; after which come vp small berries, somewhat bigger then Strawberries, and longer, either red or white, made of many graines, more eminent then in the Strawberry, with a kinde of douninesse cast ouer them, of a pleasant taste, yet somewhat sowre, and nothing so pleasant as the Strawberrie. The white Raspis is a little more pleasant then the red, wherein there is small seede incloſed : the rootes creepe vnder ground verie farre, and shooote vp againe in many places, much encreasing thereby.

There is another whose stemme and branches are wholly without prickles : the fruit is red, and somewhat longer, and a little more sharpe.

#### The Vſe of Raspis.

The leaues of Raspis may be vſed for want of Bramble leaues in gargles, and other decoctiōns that are cooling and drying, although not fully to that effect.

The Conserue or Syrupe made of the berries, is effectuall to coolc an hot stomacke, helping to refresh and quicken vp those that are ouercome with faintnesse.

The berries are eaten in the Summer time, as an afternoones dish, to please the taste of the sickie as well as the sound.

The iuyce and the distilled water of the berries are verie comfortable and cordiall.

It is generally held of many, but how true I know not, that the red wine that is vsually sold at the Vintners, is made of the berries of Ralpis that grow in colder countries, which giueth it a kinde of harshnesse: And also that of the same berries growing in hotter climates, which giueth vnto the wine a more pleasant sweetnesse, is made that wine which the Vintners call Alligant: but we haue a Vine or Grape come to vs vnder the name of the Alligant Grape, as you shall finde it set downe hereafter among the Grapes; and therefore it is likely to be but an opinion, and notruth in this, as it may be also in the other.

## C H A P. II.

*Ribes rubra, alba, nigra.* Currans red, white, and blacke.

**T**He bushes that bear those berries, which are vsually called red Currans, are not those Currans either blew or red, that are sold at the Grocers, nor any kind thereof; for that they are the grapes of a certaine Vine, as shall be shewed by and by: but a farre differing kinde of berry, whereof there are three sorts, red, white, and blacke.

The red Curran bush is of two sorts, and growtheth to the height of a man, hauing sometimes a stemme of two inches thicknesse, and diuers armes and branches, couered with a smooth, darke, brownish bark, without anie pricke or thorne at all vpon anie part thereof, whereon doe growe large cornered blackish greene leaues, cut in on the edges, seeming to be made of fife parts, almost like a Vine leafe, the ends a little pointing out, and standing one aboue another on both sides of the branches: the flowers are little and hollow, comming forth at the ioynts of the leaues, growing many together on a long stalle, hanging downe aboue a fingers length, and of an herbie colour: after which come small round fruit or berries, greene at the first, and red as a Cherry when they are ripe, of a pleasant and tart taste: the other differeth not in anie other thing then in the berries, being twice as bigge as the former: the roote is wooddy, and spreadeth diuersly.

The white Curran bush riseth vsually both higher then the red, and straighter or more vpright, bigger also in the stemme, and couered with a whiter bark: the leaues are cornered, somewhat like the former, but not so large: the flowers are small and hollow like the other, hanging downe in the same manner on long stalkes, being of a whiter colour: the berries likewise growe on the long stalkes, somewhat thicker set together, and of a cleare white colour, with a little blacke head, so transparent that the seedes may be easily scene thorough them, and of a more pleasant winie taste then the red by much.

The blacke Curran bush riseth higher then the white, with more plentifull branches, and more pliant and twiggie: the stemme and the elder branches being couered with a brownish bark, and the younger with a paler: the flowers are also like vnto little bottles as the others be, of a greenish purple colour, which turne into blacke berries, of the bignesse of the smaller red Currans: the leaues are somewhat like vnto the leaues of the red Currans, but not so large: both branches, leaues, and fruit haue a kind of stinking sent with them, yet they are not vnwholsome, but the berries are eaten of many, without offendng either taste or smell.

## The Vse of Currans.

The red Currans are vsually eaten when they are ripe, as a refreshing to an hot

1 Rubus idaeus. The Raspis. 2 Ribes fructu rubro vel albo. White or red Currans. 3 Grossularia vulgaris. The ordinary Gooseberry. 4 Grossularia fructu rubro. The great red Gooseberry. 5 Grossularia aculeata. The prickly Gooseberry. 6 Oxyacantha junc Berberis. The Barbary bush. 7 Acanthus Byzantina. The Filbert of Constantinople. 8 Acanthus rubra nobilis. The best red Filbert.

hot stomacke in the heate of the yeare, which by the tartnesse is much delighted. Some preferue them, and conserue them also as other fruits, and spend them at neede.

The white Currans, by reason of the more pleasant winie taste, are more accepted and desired, as also because they are more daintie, and less comon.

Some vsē both the leaues and berries of the blacke Currans in sawces, and other meates, and are well pleased both with the sauour and taste thereof, although many mislike it.

## C H A P. III.

*Viva Crispa sine Grossularia.* Gooseberries or Feaberries.

**W**ee haue diuers sorts of Gooseberries, besides the common kinde, which is of three sorts, small, great, and long. For wee haue three red Gooseberries, a blewe and a greene.

The common Gooseberrie, or Feaberry bush, as it is called in diuers Countries of England, hath oftentimes a great stemme, couered with a smooth darke coloured bark, without anie thorne thereon, but the elder branches haue here and there some on them, and the younger are whitish, armed with verie sharpe and cruell crooked thorns, which no mans hand can well auoide that doth handle them, whercon are set verie greene and small cornered leaues cut in, of the fashion almost of Smallage, or Hawthrone leaues, but broad at the stalke: the flowers come forth singule, at euerie ioynt of the leafe one or two, of a purplish greene colour, hollow and turning vp the brims a little: the berries follow, bearing the flowers on the heads of them, which are of a pale greene at the first, and of a greenish yellow colour when they are ripe, striped in diuers places, and cleare, almost transparent, in which the seede lyeth. In some these berries are small and round, in others much greater; a third is great, but longer then the other: all of them haue a pleasant winie taste, acceptable to the stomacke of anie (but the long kinde hath both the thicker skin, and the worser taste of the other) and none haue been distempered by the eating of them, that euer I could heare of.

The first of the red Gooseberries is better knowne I thinke then the rest, and by reason of the small bearing not much regarded; the stemme is somewhat bigge, and couered with a smooth darke coloured barke, the younger branches are whiter, and without anie thorne or pricke at all, so long, weake, small, and slender, that they lye vpon the ground, and will there roote againe: the leaues are like vnto the former Gooseberries, but larger: the flowers and berries stand singule, and not manie to bee found anie yeaere vpon them, but are somewhat long, and are as great as the ordinary Gooseberry, of a darke brownish red colour, almost blackish when they are ripe, and of a sweetish taste, but without any great delight.

The second red Gooseberry riseth vp with a more straight stemme, couered with a brownish barke, the young branches are straight likewise, and whitish, and grow not so thicke vpon it as the former red kinde, and without any thorne also vpon them: the leaues are like vnto the former red, but smaller: the berries stand singule, at the leaues as Gooseberries doe, and are of a fine red colour when they are ripe, but change with standing to be of a darker red colour, of the bignesse of the small ordinary Gooseberry, of a pretty tart taste, and somewhat sweete withall.

The third red Gooseberry which is the greatest, and knowne but vnto few, is so like vnto the common great Gooseberry, that it is hardly distinguished: the fruit or berries grow as plentifully on the branches as the ordinary, and are as great & round as the great ordinary kinde, but reddish, and some of them paler, with red stripes.

The blewe Gooseberry riseth vp to bee a bush like vnto the red Curran, and of the same bignesse and height, with broader and redder leaues at the first shooting out, then the second red Gooseberry: the berries are more sparingly set on the branches, then on the small red, and much about the same bignesse, or rather lesser, of the colour of a Damson, with an ouershadowing of a bleuish colour vpon them, as the Damson hath, before it be handled or wiped away.

The greene prickly Gooseberry is very like vnto the ordinary Gooseberry in stemme and branches, but that they are not stored with so many sharpe prickles; but the young shoothes are more plentifull in small prickles about, and the greene leafe is a little smaller: the flowers are alike, and so are the berries, being of a middle size, and not very great, greene when they are thorough ripe as well as before, but mellower, and hauing a few small short prickles, like small short haire vpon them, which are harmlesse, and without danger to anie the most dainty and tender palate that is, and of a verie good pleasant taste. The seede hereof hath produced bushes bearing berries, hauing few or no prickles vpon them.

## The Vse of Gooseberries.

The berries of the ordinary Gooseberries, while they are small, greene, and hard, are much vsed to bee boyled or scalded to make sawce, both for fish and flesh of diuers sorts, for the sick sometimes as well as the sound, as also before they be neere ripe, to bake into tarts, or otherwise, after manie fashions, as the cunning of the Cooke, or the pleasure of his commanders will appoint. They are a fit dish for women with childe to stay their longings, and to procure an appetite vnto meate.

The other sorts are not vsed in Cookery that I know, but serue to bee eaten at pleasure; but in regard they are not so tart before maturity as the former, they are not put to those vses they be.

## C H A P. IIII.

*Oxyacantha, sed potion Berberis.* Barberries.

**T**He Barberry bush growth oftentimes with very high stemmes, almost two mens height, but vsually somewhat lower, with manie shoothes from the roore, couered with a whitish rinde or barke, and yellow vnderneath, the wood being white, and pithy in the middle: the leaues are small, long, and very greene, ticked or finely dented about the edges, with three small sharpe thornes, for the most part set together at the setting on of the leaues: the flowers doe growe vpon long clustering stalkes, small, round, and yellow, sweete in smell while they are fresh, which turne into small, long, and round berries, white at the first, and very red when they are ripe, of a sharpe sowre taste, fit to set their teeth on edge that eate them: the roote is yellow, spreading far vnder the vpper part of the ground, but not very deepe.

There is (as it is thought) another kinde, whose berries are thrice as bigge as the former, which I confess I haue not seene, and know not whether it be true or no: for it may peraduenture be but the same, the goodnessse of the ground and ayte where they growe, and the youngnesse of the bushes causing that largenesse, as I haue obserued in the same kinde, to yeld greater berries.

There is said to be also another kinde, whose berries shold be without stones or seede within them, not differing else in anie thing from the former: but because I haue long heard of it, and cannot vnderstand by all the inquirie I haue made, that any hath seene such a fruit, I rest doubtfull of it.

## The Vse of Barberries.

Some doe vsē the leaues of Barberries in the stead of Sorrell, to make sawce for meate, and by reason of their savoresse are of the same quality.

The berries are vsed to be pickled, to serue to mince or set out dishes of fish and flesh in broth, or otherwise, as also sometime to bee boyled in the broth, to giue it a sharpe relish, and many other wayes, as a Master Cooke can better tell then my selfe.

The berries are preferred and conserued to give to sicke bodies, to helpe to coole any heate in the stomacke or mouth, and quicken the appetite. The depurate iuyce is a fine menstrue to dissolute many things, and to verie good purpose, if it be cunningly handled by an Artist.

The yellow inner bark of the branches, or of the rootes, are vsed to be boyled in Ale, or other drinke, to be giuen to those that haue the yellow iaudifie: As also for them that haue anie fluxes of choller, to helpe to stay and binde.

Clusius setteth downe a secret that hee had of a friend, of a cleane differing propertie, which was, that if the yellow bark were laid in steepe in white wine for the space of three houres, and afterwards drunke, it would purge one very wonderfully.

## C H A P. V.

*Nux Auctane. The Filberd.*

**F**He Filberd tree that is planted in Orchards, is very like vnto the Hasell nut tree that groweth wilde in the woods, growing vpright, parted into many boughes and tough pliable twigges, without knots, covered with a brownish, speckled, smooth, thinne rinde, and greene vnderneath: the leaues are broad, large, wrinkled, and full of veines, cut in on the edges into deepe dents, but not into any gashes, of a darke greene colour on the vpperide, and of a grayish ash colour vnderneath: it hath small and long catkins in stead of flowers, that come forth in the Winter, when as they are firme and close, and in the Spring open themselues somewhat more, growing longer, and of a brownish yellow colour: the nuts come not vpon those stalkes that borethose catkins, but by themselves, and are wholly inclosed in long, thicke, rough huskes, bearded as it were at the vpper ends, or cut into divers long iaggcs, much more then the wood nut: the nut hath a thinne and somewhat hard shell, but not so thicke and hard as the wood nut, in some longer then in other, and in the long kinde, one hath the skinne white that couereth the kernels, and another red.

There is another sort of the round kinde that came from Constantinople, whose huske is more cut, torne, or iagged, both aboue and belowe, then any of our country; the bark also is whiter, and more rugged then ours, and the leaues somewhat larger.

We haue had from Virginia Hasell nuts, that haue beene smaller, rounder, browner, thinner sheld, and more pointed at the end then ours: I know not if any hath planted of them, or if they differ in leafe or any thing else.

## The Vse of Filberds.

Filberds are eaten as the best kinde of Hasell nuts, at bankets among other dainty fruits, according to the season of the yeare, or otherwise, as every one please: But Macer hath a Verse, expressing prettily the nature of these nuts, which is,

*Ex minimis nucibus nulli datur esca salubris.*

that is, There is no wholesome food or nourishment had from these small kinde of nuts.

Yet they are vsed sometime physically to be rosted, and made into a Locr or Electuary, that is vsed for the cough or cold. And it is thought of some, that Mithridates meant the kernels of these nuts, to be vsed with Figs and Rue for his Antidote, and not of Walnuts.

## C H A P.

## C H A P. VI.

*Vitis. The Vine.*

**T**Here is so great diuersities of Grapes, and so consequently of Vines that bear them, that I cannot give you names to all that here grow with vs: for Iohn Tradescante my verie good friend, so often before remembred, hath assured me, that he hath twentie sorts growing with him, that hee never knew how or by what name to call them. One description therefore shall serue (as I vse to doe in such varieties) for all the rest, with the names afterwards, of as many as we can giue, and the seuerall formes, colours and proportions of the grapes.

The manured Vine, in the places where it hath abiden long time, groweth to haue a great bodie, stemme or trunke, sometimes of the bignesse of a mans arme, sleeve and all, spreading branches if it bee suffered without end or measure, but vsually stord with many armes or branches, both old and new, but weake, and therefore must bee sustainted; whereof the old are couered with a thin scaly rinde, which will often chap and peele off of it selfe; the youngest being of a reddish colour, smooth and firme, with a hollownesse or pith in the middle: from the ioints of the young branches, and sometimes from the bodie of the elder, breake out on euerie side broade greene leaues, cut on the edges into fve diuisions for the most part, and besides notched or dened about: right against the leafe, and likewife at other ioynts of the branches, come forth long twining or clasping tendrels, winding themselues about any thing standeth next vnto them: at the bottome of these leaues come forth clusters of small greenish yellow bloomes or flowers, and after them the berries, growing in the same manner in clusters, but of diuers formes, colours, tastes and greatnessse. For some grapes are great, others lesse, some very small (as the Currans that the Grocers sell) some white, some red, blew, blacke, or partie-coloured, some are as it were square, others round: some the clusters are close, others open, some are sweete, others sower or harsh, or of some other mixed taste, euerie one differing from others, verie notably either in taste, colour or forme, within euerie one of which grapes, (and yet there is a grape without stones) are contained one, two, or more kernels or stones, some of them being smal, others greater: the rootes spread far and deepe. They that keepe their Vines in the best order, doe cut them low, not suffering them to grow high, or with too many branches, whereby they grow the better, take vp the lesser roome, and bring their grapes fairer and sweeter.

## The kinds of Vines and Grapes.

Our ordinarie Grape both white and red, which excelleth Crabs for veriuice, and is not fit for wine with vs.

The white Muscadine Grape is a verie great Grape, sweete and firme, some of the bunches haue weighed sixe pound, and some of the grapes halfe an ounce.

The redde Muscadine is as great as the white, and chiefly differeth in colour.

The Burlet is a very great white Grape, but fitter for veriuice then wine for the most part; yet when a hot yeare happeneth fit for it, the Grape is pleasant.

The little blacke Grape that is ripe very early.

The Raisin of the Sunne Grape is a very great Grape, and very great clusters, of a reddish colour when it is ripe with vs, yet in an extraordinarie hot yeare, it hath got a little blewnesse cast ouer it by the heat: but naturally verie blew.

The Curran Grape (or the Grape of Corinth) is the least Grape of all, and beareth both few, and verie seldome with vs, but in reasonable great clusters, and of a blackish blew colour, when they are ripe with vs, and very sweet

sweete. There is another sort of them that are red or browne, and of a sower taste, nothing so sweete.

The Greeke wine Grape is a blackish Grape, and very sweete.

The Frontignack is a white Grape, of a verie sweete and delicate taste, as the wine declareth, that smellethe as it were of Muske.

The square Grape is reported to bear a Grape not fully round, but sided, or as it were square, whereby it became so called.

The Damasco Grape is a great white grape, very sweete, and is the true *Vitis Zibeba*, that the Apothecaries should vse in the *Trochisci Cibis*: and such wee haue had in former times come ouer vnto vs in great, long and round white boxes, containing halfe an hundred weight a peece.

The Russet Grape is a reasonable faire grape, exceeding sweet and whitish, with a thicke skinne, crusted ouer with a shew of ash colour.

The white long Grape is like vnto a Pigeons egge, or as it were pendent like a Pearle.

The partie-coloured Grape is a reasonable great Grape, and discoloured when it is ripe, sometimes the whole bunches, and sometimes but some of the grapes being parted whitish, and blacke halfe through, verie variably.

The Rhenish wine Grape is a white Grape, and endureth the cold of winter when it commeth earely, more then the Muscadine before set downe, and is nothing so sweete.

The White wine Grape is verie like vnto the Rhine Grape, the soile only and climate adding more sweetnesse vnto the one then to the other.

The Claret wine Grape is altogether like the white Grape, but that it is not white, but of a reddish colour, which lying bruised vpon the skins before they are pressed, giue that Claret tincture to the wine.

The Teint is a Grape of a deeper or darker colour, whose iuice is of so deepe a colour, that it serueth to colour other wine.

The Burlarobe is a faire sweete white Grape of much esteeme about Paris.

The Alligant is a verie sweete Grape, giuing so deep and liuely a coloured red wine, that no other whatsoeuer is comparable to it, and therfore vsually called Spaniards blood.

The blew or blacke Grape of Orleans is another blacke Grape, giuing a darke coloured sweete wine much commended in those parts.

The Grape without stones is also a kinde by it selfe, and groweth naturally neere Ascalon, as Brochard affirmeth, the wine whereof is redde, and of a good taste.

The Virginia Vine, whereof I must needs make mention among other Vines, beareth small Grapes without any great store of iuice therein, and the stone within it bigger then in any other Grape: naturally it runneth on the ground, and beareth little.

#### The Vse of Vines, Grapes, and other parts that come of them.

The greene leaues of the Vine are cooling and binding, and therefore good to put among other herbes that make gargles and lotions for sore mouthes.

And also to put into the broths and drinke of those that haue hot burning feauers, or any other inflammation.

They stay (as it is held for true) wemens longings, if they be either taken inwardly, or applyed outwardly.

Wine is vsually taken both for drinke and medicine, and is often put into sawces, broths, cawdles, and gellies that are giuen to the sicke. As also into diuers Physicall drinke, to be as a *vehiculum* for the properties of the ingredients.

It is distilled likewise after diners manners, with diuers things, for diuers & sundry wateres to drinke, & for diuers purposes both inward and outward.

As

1. Vitis nigra minores. The small blacke Grape. 2. Vitis cerasiferae maiores. The great blew Grape. 3. Vitis Muscatellina. The Muscadine Grape. 4. Vitis Serrata. The Burlat Grape. 5. Vitis cordata. The Rayfins of the tunne Grape. 6. Ficus. The Figge tree.

B. b

Also distilled of it selfe, is cailed Spirit of wine, which serueth to dissolve, and to draw out the tincture of diuers things, and for many other purposes.

The iuice or veriuice that is made of green hard grapes, before they be ripe, is vsed of the Apothecaries to be made into a Syrupe, that is very good to coole and refresh a faint stomacke.

And being made of the riper grapes is the best veriuice, farre exceeding that which is made of crabs, to be kept all the yeare, to be put both into meates and medicines.

The grapes of the best sorts of Vines are pressed into wine by some in these dayes vs, and much more as Iverily beleue in times past, as by the name of Vineyard giuen to many places in this Kingdome, especially where Abbies and Monasteries stood, may bee conjectured: but the wine of late made hath beeene but small, and not durable, like that which commeth from beyond Sea, whether our vnkindly yeares, or the want of skill, or a conuenient place for a Vineyard be the caufe, I cannot well tell you.

Grapes of all sorts are familiarly eaten when they are ripe, of the sicke sometimes as well as the sound.

The dried grapes which we call great Raynsins, and the Currans which we call small Raynsins, are much vsed both for meates, broths, and sawces, in diuers manners, as this Countrey in generall aboue any other, wherein many thousands of Frailesfull, Pipes, Hogs-heads, and Buts full are spent yearly, that it breedeth a wonder in them of those parts where they growe and prouide them, how we could spend so many.

The Raynsins of the Sunne are the best dried grapes, next vnto the Damasco, and are very wholsome to eate fasting, both to nourish, and to helpe to loosen the belly.

The dried Lees of wine called Argoll or Tartar, is put to the vse of the Goldsmith, Dyer, and Apothecary, who doe all vse it in seuerall manners, very one in his art.

Of it the Apothecaries make *Creamor Tartari*, a fine medicine to bee vsed, as the Physician can best appoint, and doth helpe to purge humours by the stoole.

Thereof likewise they make a kinde of water or oyle, fit to bee vsed, to take away freckles, spots, or any such deformities of the face or skinne, and to make it smooth. It causeth likewise haire to growe more abundantly in those places where it naturally shoulde growe.

The liquor of the Vine that runneth forth when it is cut, is commended to be good against the stone wheresoeuer it be; but that liquor that is taken from the end of the branches when they are burnt, is most effectuall to take away spots and markes, ring-wormes and tetteres in any place.

## CHAP. VII.

### *Ficus. The Figge tree.*

The Figge trees that are noured vp in our country are of three sorts, whereof two are high, the one bearing against a wall godly sweete and delicate Figs, called Figs of Algarua, and is blewish when it is ripe: the other tall kinde is nothing so good, neither doth bear ripe Figs so kindly and well, and peraduenture may be the white ordinary kinde that commeth from Spaine. The third is a dwarfe kinde of Figge tree, not growing much higher then to a mans body or shoulders, bearing excellent good Figges and blew, but not so large as the first kinde.

The Figge trees of all these three kindes are in leaves and growing one like vnto another, sauing for their height, colour, and sweetnesse of the fruit, haing many armes or branches, hollow or pithy in the middle, bearing very large leaves, and somewhat thicke, diuided sometimes into three, but vsually into fve sections, of a darke greene colour on the vpper side, and whitish vnderneath, yeelding a milkie iuyce when it is broken,

broken, as the branches also, or the figges when they are greene: the fruit breaketh out from the branche without any blossome, contrary to all other trees of our Orchard, being round and long, fashioned very like vnto a small Pears, full of small white grains or kernels within it, of a very sweete taste when it is ripe, and very mellow or soft, that it can hardly be carried farre without bruising.

The other two sortes you may easily know and understand, by so much as hath been said of them. Take only this more of the Figge tree, That if you plant it not against a bricke wall, or the wall of an house, &c, it will not ripen so kindly. The dwarfe Figge tree is more tender, and is therefore planted in great square tubs, to be remoued into the sunne in the Summer time, and into the house in Winter.

### The Vse of Figges.

Figges are serued to the table with Raynsins of the Sunne, and blanched Almonds, for a Lenten dish.

The Figs that growe with vs when they are ripe, and fresh gathered, are eaten of diuers with a little salt and pepper, as a dainty banquet to entertaine a freind, which seldome passeth without a cup of wine to wash them downe.

In Italy (as I haue beeene enformed by diuers Gentlemen that haue liued there to study physike) they eate them in the same manner, but dare not eate many for feare of a feuer to follow, they doe account them to be such breeders of blood, and heaters of it likewise.

The Figges that are brought vs from Spaine, are vsed to make Ptisan drinke, and diuers other things, that are giuen them that haue coughes or colds.

It is one of the ingredients also with Nuts and Rice, into Mithridates counterpoison.

The small Figges that growe with vs, and will not ripen, are preserued by the Comfitmakers, and candied also, to serue as other moist or candied banqueting stufte.

## CHAP. VIII.

### *Sorbus. The Seruicetree.*

Here are two kindes of Seruice trees that are planted in Orchards with vs, and there is also a wilde kinde like vnto the later of them, with Ashen leaues, found in the woods growing of it selfe, whose fruit is not gathered, nor vsed to bee eaten of any but birds. And there is another kinde also growing wilde abroad in many places, taken by the Country people where it groweth, to be a Seruice tree, and is called in Latine, *Aria Theophrasti*, whose leaues are large, somewhat like Nut tree leaues, but greene aboue, and grayish vnderneath: some doe vse the fruit as Seruices, and for the same purposes to good effect, yet both of these wilde kindes wee leauie for another worke, and here declare vnto you onely those two sortes are noured vp in our Orchards.

The more common or ordinary Seruice tree with vs, is a reasonable great tree, covered with a smooth bark, spread into many great armes, whercon are set large leaues, very much cut in on the edges, almost like vnto a Vine leafe, or rather like vnto that kind of Maple, that is vsually called the Sycomore tree with vs: the flowers are white, and growe many clustering together, which after bring forth small browne berries when they are ripe, of the bignesse almost of Hasell nuts, with a small tuft, as if it were a crowne on the head, wherein are small blacke kernels.

The other kinde, which is more rare with vs, and brought into this Land by Iohn Tradescante, heretofore often remembred, hath diuers winged leaues, many set together like vnto an Ashen leafe, but smaller, and euery one endented about the edges: the flowers growe in long clusters, but nothing so many, or so close set as the wilde kinde: the fruit of this tree is in some round like an Appel, and in others a little longer like

like a Pearc, but of a more pleasant taste then the ordinarie kinde, when they are ripe and mellowed, as they vse to doe with both these kindes, and with Medlars.

#### The Vse of Services.

They are gathered when they growe to be neare ripe (and that is never before they haue felt some frosts) and being tyed together, are either hung vp in some warme roome, to ripen them thoroughly, that they may bee eaten, or (as some vse to doe) lay them in strawe, chaffe, or branne, to ripen them.

They are binding, fit to be taken of them that haue any scouring or laske, to helpe to stay the fluxe; but take heed, lest if you bind too much, more paine and danger may come thereof then of the scouring.

#### CHAP. IX.

##### *Mespilus.* The Medlar tree.

There are three sorts of Medlers: The greater and the lesser English, and the Neapolitan.

The great and the small English Medlar differ not one from the other in any thing, but in the size of the fruit, except that the small kinde hath some prickes or thornes vpon it, which the great one hath not, bearing diuers boughes or armes, from whence breake forth diuers branches, whereon are set long and somewhat narrow leaues, many standing together; in the middle whereof, at the end of the branch, commeth the flower, which is great and white, made of fve leaues, broad at the ends, with a nicke in the middle of euery one; after which commeth the fruit, being round, and of a pale brownish colour, bearing a crowne of those small leaues at the toppe, which were the huske of the flower before, the middle thereof being somewhat hollow, and is harsh, able to choake any that shall eate it before it be made mellow, wherein there are certaine flat and hard kernels.

The Medlar of Naples groweth likewise to bee a reasonable great tree, spreading forth armes and branches, whereon are set many gashed leaues, somewhat like vnto Hawthorne leaues, but greater, and likewise diuers thornes in many places: the flowers are of an herbie greene colour, and small, which turne into smaller fruit then the former, and rounder also, but with a small head or crowne at the toppe like vnto it, and is of a more sweete and pleasant taste then the other, with three seeds only therein ordinarily.

#### The Vse of Medlars.

Medlars are vset in the same manner that Services are, that is, to be eaten when they are mellowed, and are for the same purpos(es) to binde the body when there is a cause: yet they as well as the Services, are often eaten by them that haue no neede of binding, and but onely for the pleasant sweetnesse of them when they are made mellow, and sometimes come as a dish of ripe fruit at their fit season, to be serued with other sortes to the table.

#### CHAP. X.

##### *Loto.* The Lote or Nettletree.

The first kinde of Lote tree, whereof Dioscorides maketh mention, is but of one kinde; but there are some other trees spoken of by Theophrastus, that may be referred thereunto, which may bee accounted as bastard kindes thereof, of which I meane to entreate in this Chapter, hauing giuen you before the description of

1 *Sorbus legitima.* The true Service tree. 2 *Sorbus vulgaris flos Terminalis.* The ordinary Service tree. 3 *Mespilus vulgaris.* The common Medlar tree. 4 *Mespilus Arnica.* The Medlar of Naples. 5 *Lorus arbor.* The Nettle tree. 6 *Lorus Virginiana.* The Pishamia or Virginia Plumme. 7 *Cornus mas.* The Cerasifl. Cherry tree.

## The Orchard.

of another kinde hereof (by the opinion of good Authors) vnder the name of *Lazzo-cerasus*.

The first or true Lote tree groweth to be a tree of a great height, whose bodie and elder branches are couered with a smooth darke greene bark, the leaues are somewhat rough in handling, of a darke greene colour, long pointed, and somewhat deepe dented about the edges, somewhat like vnto a Nettle leafe, and oftentimes growe yellow toward Autumne: the flowers stand here and there scattered vpon the branches; after which come round berries like vnto Cherries, hanging downwards vpon long foot-stalkes, greene at the first, and whitish afterwards; but when they are ripe they become reddish, and if they be suffered to hang too long on the branches, they grow blackish, of a pleasant austre taste, nor to be misliked, wher in is a hard round stone.

The second, which is a bastard kinde, and called *Guasacum Patatinum*, groweth to bee a faire tree, with a smooth darke greene bark, shooting out many faire great boughes, and also slender greene branches, beset with faire broad greene leaues, almost like vnto the leaues of the Cornell tree, but larger: the flowers growe along the branches close vnto them, without any or with a very short foot-stalke consisting of foure greene leaues, which are as the huske, containing within it a purplish flower, made of foure leaues somewhat reddish: the fruit standeth in the middle of the green huske, greene at the first, and very harsh, but red and roued when it is ripe, and somewhat like a Plumme, with a small point or pricke at the head thereof, and of a reasonable pleasant taste or relish, wherein are contained flat and thicke browne seeds or kernels, like vnto the kernels of *Cafisia Fistula*, somewhat hard, and not so stonic, but that it may somewhat easily be cut with a knife.

The third is called in Virginia *Pisbamin*, The Virginia Plumme (if it be not all one with the former Guaiacana, whereof I am more then halfe perswaded) hath growne with vs of the kernels that were sent out of Virginia, into great trees, whose wood is very hard and brittle, and somewhat white withall: the branches are many, and grow slender to the end, couered with a very thinne greenish bark, whereon doe grow many faire broad greene leaues, without dent or notch on the edges, and so like vnto the former *Guaiacum*, that I verily thinke it (as I before said) to bee the same. It hath not yet borne flower or fruit in our Countrey that I can vnderstand: but the fruit, as it was sent to vs, is in forme and bignesse like vnto a Date, couered with a blackish skinne, set in a huske of foure hard leaues, very firme like vnto a Date, and almost as sweete, with great flat and thicke kernels within them, very like vnto the former, but larger.

### The Vse of these Lote trees.

The first sort is eaten as an helper to coole and binde the body: the last, as Captaine Smith relateth in the discouery of Virginia, if the fruit be eaten while it is greene, and not ripe, is able by the harsh and binding taste and quality to draw ones mouth awry (even as it is said of the former Guaiacana) but when it is thorough ripe it is pleasant, as I said before.

## CHAP. XI.

### *Cornus mas*. The Cornell tree.

The Cornell tree that is planted in Orchards, being the male (for the female is an hedge bush) is of two sorts, the one bearing red, the other whiter berries, which is very rare yet in our country, and not differing else.

It groweth to a reasonable bignesse and height, yet neuer to any great tree, the wood whereof is very hard, like vnto horne, and thereof it obtained the name: the body and branches are couered with a rugged bark, and spreadeth reasonable well, hauing somewhat smooth leaues, full of veines, plaine, and not dented on the edges: the flowers are many small yellow tufts, as it were of short haire or threads set together, which come forth before any leafe, and fall away likewise before any leafe bee much open: the fruit are long and round berries, of the bignesse of small Olives, with an hard

## The Orchard.

hard round stone within them, like vnto an Olive stone, and are of a yellowish red when they are ripe, of a reasonable pleasant taste, yet somewhat austere withall.

The white (as I said) is like vnto the red, but onely that his fruit is more white when it is ripe.

### The Vse of the Cornelles.

They helpe to binde the body, and to stay laskes, and by reason of the pleasantnesse in them when they are ripe, they are much desired.

They are also preserued and eaten, both for rarity and delight, and for the purpose aforesaid.

## CHAP. XII.

### *Cerasus*. The Cherry-tree.

There are so many varieties and differences of Cherries, that I know not well how to expresse them vnto you, without a large relation of their severall formes. I will therefore endeavour after one generall description (as my custome is in many other the like variable fruits) to giue as briefe and short notes vpon all the rest, as I can both for leafe and fruit, that so you may the better know what the fruit is, when you haue the name.

The English Cherrie tree groweth in time to be of a reasonable bignesse and height, spreading great armes, and also small twiggy branches plentifully; the leaues whereof are not vrry large or long, but nicked or dented about the edges: the flowers come forth two or three or foure at the moit together, at a knot or ioynt, euerie one by it selfe, vpon his owne small and long footestalke, consisting of fve white leaues, with some threds in the middle; after which come round berries, greene at the first, and red when they are through ripe, of a meane bignesse, and of a pleasant sweete taste, somewhat tart withall, with a hard white stone within it, whose kernell is somewhat bitter, but not vnpleasant.

The Flanders Cherrie differeth not from the English, but that it is somewhat larger, and the Cherry somewhat greater and sweeter, and not so fower.

The early Flanders Cherry is more rathre or early ripe, almost as soone as the May Cherry, especilly planted against a wall, and of many false knaues or Gardiners are sold for May Cherrie trees.

The May Cherry in a standard beareth ripe fruite later then planted against a wall, where the berries will be red in the verie beginning of May sometimes.

The Arch-Dukes Cherrie is one of the fairest and best cherries wee haue, being of a very red colour when it is ripe, and a little long more then round, and somewhat pointed at the end, of the best relish of any Cherrie whatsoeuer, and of a firme substance; scarce one of twentie of our Nurserie men doe sell the right, but giue one for another: for it is an inherent qualtie almost hereditarie with most of them, to sell any man an ordinary fruit for whatsoeuer rare fruit he shall aske for: so little they are to be trusted.

The ounce Cherrie hath the greatest and broadest leafe of any other cherrie, but beareth the smalles store of cherries euerie yeare that any doth, and yet blossometh well: the fruit also is nothing answerable to the name being not verie great, of a pale yellowish red, neere the colour of Amber, and therefore some haue called it, the Amber Cherrie.

The great leaved Cherrie is thought of diuers to bee the Ounce Cherrie, because it hath almost as great a leafe as the former: but the fruit of this also doth not answer the expectation of so great a leafe, being but of a meane bignesse, and a small bearer, yet of a pale reddish colour.

The true Gascoigne Cherry is known but to a few, for our Nursery men do so change the names of most fruits they sell, that they deliuere but very few true names to any: In former times before our wilde blacke Cherrie was found to grow plentifullly in our owne woods in many places of this Land, the French continually stored vs with wilde stockes to graft vpon, which then were called Gascoigne stocks, but since they haue so termed.

termed another red Cherrie, and obtruded it vpon their customers: but the true is one of our late ripe white Cherries, even as Gerard saith, it is a great cherrie and spotted: and this is that Cherrie I so commend to be a fit stocke to graft May cherries vpon.

The Morello Cherrie is of a reasonable bignesse, of a darke red colour when they are full ripe, and hang long on, of a sweetish sower taste, the pulpe or substance is red, and somewhat firme: if they be dried they will haue a fine sharpe or sower taste very delectable.

The Hartlippe Cherrie is so called of the place where the best of this kinde is nourished vp, being betweene Sittingbourne and Chattam in Kent, and is the biggest of our English kindes.

The smaller Lacure or Hart Cherrie is a reaonable faire Cherrie, full aboue, and a little pointing downwaide, after the fashion of an heart, as it is vsually painted, blackish when it is full ripe, and lesser then the next.

The great Lacure or Hart Cherrie differeth not in forme, but in greatnessse, being vsually twice as great as the former, and of a reddish blacke colour also: both of them are of a firme substance, and reasonable sweete. Some doe call the white cherrie, the White hart cherrie.

The Luke Wardes Cherrie hath a reasonable large leafe, and a larger flower then many other: the cherries grow with long stalkes, and a stome of a meane size within them, of a darke reddish colour when they are full ripe, of a reasonable good rellysh, and beareth well.

The Corone Cherrie hath a leafe little differing from the Luke Wardes cherrie; the fruit when it is ripe, is of a faire deepe red colour, of a good bignesse, and of a verie good taste, neither verie sweete or sower: the pulpe or iuice will staine the hands.

The Vrinall Cherrie in a most fruitfull yare is a small bearer, hauing many years none, and the best but a few; yet doth blossome plentifully every yare for the most part: the cherrie is long and round, like vnto an Vrinall, from whence it tooke his name; reddish when it is full ripe, and of an indifferent sweete rellysh.

The Agriot Cherrie is but a small Cherrie, of a deepe reddish colour when it is ripe, which is late; of a fine sharpe taste, most pleasant and wholesome to the stomacke of all other cherries, as well while they are fresh as being dried, which manner they much vse in France, and keepe them for the vse both of the sicke and sound at all times.

The Biguarre Cherrie is a fair cherrie, much spotted with white spots vpon the pale red berry, and sometimes discoloured halfe white and halfe reddish, of a reasonable good rellysh.

The Morocco Cherrie hath a large white blossome, and an indifferent big berrie, long and round, with a long stalk of a darke reddish purple colour, a little tending to a blew when it is full ripe, of a firme substance: the iuice is of a blackish red, discoloring the bands or lips, and of a pleasant taste: Some doe thinke that this and the Morello be both one.

The Naples Cherrie is also thought to bee all one with the Morello or Morocco.

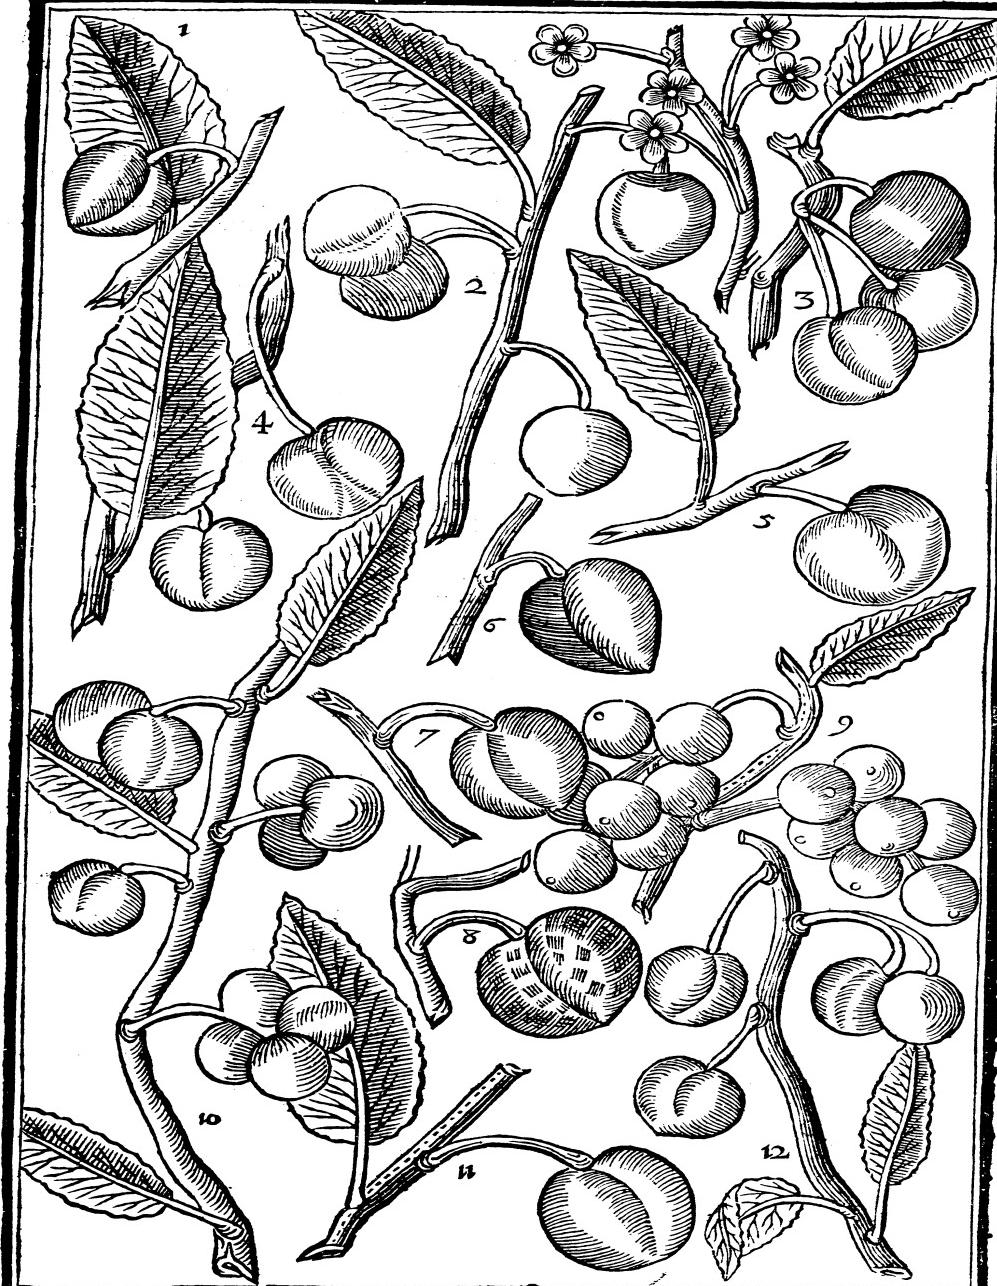

The white Spanish Cherrie is an indifferent good bearer, the leafe and blossome somewhat large, and like the Luke Wardes cherrie: the cherries are reasonable faire berries, with long stalkes and great stomes, white on the outside, with some rednesse, on the one side of a firme substance, and reasonable sweet, but with a little aciditie, and is one of the late ripe ones: But there is another late ripe white Cherry, which some call the Gafoigne, before remembred.

The Flanders cluster Cherrie is of two sorts, one greater then another: the greater kinde hath an indifferent large leafe; the blossomes haue many threds within them, shewing as it were many parts, which after turne into clusters of berries, foure, five or sixe together, and but with one stalk vnder them, as if they grew one out of another, and sometimes they will beare but two or three, and most of them but one cherry on a stalk, which are red when they are ripe, very tender, and waterish sweete in eating.

The lesser is in all things like the greater, but smaller, which maketh the difference.

The wildecluster or birds cluster Cherry beareth many blossomes set all along the stalkes, and cherries after them in the same manner, like a long thinnie bunch of grapes, and therefore called of some the Grape cherry: there are of them both red and blacke.

The

1. *Cerasus praeceps*. The May Cherry. 2. *Cerasus Baroniæ*. The Flanders Cherry. 3. *Cerasus Hispanica fuscata*. The white Cherry. 4. *Cerasus platanifolia*. The great-leaved Cherry. 5. *Cerasus Lacis Wardi*. Luke Wards Cherry. 6. *Cerasus Neapolitana*. The Naples Cherry. 7. *Cerasus Corauna*. The Heart Cherry. 8. *Cerasus maculata*. The biguarre or spotted Cherry. 9. *Cerasus amurensis*. The wilde cluster Cherry. 10. *Cerasus Lymbejiana*. The Flanders clauer Cherry. 11. *Cerasus Archiducae*. The Archdukes Cherry. 12. *Cerasus dwarfus*. The dwarfie Cherry.

The soft sheld Cherrie is a small red cherrie when it is ripe, hauing the stone within it so soft and tender, that it may easily be broken in the eating of the cherrie.

John Tradescantes Cherrie is most vsually sold by our Nursery Gardiners, for the Archdukes cherrie, because they haue more plenty thereof, and will better be increased, and because it is so faire and good a cherrie that it may be obtruded without much discontent: it is a reasonable good bearer, a faire great berrie, deepe coloured, and a little pointed.

The Baccalaos or New-found-land Cherrie hath a shining long leafe, most like vnto a Peach leafe, the blossomes come very many together as it were in an umbell, which is such a cluster as is neither like the Flanders cluster, nor the wilde cluster cherrie blossom: it bringeth forth berries standing in the same manner euerie one vpon his own foostalke, being no bigger then the largest berrie of the red Curran tree or bush, of a pale or waterish red colour when it is ripe.

The strange long cluster Cherrie, or *Padus Theophrasti Dalechampio* is reckoned by the Author of that great Herball that goeth vnder his name, among the sorts of cherries; and so must I vntill a fitter place be found for it. It groweth in time to be a great tree, with a sad coloured barke both on the bodie and branches, whereon doe grow many leaues, somewhat broade, shorter, harder, and a little more crumpled then any cherrie leafe: the blossomes are very small, and of a pale or whitish colour, smelling very sweete and strong, or rather heady, like Orange flowers, growing on small long branches, very like the toppe of flowers vpon the Laburnum or Beane trefoile trees: after which come small blacke berries, growing together all along the long stalk, like vnto the wilde cluster or birds cherrie mentioned before, but not much bigger then tares, with small stones within them, and little or no substance vpon them: the French call the tree *Paster*, because the wood thereof stinketh, and make it to be wonderfull that the blossomes of the tree should be so sweete, and the wood so stinking.

The Cullen Cherrie is a darke red cherrie like the Agriot, which they of those parts neare Cullen and Vtrecht &c. vse to put into their drinke, to giue it the deeper colour.

The great Hungarian Cherrie of Zwerts is like both in leafe and fruite vnto the Morello cherrie, but much greater and fairer, and a far better bearer: for from a small branch hath beene gathered a pound of cherries, and this is vsuall continually, and not accidentally, most of them foure inches in compasse about, and very many of them more of a faire deepe red colour, and very sweete, excelling the Arch-Dukes cherry, or any other whatsoeuer.

The Cameleon or strange changeable Cherry deseruedly hath this name, although of mine owne imposition, not only because it beareth vsually both blossomes, greene and ripe fruit at one time thereupon, but that the fruit will be of many formes; some round, some as it were square, and some bunched forth on one side or another, abiding constant in no fashion, but for the most part shewing forth all these diuersities euerie year growing vpon it: the fruit is of a very red colour, and good taste.

The great Rose Cherry, or double blossomed Cherry differeth not in any thing from the English Cherrie, but only in the blossomes, which are very thicke of white leaues, as great and double as the double white Crowfoote, before remembred, and sometimes out of the middle of them will spring another smaller flower, but double also; this sel-dom beareth fruit, but when it doth I suppose it commeth from those blossomes are the least double, and is red, no bigger then our ordinary English cherrie.

The lesser Rose or double blossomed Cherrie beareth double flowers also, but not so thicke and double as the former, but beareth fruit more plentifully, of the same colour and bignesse with the former.

The Dwarfe Cherrie is of two sorts, one whose branches fall downe low, round about the body of it, with small greene leaues, and fruit as small, of a deep red colour.

The other, whose branches, although small, grow more vpright, hauing greener shining leaues: the fruit is little bigger then the former, red also when it is ripe, with a little point at the end: both of them of a sweetish relish, but more sower.

The great bearing Cherry of Master Millen is a reasonable great red cherry, bearing very plentifully, although it bee planted against a North wall, yet it will bee late ripe, but of an indifferent sweet and good relish.

The long finger Cherry is another small long red one, being long & round like a finger, wherof it took the name: this is not the Vrinall cherry before, but differing from it.

The

### The Vse of Cherries.

All these sorts of Cherries serue wholly to please the palate, and are eaten at all times, both before and after meales.

All Cherries are cold, yet the sower more then the sweete; and although the sweete doe most please, yet the sower are more wholesome, if there bee regard taken in the vsing.

The Agriot or sower Cherries are in France much vsed to bee dried (as is said before) as Prunes are, and so serue to ministred to be the sick in all hot diseases, as feuers &c. being both boyled in their drinke, and taken now and then of themselves, which by reason of their tartnesse, doe please the stomacke passing well.

The Gum of the Cherrie tree is commended to bee good for those are troubled with the grauell or stone. It is also good for the cough being dissolved in liquour, and stirreth vp an appetite. The distilled water of the blacke Cherries, the stones being broken among them, is vsed for the same purpose, for the grauell, stone, and winde.

### C H A P. XIII.

#### *Prunus. The Plumme tree.*

There are many more varieties of Plummes then of Cherries, so that I must follow the same order with these, that I did with them, euen give you their names apart, with briefe notes vpon them, and one description to serue for all the rest. And in this recital I shall leave out the Apricocks which are certainly a kind of Plum, of an especiall difference, and not of a Peach, as Galen and some others haue thought, and set them in a chapter by themselves, and only in this set down those fruits are vsually called Plums.

The Plum tree (especially diuers of them) riseth in time to bee a reasonable tall and great tree, whose bodie and greater armes are couered with a more rugged barke, yet in some more or lesse, the younger branches being smooth in all, the leaues are somewhat rounder then those of the Cherrie tree, and much differing among themselves, some being longer, or larger, or rounder then others, and many that are exercized herein, can tell by the leafe what Plum the tree beareth (I speake this of many, not of all) as in many Cherries they can doe the like: the flowers are white, consisting of five leaues: the fruit is as variable in forme, as in taste or colour, some being oval, or Pear fashion or Almond like, or spherically or round, some firme, some soft and waterish, some sweete, some sower or harsh, or differing from all thet tastes: and some white, others blacke, some red, others yellow, some purple, others blew, as they shall bee briefly set downe vnto you in the following lines, where I meane not to insert any the wilde or hedge fruit, but those only are fit for an Orchard, to be stored with good fruit: and of all which sorts, the choyest for goodnessse, and rarest for knowledge, are to be had of my very good friend Master John Tradescante, who hath wonderfully laboured to obtaine all the rarest fruits hee can haue off in any place of Christendome, Turkey, yea or the whole world; as also with Master John Millen, dwelling in Olde streete, who from John Tradescante and all others that haue had good fruit, hath stored himselfe with the best only, and he can sufficiently furnish any.

The Amber Primordian Plumme is an indifferent faire Plumme, early ripe, of a pale yellowish colour, and of a waterish taste, not pleasing.

The red Primordian Plumme is of a reasonable size, long and round, reddish on the outside, of a more dry taste, and ripe with the first sorts in the beginning of August.

The blew Primordian is a small plumme, almost like the Damascene, and is subiect to drop off from the tree before it be ripe.

The white Date Plum is no very good fruit.

The

The red Date plumme is a great long red pointed plumme, and late ripe, little better then the white.

The blacke Muzzell plumme is a good plumme, reasonable drye, and tasteth well.

The red Muzzell Plumme is somewhat flat as well as round, of a very good taste, and is ripe about the middle of August.

The white Muzzell plumme is like the redde, but somewhat smaller, and of a whitish greene colour, but not so well tasted.

The Imperiall plum is a great long reddish plum, very waterish, and ripeneth somewhat late.

The Gaunt plum is a great round reddish plum, ripe somewhat late, and eateh waterish.

The red Pescod plum is a reasonable good plum.

The white Pescod plum is a reasonable good rellyed plumme, but somewhat waterish.

The greene Pescod plum is a reasonable big and long pointed plum, and ripe in the beginning of September.

The Orenge plum is a yellowish plum, moist, and somewhat sweetish.

The Morocco plumme is blacke like a Damson, well tasted, and somewhat drye in eating.

The Dine plum is a late ripe plum, great and whitish, speckled all ouer.

The Turkie plum is a large long blackish plum, and somewhat flat like the Muzzell plum, a well rellyed dry plum.

The Nutmeg plumme is no bigger then a Damson, and is of a greenish yellow colour when it is ripe, which is with vs about Bartholmew tide, and is a good plum.

The Perdigon plumme is a dainty good plumme, early blackish, and well rellyed.

The Verdoch plum is a great fine greene shining plum fit to preserue.

The Ienua plum is the white Date plum, before remembred.

The Barberry plum is a great early blacke plum, and well tasted.

The Prunella plum is a small white plum, of a fine tart taste : it was wont to bee v-  
erally brought ouer in small round boxes, and sold most commonly at the Confit-makers, (cut in twaine, the stone cast away) at a very deere rate: the tree groweth and  
beareth well with vs.

The Shepway Bulleis is of a darke blewifh brown colour, of a larger size then the ordinary, and of a sharpe taste, but not so good as the common.

The white and the blacke Bulleis are common in most Countries, being small round plums, lesser then Damsons, sharper in taste, and later ripe.

The Flushing Bulleis growth with his fruite thicke clustering together like grapes.

The Winter Creke is the latest ripe plum of all sorts, it groweth plentifully about Bishops Hatfield.

The white Pearle plum early ripe, is of a pale yellowifh greene colour.

The late ripe white Pearle plum is a greater and longer plum, greenish white, and is not ripe vntill it be neare the end of September, both waterish plums.

The blacke Pearle plum is like unto the white Pearle plumme, but that the colour is blackish when it is ripe, and is of a very good relly, more firme and drye then the other.

The red Pearle plumme is of the same fashion and goodnessse, but is the worst of the three.

The white Wheate plum is a waterish fulsome plum.

The red Wheate plum is like the other for taste.

The Bowle plum is flat and round, yet flatter on the one side then on the other, which caused the name, and is a very good rellyed blacke plum.

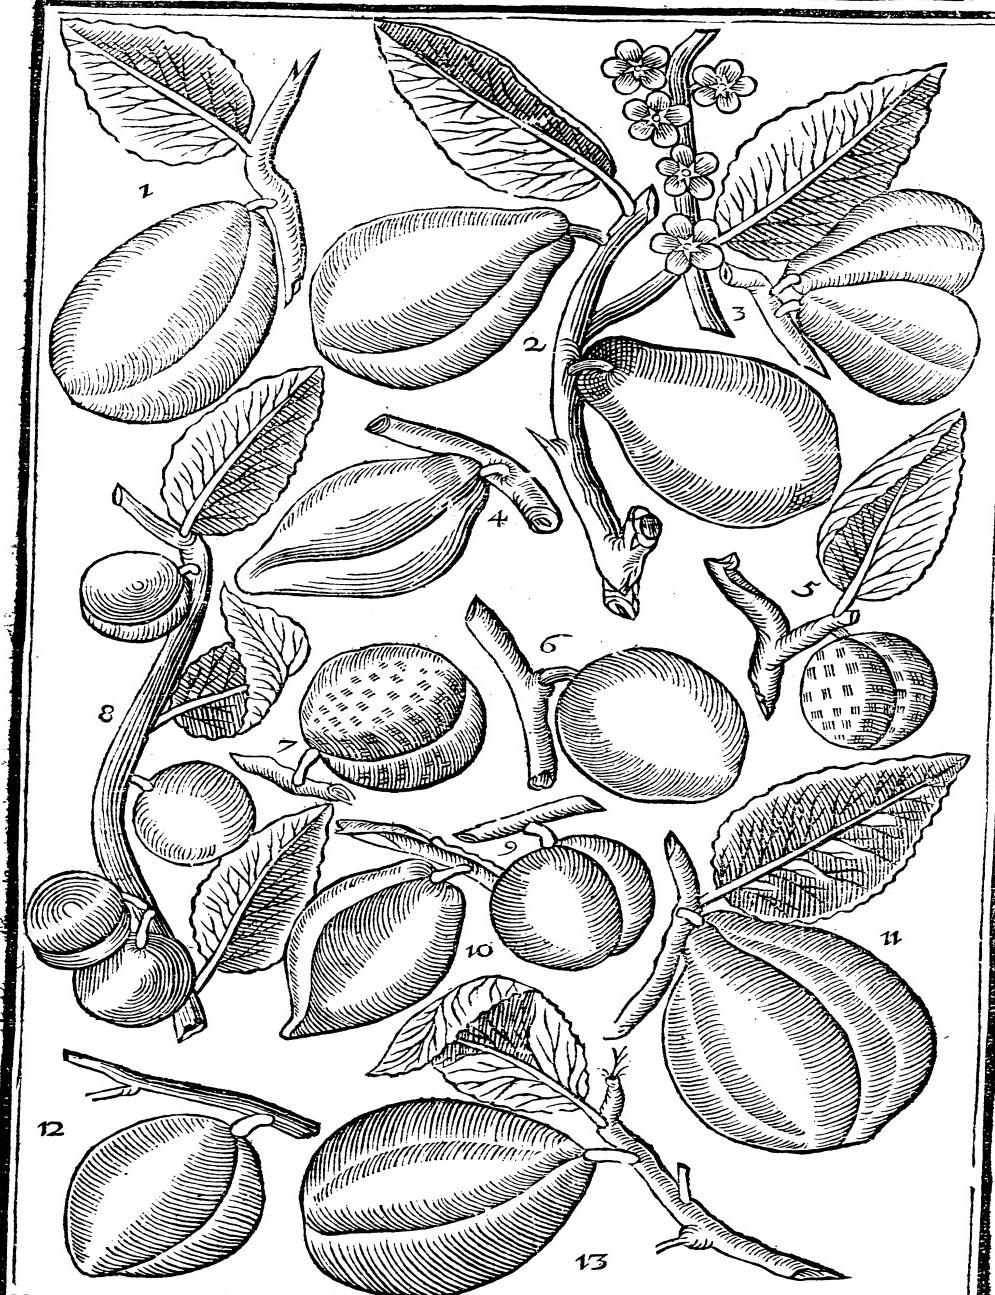

The Friars plumme is a very good plum, well tafted, and comming cleane from the stone, being blacke when it is ripe, and some whitish spots vpon it.

The Catalonia plum is a very good plum.

The don Alteza is also a very good plum.

The Muscadine plum, some call the Queene mother plumme, and some the Cherry plum, is a faire red plum, of a reasonable bignesse, and ripe about Bartholmew tide.

The Christian plum, called also the Nutmeg plum, the tree groweth very shrubby, and

1. *Prunus Imperiale*. The Imperiall Plum. 2. *Prunus Turcicum*. The Turkey Plum. 3. *Prunus persica rubrum*. The red Primordian Plum. 4. *Prunus Mazzellina*. The Muzzell Plum. 5. *Prunus Ambarinum*. The Amber Plum. 6. *Prunus Regium*. The Queen mother Plum. 7. *Prunus persica*. The green Oysterly Plum. 8. *Prunus Arantiacon*. The Orenge Plum. 9. *Prunus Myrtiflora*. The Nutmeg Plum. 10. *Prunus Sylvestris*. The Plum. 11. *Prunus Gandavensis*. The Gagat Plum. 12. *Prunus Dafylata*. The Date Plum. 13. *Prunus Pyramidalis*. The circly Peare Plum.

and will abide good for six weekes at the least after it is gathered , and after all other plums are spent.

The Cherry plum remembred before, speaking of the Muscadine plum , is a very good plum, but small.

The Amber plum is a round plum, as yellow on the outside almost as yellow waxe, of a sowre vnpleasant taste that whiche I tasted, but I thinke it was not the right ; for I haue seene and tasted another of the same bignesse, of a paler colour, farre better relished, and a firmer substance, comming cleane from the stone like an Apricocke.

The Apricocke plum is a good plum when it is in its perfection, but that is seldome; for it doth most vsually cracke , thereby diminishing much of its goodnesse , and besides yeeldeth gumme at the crackes.

The Eason plum is a little red plum, but very good in taste.

The Violet plum is a small and long blackish blew plum , ripe about Bartholmew tide, a very good dry eating fruit.

The Grape plum is the Flushing Bulleis before remembred

The Dennie plum is called also the Cheston, or the Friars plum before remembred.

The Damaske Violet plum, or Queen mother plum spoken of before.

The blacke Damascene plum is a very good dry plum , and of a darkeblew colour when it is ripe.

The white Damson is nothing so well relished as the other.

The great Damson or Damaske plum is greater then the ordinary Damson, and sweeter in taste.

The blew Damson well knowne, a good fruit.

The Coferers plum is flat, like vnto a Peare plum , it is early ripe and blacke , of a very good relish.

The Margate plum the worst of an hundred.

The greene Oysterly plum is a reasonable great plum, of a whitish green colour when it is ripe, of a moist and sweete taste, reasonable good.

The red Mirobalane plum groweth to be a great tree quickly, spreading very thicke and farre, very like the blacke Thorne or Sloe bush : the fruit is red, earlicr ripe, and of a better taste then the white.

The white Mirobalane plum is in most things like the former red, but the fruit is of a whitish yellow colour, and very pleasant, especially if it be not ouer ripe: both these had need to be plashed against a wall, or else they will hardly beare ripe fruit.

The Olieue plums is very like a greene Olieue, both for colour and bignesse, and groweth lowe on a small bushing tree , and ripeneth late , but is the best of all the sorts of greene plums.

The white diaper'd plum of Malta, scarce knowne to any in our Land but John Tradescante, is a very good plum, and striped all ouer like diaper, and thereby so called.

The blacke diaper'd plum is like the Damascene plum, being blacke with spots , as small as pins points vpon it, of a very good relish.

The Peake plum is a long whitish plum, and very good.

The Pishamia or Virginia plum is called a plum, but vtterly differeth from all sorts of plums, the description whereof may truely enforme you , as it is set downe in the tenth Chapter going before, whereunto I referre you.

#### The Vse of Plums.

The great Damaske or Damson Plummes are dried in France in great quantities, and brought ouer vnto vs in Hogs-heads , and other great vessels , and are those Prunes that are vsually sold at the Grocers , vnder the name of Damaske Prunes : the blacke Bulleis also are those (being dried in the same manner) that they call French Prunes , and by their tartnesse are thought to binde, as the other, being sweet, to loosen the body.

The Bruneola Plumme, by reaon of his pleasant tartnesse, is much accounted of, and being dried, the stones taken from them, are brought ouer to vs in small boxes, and sold deere at the Comfitmakers , where they very often accompany all other sorts of banqueting stuffes.

Some

Some of these Plums, because of their firmenesse , are vndoubtedly more wholesome then others that are sweete and waterish , and cause lesse offence in their stomackes that eat them ; and therefore are preferued with Sugar, to be kept all the yeare. None of them all is vsed in medicines so much as the great Damson or Damaske Prune, although all of them for the most part doe coole, lenifie, and draw forth choller, and thereby are fittest to be vsed of such as haue chollerike Agues.

#### CHAP. X I I I .

##### *Mala Armeniaca sine Pracocia. Apricocks.*

**A** The Apricocke (as I said) is without question a kinde of Plumme, ratherthen a Peach, both the flower being white, and the stome of the fruit smooth also, like a Plumme , and yet because of the excellencie of the fruit, and the difference therein from all other Plummes, I haue thought it meete to entreate thereof by it selfe, and shew you the varieties haue been obserued in these times.

The Apricocke tree riseth vp to a very great height, either standing by it selfe (where it beareth not so kindly , and very little in our country) or planted against a wall, as it is most vsually, hauing a great stemme or body, and likewise many greater armes or branches, couered with a smooth barke : the leues are large, broad, and almost round, but pointed at the ends, and finely dented about the edges : the flowers are white, as the Plumme tree blossomes, but somewhat larger, and rounder set : the fruit is round, with a cleft on the one side, somewhat like vnto a Peach, being of a yellowish colour as well on the inside as outside, of a firme or fast substance , and dry, not ouer-moist in the eating , and very pleasant in taste, containing within it a broad and flat stone, somewhat round and smooth, not rugged as the Peach stone , with a pleasant sweete kernell (yet some haue reported , that there is such as haue their kernels bitter, which I did neuer see or know) and is ripe almost with our first or earliest Plummes, and thereof it tooke the name of *Præcox* , and it may bee was the earliest of all others was then knowne, when that name was giuen.

The great Apricocke, which some call the long Apricocke, is the greatest and fairest of all the rest.

The smaller Apricocke, which some call the small round Apricocke, is thought to be small , because it first sprang from a stome : but that is not so ; for the kinde it selfe being inoculated , will bee alwaies small , and neuer halfe so faire and great as the former.

The white Apricocke hath his leaves more folded together, as if it were halfe double : it beareth but seldome, and very few, which differ not from the ordinary , but in being more white, without any red when it is ripe.

The Mascline Apricocke hath a finer greene leafe, and thinner then the former, and beareth very seldome any stome of fruit, which differeth in nothing from the first , but that it is a little more delicate.

The long Mascline Apricocke hath his fruit growing a little longer then the former, and differeth in nothing else.

The Argier Apricocke is a smaller fruit then any of the other, and yellow , but as sweete and delicate as any of them, hauing a blackish stome within it, little bigger then a Lacure Cherry stome : this with many other sorts John Tradescante brought with him returning from the Argier voyage , whither hee went voluntary with the Fleet, that went against the Pyrates in the yeare 1620.

#### The Vse of Apricocks.

Apricocks are eaten oftentimes in the same manner that other dainty Plummes are, betweene meales of themselues , or among other fruit at banquets.

Ccc 2

They

They are also preserued and candid, as it pleaseth Gentlewomen to bestowe their time and charge, or the Comfitmaker to sort among other candid fruits.

Some likewise dry them, like vnto Peares, Apples, Damsons, and other Plummes.

Matthiolus doth wonderfully commend the oyle drawne from the kernels of the stones, to annoyn the inflamed *bemorrhoides* or piles, the swellings of vlcers, the roughnesse of the tongue and throat, and likewise the paines of the eares.

## C H A P. X V.

*Mala Persica.* Peaches.

**A**S I ordered the Cherries and Plummes, so I intend to deale with Peaches, because their varieties are many, and more knowne in these dayes then in former times: but because the Nectorin is a differing kinde of Peach, I must deale with it as I did with the Apricocke among the Plummes, that is, place it in a Chapter by it selfe.

The Peach tree of it selfe groweth not vsually altogether so great, or high as the Apricocke, becaufe it is lesse durable, but yet spreadeth with faire great branches, from whence spring smaller and slenderer reddish twigges, whereon are set long narrow greene leaues, dented about the edges: the blossomes are greater then of any Plumme, of a deepe bluish or light purple colour: after which commeth the fruit, which is round, and sometimes as great as a reasonable Apple or Pippin (I speake of some sorts; for there be some kindes that are much smaller) with a furrow or cleft on the one side, and couered with a frost or cotton on the outside, of colour either russet, or red, or yellow, or of a blackish red colour; of differing substances and tastes also, some being firme, others waterish, some cleauing fast to the stone on the inside, others parting from it more or lesse easily, one excellinge another very farre, wherein is contained a rugged stone, with many chinkes or clefts in it, the kernell whereof is bitter: the roots growe neither deepe nor farre, and therefore are subiect to the winds standing alone, and nor against a wall. It sooner waxeth old and decayeth, being sprung of a stone, then being inoculated on a Plumme stocke, whereby it is more durable.

The great white Peach is white on the outside as the meate is also, and is a good well rellished fruit.

The small white Peach is all one with the greater, but differeth in size.

The Carnation Peach is of three sorts, two are round, and the third long; they are all of a whitish colour, shadowed ouer with red, and more red on the side is next the sunne: the lesser round is the more common, and the later ripe.

The grand Carnation Peach is like the former round Peach, but greater, and is as late ripe, that is, in the beginning of September.

The red Peach is an exceeding well rellished fruit.

The russet Peach is one of the most ordinary Peaches in the Kingdome, being of a russet colour on the outside, and but of a reasonable rellish, farre meaner then many other.

The Island Peach is a faire Peach, and of a very good rellish.

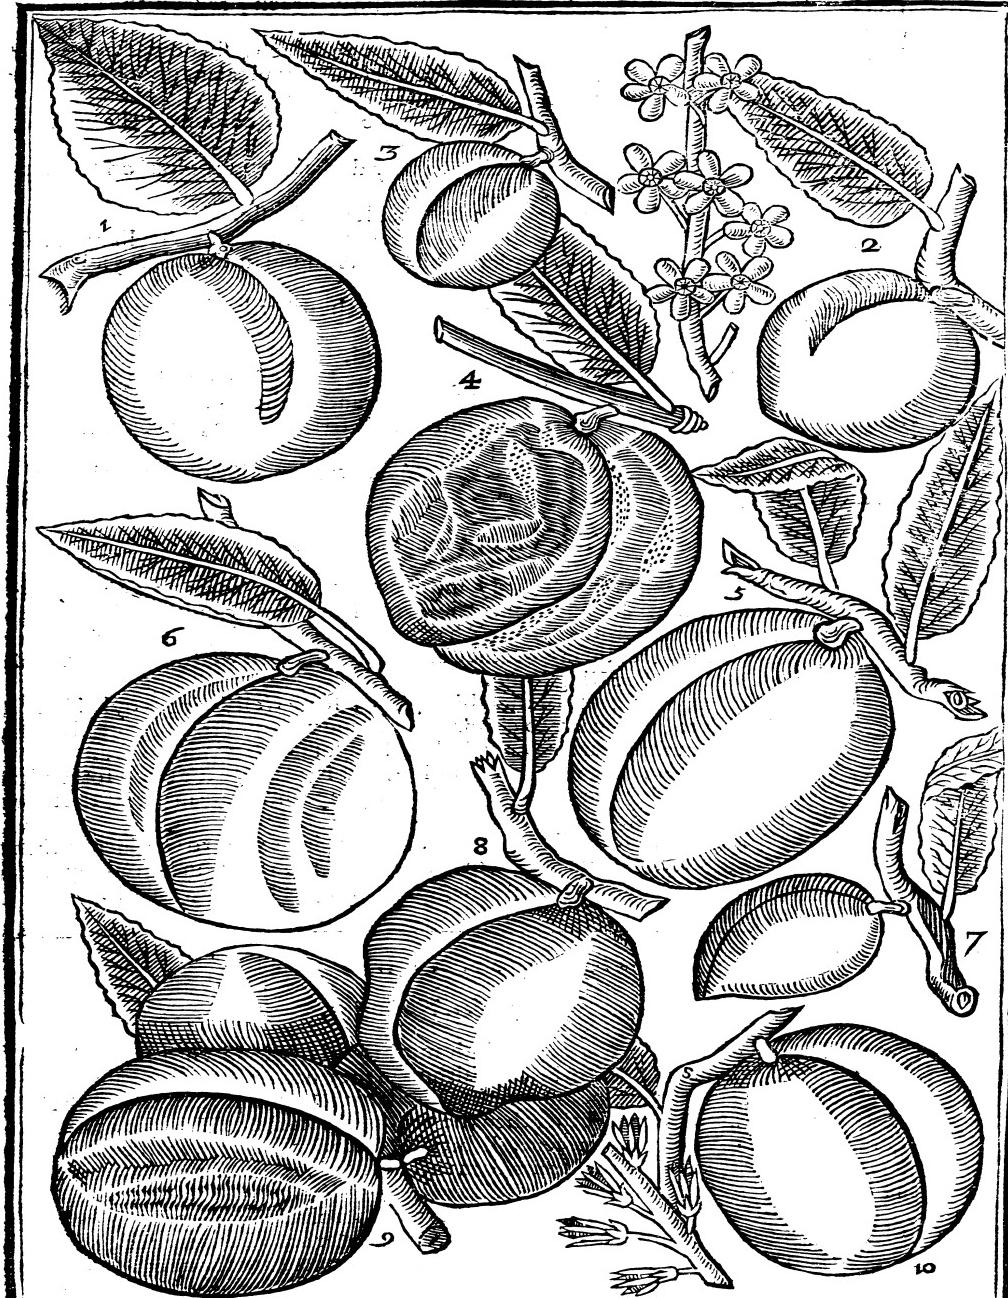

The Newington Peach is a very good Peach, and of an excellent good rellish, being of a whitish greene colour on the outside, yet halfe reddish, and is ripe about Bartholmew tide.

The yellow Peach is of a deepe yellow colour; there be hereof divers sorts, some good and some bad.

The St. James Peach is the same with the Queenes Peach, here belowe set downe, although some would make them differing.

The Melocorne Peach is a yellow faire Peach, but differing from the former yellow both in forme and taste, in that this hath a small crooked end, or point for the most part, it is ripe before them, and better rellished then any of them.

The

1 *Malus Armeniaca Prunosa.* The Apricote. 2 *Mela Persica Melocarne.* The Melocorne Peach. 3 *Persica Melastylina.* The Nectars Peach. 4 *Persica Amara.* The blacke Peach. 5 *Persica Camellina.* The long Carnation Peach. 6 *Persica Regia.* The Queenes Peach. 7 *Angeleina.* The Almond. 8 *Persica de Tres.* The Peach de Tres. 9 *Reripersica rubra opima.* The best Romanes red Nectarin. 10. *Anacarpus bracteata.* The barded Nectarin with a prickly bladde.

The Peach *du Tress* is a long and great whitish yellow Peach, red on the outside, early ripe, and is another kinde of Nutmeg Peach.

The Queenes Peach is a faire great yellowish browne Peach, shadowed as it were ouer with deepe red, and is ripe at Bartholmew tide, of a very pleasant good taste.

The Roinane Peach is a very good Peach, and well relished.

The Durasme or Spanish Peach is of a darke yellow with red colour on the outside, and white within.

The blacke Peach is a great large Peach, of a very darke browne colour on the outside, it is of a waterish taste, and late ripe.

The Alberza Peach is late ripe, and of a reasonable good taste.

The Almond Peach, so called, because the kernell of the stone is sweete, like the Almond, and the fruit also somewhat pointed like the Almond in the huske; it is early ripe, and like the Newington Peach, but lesser.

The Man Peach is of two sorts, the one longer then the other, both of them are good Peaches, but the shorter is the better relished.

The Cherry Peach is a small Peach, but well tasted.

The Nutmeg Peach is of two sorts, one that will be hard when it is ripe, and eatheth not so pleasantly as the other, which will bee soft and mellow; they are both small Peaches, having very little or no resemblance at all to a Nutmeg, except in being a little longer then round, and are early ripe.

Many other sorts of Peaches there are, whereunto wee can giue no especiall name, and therefore I passe them ouer in silence.

#### *The Vse of Peaches.*

Those Peaches that are very moist and waterish (as many of them are) and not firme, doe soone putrefie in the stomacke, causynge surfeits often-times; and therefore every one had neede bee carefull, what and in what manner they eate them: yet they are much and often well accepted with all the Gentry of the Kingdome.

The leaues, because of their bitternesse, serue well being boyled in Ale or Milke, to be giuen vnto children that haue wormes, to help to kill them, and doe gently open the belly, if there be a sufficient quantity vsed.

The flowers haue the like operation, that is, to purge the body somewhat more forceably then Damaskē Rosēs; a Syrupe therefore made of the flowers is very good.

The kernels of the Peach stones are oftentimes vsed to be giuen to them that cannot well make water, or are troubled with the stome, for it openeth the stoppings of the vritory passages, whereby much ease ensueth.

#### *C H A P. X VI.*

##### *Nucipersica. Nectorins.*

I presume that the name *Nucipersica* doth most rightly belong vnto that kinde of Peach, which we call Nectorins, and although they haue beeene with vs not many yeares, yet haue they beeene knowne both in Italy to Matthiolus, and others before him, who it seemeth knew no other then the yellow Nectorin, as Dalechampius also: But we at this day doe know fiew seuerall sorts of Nectorins, as they shall be presently set downe, and as in the former fruits, so in this, I will giue you the description of one, and briefe notes of the rest.

The Nectorin is a tree of no great bignesse, most vsually lesser then the Peach tree, his body and elder boughes being whitish, the younger branches very red, whereon grow narrow long greene leaues, so like vnto Peach leaues, that none can well distinguish them, vnsleste it be in this, that they are somewhat lesser: the blossomes are all reddish, as the Peach, but one of a differing fashion from all the other, as I shall shew you by and by: the fruit that followeth is smaller, rounder, and smoother then Peaches, without any cleft on the side, and without any douny cotton or freeze at all; and herein

herein is like vnto the outer greene rinde of the Wallnut, whereof as I am periwaded it tooke the name, of a fast and firme meate, and very delicate in taste, especially the best kindes, with a rugged stone within it, and a bitter kernell.

The Muske Nectorin, so called, because it being a kinde of the best red Nectorins, both smelth and eatheth as if the fruit were steeped in Muske: some thinke that this and the next Romane Nectorin are all one.

The Romane red Nectorin, or cluster Nectorin, hath a large or great purplish blossome, like vnto a Peach, reddish at the bottome on the outside, and greenish within: the fruit is of a fine red colour on the outside, and groweth in clusters, two or three at a ioynt together, of an excellent good taste.

The baird red Nectorin hath a smaller or piacking blossome, more like threads then leaues, neither so large nor open as the former, and yellowish within at the bottome: the fruit is red on the outside, and groweth neuer but one at a ioynt; it is a good fruit, but eatheth a little more rawish then the other, even when it is full ripe.

The yellow Nectorin is of two sorts, the one an excellent fruit, mellow, and of a very good relish; the other hard, and no way comparable to it.

The greene Nectorin, great and small; for such I haue seene abiding constant, although both planted in one ground: they are both of one goodnesse, and accounted with most to be the best relished Nectorin of all others.

The white Nectorin is said to bee differing from the other, in that it will bee more white on the outside when it is ripe, then either the yellow or greene: but I haue not yet seene it.

#### *The Vse of Nectorins.*

The fruit is more firme then the Peach, and more delectable in taste; and is therefore of more esteeme, and that worthily.

#### *C H A P. X VII.*

##### *Amygdala. Almonds.*

The Almond also may be reckoned vnto the stock or kindred of the Peaches, it is so like both in leaue and blossome, and somewhat also in the fruit, for the outward forme, although it hath onely a dry skinne, and no pulpe or meate to bee eaten: but the kernell of the stone or shell, which is called the Almond, maketh recompence of that defect, whereof some are sweete, some bitter, some great, some small, some long, and some short.

The Almond tree growth vpright, higher and greater then any Peach; and is therefore vsually planted by it selfe, and not against a wall, whose body sometime exceedeth any mans sadome, whereby it sheweth to be of longer continuance, bearing large armes, and smaller branches also, but brittle, whereon are set long and narrow leaues, like vnto the Peach tree: the blossomes are purplish, like vnto Peach blossoms, but paler: the fruit is somewhat like a Peach for the forme of the skinne or outside, which is rough, but not with any such cleft therein, or with any pulpe or meate fit to bee eaten, but is a thicke dry skinne when it is ripe, covering the stone or shell, which is smooth and not rigged, and is either long and great, or small, or thicke and short, according as the nut or kernell within it is, which is sweete both in the greater and smaller, and onely one smaller kinde which is bitter: yet this I haue obserued, that all the Almond trees that I haue seene growe in England, both of the sweete and bitter kindes, beare Almonds thicke and short, and not long, as that sort which is called the Lorden Almond.

#### *The Vse of Almonds.*

They are vsed many wayes, and for many purposes, either eaten alone with Figges, or Rayfins of the Sunne, or made into paste with Sugar and Rosewater for Marchpanes, or put among Floure, Egges, and Sugar, to make

make Mackerons, or crusted ouer with Sugar, to make Comfits, or mixed with Rosewater and Sugar, to make Butter, or with Barley water, to make Milke, and many other waies, as every one listeth that hath skill in such things.

The oyle also of Almonds is vsed many waies, both inwardly and outwardly, for many purposes; as the oyle of sweete Almonds mixt with powdered white Sugar Candy, for coughes and hoarsenesse, and to be drunk alone, or with some other thing (as the Syrupe of Marsh Mallowes) for the stone, to open and lenifie the passages, and make them slipperie, that the stone may passe the easier. And also for women in Child bed after their sore trauell. And outwardly either by it selfe, or with oyle of Tartar to make a creame, to lenifie the skin, parched with the winde or otherwise, or to annoyn the stomacke either alone, or with other things to helpe a cold.

The oyle of bitter Almonds is much vsed to be dropped into their eares that are hard of hearing, to helpe to open them. And as it is thought, doth more scourge and cleane the skin then the sweet oyle doth, and is therefore more vsed of many for that purpose, as the Almonds themselfes are.

## C H A P. X V I I I.

*Mala Arantia.* Orentes.

**I** Bring here to your consideration, as you see, the Orente tree alone, without mentioning the Citron or Lemon trees, in regard of the experience we haue seen made of them in diuers places: For the Orente tree hath abiden with some extraordinary looking and tending of it, when as neither of the other would by any meanes be preserued any long time. If therefore any be desirous to keepe this tree, he must so prouide for it, that it be preserued from any cold, either in the winter or spring, and exposed to the comfort of the sunne in summer. And for that purpose some keepe them in great square boxes, and lift them to and fro by iron hooks on the sides, or cause them to be rowled by trundels, or small wheeles vnder them, to place them in an house, or close gallerie for the winter time: others plant them against a bricke wall in the ground, and defend them by a shed of boardes, couered ouer with seare-cloth in the winter, and by the warmth of a stoue, or other such thing, give them some comfort in the colder times: but no tent or meane prouision will preserue them.

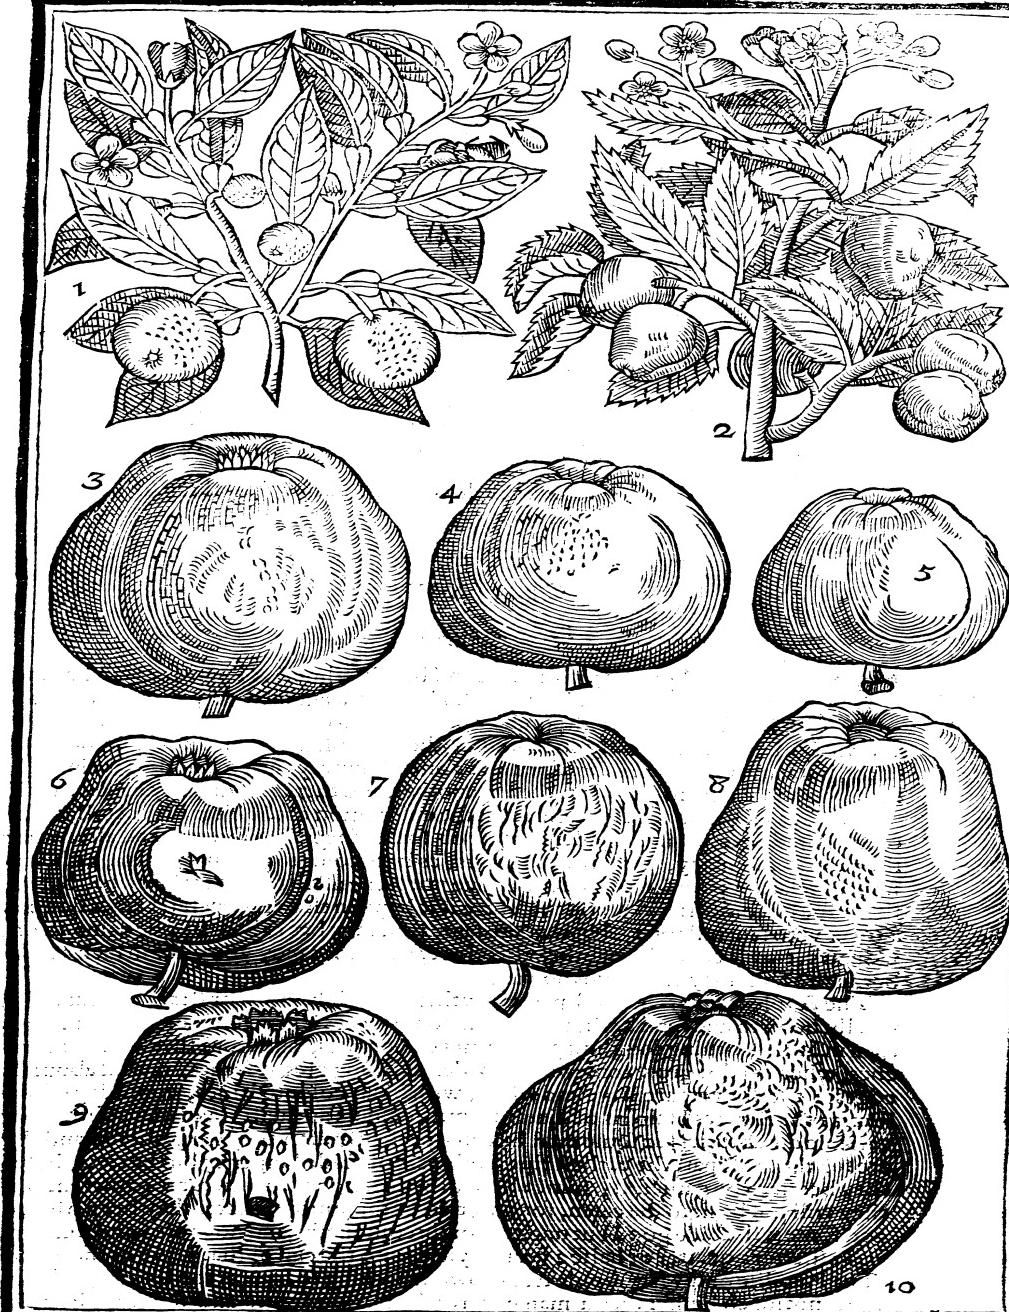

The Orente tree in the warme Countries groweth very high, but with vs (or else it is a dwarfe kinde thereof) riseth not very high: the bark of the elder stemmes being of a darke colour, and the young branches very greene, whereon grow here and there some few thornes: the leaues are faire, large, and very greene, in forme almost like a Bay leafe, but that it hath a small care, or peece of a leafe, fashioned like vnto an heart vnder evry one of them, with many small holes to be seene in them, if you hold them vp betwene you and the light, of a sweet but strong smell, naturally not falling away, but alwaies abiding on, or vntill new be come vp, bearing greene leaues continually: the flowers are whitish, of a very strong and heady sent; after which come small round fruit, greene at the first, while they are small, and not neare maturite, but being grown and ripe, are (as all men know) red on the out side, some more pale then others, and some kindes of a deeper yellowish red, according to the climate, and as it receiueth the heate of the sunne, wherein is contained sower or sweete iuice, and thicke white kernels among it: it beareth in the warme Countries both blossomes and greene fruit continually vpon it, and ripe fruit also with them for the best part of the yeare, but especially in Autumne and Winter.

## The Use of Orentes.

Orentes are vsed as sawce for many sorts of meates, in respect of their sweete sownernes, giuing a relish of delight, whereinsoever they are vsed.

The inner pulpe or juice doth serue in agues and hot diseases, and in Summer to coole the heate of dejected stomackes, or fainting spirits.

The

1. *Mala Arantia.* The Orente tree. 2. *Mala.* The Apple tree. 3. *Malum Carbonarium.* The Pome Apple. 4. *Malum Cursipedulum.* The pointed Apple. 5. *Malum.* The Pearmin. 6. *Malum Regium.* The Queen Apple. 7. *Malum primum matsumurae.* The Genneting. 8. *Malum Regale.* The round Apple. 9. *Malum Kozanji et sericeum.* The Keatish Codlin. 10. *Malum Regium spurius.* The Bardfield Quince.

The dried rinde, by reason of the sweete and strong sent, serueth to bee put among other things to make sweete pouthers.

The outer rindes, when they are clensed from all the inner pulpe and skins, are preserved in Sugar, after the bitternesse by often steepings hath been taken away, & do serue either as Succots, and banqueting stuffes, or as ornaments to set our dishes for the table, or to giue a relish vnto meats, whether baked or boyled: Physically they helpe to warme a cold stomack, and to digest or breake wnde therein: or they are candied with Sugar, and serue with other dried lunquets.

The water of Orange flowers is oftentimes vsed as a great perfume for glones, to wash them, or in stead of Rose-water to mixe with other things.

It is vsed to bee drunke by some, to preuent or to helpe any pestilentiall feuer.

The oyntment that is made of the flowers, is very comfortable both for the stomache, against the could or cough, or for the head, for paines and disnesse.

The kernels or seede beeing cast into the ground in the spring time, will quickly grow vp, (but will not abide the winter with vs, to bee kept for growing trees) and when they are of a finger length high, being pluckt vp, and put among fallats, will giue them a maruellous fine aromaticke or spicke taste, very acceptable.

The seed or kernels are a little cordiall, although nothing so much as the kernels of the Pomecitron.

#### CHAP. XIX.

##### Pome. Apples.

**T**He sorts of Apples are so many, and infinite almost as I may say, that I cannot give you the names of all, though I haue endeauoured to give a great many, and I thinke it almost impossible for any one, to attaine to the full perfection of knowledge herein, not onely in regard of the multiplicite of fashions, colours and tastes, but in that some are more familiar to one Countrey then to another, being of a better or worse taste in one place then in another, and therefore diuersly called: I will therefore as I haue done before, give you the description of the Tree in generall, as also of the Paradise or dwarfe Apple, because of some especciall difference, and afterwards the names of as many, with their fashions, as haue come to my knowledge, either by sight or relation: for I doe confess I haue not seene all that I here set downe, but vse the helpe of some friends, and therefore if it happen that the severall names doe not answer vnto severall sorts, but that the same fruit may bee called by one name in one Country, that is called by another elsewhere, excuse it I pray you; for in such a number, such a fault may escape vnknowne.

The Apple tree for the most part is neyther very high, great or straight, but rather vsually boweth and spreadeth (although in some places it groweth fairer and straighter then in others) hauing long and great armes or boughes, and from them smaller branches, whereon doe grow somewhat broade, and long greene leaues, nicked about the edges: the flowers are large and white, with blush coloured sides, consisting of five leaues: the fruit (as I said) is of diuers formes, colours and tastes, and likewise of a very variable durabilitie, for some must be eaten presently after they are gathered, and they are for the most part the earliest ripe; others will abide longer vpon the trees, before they bee fit to be gathered; some also will be so hard when others are gathered, that they will not be fit to be eaten, for one, two or three moneths after they bee gathered, and some will abide good but one, two or three moneths, and no more; and some will be best, after a quarter or halfe a yeres lying, vnto the end of that yere or the next.

The Paradise or dwarfe Apple tree groweth nothing so high as the former, and many times not much higher then a man may reach, hauing leaues and flowers altogether like the other, the fruit is a faire yellow Apple, and reasonable great, but very light and spongy or loose, and of a bitterish sweete taste, nothing pleasant. And these faults al-

so are incident vnto this tree, that both bodie and branches are much subiect vnto cancker, which will quickly eate it round, and kill it; besides it will haue many bunches, or tuberos swellings in many places, which grow as it were scabby or rough, and will soone cause it to perish: the roote sendeth forth many shoothes and suckers, whereby it may be much increased. But this benefit may be had of it, to recompence the former faults, That being a dwarfe Tree, whatsoeuer fruit shall bee grafted on it, will keepe the graft low like vnto it selfe, and yet beare fruit reasonable well. And this is a pretty way to haue Pippins, Pomewaters, or any other sort of Apples (as I haue had my selfe, and also seene with others) growing low, that if any will, they may make a hedge rowe of these low fruits, planted in an Orchard all along by a walke side: but take this Caucat, if you will auoide the danger of the cancker and knots, which spoile the tree, to graft it hard vnto the ground, that therby you may giue as little of the nature of the stock thereunto as possibly you can, which wil vndoubtedly help it very much.

##### The kindes or sorte of Apples.

The Summer pippin is a very good apple first ripe, and therefore to bee first spent, because it will not abide so long as the other.

The French pippin is also a good fruit and yellow.

The Golding pippin is the greatest and best of all sorte of pippins.

The Russet pippin is as good an apple as most of the other sorte of pippins.

The spotted pippin is the most durable pippin of all the other sorte.

The ordinary yellow pippin is like the other, and as good; for indeed I know no sorte of pippins but are excellent good wellrellished fruite.

The great pearemaine differeth little either in taste or durabilitie from the pippin, and therefore next vnto it is accounted the best of all apples.

The summer pearemaine is of equall goodness with the former, or rather a little more pleasing, especially for the time of its eating, which will not bee so long lasting, but is spent and gone when the other beginneth to be good to eat.

The Russetting is also a firme and a very good apple, not so waterish as the pippin or pearemaine, and will last the best part of the year, but will be very mellow at the last, or rather halfe dried.

The Broading is a very good apple.

The Pomewater is an excellent good and great whitish apple, full of sap or moisture, somewhat pleasant sharpe, but a little bitter withall: it will not last long, the winter frostes soone causing it to rot, and perish.

The Flower of Kent is a faire yellowish greene apple both good and great.

The Gillofower apple is a fine apple, and finely spotted.

The Marligo is the same, that is called the Marigold apple, it is a middle sized apple, very yellow on the outside, shadowed ouer as it were with red, and more red on one side, a reasonable wellrellished fruit.

The Blandrill is a good apple.

The Dauie Gentle is a very good apple.

The Grantlin is somewhat a long apple, smaller at the crowne then at the stalke, and is a reasonable good apple.

The gray Costerd is a good great apple, somewhat whitish on the outside, and abideth the winter.

The greene Costerd is like the other, but greener on the outside continually.

The Haruy apple is a faire great goodly apple, and very wellrellished.

The Dowse apple is a sweetish apple not much accounted of.

The Pome-paris is a very good apple.

The Belle boone of two sorte winter and summer, both of them good apples, and faire fruit to look on, being yellow and of a meane bignesse.

The pound Royall is a very great apple, of a very good and sharpe taste.

The Doues Bill a small apple.

The Deuson or apple Iohn is a delicate fine fruit, wellrellished when it beginneth to be fit to be eaten, and endureth good longer then any other apple.

The Master William is greater then a pippin, but of no very good relish.

The Master Iohn is a better tasted apple then the other by much.

The Spicing is a well tasted fruite.

*Pome de Rambures* } all faire and good apples brought from France.  
*Pome de Capanda* }

The Queene apple is of two sorts, both of them great faire red apples, and well relished, but the greater is the best.

The Bastard Queene apple is like the other for forme and colour, but not so good in taste: some call this the bardfield Queening.

The Boughton or greening is a very good and well tasted apple.

The Leathercoate apple is a good winter apple, of no great bignesse, but of a very good and sharpe taste.

The Pot apple is a plaine Country apple.

The Cowslout is no very good fruit.

The Gildiling apple is a yellow one, not much accounted.

The Cats head apple tooke the name of the likenesse, and is a reasonable good apple and great.

The Kentish Codlin is a faire great greenish apple, very good to eate when it is ripe; but the best to coddle of all other apples.

The Stoken apple is a reasonable good apple.

The Geneting apple is a very pleasant and good apple.

The Worcester apple is a very good apple, as bigge as a Pomewater.

*Dorime Couadis* is a French apple, and of a good relish.

The French Goodwin is a very good apple.

The old wife is a very good, and well relished apple.

The towne Crab is an hard apple, not so good to be eaten rawe as roasted, but excellent to make Cider.

The Virgilling apple is a reasonable good apple.

The Crowes egge is no good relished fruit, but nourised vp in some places of the common people.

The Sugar apple is so called of the sweetnesse.

Sops in wine is so named both of the pleasantnesse of the fruit, and beautie of the apple.

The womans breast apple is a great apple.

The blacke apple or pippin is a very good eating apple, and very like a Pearemaine; both for forme and bignesse, but of a blacke footy colour.

Tweenty sorts of Sweetings and none good.

The Peare apple is a small fruit, but well relished being ripe, and is for shape very like vnto a small short Peare, and greene.

The Paradise apple is a faire goodly yellow apple, but light and spongy, and of a bitterish sweet taste, not to be commended.

The apple without blossome, so called because although it haue a small shew of a blossome, yet they are but small thredes rather than leaues, never shewing to bee like a flower, and therefore termed without blossome: the apple is neyther good eating nor baking fruit.

Wildings and Crabs are without number or vse in our Orchard, being to be had out of the woods, fields and hedges rather then any where else.

#### The Vse of Apples.

The best sorts of Apples serue at the last course for the table, in most mens houses of account, where, if there grow any rare or excellent fruit, it is then set forth to be seene and tasted.

Diuers other sorts serue to bake, either for the Masters Table, or the meynes sustenance, either in pyes or pans, or else stewed in dishes with Rosewater and Sugar, and Cinnamon or Ginger cast vpon.

Some kinds are fitteſt to roaſt in the winter time, to warme a cup of wine, ale or beere; or to be eaten alone, for the nature of ſome fruit is neuer ſo good, or worth the eating, as when they are roaſted.

Some

Some ſorts are fitteſt to ſcald for Codlins, and are taken to coole the ſtomacke, as well as to pleafe the taste, hauing Rosewater and Sugar put to them.

Some ſorts are best to make Cider of, as in the West Countrey of England great quantitieſ, yea many Hogsheads and Tunnes full are made, especially to bee carried to the Sea in long voyages, and is found by experieſce to bee of excellent vſe, to mixe with water for beuerage. It is vſually ſene that thoſe fruits that are neither fit to eate raw, roaſted, nor baked, are fitteſt for Cider, and make the beſt.

The iuice of Apples likewiſe, as of pippins, and pearemaines, is of very good vſe in Melancholick diseases, helping to procure mirth, and to expell heauineſſe.

The diſtilled water of the ſame Apples is of the like effect.

There is a fine ſweet oyntment made of Apples called *Pomatum*, which is much vſed to helpe chapt lips, or hands, or for the face, or any other part of the ſkinne that is rough with wind, or any other accident, to ſupplethem, and make them ſmooth.

#### CHAP. XX.

##### *Cydonia. Quinces.*

WE haue ſome diuerſities of Quinces, althoſt not many, yet more then our elder times were acquainted with, which ſhall be here exprefſed.

The Quince tree groweth oftentimes to the height and bignesse of a good Apple tree, but more vſually lower, with crooked and ſpreadinge armes and branches farre abroad, the leaues are ſomewhat round, and like the leaues of the Apple tree, but thicker, harder, fuller of veines, and white on the vnderside: the bloffomes or flowers are white, now and then daſht ouer with bluſh, being large and open, like vnto a ſingle Rose: the fruit followeth, which when it is ripe is yellow, and couered with a white cotton or freeze, which in the younger is thicker and more plentifull, but waxeth leſſe and leſſe, as the fruit ripeneth, being bunched out many times in ſeverall places, and round, especially about the head, ſome greater, others ſmaller, ſome round like an Apple, others long like a Peare, of a strong heady ſent, accounted not wholsome or long to be endured, and of no durabilitie to keepe, in the middle whereof is a core, with many blackiſh ſeedes or kernels therein, lying close together in cels, and compaſſed with a kinde of cleare gelly, which is eaſier ſene in the ſcalded fruit, then in the raw.

The English Quince is the ordinarie Apple Quince, ſet downe before, and is of ſo harſh a taste being greene, that no man can endure to eate it rawe, but eyther boyled, ſtewed, roaſted or baked; all which waies it is very good.

The Portingall Apple Quince is a great yellow Quince, ſeldome comming to bee whole and faire without chapping; this is ſo pleasant being fresh gathered, that it may be eaten like vnto an Apple without offence.

The Portingall Peare Quince is not fit to be eaten rawe like the former, but muſt be vſed after ſome of the waies the English Quince is appointed, and ſo it will make more dainty dishes then the English, because it is leſſe harſh, will bee more tender, and take leſſe ſugar for the ordering then the English kinde.

The Barbary Quince is like in goodnesſe vnto the Portingall Quince laſt ſpoken of, but leſſer in bignesse.

The Lyons Quince.

The Brusawicke Quince.

#### The Vſe of Quinces.

There is no fruit growing in this Land that is of ſo many excellent vſes as this, ſeruing as well to make many dishes of meate for the table, as for ban-

D d d

banquets, and much more for the Physicall vertues, whereof to write at large is neither conuenient for mee, nor for this worke: I will onely briefly recite some, as it were to give you a taste of that plenty remaineth therein, to bee conuerted into sundry formes: as first for the table, while they are fresh (and all the yeare long after being pickled vp) to be baked, as a dainty dish, being well and orderly cookt. And being preserued whole in Sugar, either white or red, serue likewise, not only as an after dish to close vp the stomacke, but is placed among other Preferuaries by Ladies and Gentlewomen, and bestowed on their friends to entertaine them, and among other sorts of Preseruaries at Banquets. Codiniacke also and Marmilade, Jelly and Paste, are all made of Quinces, chiefly for delight and pleasure, although they haue also with them some physciall properties.

We haue for the vse of physicke, both Iuyce and Syrupe, both Conserue and Condite, both binding and loosening medicines, both inward and outward, and all made of Quinces.

The Ielly or Muccilage of the seedes, is often vsed to be laid vpon wemens breasts, to heale them being sore or rawe, by their childrens default giuing them sucke.

Athenaeus reciteth in his third booke, that one Philarchus found, that the smell of Quinces tooke away the strength of a certayne poifon, called *Phariacum*. And the Spaniards haue also found, that the strength of the iuyce of white Ellebor (which the Hunters vse as a poifon to dippe their arrow heads in, that they shoothe at wilde beasts to kill them) is quite taken away, if it stand within the compasse of the smell of Quinces. And also that Grapes, being hung vp to bee kept, and spent in Winter, doe quickly rot with the smell of a Quince.

## C H A P. XXI.

## Pyr. Peares.

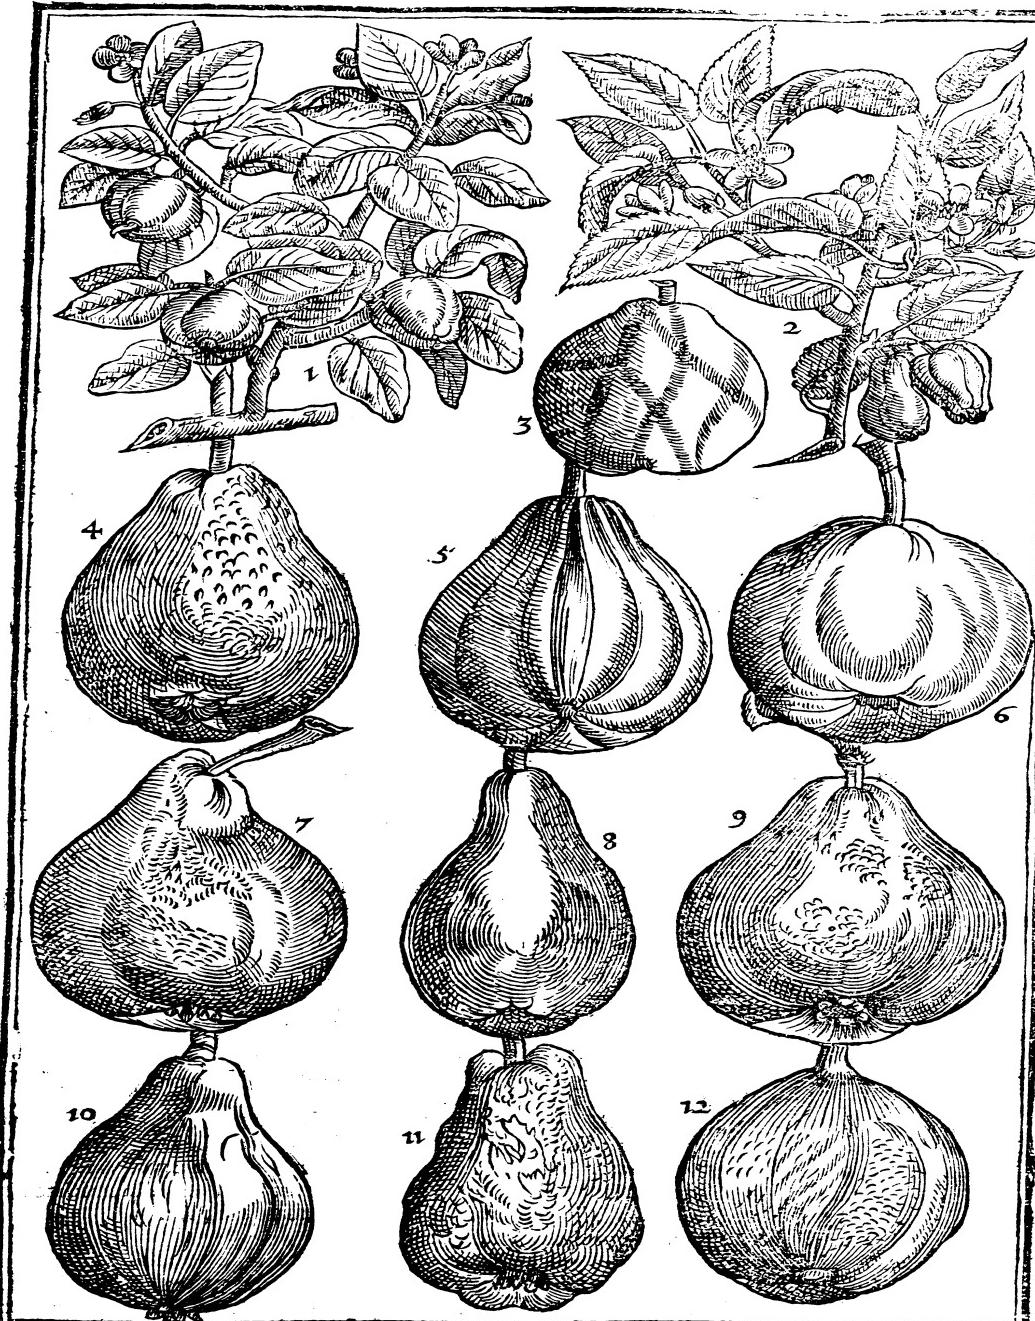

**T**He variety of peares is as much or more then of apples, and I thinke it is as hard in this, as before in apples, for any to be so exquisite, as that hee could number vp all the sortes that are to be had: for wee haue in our country so manie, as I shall giue you the names of by and by, and are hitherto come to our knowledge: but I verily beleeeue that there be many, both in our country, and in others, that we haue not yet knowne or heard of; for every yeare almost wee attaine to the knowledge of some, we knew not of before. Take therefore, according to the manner before held, the description of one, with the feuerall names of the rest, vntill a more exact discourse be had of them, every one apart.

The Pearmtree groweth more slowly, but higher, and more vpright then the apple tree, and not lesse in the bulke of the body: his branches spread not so farre or wide, but growe vprighter and closer: the leaues are somewhat broader and rounder, greene aboue, and whiter vnderneath then those of the apple tree: the flowers are whiter and greater: the fruit is longer then round for the most part, smaller at the stalke, and greater at the head, of so many differing formes, colours, and tastes, that hardly can one distinguish rightly between them, the times also being as variable in the gathering and spending of them, as in apples: the roote groweth deeper then the apple tree, and therefore abideth longer, and giueth a faster, closer, & smoother gentle wood, easie to be wrought vpon.

## The kindes of Peares.

The Summer bon Chretien is somewhat a long pearre, with a greene and yellow ruffetish coate, and will haue sometimes red sides; it is ripe at Michaelmas: some vse to dry them as they doe Prunes, and keepe them all the yeare after. I haue not seene or heard any more Summer kindes hereof then this one, and needeth no wall to nurse it as the other.

The

1. *Malus Cerasus*, The Quince tree. 2. *Cydonia Lushanicum*, The Portmellall Quince. 3. *Pyrus*, The Pearmtree. 4. *Pyrum Pomegranatum*, *sive Cuscina juncata*. 5. *Pyrus pyramidalis* *fructuosa*. The painted or striped Pear of Jerusalem. 6. *Pyrus Palaestina*, The Burgosor Pear. 7. *Pyrus Cucumerinum* *sive Pomegranatum effusum*. The Summer Bon Chretien. 8. *Pyrum Uslana*. The best Warden. 9. *Pyrus Libiale*. The euall Pear. 10. *Pyrus Windhriana*. The Windsor Pear. 11. *Pyrus Comosum*. The Gattiola Pear. 12. *Pyrus Caryophyllea*. The Gillofower Pear.

Dd 2

*The Orchard.*

The Winter bon Chretien is of many sorts, some greater, others lesser, and all good; but the greatest and best is that kinde that groweth at Syon: All the kinds of this Winter fruit must be planted against a wall, or else they will both seldome bear, and bring fewer also to ripenesse, comparable to the wall fruit: the kindes also are according to their lasting; for some will endure good much longer then others.

The Summer Bergomot is an excellent well relished pear, flattish, & short, not long like others, of a meane bignesse, and of a darke yellowish greene colour on the outside.

The Winter Bergomot is of two or three sorts, being all of them small fruit, somewhat greener on the outside then the Summer kindes, all of them very delicate and good in their due time: for some will not be fit to bee eaten when others are full-nigh spent, every of them outlasting another by a moneth or more.

The Diego pear is but a small pear, but an excellent well relished fruit, tasting as if Muske had beene put among it; many of them grove together, as it were in clusters.

The Duetete or double headed pear, so called of the forme, is a very good pear, not very great, of a russetish browne colour on the outside.

The Primating pear is a good moist pear, and early ripe.

The Geneting pear is a very good early ripe pear.

The greene Chesill is a delicate mellow pear, even melting as it were in the mouth of the eater, although greenish on the outside.

The Catherine pear is knowne to all I thinke to be a yellow red fided pear, of a full waterish sweete taste, and ripe with the foremost.

The King Catherine is greater then the other, and of the same goodness, or rather better.

The Russet Catherine is a very good middle sized pear.

The Windsor pear is an excellent good pear, well knowne to most persons, and of a reasonable greatnesse: it will bear fruit some times twice in a year (and as it is said) three times in some places.

The Norwich pear is of two sorts, Summer and Winter, both of them good fruit, each in their season.

The Worster pear is blackish, a farre better pear to bake (when as it will be like a Warden, and as good) then to eat rawe, yet so it is not to be misliked.

The Muske pear is like vnto a Catherine pear for bignesse, colour, and forme, but farre more excellent in taste, as the very name importeth.

The Rosewater pear is a goodly faire pear, and of a delicate taste.

The Sugar pear is an early pear, very sweete, but waterish.

The Summer Popperin, both of them are very good firme dry pears, somewhat Spotted, and brownish on the outside.

The Winter Popperin is a winter fruit, of equall goodness with the former.

The greene Popperin is a winter fruit, of equall goodness with the former.

The Soueraigne pear, that which I haue seene and tasted, and so termed vnto me, was a small brownish yellow pear, but of a most dainty taste; but some doe take a kind of Bon Chretien, called the Elizabeth pear, to be the Soueraigne pear; how truely let others iudge.

The Kings pear is a very good and well tasted pear.

The pear Royall is a great pear, and of a good relish.

The Warwickke pear is a reasonable faire and good pear.

The Greenfield pear is a very good pear, of a middle size.

The Lewes pear is a brownish greene pear, ripe about the end of September, a reasonable well relished fruit, and very moist.

The Bishop pear is a middle sized pear, of a reasonable good taste, not very waterish; but this property is oftentimes seene in it, that before the fruit is gathered, (but more vsually those that fall of themselves, and the rest within a while after they are gathered) it will be rotten at the core, when there wil not be a spot or blemish to be seene on the outside, or in all the pear, vntill you come neare the core.

The Wilford pear is a good and a faire pear.

The Bell pear is a very good greene pear.

The Portingall pear is a great pear, but more goodly in shew then good indeed.

The Gratiola pear is a kinde of Bon Chretien, called the Cowcumber pear, or Spinola's pear.

The Rowling pear is a good pear, but hard, and not good before it bee a little rowled or bruised, to make it eat the more mellow.

*The Orchard.*

The Pimpe pear is as great as the Windsor pear, but rounder, and of a very good relish.

The Turnep pear is a hard winter pear, not so good to eat rawe, as it is to bake.

The Arundell pear is most plentiful in Suffolke, and there commended to be a verie good pear.

The Berry pear is a Summer pear, reasonable faire and great, and of so good and wholesome a taste, that few or none take harme by eating neuer so many of them.

The Sand pear is a reasonable good pear, but small.

The Morley pear is a very good pear, like in forme and colour vnto the Windsor, but somewhat grayer.

The pear pricke is very like vnto the Greenfield pear, being both faire, great, and good.

The good Rewell is a reasonable great pear, as good to bake as to eat rawe, and both wyses it is a good fruit.

The Hawkes bill pear is of a middle size, somewhat like vnto the Rowling pear.

The Petworth pear is a winter pear, and is great, somewhat long, faire, and good.

The Slipper pear is a reasonable good pear.

The Robert pear is a very good pear, plentifull in Suffolke and Norfolke.

The pound pear is a reasonable good pear, both to eat rawe, and to bake.

The ten pound pear, or the hundred pound pear, the truest and best, is the best Bon Chretien of Syon, so called, because the grafts cost the Master so much the fetching by the messengers expences, when he brought nothing else.

The Gillofower pear is a winter pear, faire in shew, but hard, and not fit to bee eaten rawe, but very good to bake.

The pear Couteau is neither good one way nor other.

The Binsce pear is a reasonable good winter pear, of a russetish colour, and a small fruit: but will abide good a long while.

The Pucell is a greene pear, of an indifferent good taste.

The blacke Sorrell is a reasonable great long pear, of a darke red colour on the outside.

The red Sorrell is of a redder colour, else like the other.

The Surrine is no very good pear.

The Summer Hasting is a litte greene pear, of an indifferent good relish.

Pearre Gergonell is an early pear, somewhat long, and of a very pleasant taste.

The white Genneting is a reasonable good pear, yet not equall to the other.

The Sweater is somewhat like the Windsor for colour and bignesse, but nothing neare of so good a taste.

The bloud red pear is of a darke red colour on the outside, but piercing very little into the inner pulpe.

The Hony pear is a long greene Summer pear.

The Winter pear is of many sorts, but this is onely so called, to bee distinguisched from all other Winter peares, which haue severall names giuen them, and is a very good pear.

The Warden or Luke Wards pear of two sorts, both white and red, both great and small.

The Spanish Warden is greater then either of both the former, and better also.

The pearre of Ierusalem, or the stript pearre, whose bark whilke it is young, is as plainly seene to be stript with greene, red, and yellow, as the fruit it selfe is also, and is of a very good taste: being baked also, it is as red as the best Warden, whereof Master William Ward of Essex hath assured mee, who is the chiefe keeper of the Kings Granary at Whitehall.

Heresof likewise there is a wilde kinde no bigger then ones thumbe, and striped in the like manner, but much more.

The Choke peares, and other wilde peares, both great and small, as they are not to furnish our Orchard, but the Woods, Forrests, Fields, and Hedges, so wee leauue them to their naturall places, and to them that keep them, and make good vse of them.

*The Vse of Peares.*

The most excellent sorts of Peares, serue (as I said before of Apples) to  
Ddd 3 make

make an after-course for their masters table, where the goodness of his Orchard is tryed. They are dried also, and so are an excellent repaste, if they be of the best kindes, fit for the purpose.

They are eaten familiarly of all sorts of people, of some for delight, and of others for nourishment, being baked, stewed, or scalded.

The red Warden and the Spanish Warden are reckoned among the most excellent of Peares, either to bake or to roast, for the sicke or for the sound: And indeede, the Quince and the Warden are the two onely fruits are permitted to the sicke, to eate at any time.

Perry, which is the iuyce of Peares pressed out, is a drinke much esteemed as well as Cyder, to be both drunke at home, and carried to the Sea, and found to be of good vse in long voyages.

The Perry made of Choke Peares, notwithstanding the harshnesse, and euill taste, both of the fruit when it is greene, as also of the iuyce when it is new made, doth yet after a few moneths become as milde and pleasant as wine, and will hardly bee knowne by the sight or taste from it: this hath beene found true by often experience; and therefore wee may admire the goodness of God, that hath giuen such facility to so wilde fruits, altogether thought vselesse, to become vsefull, and apply the benefit thereof both to the comfort of our soules and bodies.

For the Physicall properties, if we doe as Galen teacheth vs, in *secundo Alimentorum*, referre the qualities of Peares to their severall tastes, as before he had done in Apples, we shall not neede to make a new worke, those that are harsh and sowre doe coole and binde, sweet do nourish and warme, and those betweene these, to haue middle vertues, answerable to their temperatures, &c.

Much more might be said, both of this and the other kinds of fruits; but let this suffice for this place and worke, vntill a more exact be accomplished.

### C H A P. XXII.

#### *Nux Ingens. The Walnut.*

**A**lthough the Wallnut tree bee often planted in the middle of great Court-yards, where by reason of his great spreading armes it taketh vp a great deale of roome, his shadow reaching farre, so that scarce any thing can well grow neare it; yet because it is likewise planted in fit places or corners of Orchards, and that it beareth fruit or nuts, often brought to the table, especially while they are freshest, sweetest, and fittest to be eaten, let not my Orchard want his company, or you the knowledge of it. Some doe thinkie that there are many sorts of them, because some are much greater then others, and some longer then others, and some haue a more frangible shell then others; but I am certainly perswaded, that the soyle and climate where they grow, are the whole and onely cause of the varieties and differences. Indeed Virginia hath sent vnto vs two sorts of Wallnuts, the one blacke, the other white, whereof as yet wee haue no further knowledge. And I know that Clusius reporteth, he tooke vp at a banquet a long Wallnut, differing in forme and tendernesse of shell from others, which being set, grew and bore farre tenderer leaues then the other, and a little snipt about the edges, which (as I said) might alter with the soyle and climate: and besides you may obserue, that many of Clusius differences are very nice, and so I leaue it.

The Wallnut tree groweth very high and great, with a large and thicke body or trunke, couered with a thicke cloven whitish greene bark, tending to an ash-colour, the armes are great, and spread farre, breaking out into smaller branches, whereon doe grow long & large leaues, fve or seuen set together one against another, with an odde one at the end, somewhat like vnto Ashen leaues, but farre larger, and not so many on a stalke, smooth, and somewhat reddish at the first springing, and tender also, of a reasonable good sent, but more strong and headie when they growe old: the fruit or nut is great and round, growing close to the stalkes of the leaues, either by couples or by three

three set together, couered with a double shell, that is to say, with a greene thicke and soft outer rinde, and an inner hard shell, within which the white kernell is contained, couered with a thinne yellow rinde or peeling, which is more easily peeled away while it is greene then afterwards, and is as it were parted into four quarters, with a thinne wooddy peece parting it at the head, very sweete and pleasant while it is fresh, and for a while after the gathering; but the elder they growe, the harder and more oily: the catkins or blowings are long and yellow, made of many scaly leaues set close together, which come forth early in the Spring, and when they open and fall away, vpon their stalkes arise certaine small flowers, which turne into so many nuts.

#### The Vse of Wallnuts.

They are often serued to the table with other fruits while they abide fresh and sweete; and therefore many to keepe them fresh a long time haue devised many wayes, as to put them into great pots, and bury them in the ground, and so take them out as they spend them, which is a very good way, and will keep them long.

The small young nuts while they are tender, being preserued or candid, are vsed among other sorts of candid fruits, that serue at banquets.

The iuyce of the outer greene huskes are held to be a soueraigne remedy against either poyson, or plague, or pestilentiall feuer.

The distilled water of the huskes drunke with a little vinegar, if the fits growe hot and tedious, is an approued remedy for the same.

The water distilled from the leaues, is effectuall to be applied to fluent or running vlcers, to dry and binde the humours.

Some haue vsed the pouder of the catkins in white wine, for the suffocation or strangling of the mother.

The oyle of Wallnuts is vSED to varnish Ioyners workes. As also is accounted farre to excell Linseede oyle, to mixe a white colour withall, that the colour bee not dimmed. It is of excellent vse for the coldnesse, hardness and contracting of the sinewes and ioynts, to warme, supple, and to extend them.

### C H A P. XXIII.

#### *Castanea Equina. The Horse Chesnut.*

**A**lthough the ordinary Chesnut is not a tree planted in Orchards, but left to Woods, Parkes, and other such like places; yet wee haue another sort which wee haue nurst vp from the nuts sent vs from Turkey, of a greater and more pleasant aspect for the faire leaues, and of as good vse for the fruit. It groweth in time to be a great tree, spreading with great armes and branches, whereon are set at severall distances goodly faire great greene leaues, diuided into six, seuen, or nine parts or leaues, every one of them nicked about the edges, very like vnto the leaues of *Ricinus*, or *Palma Christi*, and almost as great: it beareth at the ends of the branches many flowres set together vpon a long stalke, consisting of foure white leaues a peece, with many threads in the middle, which afterwards turne into nuts, like vnto the ordinary Chesnuts, but set in rougher and more prickly huskes: the nuts themselves being rounder and blacker, with a white spot at the head of each, formed somewhat like an heart, and of a little sweeter taste.

#### The Vse of this Chesnut.

It serueth to binde and stop any maner of fluxe, be it of bloud or humours, either of the belly or stomacke, as also the much spitting of bloud. They are roasted and eaten as the ordinary sort, to make them taste the better.

They are vsually in Turkie giuen to horses in their prouender, to cure them of coughes, and helpe them being broken winded.

## C H A P. XXIII.

*Morus.* The Mulberrie.

**T**here are two sorts of Mulberries sufficiently known to most, the blackish and the white : but wee haue had brought vs from Virginia another sort, which is of greater respect then eyther of the other two, not onely in regard of the ratiarie, but of the vse, as you shall presently vnderstand.

1. *Morus nigra.* The blacke Mulberrie.

The blacke Mulberrie tree groweth oftentimes tall and great, and oftentimes also crooked, and spreading abroade, rather then high; for it is subiect to abide what forme you will conforme it vnto : if by suffering it to grow, it will mount vp, and if you will binde it, orplash the boughes, they will so abide, and be carried ouer arbours, or other things as you will haue it. The bodie growth in time to bee very great, couered with a rugged or thicke bark, the armes or branches being smoother, whereon doe grow round thicke leaues pointed at the ends, and nicked about the edges, and in some there are to be seene deep gashes, making it seeme somewhat like the Vine leafe: the flowers are certaine short dounie catkings, which turne into greene berries at the first, afterwards red, and when they are full ripe blacke, made of many graines set together, like vnto the blacke berrie, but longer and greater : before they are ripe, they haue an austere and harsh taste, but when they are full ripe, they are more sweete and pleasant ; the iuice whereof is so red, that it will staine the hands of them that handle and eate them.

2. *Morus alba.* The white Mulberrie.

The white Mulberrie tree groweth not with vs to that greatnesse or bulke of bodie that the blacke doth, but runneth vp higher, slenderer, more knotty, hard and brittle, with thinner spreade armes and branches : the leaues are like the former, but not so thicke set on the branches, nor so hard in handling, a little paler also, hauing somewhat longer stalkes: the fruit is smaller and closer set together, greene, and somewhat harsh before they be ripe, but of a wonderfull sweetnesse, almost ready to procure loathing, when they are thorough ripe, and white, with such like seede in them as in the former, but smaller.

3. *Morus Virginiana.* The Virginia Mulberrie.

The Virginia Mulberrie tree groweth quickly with vs to be a very great tree, spreaching many armes and branches, whereon grow faire great leaues, very like vnto the leaues of the white Mulberrie tree : the berry or fruit is longer and redder then either of the other, and of a very pleasant taste.

## The Vse of Mulberries.

The greatest and most especiall vse of the planting of white Mulberries, is for the feeding of Silke wormes, for which purpose all the Easterne Countries, as Persia, Syria, Armenia, Arabia &c. and also the hither part of Turkie, Spaine also and Italie, and many other hot Countries doe nourish them, because it is best for that purpose, the wormes feeding thereon, giving the finest and best filke ; yet some are confident that the leaues of the blacke will doe as much good as the white : but that respect must be had to change your seede, because therein lyeth the greatest mysterie. But there is a Booke or Tractate printed, declaring the whole vse of whatsoeuer can belong vnto them : I will therefore referre them thereunto, that would

1. *Nux Inglesia.* The Walnut. 2. *Castanea equina.* The horse Chestnut. 3. *Morus nigra vel alba.* The Mulberry. 4. *Morus Virginiana.* The Virginia Mulberry. 5. *Laurus syriaca.* The ordinary Baytree. 6. *Lauris Cerasifera Virginiana.* The Virginia Cherry Bay.

would further vnderstand of that matter.

Mulberries are not much desired to be eaten, although they be somewhat pleasant, both for that they staine their fingers and lips that eat them, and doe quickly putrefie in the stomacke, if they bee not taken before meate.

They haue yet a Physicall vse, which is by reason of the astringent quality while they are red, and before they bee ripe, for sore mouthes and throats, or the like, whereunto also the Syrup, called Diamoron, is effectuall.

### *Corollarium.*

## A C O R O L L A R I E To this Orchard.

Here are certaine other trees that beare no fruit fit to bee eaten, which yet are often seene planted in Orchards, and other fit and conuenient places about an house, whereof some are of especiall vse, as the Bay tree &c. others for their beauty and shadow are fit for walkes or arbours; some being euer green are most fit for hedge-rowes; and some others more for their raritie then for any other great vse, wherof I thought good to entreat apart by themselues, and bring them after the fruit trees of this Orchard, as an ornament to accomplish the same.

### 1. *Laurus.* The Bay tree.

There are to bee reckoned vp fие kindes of Bay trees, three whereof haue been entreated of in the first part, a fourth wee will only bring hereto your consideration, which is that kinde that is vsually planted in every mans yard or orchard, for their vse throughout the whole land, the other we will leauie to bee considered of in that place is fit for it.

The Bay tree riseth vp oftentimes to carry the face of a tree of a meane bignesse in our Countrey (although much greater in the hotter) and oftentimes shooteth vp with many suckers from the roote, shewing it selfe more like to a tall shrubbe or hedge-bush, then a tree, hauing many branches, the young ones whereof are sometimes reddish, but most vsually of a light or frelh greene colour, when the stemme and elder boughes are couered with a darke greene bark: the leaues are somewhat broad, and long pointed as it were at both the ends, hard and sometimes crumpled on the edges, of a darke greene colour aboue, and of a yellowish greene vnderneath, in smell sweet, in taste bitter, and abiding euer greene: the flowers are yellow and mossie, which turne into berries that are a little long as well as round, whose shell or outermost peele is greene at the first, and blacke when it is ripe; wherein is contained an hard bitter kernell, which cleaueth in two parts.

### The Vse of Bayes.

The Bay leaues are of as necessary vse as any other in Garden or Orchard, for they serue both for pleasure and profit, both for ornament and for vse, both for honest Civill vses, and for Physicke, yea both for the sicke and for the sound, both for the liuing and for the dead: And so much might be said of this one tree, that if it were all told, would as well weary the Reader, as the Relater: but to explaine my selfe; It serueth to adorne the house of God as well as of man: to procure warmth, comfort and strength to the limmes of men and women, by bathings and annoyntings outward, and by drinke &c. inward to the stomacke, and other parts: to season vessels &c. wherein are preserued our meates, as well as our drinke: to cōserve or en-

circle as with a garland, the heads of the liuing, and to sticke and decke forth the bodies of the dead: so that from the cradle to the graue we haue still vse of it, we haue still neede of it.

The berries likewise serue for stiches inward, and for paines outward, that come of cold eyther in the ioynts, sinewes, or other places.

### 2. *Laurea Cerasus*, sive *Laurus Virginiana*. The Virginian Bay, or Cherry Baye.

This Virginian (whether you will call it a Baye, or a Cherrie, or a Cherrie Bay, I leauie it to evry ones free will and iudgement, but yet I thinke I may as wel call it a Bay as others a Cherrie, neither of them being answerable to the tree, which neyther beareth such berries as are like Cherries, neither beareth euer greene leaues like the Bay: if it may therefore bee called the Virginia Cherry Bay, for a distinction from the former Bay Cherry that beareth faire blakke Cherries, it will more fitly agree thereunto, vntill a more proper may be imposed) riseth vp to be a tree of a reasonable height, the stemme or bodie thereof being almost as great as a mans legge, spreading forth into diuers armes or boughes, and they againe into diuers small branches, whereon are set without order diuers faire broade greene leaues, somewhat like vnto the former Bay leaues, but more limber and gentle, and not so hard in handling, broader also, and for the most part ending in a point, but in many somewhat round pointed, very finely notched or toothed about the edges, of a bitter taste, very neere resembling the taste of the Bay leaf, but of little or no sent at all, either greene or dryed, which fall away every autumne, and spring afresh every yeare: the blosomes are small and white, many growing together vpon a long stalke, somewhat like the Bird Cherry blosomes, but smaller, and come forth at the ends of the young branches, which after turne into small berries, every one set in a small cup or huske, greene at the first, and blacke when they are ripe, of the bignesse of a small peale, of a strong bitter taste, and somewhat aromaticall withall, but without any fleshy substance like a Cherry at all vpon it; for it is altogether like a berry.

### The Vse of this Virginia Cherry Bay.

Being a stranger in our Land, and possessed but of a very few, I doe not heare that there hath beene any triall made thereof what properties are in it: let this therefore suffice for this present, to haue shewed you the description and forme thereof, vntill we can learne further of his vses.

### 3. *Pinus.* The Pine tree.

Y purpose in this place is not to shew you all the diuersities of Pine trees, or of the rest that follow, but of that one kinde is planted in many places of our Land for ornament and delight, and there doth reasonably well abide: take it therefore into this Orchard, for the raritie and beautie of it, though we haue little other vse of it.

The Pine tree groweth with vs, though slowly, to a very great height in many places, with a great straight bodie, couered with a grayish greene bark, the younger branches are set round about, with very narrow long whitish greene leaues, which fall away from the elder, but abide on the younger, being both winter and summer alwaies greene. It hath growing in sundry places on the branches, certaine great hard woody clogs (called of some apples, or others nuts) composed of many hard wooddy scales, or tuberous knobs, which abide for the most part alwaies greene in our Countrey, and hardly become brownish, as in other Countries, where they haue more heat and comfort of the Sun, and where the scales open themselues, wherein are contained white long and round kernels, very sweete while they are fresh, but quickly growing oyly and rancide.

**The Vse of the Pine apples and kernels.**

The Cones or Apples are vsed of diuers Vintners in this City, being painted, to expresse a bunch of grapes, whereunto they are very like, and are hung vp in their bushes, as also to fasten keyes vnto them, as is seene in many places.

The kernels within the hard shels, while they are fresh or newly taken out, are vsed many waies, both with Apothecaries, Comfit-makers, and Cookes : for of them are made medicines, good to lenifie the pipes and passages of the lungs and throat, when it is hoarse. Of them are made Comfits, Pastes, Marchpanes, and diuers other such like : And with them a cunning Cooke can make diuers Keck shoses for his Masters table.

Matthiolus commendeth the water of the greene apples distilled, to take away the wrinkles in the face, to abate the ouer-swelling breasts of Maidens, by fomenting them after with linnen clothes, wet in the water; and to restore such as are rauisht into better termes.

**4. *Abies.* The Firre tree.**

**T**He Firre tree growtheth naturally higher then any other tree in these parts of Christendome where no Cedars grow, and euен equalling or ouer-topping the Pine : the steme or bodie is bare without branches for a great heigh, if they bee elder trees, and then branching forth at one place of the bodie fourways in manner of a croffe, those boughes againe hauing two branches at every ioynt, on which are set on all sides very thicke together many small narrow long hard whitish greene leaues, and while they are young tending to yellownesse, but nothing so long or hard or sharpe pointed as the Pine tree leaues, growing smaller and shorter to the end of the branches : the bloomings are certaine small long scaly catkins, of a yellowish colour, comming forth at the ioynts of the branches, which fall away : the cones are smaller and longer then of the Pine tree, wherein are small three square seede contained, not halfe so big as the Pine kernels.

**The Vse of the Firre tree.**

The vse of this tree is growne with vs of late daies to bee more frequent for the building of houses then euer before : for hereof (namely of Deale timber and Deale boord) are framed many houses, and their floores, without the helpe of any other timber or boord of any other tree almost ; as also for many other workes and purposes. The yellow Roffen that is vsed as well to make salves as for many other common vses, is taken from this tree, as the Pitch is both from the Pitch and Pine trees, and is boyled to make it to bee hard, but was at the first a yellow thin cleere Turpentine, and is that best sort of common Turpentine is altogether in vse with vs, as alſo another more thicke, whitish, and troubled, both which are vsed in salves, both for man and beast (but not inwardly as the cleere white Venice Turpentine is) and serueth both to draw, cleanse and heale. Dodonæus seemeth to say, that the cleere white Turpentine, called Venice Turpentine, is drawn from the Firre : but Matthiolus confuteth that opinion, which Fulſius alſo held before him.

**5. *Ilex arbor.* The euer-greene Oake.**

**T**He *Ilex* or euer-greene Oake riseth in time to be a very great tree, but very long and slow in growing (as is to be seene in the Kings priuy Garden at Whitehall, growing iuft against the backe gate that openeth into the way going to Westminſter, and in ſome other places) ſpreading many fair large great armes and branches, whereon are ſet ſmall and hard greene leaues, ſomewhat ended or cornered, and prickly.

1. *Pinus.* The Pine tree. 2. *Abies.* The Firre tree. 3. *Ilex.* The euer-greene Oake. 4. *Cupressus.* The Cipreflie tree. 5. *Arbutus.* The Strawberry tree. 6. *Alaternus.* The euer-greene Primer.

prickly on the edges, especially in the young trees, and sometimes on those branches that are young and newly sprung forth from the elder rootes, but else in a manner all smooth in the elder growne, abiding greene all the winter as well as summer, and are of a grayish greene on the vnderside. It beareth in the spring time certaine slender long branches (like as other Okes doe) with small yellowish mollie flowers on them, which fall away, and are vnprofitable, the acornes not growing from those places, but from others which are like vnto those of our ordinary Oake, but smaller and blacker, and set in a more ruggid huske or cuppe. This and no other kinde of *Ilex* doe I know to grow in all our land in any Garden or Orchard: for that kind with long and narrower leaues, and not prickly, growing so plentifully as Matthiolus saith in *Tulcane*, I have not seen: and it is very probable to bee the same that Plinie remembreth to haue the leafe of an Olie, but not as some would haue it, that *Smilax* Theophrastus maketh mention in his third Booke and sixteenth Chapter of his Historie of Plants, which the Arcadians so called, and had the leafe of the *Ilex*, but not prickly: for Theophrastus saith, the timber of *Smilax* is smooth and soft, and this of the *Ilex* is harder, and stronger then an Oake.

#### *The Vse of the *Ilex* or euer-greene Oake.*

Seeing this is to be accounted among the kindes of Oake (and all Oakes by Dioscorides his opinion are binding) it is also of the same qualite, but a little weaker, and may serue to strengthen weake members. The young tops and leaues are also vsed in gargles for the mouth and throat.

#### *6 Capressus. The Cypressse tree.*

**T**He Cypressse tree that is nurſed vp by vs, in our Country, doth grow in those places where it hath beene long planted, to a very great height, whose bodie and boughes are couered with a reddish ash-coloured bark; the branches grow not spreading, but vpright close vnto the bodies, bushing thicke below, and small vpwards, spire fashion, those below reaching neere halfe the way to them aboue, whereon doe grow euer greene leaues, small, long and flat, of a resinous sweete smell, and strong taste, somewhat bitter: the fruit, which are called nuts, grow here and there among the boughes, sticking close vnto them, which are small, and clouen into diuers parts, but cloſe while they are young, of a russetish browne colour; wherein are contained small browne seedes, but not ſo ſmall as motes in the Sunne, as Matthiolus and others make them to be.

#### *The Vſe of the Cypressse tree.*

For the goodly proportion this tree beareth, as also for his euer-greene head, it is and hath beene of great account with all Princes, both beyond, and on this ſide of the Sea, to plant them in towes, on both ſides of ſome ſpatious walke, which by reaſon of their high growing, and little ſpreadiſg, muſt be planted the thicker together, and ſo they giue a goodly, pleasant and ſweet shadow: or elſe alone, if they haue not many, in the middle of ſome quarter, or as they thiſke meete. The wood thereof is firme and durable, or neuer decaying, of a brown yellow colour, and of a ſtrong ſweete ſmell, whereof Cheſts or Boxes are made to keepe apparell, linnen, furres, and other things, to preſerue them from moths, and to giue them a good ſmell.

Many Phyſicall properties, both wood, leaues and nuts haue, which here is not my purpoſe to vnfold, but only to tell you, that the leaues being boyled in wine, and drunke, helpe the diſſicultie of making vrine, and that the nuts are binding, fit to bee vsed to ſtay fluxes or laskes, and good alſo for ruptures.

#### *7. Arbutus*

#### *7. Arbutus. The Strawberry tree.*

**T**he Strawberry tree groweth but ſlowly, and riſeth not to the height of any great tree, no not in France, Italy, or Spaine: and with vs the coldneſſe of our country doth the more abate his vigour, ſo that it ſeldome riſeth to the height of a man: the bark of the body is rough, and ſmooth in the younger branches: the leaues are faire and greene, very like vnto Baye leaues, finely dented or ſnipped about the edges, abiding alwayes greene thereon both Winter and Summer: the flowers come forth at the end of the branches vpon long stalkes, not cluſting thicke together, but in long bunches, and are ſmall, white, and hollow, like a little bottle, or the flower of Lilly Conually, which after turne into rough or rugged berries, moſt like vnto Strawberries (which hath giuen the name to the tree) ſomewhat reddiſh when they are ripe, of a harsh taste, nothing pleasant, wherein are contained many ſmall ſeedes: It hardly bringeth his fruit to ripenesſe in our country; for in their naturall places they ripen not vntill Winter, which there is much milder then with vs.

#### *The Vſe of the Strawberry tree.*

Amatus Lufitanus I thinkē is the firſt that euer recorded, that the water diſtilled from the leaues and flowers hereof, ſhould bee very powerfull againſt the plague and poysons: for all the ancient Writers doe report, that the fruit hereof being eaten, is an enemy to the ſtomacke and head. And Cluſius likewiſe ſetteth downe, that at Liffbone, and other places in Portingall where they are frequent, they are chiefly eaten, but of the poorer ſort, women and boyes. They are ſomewhat astringent or binding, and therefore may well ſerue for fluxes. It is chiefly nurſed with vs for the beauty and rareneſſe of the tree; for that it beareth his leaues alwayes green.

#### *8. Alaternus. The euer greene Priuet.*

**T**he tree which we haue growing in our country called *Alaternus*, groweth not to be a tree of any height, but abiding lowe, ſpreadeth forth many branches, whereon are ſet diuers ſmall and hard greene leaues, ſomewhat round for the forme, and endented a little by the edges: it beareth many ſmall whitish greene flowers at the ioynts of the stalkes, and ſetting on of the lower leaues cluſting thicke together, which after turne into ſmall blacke berries, wherein are contained many ſmall graines or ſeedes: the beauty and verdure of theſe leaues abiding ſo fresh all the yeare, doth cauſe it to be of the greater reſpect, and therefore findeth place in their Gardens onely, that are curiuſe conſeruers of all natures beauties.

#### *The Vſe of the euer greene Priuet.*

It is ſeldome vsed for any Phyſicall property, neither with vs, nor in the places where it is naturall and plentifull: but as Cluſius reportereth, hee learned that the Portingall Fishermen do dye their nets red with the decoction of the bark hereof, and that the Dyers in thoſe parts doe vſe the ſmall peces of the wood to ſtrike a blackiſh bleu colour.

#### *9. Celastrus Theophrasti Cluſio. Cluſius his Celaſtrus.*

**A**lthough the Collectour (who is thought to be Ioannes Molincus of the great Herball or History of plants, and generally bearing Daleschampius name, because the finding and relation of diuers herbes therein exprefſed, is appropriate to him, and printed at Lyons) of all our modern writers doth firſt of ali others appoint the *Celaſtrus*, whereof Theophrastus onely among all the ancient Writers of plants

plants maketh mention, to be the first *Aliternus* that Clusius hath set forth in his History of rarer plants: yet I finde, that Clusius himselfe before his death doth appropriate that *Celastrus* of Theophrastus to another plant, growing in the Garden at Leyden, which formerly of diuers had beeene taken to be a kinde of *Laurus Tinus*, or the wilde Baye; but he impugning that opinion for diuers respects, decyphrath out that Leyden tree in the same manner that I doe: and because it is not onely faire, in bearing his leaues alwayes greene, but rare also, being nourisched vp in our Land in very few places, but principally with a good old Lady, the widow of Sir John Leuson, dwelling neare Rochester in Kent; I thought it fit to commend it for an ornament, to adorne this our Garden and Orchard. It groweth vp to the height of a reasonable tree, the body whereof is couered with a darke coloured barke, as the elder branches are in like manner; the younger branches being greene, whereon are set diuers leaues thicke together, two alwayes at a ioynt, one against another, of a sad but faire greene colour on the vpper side, and paler vnderneath, which are little or nothing at all snipped about the edges, as large as the leaues of the *Laurus Tinus*, or wilde Baye tree: at the end of the young branches breaketh forth between the leaues diuers small stalkes, with foure or five flowers on each of them, of a yellowish greene colour, which turns into small berries, of the bignesse of blacke Cherries, greene at the first, and red when they begin to be ripe, but growing blacke if they hang too long vpon the branches, wherein is contained a hard shell, and a white hard kernell within it, couered with a yellowish skin. This abideth (as I said before) with greene leaues as well Winter as Summer; and therefore fittest to be planted among other of the same nature, to make an euer greene hedge.

#### The Vse of Clusius his Celastrus.

Being so great a stranger in this part of the Christian world, I know none hath made tryall of what property it is, but that the taste of the leaues is somewhat bitter.

#### 10. *Pyracantha*. The euer greene Hawthorne, or prickly Corall tree.

**T**HIS euer greene shrubbe is so fine an ornament to a Garden or Orchard, either to be nourisched vp into a small tree by it selfe, by prunning and taking away the suckers and vnder branches, or by suffering it to grow with suckers, thicke and plashing the branches into a hedge, for that it is pliable to be ordered either way; that I could not but giue you the knowledge thereof, with the description in this manner. The younger branches are couered with a smooth darke bleuish greene barke, and the elder with a more ash coloured, thicke set with leaues without order, some greater and others smaller, somewhat like both in forme and bignesse vnto the leaues of the Barberry tree, but somewhat larger, and more snipt about the edges, of a deeper green colour also, and with small long thornes scattered here & there vpon the branches: the flowers come forth as well at the ends of the branches, as at diuers places at the ioynts of the leaues, standing thicke together, of a pale whitish colour, a little dash'd ouer with a shew of blush, consisting of five leaues a piece, with some small threads in the middle, which turne into berries, very like vnto Hawthorne berries, but much redder and dryer, almost like polished Corall, wherein are contained foure or five small yellowish white three square seede, somewhat shining. It is thought to be the *Oxyacanthe* of Dioscorides, but seeing Dioscorides doth explaine the forme of the leafe in his Chapter of Medlars, which he concealed in the Chapter of *Oxyacanthe*, it cannot be the same: for *Adespilus Anthodon* of Theophrastus, or *Aronia* of Dioscorides, hath the leafe of *Oxyacanthe*, as Dioscorides saith, or of Smalladage, as Theophrastus, which cannot agree to this Thorne; but doth most liuely delineate our white Thorne or Hawthorne, that now there is no doubt, but that *Oxyacanthe* of Dioscorides is the Hawthorne tree or bush.

#### The Vse of this Corall tree.

Although Lobel maketh mention of this tree to grow both in Italy, and Prouince

<sup>1</sup> *Celastrus Theophrasti Clusii. Clusius his Celastrus.* <sup>2</sup> *Pyracantha. The euer greene prickly Corall tree.* <sup>3</sup> *Taxus. The Yewe tree.* <sup>4</sup> *Buxus Arbor. The Boxe tree.* <sup>5</sup> *Buxus humilis. The lowe or dwarfe Boxe.* <sup>6</sup> *Sasina. The Saine tree.* <sup>7</sup> *Paliurus Christi thorne.* <sup>8</sup> *Larix. The Larchtree.*

## The Corollarie to this Orchard.

Prouesse in France, in some of their hedges, yet he saith it is neglected in the naturall places, and to be of no vse with them: neither doe I heare, that it is applied to any Physicall vse with vs, but (as I before said) it is preserved with diuers as an ornament to a Garden or Orchard, by reason of his euer greene leaues, and red berries among them, being a pleasant spectacle, and fit to be brought into the forme of an hedge, as one please to lead it.

### 11. Taxus. The Yewtree.

**T**He Yewe tree groweth with vs in many places to bee a reasonable great tree, but in hoter countries much bigger, couered with a reddish gray scaly barke; the younger branches are reddish likewise, whereon grow many winged leaues, that is, many narrow long darke greene leaues, set on both sides of a long stalle or branch, neuer dying or falling away, but abiding on perpetually, except it be on the elder boughes: the flowers are small, growing by the leaues, which turne into round red berries, like vnto red Asparagus berries, in taste sweetish, with a little bitterness, and causing no harme to them for any thing hath been knowne in our country,

#### The Vse of the Yewtree.

It is found planted both in the corners of Orchards, and against the windows of Houses, to be both a shadow and an ornament, in being alwayes greene, and to decke vp Houses in Winter: but ancient Writers haue euer reckoned it to be dangerous at the least, if not deadly.

### 12. Buxus. The Boxe tree.

**T**He Boxe tree in some places is a reasonable tall tree, yet growing slowly; the trunke or body whereof is of the bignesse of a mans thigh, which is the biggest that euer I saw: but sometimes, and in other places it groweth much lower, vsually not aboue a yard, or a yard and a halfe high, on the backe sides of many Houses, and in the Orchards likewise: the leaues are small, thicke and hard, and still the greater or lesser the tree is, the greater or lesser are the leaues, round pointed, and of a fresh shining greene colour: the flowers are small and greenish, which turne into heads or berries, with four horns, whitish on the outside, and with reddish seede within them.

There is another kinde hereof but lately come to our knowledge, which differeth not in any thing from the former, but onely that all the leaues haue a yellow list or gird about the edge of them on the vpperside, and none on the lower, which maketh it seeme very beautifull; and is therefore called gilded Boxe.

*Buxus sempervirens.*  
*Gilded Boxe.*  
**Buxus sempervirens.**  
**Dwarf Boxe.**

We haue yet another kinde of Boxe, growing small and lowe, not aboue halfe a foote, or a foote high at the most, vnlesse it be neglected, which then doth grow a little more shrubby, bearing the like leaues, but smaller, according to the growth, and of a deeper greene colour: I could neuer know that this kinde euer bore flower or seede, but is propagated by slipping the roote, which encreaseth very much.

#### The Vse of Boxe.

The wood of the Boxe tree is vsed in many kindes of small works among Turners, because it is hard, close, and firme, and as some haue said, the roots much more, in regard of the diuers waues and crooked veites running through it. It hath no Physicall vse among the most and best Physitians, although some haue reported it to stay fluxes, and to be as good as the wood of *Gaiacum*, or *Lignum vite* for the French disease. The leaues and branches serue both Summer and Winter to decke vp houses; and are many times giuen to horses for the hots.

The lowe or dwarfe Boxe is of excellent vse to border vp a knot, or the

## The Corollarie to this Orchard.

long beds in a Garden, being a maruailous fine ornament thereunto, in regard it both groweth lowe, is euer greene, and by cutting may bee kept in what maner euer one please, as I haue before spoken more largely.

### 13. Sabina. The Sauine tree or bush.

**T**He Sauine tree or bush that is most vsuall in our country, is a small lowe bush, not so high as a man in any place, nor so bigge in the stemme or trunke as a mans arme, with many crooked bending boughes and branches, whereon are set many small, short, hard, and prickly leaues, of a darke green colour, fresh and green both Winter and Summer: it is reported, that in the naturall places it beareth small blacke berries, like vnto Juniper, but with vs it was neuer knowne to beare any.

#### The Vse of Sauine.

It is planted in out-yards, backsides, or void places of Orchards, as well to cast clothes thereon to dry, as for medicines both for men and horses: being made into an oyle, it is good to annoiint childrens bellies for to kill the Wormes: and the powder thereof mixed with Hogs greafe, to annoiint the running sores or scabs in their heads; but beware how you giue it inwardly to men, women, or children. It is often put into horses drenches, to helpe to cure them of the bots, and other diseases.

### 14. Paliurus. Christsthorne.

**T**HIS thorny shrubbe (wherewith as it is thought, our Sauiour Christ was crowned, because as those that haue travelled through Palestina and Iudea, doe report no other thorne doth grow therein so frequent, or so apt to be writhed) riseth in some places to a reasonable height, but in our country seldom exceedeth the height of a man, bearing many slender branches, full of leaues, set on either side thereof one by one, which are somewhat broad and round, yet pointed, and full of veines, thicke set also with small thornes, euen at the foote of euery branch, and at the foote of euery leafe one or two, some standing vpright, others a little bending downe: the flowers are small and yellow, standing for the most part at the end of the branches, many growing vpon a long stalle, which after turne into round, flat, and hard shelly fruit, yet couered with a soft fleshy skinne, within whichare included two or three hard, small, and browne flat seeds, lying in seuerall partitions. The leaues hereof fall away euery yeare, and spring forth afresh againe the next May following. The rariety and beauty of this shrubbe, but chiefly (as I thinke) the name hath caused this to be much accounted of with all louers of plants.

#### The Vse of Christsthorne.

Wee haue so few of these shrubbes growing in our country, and those that are, doe, for any thing I can vnderstand, neuer bear fruit with vs; that there is no other vse made hereof then to delight the owners: but this is certainly received for the *Paliurus* of Dioscorides and Theophrastus, and thought also by Matthiolus to be the very true *Rhamnus tertia* of Dioscorides. Matthiolus also seemeth to contradict the opinion is held by the Physitians of Mompelier, and others, that it cannot be the *Paliurus* of Theophrastus. It is held to be effectuall to helpe to breake the stone, both in the bladder, reines, and kidneyes: the leaues and young branches haue an astrigent quality, and good against poysons and the bitings of serpants.

### 15. Larix.

## 15. Larix. The Larch tree.

The Larch tree, where it naturally groweth, riseth vp to be as tall as the Pine or Firre tree, but in our Land being rare, and nourised vp but with a few, and those onely louers of rarities, it groweth both slowly, and becommeth not high: the barke hereof is very rugged and thicke, the boughes and branches grow one aboue another in a very comely order, hauing diuers small yellowish knobs or bunches set thereon at severall distances; from whence doe yearly shoothe forth many small, long, and narrow smooth leaues together, both shorter and smaller, and not so hard or sharpe pointed as either the Pine or Firre tree leaues, which doe not abide the Winter as they doe, but fall away every yeare, as other trees which shed their leaues, and gaine fresh every Spring: the blossomes are very beautifull and delectable, being of an excellent fine crimson colour, which standing among the greene leaues, allure the eyes of the beholders to regard it with the more desire: it also beareth in the naturall places (but not in our Land that I could heare) small soft cones or fruit, somewhat like vnto Cyppresse nuts, when they are greene and close.

## The Vse of the Larch tree.

The coles of the wood hereof (because it is so hard and durable as none more) is held to be of most force being fired, to cause the Iron oare to melt, which none other would doe so well. Matthiolus contesteth against Fuchsius, for deeming the Venice Turpentine to be the liquid Rosson of the Firre tree, which he assureth vpon his owne experiance and certaine knowledge, to be drawne from this Larch tree, and none other; which cleere Turpentine is altogether vsed inwardly, and no other, except that of the true Turpentine tree, and is very effectuall to cleanse the reines, kiddeyes, and bladder, both of grauell and the stone, and to prouoke vrine: it is also of especiall property for the *gonorrhœa*, or running of the reines, as it is called, with some powder of white Amber mixed therewith, taken for certaine dayes together. Taken also in an Electuary, it is singular good for to expectorate rotten flegme, and to helpe the conuumption of the lungs. It is vsed in plasters and salves, as the best sort of Turpentine. The Agaricke that is vsed in physick, is taken from the bodies and armes of this tree. And Matthiolus doth much infist against Brasauolus, that thought other trees had produced Agaricke, affirming them to be hard *Fungi*, or Mushrooms (such as wee call Touch-wood) wherwith many vsed to take fire, strooke thereto from Steele.

## 16. Tilia. The Line or Linden tree.

There are two sorts of Line trees, the male and the female; but because the male is rare to be seene, and the female is more familiar, I will onely giue you the description of the female, and leaue the other.

The female Line tree groweth exceeding high and great, like vnto an Elme, with many large spreading boughes, couered with a smooth barke, the innermost being very pliyant and bending from whence come smaller branches, all of them so pliable, that they may bee led or carried into any forme you please: the leaues thereon are very faire, broad, and round, somewhat like vnto Elme leaues, but fairer, smoother, and of a fresher greene colour, dented finely about the edges, and ending in a sharpe point: the flowers are white, and of a good smell, many standing together at the top of a stalke, which runneth all along the middle ribbe of a small long whitish leafe; after which come small round berries, wherein is contained small blackish seede: this tree is wholly neglected by those that haue them, or dwell neare them, because they suppose it to be fruitlesse, in regard it beareth chaffie huskes, which in many places fall away, without giuing ripe seede.

The

1. *Tilia semina*. The Line or Linden tree. 2. *Tamariscus*. The Tamarisktree. 3. *Acer maius latifolium*. The Sycomore tree. 4. *Sympetrum Hederae Virginianum*. The Virginia Vine or racher Iuze.

**The Vse of the Line tree.**

It is planted both to make goodly Arbours, and Summer banqueting houses, either belowe vpon the ground, the boughes seruing very handfomely to plash round about it, or vp higher, for a second aboue it, and a third also: for the more it is depressed, the better it will grow. And I haue seene at Cobham in Kent, a tall or great bodied Line tree, bare without boughes for eight foote high, and then the branches were spread round about so orderly, as if it were done by art, and brought to compasse that middle Arbour: And from those boughes the body was bare againe for eight or nine foote (wherein might bee placed halfe an hundred men at the least, as there might be likewise in that vnderneath this) & then another rowe of branches to encompass a third Arbour, with stayres made for the purpose to this and that vnderneath it: vpon the boughes were laid boards to tread vpon, which was the goodliest spectacle mine eyes euer beheld for one tree to carry.

The coles of the wood are the best to make Gunpowder. And being kindled, and quenched in vinegar, are good to dissolve clotted blood in those that are bruised with a fall. The inner barke being steeped in water yeeldeth a slimie iuyce, which is found by experiance, to be very profitable for them that haue been burnt with fire.

**17. Tamarix. Tamariske tree.**

**T**He Tamariske tree that is common in our country, although in some places it doth not grow great, yet I haue seene it in some other, to be as great as a great apple tree in the body, bearing great armes; from whose smaller branches spring forth young slender red shoothes, set with many very fine, small, and short leaues, a little crisped, like vnto the leaues of Sauine, not hard or rough, but soft and greene: the flowers be white mossie threads, which turne into dounie seede, that is carried away with the wind.

**T**here is another kinde hereof very beautifull and rare, not to be seene in this Land I thinke, but with M<sup>r</sup>. William Ward, the Kings seruant in his Granary, before remembred, who brought me a small twigge to see from his house at Boram in Essex, whose branches are all red while they are young, and all the leaues white, abiding so all the Summer long, without changing into any shew of greene like the other, and so abideth constant yeare after yeare, yet shedding the leaues in Winter like the other.

**The Vse of Tamariske.**

The greatest vse of Tamariske is for spleneticke diseases, either the leaues or the barke made into drinke; or the wood made into small Cans or Cups to drinke in.

**18. Acer maimai latifolium. The great Maple or Sycomore tree.**

**T**He Sycomore tree, as we vsually call it (and is the greatest kind of Maple, cherisched in our Land onely in Orchards, or elsewhere for shade and walkes, both here in England, and in some other countries also) growtheth quickly to bee a faire spreading great tree, with many boughes and branches, whose barke is somewhat smooth: the leaues are very great, large, and smooth, cut into four or five diuisions, and ending into so many corners, every one standing on a long reddish stalke: the bloomings are of a yellowish greene colour, growing many together on each side of a long stalke, which after turne into long and broad winged seede, two alwaies standing together on a stalke, and bunched out in the middle, where the seed or kernell lyeth, very like vnto the common Maple growing wilde abroad, but many more together, and larger.

**The Vse of the Sycomore tree.**

It is altogether planted for shady walkes, and hath no other vse with vs that I know.

**19. Nux Veficaria. The bladder Nut.**

**T**His tree growtheth not very high, but is of a meane stature, when it is preserued and pruned to grow vpright, or else it shooteth forth many twigges from the rootes, and so is fit to plant in a hedge rowe, as it is vsed in some places: the body and armes are couered with a whitish greene barke: the branches and leaues on them are like vnto the Elder, haing three or five leaues set one against another, with one of them at the end, each whereof is nicked or dented about the edges: the flowers are sweete and white, many growing together on a long stalke, hanging downward, in forme resembling a small Daffodill, haing a small round cup in the middle, and leaues about it: after which comie the fruit, inclosed in russetish greene bladders, containing one or two browniish nuts, lesser then Hafell nuts, whose outer shell is not hard and woody, like the shell of a nut, but tough, and hard withall, not easie to breake, within which is a greene kernell, sweetish at the first, but lothsome afterwards, ready to procure casting, and yet liked of some people, who can well endure to eate them.

**The Vse of the Bladder Nut.**

The greatest vse that I know the tree or his fruit is put vnto, is, that it is receiued into an Orchard, either for the rarity of the kinde, being suffered to grow into a tree, or (as I said before) to make an hedge, being let grow into suckers.

Some Quacksaluers haue vsed these nuts as a medicine of rare vertue for the stone, but what good they haue done, I neuer yet could learne.

**20. Rhus Myrtifolia. The Mirtle leafed Sumach.**

**T**His lowe shrubbe growtheth seldom to the height of a man, haing many slender branches, and long winged leaues set thereon, every one whereof is of the bignesse of the broad or large Mirtle leafe, and set by couples all the length of the ribbe, running through the middle of them. It beareth diuers flowers at the tops of the branches, made of many purple threads, which turne into small blacke berries, wherein are contained small, white, and rough seed, somewhat like vnto Grape kernels or stones. This vseth to dye down to the ground in my Garden every Winter, and rise vp again every Spring, whether the nature thereof were so, or the coldnesse of our climate the cause therof, I am not well assured. It is also rare, and to be seen but with a few.

**The Vse of this Sumach.**

It is vsed to thicken or tanne leather or hides, in the same manner that the ordinary Sumach doth; as also to stay fluxes both in men and women.

**21. Rhus Virginiana. The Virginia Sumach, or Buckes horne tree of Virginia.**

**T**His strange tree becommeth in some places to bee of a reasonable height and bignesse, the wood whereof is white, soft, and pithy in the middle, like vnto an Elder, couered with a darke coloured barke, somewhat smooth: the young branches that are of the last yeares growth are somewhat reddish or browne, very soft and

and smooth in handling, and so like vnto the Velvet head of a Deere, that if one were cut off from the tree, and shewed by it selfe, it might soone deceiue a right good Woodman, and as they grow seeme most like thereunto, yelding a yellowish milke when it is broken, which in a small time becometh thicke like a gumme: the leaues grow without order on the branches, but are themselues set in a seemly order on each side of a middle ribbe, seuen, nine, ten, or more on a side, and one at the end, each whereof are somewhat broad and long, of a darke greene colour on the vpperside, and paler greene vnderneath, finely snipped or toothed round about the edges: at the ends of the branches come forth long and thicke browne tufts, very soft, and as it were woolly in handling, made all of short threads or thrums; from among which appear many small flowers, much more red or crimson then the tufts, which turne into a very small seede: the roote shooteth forth young suckers farre away, and round about, whereby it is mightily encreased.

## The Vse of this Sumach.

It is onely kept as a rarity and ornament to a Garden or Orchard, no bo-  
die, that I can heare of, hauing made any tryall of the Physicall properties.

22. *Vitis, seu portus Hedera Virginensis.* The Virginia Vine, or rather Iuie.

**T**HIS slender, but tall climing Virginia Vine (as it was first called; but Iuie, as it doth better resemble) riseth out of the ground with diuers stems, none much bigger then a mans thumbe, many lesse; from whence shoothe forth many long weake branches, not able to stand vpright, vnlesse they be sustainted: yet planted neare vnto a wall or pale, the branches at seuerall distances of the leaues will shoothe forth small short tendrels, not twining themselues about any thing, but ending into foure, fife, or six, or more small short and somewhat broad clawes, which will fasten like a hand with fingers so close thereunto, that it will bring part of the wall, morter, or board away with it, if it be pulled from it, and thereby stay it selfe, to climbe vp to the toppe of the highest chimney of a house, being planted therat: the leaues are crumpled, or rather folded together at the first comming forth, and very red, which after growing forth, are very faire, large, and greene, diuided into foure, fife, six, or seuen leaues, standing together vpon a small foote-stalke, set without order on the branches, at the ends whereof, as also at other places sometime, come forth diuers short tufts of buds for flowers; but we could neuer see them open themselues, to shew what manner of flower it would be, or what fruit would follow in our country: the roote spreadeth here and there, and not very deepe.

## The Vse of this Virginian.

We know of no other vse, but to furnish a Garden, and to encrease the number of rarities.

And thus haue I finished this worke, and furnished it with whatsoeuer Art and Nature concurring, could effect to bring delight to those that liue in our Climate, and take pleasure in such things; which how well or ill done, I must abide every ones censure: the iudicious and courteous I onely respect, let Momus bite his lips, and eate his heart; and so Farewell.

FINIS.
